RAYANA. This tree (qu. Ficus religiosa) in Western India is sacred, and is dedicated by the Jains to their first Tirthankara named Reshabhanat'ha, the patron saint of Satrunjaya. His shrines have all a rayana tree overshadowing his charana or footprints.

RAYAT LAUT, a seafaring race of the Indian Archipelago, adventurous navigators. The Rayat Laut, subjects of the sea, or Orang Akkye, are unquestionably from the same stock as the Jakun. The two tribes are expert divers and fishermen, and frequently make long voyages in their fragile vessels. Otherwise they reside along with their families in their boats for months together, employed in fishing, collecting agar-agar, trepang, etc. The Rayat Laut have but faint ideas of the existence of a benignant supreme Being, and of a state of future existence. In appearance, they resemble the Jakun and Malay, allowing for the physical alteration always induced by difference of food, daily occupations, and habits, especially when continued through many generations. They are darker than the Malay, more savage and uncouth in aspect.—*Newbold's British Settlements.*

RAYAVATA, one of the 14 Hindu patriarchs who are supposed to preside over the 14 Manwantara of the calpa, and whose anniversaries are noticed in the calendar.

RAYMOND, a French officer in the service of Nizam Ali, nizam of the Dekhan. In March 1795, with 18,000 men, he met the Mahrattas at Kurdla with 130,000 horse and foot and 150 pieces of cannon, and was completely defeated. His tomb, to the east of the city, is a shrine to which annually great numbers resort, offering chaplets of flowers. The people first visit his house on the bank of the Musa river, and view his uniform, annually laid out on the day of his death, and then proceed to the tomb.

RAZAI. HIND. A counterpane quilted with cotton.

RAZAQ. ARAB. Food.

RAZI, JAV., qu. Rassi, ARAB. A ferment used in Java in the distillation of the fermented liquor called Badek.

RAZI, the literary name of Muhammad-bin-Zakariah Abu Baqr-ur-Razi, from which place he was known in Western Europe as Rhazes or Razes. He was a famous physician, born and brought up at Rai, in Irak-i-Ajami, now designated Turkish Arabia. He acquired great philological and philosophical knowledge, but until he was 30 years old, he was chiefly known as a musician. After his fortieth year, he applied himself exclusively to the study of medicine and philosophy, and studied under Ibn Zain-u-Tabari at Baghdad. He travelled to Jerusalem and Africa, and it is said also to Spain. He became the medical superintendent of an hospital at Rai, and afterwards of one at Baghdad. He died A.D. 923 or 932, at Rai or Baghdad. All his works were published in folio, A.D. 1516, and were translated by Dr. Meade into English, A.D. 1747.

RAZI-NAMA, an acquittal, literally a deed of consent or acquiescence.

RAZZIA BEGUM, known also as the Sultana Razzia, was the daughter of Shams-ud-Din Altamsh. On the death of Altamsh, his son Rukn-ud-Din was deposed after a reign of seven months, and his sister Razzia Begum raised to the throne (A.D. 1236, A.H. 634) under the title Sultana Razzia. She could read the Koran correctly; and her business talents were of so high an order, that Altamsh, when absent on his southern campaigns, twice left her in charge of his government in preference to his sons. She succeeded in sowing dissensions amongst the two factions that opposed her. She appeared daily on her throne in the usual habit of a sultan, gave audience to all comers, reformed abuses, revised the laws, decided suits of importance, and evinced all the qualities of a just and able sovereign. Ferishta says she was endowed with every princely virtue, and those who scrutinize her actions most severely will find in her no fault but that she was a woman. But she showed undue, though not criminal, partiality towards her Master of the Horse, an Abyssinian; allowed him to lift her up to her horse, and gave him the title of Amir-ul-Umra, which disgusted the nobles, as it placed him above all others. A rebellion followed, her army mutinied, and she was made prisoner, and committed to the care of Altunia, a Turki chief, while her brother Bahram was raised to the vacant throne. But she gained over Altunia, who married her, and, aided by her husband, she advanced to Dehli, but after two bloody battles they were both taken prisoners, and both were put to death. Her reign lasted 3½ years.—*Elliot's Historians; Elphin.* p. 324.

REA, a former subdivision of the rupee at Bombay; 100 rea = 1 quarter, and 4 quarters = 1 rupee.

READYMONEY. Sir Cowasjee Jahangir Readymoney, C.S.I., a highly liberal merchant of Bombay, whose gifts in charity during his life amounted to about £200,000. He died 19th July 1878.

REALGAR, red arsenic, red orpiment.

Hiung-hwang, . .	CHIN.	Tu-hiung, . . .	CHIN.
Hwang-kin-Shih,	,,	Disulphide of arsenic,	ENG.
Ming-hiung, . .	,,		

It occurs native in Yunnan, Kwei-chau, and Kansuh. It is used in soldering gold, also for the manufacture of ornamental vessels and medicine cups.—*Smith.*

REANA LUXURIANS has been introduced into the Madras Presidency. Mr. Whiteside planted the seed in clayey soil, well manured, and with water near the surface. The plants were 5 feet apart, and grew to a height of 12 feet. When half grown, the grass was eaten greedily by cattle and sheep, which fattened on it. Mr. H. T. Ross, when sub-collector of Bellary, fed a number of his own milch cows with it. He found that it doubled their yield of milk, and they were so fond of it

that they would break through any fence to get at it. The cultivation has been successful on the Neilgherries.

REANG, a mixed race or half-breed between the low Tiperah tribes and the Kuki.—*Cal. Rev.*, 1860.

REAUMURIA HYPERICOIDES is a plant of Syria and Persia, and R. vermiculata is a native of Sicily, Bombay, and Egypt. This plant resembles Salsola fruticosa. It is used at Alexandria as a remedy for the itch, being bruised and applied externally, and a decoction taken internally.

REBARI. Throughout Hindustan the Rebari rear and tend camels, and are in many places Muhammadans. In Rajputana they are a distinct tribe following Hinduism, employed entirely in rearing camels, or in stealing them, in which they evince a peculiar dexterity, uniting with the Bhatti in the practice as far as Daodpotra. When they come upon a herd grazing, the boldest and most experienced strikes his lance into the first he reaches, then dips a cloth in the blood, which at the end of his lance he thrusts close to the nose of the next, and, wheeling about, sets off at speed, followed by the whole herd, lured by the scent of blood and the example of the leader. The Rebari of Gujerat are nomade shepherds, who rear camels, sheep, and goats, and subsist by the sale of the wool and milk, and not of the animals.—*Tod; Wilson.*

RECCAN or Rakan River, on the Sumatra coast, in lat. 2° 10′ N., and long. 100° 37′ E., is about 15 miles broad at its mouth. It has at its entrance two islands; Pulo Lalang Besar, the larger, is in lat. 2° 12′ N., and long. 100° 36½′ E.; and Pulo Lalang Kecheel. Its main branch, called the Tannah Putie river, takes a S.E. direction. The mouth of the river is almost dry at low water of spring tides; the tide enters it there at a speed of 7 miles per hour, producing a bore of 30 feet at spring tides.

RECORDER, the designation of the Chief Justice of Singapore, Rangoon, Moulmein.

RED.

Lal, ...	HIND.	Deng, ...	SIAM.
Abang, ...	MALAY.	Erra, Yerra, . .	TEL.
Surkh, ...	PERS.		

Red is one of the primitive colours, of which the chief commercial varieties are fine venetian, red lead, orange and Indian red, and vermilion. The colour is esteemed sacred by several tribes, from China to Caucasus, from Tibet and Bhutan to the extremity of India, and to Ceylon.—*Ouseley's Tr.* i. p. 87.

REDANG ISLANDS, from lat. 5° 38′ N. to about lat. 6° N., on the east coast of the Malay Peninsula, in the Gulf of Siam, along which they form an extensive chain. Turtle and Kimor, or large scallops, are procurable on the N.E. side.

REDDI. TAM., TEL. In Southern India, an enterprising race of agriculturists who have migrated from their original seats near Rajamundry over the whole of Southern India, also into Maharashtra, being met with as far north as Poona, where they are considered the most thriving cultivators. The old rulers of the Telinga country were styled Reddi; and so late as 1846, Narsimma, a Reddi, on the borders of the Bellary and Kurnool collectorates, though surrounded by the Indian army, thought himself capable of opposing the British Indian Government, rebelled, and was put down by a military force. Among the Reddi of Southern India, a young woman of sixteen or twenty years of age may be married to a boy of five or six years of age. She, however, lives with some other adult male, perhaps a maternal [illegible] or cousin, but is not allowed to form a conn[illegible] with the father's relatives; occasionally it [illegible] be the boy-husband's father himself, that [illegible] woman's father-in-law. Should there be [illegible] dren from these liaisons, they are fathered [illegible] boy-husband. When the boy grows up, [illegible] is either old or past child-bearing, when [illegible] turn takes up with some other 'boy's' w[illegible] manner precisely similar to his own, and [illegible] creates children for the boy-husband. [illegible] Bummala Wanloo, TEL., people of the [illegible] caste.—*Shortt, Tr. Ethn. Soc., New Series* [illegible] p. 194; *Lubbock, Orig. Civil.* p. 55.

REDFIELD, W. C., of New York, advocated the opinion that hurricanes are great whirlwinds.

RED FISH of the Pacific Ocean is the Holocentrus ruber. A red fish eaten by Captain Cook's crew proved poisonous to some who partook of it. Red fish is a condiment of the Malay Peninsula; fish roes and sardines are made into condiments, and the species of fish used in their preparation are Alausa toli (Ikan truboh), Engraulis Brownii (Bunga ayer or badah), Dussumieria acuta (Tamban-bulat), and Clupeonia perforata (Tamban-nepes or batuh). Engraulis Brownii, *Gmelin*, inhabits the sea and the estuaries of all seas. Total length, 6 inches. In Java, Sumatra, and the Straits of Malacca, large quantities are preserved both for home consumption and exportation to China and India. The delicious condiment is famed under the denomination of red fish (Ikan merah of the Malays) or Malacca fish, and is used as a relish. At Bencoolen and Malacca, after the heads have been removed, the fishes (those of middling size are preferred) are cleansed, salted (in the proportion of one to eight parts of fish), and deposited in flat, glazed earthen vessels. In the latter they are for three days submitted to pressure by means of stones placed on thin boards or dried plantain leaves. The fishes are next freed from salt, and saturated with vinegar of cocoa palm toddy, after which are added vinegar with powdered ginger and black pepper (the latter mostly entire), and some spirits and powdered red rice. After having been kept for three days, a little more vinegar is added before placing the fishes in well-closed jars or bottles. They should be kept four or five months before being used. The expenses of a quart bottle of the condiment is about 30 cents, the selling price one Spanish dollar. Chinese settlers in the Straits prepare a similar red condiment with slices of Polynemus Indicus and P. tetradactylus, and also with prawns.—*W. T. Lewis, Esq., Penang; G. Bennett*, p. 21.

RED-HAIRED, Hang-Mao of the Chinese; British foreigners are so called.

REDIF. Padre Redif, a Christian priest, and a body of Muhammadan Mullahs, in the reign of the emperor Akbar, carried on a debate on religion before an assembly of the learned of all religions; a decided advantage, both in temper and argument, was given to the Christian. Akbar reproved the Mullahs for their violence, and expressed as his opinion that God could only be adequately worshipped by following reason, and

Reeds of the best quality of which pens are le are imported into India from Arabia, but erior descriptions, from Saccharum sara, abound many hills, and on the banks of rivers in India. eeds for weaving are formed of these, though sed also for pens. In Peninsular India, reeds or weavers are prepared by a class of persons, ho also practise as oculists. The materials used r reeds are strips of several descriptions of reed; r silk weavers they are made of the fine teeth the mango fish.—*Rohde's MSS.*

REEF or Shoal. Sha'b, ARAB. Darwin (Researches, p. 555) describes the lagoon islands, e encircling reefs, and the barrier reefs. Coral ands are arranged by Darwin into the atoll or lagoon island, a coral margin with a lagoon in the centre; barrier reefs, stretching along a vast extent of coast; and encircling coral reefs, which are merely fringes of coral along the margin of a shore. Von Birch is of opinion that the lagoon island is the margin of a submarine crater on which the coral animal has built its wonderful structure. The barrier reefs, according to Darwin, are due to subsidence. In a sheltered archipelago, they rarely rise to the surface. But in an open ocean, rolling waves and breakers throw up a barrier of broken coral far above the usual high water-mark.

In New Caledonia the encircling reef extends 140 miles beyond the island. At Vanikoro, the reef runs two or three miles from the shore, from which it is separated by a channel from 30 to 50 fathoms deep. Externally, the reef rises from an ocean profoundly deep.

The great barrier reef which fronts the N.E. coast of Australia for nearly 1062 miles, runs parallel to the shore, at distances ranging from 20 to 70 miles, the enclosed sea, 31,860 square miles in area, varying in depth from ten to sixty fathoms. Sir Charles Lyell and Darwin think (557) that the great depths of the marginal seas is caused by the subsidence of the land, the corals raising their structure as the lands subside.

There are innumerable coral reefs and coral islands, but Darwin has satisfactorily shown that atolls, or annular reefs, were originally fringing reefs constructed around islands that have since subsided. Coral reefs have thus been divided into three classes, according to their geological character,—the shore reefs fringe the shores of continents or islands; the encircling reefs or barrier reefs; the third, enclosing a lagoon, is called an atoll, or lagoon island, and is a ring or annular breakwater around an interior lake. In the Archipelago and the Pacific are many coral islands or atolls. An atoll differs from an encircling barrier reef only in the absence of land within its central expanse; and a barrier reef differs from a fringing reef, in being placed at a much greater distance from the land, with reference to the probable inclination of its submarine foundation, and in the presence of a deep water lagoon-like space or moat within the reef. Atolls sometimes constitute a great circular chain enclosing a deep basin, but opening by one or more deep breaches into the sea. Sometimes they surround a little island by a girdle of reefs; or form the immediate edging or border of an island or continent. Atolls occur in the Pacific, in the Chinese Seas, in the Marianne and Philippine Islands, Maldives, Laccadives, and Sunda group. —*Darwin on the Structure and Distribution of Coral Reefs; Hartwig.*

REEPERS are longitudinal sections of the palmyra palm, used for building purposes; the trunk of the tree is split into eight for reepers, and these are dressed with an adze. In Ceylon they are made of the kittool palm, and known as Nipera reepers; these are dearer than any other kind, they last in many instances for [illegible] years.—*Simmonds' Dict.*

REFUGE CITIES, or Sanctuaries, cities to which criminals and others obtain refuge. Hebron; Kedish; Shechem.

REG. PERS. Sand. Reg-i-Rawan, in the Registhan desert, the Baloo-desa of India. Reg-i-Rawan, moving sand. Reg-i-Sabz, dry soil.

REGENT BIRD, [illegible], is the melinus. It builds [illegible] in bowers. It is also satin bird and [illegible]. It is also king honey bird. Ramphorhynchus it is cephalus.

REG MAHI, a small mottled lizard, Lacerta scincus, *Linn.*, from 6 to 8 inches in length, found in the sands of Sind, and occasionally in dry tracts of the Multan division. This reptile used to be formerly in the Materia Medica of Europe as a restorative stimulant and antisyphilitic. Even some modern physicians, however, have justified the use of these animals.

REG-RAWAN, or moving sand, is a small hill in the Kohistan, forty miles north of Kābul, remarkable for a bed of sand on its southern face. This is subject to sliding movements, which occasion sonorous sounds. It is styled the Khwaja Reg-rawan. A whitish streak is observed, extending from the summit to the foot. It is mentioned by Baber. The natives say that it runs up again, and that it is never diminished; and that there is a cave at its foot where noises are heard.

Burnes describes the sounds as loud and hollow, very like those of a large drum; whilst Sultan Baber, in his Memoirs, speaks of the sounds of drums and nagarets, and the same instruments were specified by the Friar Odoric. A still more apt comparison is afforded by Captain Newbold's account of the like phenomenon in the Sinai desert, at the sand-hill known as Jabal Nakus, 'the hill of the bell.' Dr. Wallin also was told when crossing a wadi of the Sinai desert, called Hamade, near Wadi Araba, that sometimes very strange sounds, like those of kettle-drums or nakkara, were heard to rise from the earth, without any discoverable cause. Friar Odoric gives an account of a sandy hill, on which he heard the sound of invisible nakkara or drums. Mr. C. R. Markham, C.B., says the musical sounds caused by moving sand, which astonished Odoric, are heard also in the deserts of the west coast of Peru. Mrs. Markham and himself heard them when they halted amidst the *medano* or hills of light sand in the Arequipa desert. Another case was discovered by the late Hugh Miller in the island of Eigg (Cruise of the *Betsy*, quoted in Petermann's Mittheilungen, 1858, p. 405). Mr. Bollaert notices the Bramador or rumbling mountain of Tarapaca, which appears to be distinct from Mr. Markham's.—*J. G. S.* xxi. p. 104; *Yule, Cathay*, i. p. 244; *Burnes' Travels.*

REGULATION and Non-Regulation are terms employed in the administration of British India to indicate provinces and districts under different forms of laws. The Regulation Provinces, as a rule, are governed under the provisions of Acts of the Supreme Council of India, or by Acts of the British Parliament, and the administrative officers are designated judges and collectors. The Non-Regulation Provinces, again, are under the control of Commissioners, who rule in accordance with local provisions, often founded on previous decisions, and the Chief Commissioners and Commissioners are sometimes civilians and sometimes military men.

REGULUS CRISTATUS, the golden-crested wren of Europe, N. Asia, Japan, W. America, is partially migratory. It is replaced in the Himalaya by R. Himalayensis. The [illegible] proregulus (Regulus modestus, or [illegible] regulus) of Asia is very rare in [illegible] specimen obtained in Dalmatia, and [illegible] England,—but it is common in India, [illegible] allied species. See Birds.

REGUR. *Dec.* The black soil of the volcanic regions. See Soil.

REH has its origin in the decomposition of the elements of the rocks and soils under the action of air and water, and the rain-water washes out the soluble carbonates of lime, and also chlorides, and sulphates, and carbonates, which are formed into carbonate of lime, carbonate of soda, sulphate of lime, chloride of soda, sulphate of soda, sulphate of magnesia, which effloresce on the surface of the ground.

Reh is thus not a special salt, or mixture of salts, but a very variable compound. It is reasonably the most easily soluble salt in the earth water remaining in solution after the decomposition of carbonate of lime, and on evaporation. The ingredients and their relative proportions are found to vary in different places, exactly as the well waters at different spots differ in their contents, and in the same area there is no relation between the two.

Deterioration of the land irrigated from the Ganges and Jumna canals attracted serious attention in the villages along the Western Jumna canal, and its branches, about Dehli, Hissar, Rohtak, and Kurnool. In 1857, Mr. Sherer, magistrate of Aligarh, examined the tracts country deteriorated, and the picture presented by him of the suffering in some of the villages was truly deplorable. Out of 580 canal villages 59 or nearly 10 per cent. had been injured to degrees ranging from severely to partially, 3 per cent. being severely injured. The maximum appeared to be reached in Paniput, where 19 villages, or 19 per cent., were injured. Reh effloresces in several parts of the Panjab where there are no canals at all; in these parts it appears in land irrigated from wells where the water is very far from the surface. The effloresing salt consists of sulphate of soda, with a variable proportion of chloride of sodium or common salt. As far as experience goes, lands near canals, like the Hasli, in the Lahore constructed at, but not below, the ordinary of the watershed, are usually found to suffer from reh efflorescence. Generally speaking, farmers assert that fully impregnated reh is incurable and valueless. In gardens and plots, it has been found useful to dig the soil to the depth of 2 feet or so entirely, and put in fresh soil. Sluicing and irrigation has been recommended. Nitrate of lime is recommended as a probable chemical antidote for the salts of the reh. It has been known that the best remedy for reh is the saline efflorescence of old mortar on walls, or which appears on ground containing carbonate of lime and animal matter. In this substance nitrate of lime is found, and this salt would act by producing the insoluble carbonate of lime, and the sparingly soluble sulphate of lime, and the deliquescent nitrate of soda, instead of the effloresent sulphate and carbonate of soda which are the principal constituents of reh. Nitrate of lime is prepared by distilling shora or saltpetre with kahi safed, and neutralizing the acid liquor that passes over with chunam. The native cultivators, in some parts, have long been accustomed to employ chikna kullur, or earth which looks damp; this earth is found where animal remains are deposited, and usually contains nitrate of lime. The reh is composed principally

of sulphate of soda and chloride of sodium, with, in some places, carbonate of soda; the sulphate and carbonate of soda are very efflorescent salts, and melt partly in their water of crystallization at a temperature of about 98°, while they are rather sparingly soluble when the temperature falls below 60°. Hence during the hot weather the reh melts and percolates the ground to some considerable depth; but as the weather becomes cooler, crystals form in this soil and form a capillary network, upon which it travels till it arrives at the surface, where the salt gives off its water of crystallization, and falls into a dry powder by efflorescence. If to a solution of these salts, nitrate of lime be added, no change is produced by it on the chloride of sodium, but the sulphate and carbonate of soda are converted into nitrate of soda, a deliquescing salt, while the lime is changed either into the insoluble carbonate of lime, or the sparingly soluble sulphate of lime, neither of which are efflorescent or in any way injurious to vegetation.—*Powell's Handbook*, pp. 95, 112; *Records Govt. of India*, No. 42 of 1864, *Note on Reh, etc.*

REHAT, in Buddhism, a being entirely free from evil desire, and possessing supernatural powers.—*Hardy's Monachism*, p. 440.

REHMANNIA CHINENSIS. *Tatarinov.*

San-ti-whang,	CHIN.	Man-ti,	CHIN.
Sha-ti-whang,	,,	Man-yuen,	,,

A plant of the order Gesneraceæ. Its roots are sun-dried, and brought from Kwang-p'ing-fu in Peh-chi-li, from Yuen-chan-fu in Kiang-si, and very largely from Hwai-king-fu in Ho-nan. The root is deemed by the Chinese alterative and tonic.—*Smith's Mat. Med.*

REINHARD, WALTER, a native of the electorate of Treves, who came to India as a carpenter in the French navy. He took service with several native chiefs for brief periods, and then joined Gregory, an Armenian, who was in high employ under Mir Kasim, nawab of Bengal. After the fall of Monghir, he put to death all the English prisoners who had been collected at Patna. He next joined the Bharatpur chief, and from him finally went over to Najaf Khan. He died in 1778, and was buried at Agra. He was known as Sumru, and the Begum who had lived with him, and who is said to have been a Kashmir dancing girl, was recognised as his widow, and succeeded to all his Sardanha estates. In 1781 she was received into the Catholic Church, and in 1792 married M. le Vaisseau, a French adventurer. He was so unpopular that the people rebelled under Zafar Yab Khan, a son of Reinhard, and by an artifice of the Begum her husband was induced to commit suicide, and the disturbance was soon after quelled by her old servant George Thomas. In 1802, Zafar Yab Khan died, leaving a daughter, who was married to Mr. Dyce, an officer of her army. She had a son and two daughters. The son, David Ochterlony Dyce Sombre, was adopted by the Begum, and on her death in 1836 he succeeded to the estate. He married Mary Anne, daughter of Viscount St. Vincent, and died in Paris in 1851. His widow in 1862 married the Honourable George C. Weld Forester, now Baron Forester. The Begum by will left to schools and Romish churches, Rs. 3,74,400.—*Growse*, p. 41.

REJANG is the alphabet of Lemba and Pasummah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright scratches or strokes, and on the whole it is more complete than either the Batak or Korinchi alphabets.

REJEEPAK, (lit.) pure veins, a term applied to Arabian horses of pure strain, many of which are bred on the Persian shore, with as much attention to preserve the original blood as imported from Arabia, as could be shown in first-rate studs in England.

RELIGION. Of the various religions in the world, according to Hassel, there are, in millions, Christians, 120; Jews, nearly 4; Muhammadans, 250; Hindus, 111; Buddhists, 315. Every religion, it has been remarked, 'even the most imperfect and degraded, has something that ought to be sacred to us, for there is in all religions a secret yearning after the true though unknown God.' Movers has illustrated the religious worship of Phœnicians and Carthaginians, from their temples; the religious idea of the Arab nomades, prior to the time of Mahomed, has been described by many; the idols and temples, the hieroglyphic inscriptions, the hieratic and demotic MSS., have afforded much information regarding the religion of Egypt. Further to the east, the monuments of Babylon and Nineveh have furnished materials for the study of the Semitic religions, and images of Bel and Nisroch have been produced, and something is now known of the religions of Mexico and Peru, and of the savage inhabitants of America, Africa, and Polynesia.

Of the religions of the S. and E. of Asia and the philosophies which take their place, the demon, and spirit, and nature worship of the ruder races is perhaps the most ancient; the monotheistic religion of the Jews, 4000 years old, may be the next, followed by the Buddhist philosophy, which seems to have been believed in since 3200 years, 850 years before Sakya gave it fresh vigour, and is the most extensive of all of them, with the Jaina faith, which is as old as that of the Buddhist.

The philosophy put forth by Kung-fu-tze or Confucius, was about 500 years before Christ, and it has been added to and altered by subsequent sages of China. The Christian religion, first established in Western Asia 19 centuries ago, and early taught in Africa, Arabia, and Central and Eastern Asia, has at present, in British India, but a comparatively small number of professors. If India and South-Eastern Asia be looked at in their religious aspects, four pôlytheist faiths will be seen,—Buddhism, the Jaina faith, Brahmanism, and Shamanism; three monotheistic faiths, viz. Jewish, Christian, and Muhammadan; a mixed faith, the Sikh, partly monotheistic, but believing in incarnations; and lastly the worship of fire as an element, by the little numerous but intellectual Parsees.

The canonical books of three of the principal religions of the ancient and modern world, viz. the Veda of the Brahman, the Zendavesta of the Zoroastrian, and the Tripitaka of the Buddhist, have disclosed the real origin of Greek and Roman, and likewise of Teutonic, Slavonic, and Celtic mythology. The Koran, and the literature connected with it, afford information regarding a Semitic religion, the doctrines of Mahomed.

Besides the Aryan and Semitic families of religion, there are in China three recognised forms of public worship,—the philosophy of Confucius, that of Tao-tze, and the religion or philosophy of Fo (Buddha).

The ancient history of India shows that it has had four great religious eras, — the *Vedic*, in which Agni, Indra, and other personifications of spiritual existences, with the worship of astral and natural phenomena, were propitiated with feasts, and invoked with the hymns of the Rig Veda, and in which maidens selected their husbands in the Swayamvara, and monarchs sacrificed the horse in the Aswa Medha. In the *Brahmanic* period, the Kshatriya feasts were converted into sacrifices for the atonement of sins against Brahmanical law, and divine worship was reduced to a system of austerities and meditations upon the Supreme Spirit as Brahma. It was in this era that the Brahmans assumed the character of a great ecclesiastical hierarchy, and established that priestly dominion which still extends over the minds and senses of the Hindus of India; 3dly, the *Buddhist* period, in which Sakya Muni appeared. And, 4thly, the *Brahmanical* revival, during which Brahmans abandoned the worship of their god Brahma, and reverted to the old national gods and heroes of the Vedic Aryans. In this era Vishnu came to be regarded as the Supreme Being, and Rama and Krishna as his incarnations, and it was accompanied and followed by a belief in a deity called Siva, whose worship, based on physiological doctrines, was earnestly inculcated by its missionaries during the 8th to the 14th century of the Christian era. Both of these sects of Brahmanism are accepted by the Hindus. But at present the largest number of the Hindus are followers of Vishnu and his wife, in some one of his several incarnations; a smaller number accepting Siva and his wife. Siva is mentioned in the book of Amos (v. 26), but when his worship was first introduced into India has not been traced. Tod supposes B.C. 900.

Since the 7th century of the Christian era, conquerors from the north-west, traders from Arabia, and zealous missionaries professing Muhammadanism, have been advancing into India, China, and the western islands of the Archipelago; and the numbers professing this faith in S. and E. Asia may now amount to about 200 millions of souls.

The Vedas of the Hindus are in Sanskrit. They do not seem to have been translated as a whole into any of the vernacular tongues of India, and there are but few Brahmans who can read and understand them, though they learn portions by heart. They are considered a revelation; and the laws of Menu, the Puranas or legendary histories of India, the Tantras, and the six orthodox Hindu systems of philosophy, all derive their authority from their agreement with the Vedas. It was the Vedas of which the Buddha Sakya Muni denied the authority. In the Vedanta philosophy, the beginning of all wisdom is said to be a desire to know God, who is the cause of the universe, and this is to be learned from the Scripture. The Nyaya philosophy acknowledges four sources of knowledge,—perception, induction, analogy, and the word or Veda. The Vaiseshika philosophy is an atomistic system, not favourably looked on by the Brahmans, nevertheless proclaims the absolute authority of the Veda. The Sankhya philosophy is atheistic; it maintains that a personal God cannot be proved, though it so far conforms as to admit the received doctrine of the Veda as evidence in addition to perception and induction. The Puranas, or old books, superseded the Veda. The Buddhist religion of Burma is likewise a philosophy. The British rulers of India have allowed the utmost religious freedom to all the races under their sway, and the Bible has never been used as a class-book in any Government school in British India. This has been denounced by earnest men as time-serving. However, the Koran and the Vedas are equally excluded; but the grant-in-aid rules of 1854 permit money allowances to every school in India where education up to a certain standard is imparted, and in these grants every Christian school can equally share. To gain a full knowledge of the Veda, the Zendavesta, the Tripitaka, of the Old Testament, the Koran, or the sacred books of China, would be the work of a long life.

Sir John Lubbock has pointed out that both in Aryan and Semitic races there have existed several minor creeds, which in process of ages have disappeared. In the Aryan race, for example, there have been the religions of Greece and Rome, Odin-worship, and Druidism. In the Semitic race, there have been the Assyrian, Phœnician, and sundry other idolatries. But in each race there has also been one great religion, which, beginning at the very dawn of history, has lasted to the present hour, namely, Vedic-Brahmanism among the Aryans, and Judaism in the Semitic race. And each of these great religions has had two vast offshoots or schisms, which also still survive, namely Zoroastrianism and Buddhism from Brahmanism, and Christianity and Islam from Judaism. Further, all six of these religions are possessed of a sacred literature, to which divine authority is attributed by their adherents, namely, among the Aryans—

The Vedas of the Brahmans.
The Zendavesta of the Zoroastrians.
The Tripitaka of the Buddhists.

And among the Semitic race—

The Old Testament of the Jews.
The New Testament of the Christians.
The Koran of Muhammadans.

Besides these Aryan and Semitic Scriptures, there only exist in the world two other ancient sacred books of any value, namely, the Kings of the Confucian Chinese, and the Tao-tze King of the Taoists of China; the Grunth of the Sikhs being a comparatively modern work.

Lastly, as if to perfect the parallel, recent calculations tend to show that at the present hour, after 4000 years of development, the great religions of the Semitic and Aryan races are almost on an equality in point of numbers—Brahmanism and Buddhism, with the small remnant of Zoroastrians, counting together (according to an authority accepted by Professor Muller) about 44 per cent. of the human race; and Judaism, Islam, and Christianity numbering nearly 45 per cent. on the same calculation.

The great bulk of the races in Southern and Eastern Asia are of the Muhammadan, the Buddhist, the Brahmanical, and Sintu religions. The Muhammadans believe in God, in a future state, in a judgment for blessing or for condemn-

Mahomed as the last and greatest of
s of God; in the Koran as a divine
in khalifas as successors of Mahomed,
y saints and shrines. They believe,
coming of a Mehdi, who is to be the
mams, and who will inaugurate an era
n, now militant, will be finally triumph-
y designate their religion Islam, salva-
l style themselves Musalmān, of the
ith. Muhammadanism is essentially a
zing religion; the craving of all its pro-
being to convert all mankind to a belief in
d in Mahomed as His prophet. But with
the essential tenet, they have many diverse
of every shade of belief, from a pure mono-
to a recognised series of incarnations still
gress. They occupy parts of Europe and
ca, much of the south of Asia, and eastwards
the Archipelago. In the south-west of the
ic continent, Persia with its 7,658,000 in-
ants is almost exclusively of the Shiah form
uhammadanism, with a mere sprinkling of
Armenian Christians, and Zoroastrian fire-
ippers. But Persia is almost alone in this
of the faith. It is enclosed on three sides
ces following the Sunni traditions,—by Arabs
e S.W. and W.; by Turks in Asia to the
and N.; with Uzbak also on its north;
ariots and Turkoman to the N.E., and Afghan
be Marrani, Baluch, and Sindi, on its east;
nd the Turkoman make the sectarian difference
n their belief a ground for considering Persia
heretical. Until the present day they raid Persian
territory, and steal and sell the captives as slaves.
Persia is to them a hostile country, a dar-ul-harb,
on which they may lawfully make war. In this
region the Muhammadan population is estimated
to be 36,000,000.

Persians, . .	7,658,000	Turkoman, . .	450,000
Arabs, . . .	5,000,000	Afghans, . .	4,000,000
Turkey in Asia,	16,357,000	Sindi, . . .	1,887,204
Khiva Uzbak, .	700,000	Baluch, . . .	409,200
Bokhariots, .	2,100,000		

In India, the British Government, a Christian power, is ruling over a population of 253,891,821 souls, in diverse religious communities. A census taken in 1881 has shown their respective numbers to be as under:—

Hindus, . .	187,937,450	Kabir Panthi, .	347,994
Muhammadans,	50,121,585	Nat worship, .	143,581
Aboriginals, Non-Aryans, . .	6,426,511	Parsee, ...	85,397
Buddhist, . .	3,418,884	Jews, ...	12,009
Christian, . .	1,862,634	Brahmo, . . .	1,147
Sikh, . . .	1,853,426	Kumbhi Patia, . .	913
Jain, . . .	1,221,896	Others and unspecified, . .	59,985
Satnami, . . .	398,409		

The non-Aryan races of India have not advanced beyond the idea of demons who scourge the human race. Many of them have totems; others are Shamanistic, and are continually finding new objects of worship in the spirits of men and women who have died a violent death, or have lived lives of turmoil. Mari Amman, or death mother, of the Tamil race, is a recently acknowledged divinity who sends smallpox. She is a compound of their Amman or village goddess and of Kali, the consort of Siva. Since cholera has swept through the land, the people of Ujjain have formed a new goddess, Maha Kala, whom they believe sends that dread disease. A great number of the non-Aryan races are recognised to be of Turanian descent. Many of them are in a servile condition, and until the present day are almost in a state of predial slavery, in some parts bought and sold with the lands. Many are illiterate, have no sacred books, and worship spirits, ancestors, idols, and shapeless stones from the river beds. But even amongst the followers of the Brahmanical Hindu faith and the Jaina sect, all of whom possess sacred books, there is found every conceivable kind of worship, from the grossest sensualism to the most exalted spiritualism, and from the worship of stocks and stones to the most sublime conceptions of the omnipresent God.

The Muhammadans are descendants of Arab, Turk, Moghul, and Persian invaders, and of converts from Hindus and aboriginal races. They are largely of the Sunni sect, but the unity of their creed and the firmness of British rule have done much to make them one body. With Brahmanism it is different. Of very varied origin, largely from a nature-worship, with a belief in mythological personages, and some of their chief gods deified princes, their beliefs are greatly diversified. Great minds are constantly arising and forming new sects or are pondering over problems, moral, social, and political. The Sikh, the Satnami, the Kabir Panthi are all recent, and the Brahmo is of the 19th century. Brahmanism is proselytizing by millions among the aboriginal races, but is loosening its grasp on many of the educated classes. The tendency is to adopt some form of philosophy as a substitute for their old traditional religions, and this seems likely to embrace the majority of the educated classes throughout India.

The most recent philosophy was originated by Ram Mohan Roy, a Brahman, and its best expounder at present (1883) is Keshab Chander Sen. The name assumed by the most prominent among them is that of Brahmo, and ramifications of this sect have spread throughout the presidencies of Bengal, Madras, and Bombay. They renounce superstition, paganism, and absurdities of all sorts. They abjure atheism and materialism; they repudiate Buddhism, Hinduism, and Muhammadanism. They regard Christianity, not as a religion to be adopted, but as one of several paths leading towards pure and abstract truth, and they look towards the Vedas and Puranas, handed down from the Aryan Hindus, as constituting another of these ways. Theirs is a theism, including faith in a Supreme Being, in the immortality of the soul, and in a future state of rewards and punishments.

Sir Alfred C. Lyall thinks that in India there will, in two or three generations, be a wide and rapid transformation of its religion; that the old gods of Hinduism will die in their new elements of intellectual light and air. Some, he says, may think that Christianity will, a second time in the world's history, step into the vacancy created, and occupy the tracts laid open by the upheaval of a whole continent to a new intellectual level. But, he says, the state of thought in Western Europe hardly encourages conjecture that India will receive from that quarter any such decisive impulse as that which overturned the decaying paganism of Greece and Rome. Christianity has not yet spread sufficiently to have become an actual power in the country, but the Brahmoists admire Christianity in the main, as supplying a pattern for human conduct.

Under Hindu law, until 1850, a change of

religion by any Hindu involved loss of property; but an Act passed in that year by the Legislative Council of British India declared that change of religion did not involve loss of property.

East of British India, Buddhism has been favourably received by great nationalities. Tribes on the Assam borders, the people of Manipur, many broken tribes amongst the hills and the valleys of the Irawadi, the Mei-kong, and other great rivers, are following spirit and nature worship. The Malays of the Archipelago are now mostly Muhammadans, and the Spanish Indies in the Philippines almost all Christian; but Ceylon is partly Buddhist, partly Hindu; and Burma, Siam, Annam, Cochin-China, Cambodia, China, and Corea are chiefly Buddhist, though China largely follows the philosophy of Confucius or the corrupted Taoist philosophy of Meng-tze.

In the temples of Confucius in China, the only object of reverence is the monumental tablet before which the devout burn incense and pray. At the entrance of their Buddhist temples are colossal figures, supposed to be warders of the place; in all other temples are numerous idols, not only of Buddha in his three attitudes of contemplation, exhortation, and repose, but of many other deities, as the god of war, the god of agriculture, and the queen of heaven.

A prominent feature of Japan society is the variety of religious beliefs. The State cult is the Sintu (Sin, the gods, and Tu, faith), an apotheosis of all great heroes and saints. The Buddhists are there the more numerous sect, but their priests had become so singularly unacquainted with the tenets of their religion, that some inquirers recently visited England to study its doctrines in the books of the public libraries. The populations dwelling in these south-east regions of Further Asia have been estimated as under:—

Assam tribes, .	200,000	Sunda Islands and Moluccas, .	28,867,000
Manipur, . .	126,000	Netherland India and part of N. Guinea, . .	27,962,000
Burma, . . .	4,000,000	N. Guinea and neighbouring Islands, . .	500,000
Siam, . . .	5,750,000	Philippines, .	6,300,000
Annam, . . .	21,000,000	Corea, . . .	8,500,000
French Cochin-China, . .	1,597,013	Japan, with the Kuriles, Loo-Choo, and Bonin Islands,	36,357,212
Cambodia, . .	890,000		
Malacca tribes,	300,000		
China proper,	350,000,000		
Eastern Turkestan, . . .			
Tibet, Manchuria, Mongolia, .	21,180,000		
Ceylon, . . .	2,606,930

REMBOWAH. BURM. In Arakan used as food. This description of arrow-root is prepared from the Pembanoo root, obtainable in large quantities. Price, 4 rupees per maund.—*Local Committee, Akyab.*

REMORA, or sucking fish, attaches itself to sharks. The sucker is on the back of the head. Fishermen in the Mozambique Channel are said to pass a string through the tail, and allow the fish to swim away; it attaches itself to turtle and fish, which are then pulled in.

REMUSAT, ABEL, a learned Parisian sinologue; author of Description d'un Gr[illegible] peu connu et situé entre le Japon [illegible] Mariannes.

RENAUDOT, ABBE, author of [illegible] Rélations des Indes et de la Chine, [illegible] It gives the notes of travel of Suleim[illegible] Khurdadba, two Arab merchants, w[illegible] India and China apparently in the 9th [illegible] centuries, and are the first among weste[illegible] to make mention of tea (tcha) and [illegible] They also mention arrack and rice.

RENNELL, MAJOR JAMES, author of a [illegible] of India. He was the first writer who ga[illegible] intelligible account of the countries now [illegible] British India, and has been styled the fat[illegible] Indian geography. He was the author of a [illegible] Atlas, containing Maps of the Theatre of W[illegible] Commerce on that side of Hindustan, London 1[illegible] Atlas of Bengal and Behar, London 1780–81; Description of the Roads in Bengal and B[illegible] 4to and 12mo, London 1778–99; Memoir [illegible] Map of Hindustan, with an Account of [illegible] Ganges and Brahmaputra Rivers, London [illegible] Marches of the British Armies in the Penins[illegible] India during the Campaigns of 1790 and [illegible] Geographical System of Herodotus Examine[illegible] Explained, 4to, London 1800; Geography of [illegible] dotus Examined and Explained, 2 vols., Lo[illegible] 1830; Geographical Illustrations of the Ex[illegible] tion of Cyrus and the Retreat of the Ten Tho[illegible] Greeks, with the Plates, atlas folio, 2 vols. fol[illegible] and 4to, London 1816; A Treatise on the Comparative Geography of Western Asia, 2 vols. 8vo, London 1831.

RENNET. Masr, ARAB.; Panir, Maya, HIND. The dried contents of the stomach of a calf, used for coagulating or curdling milk.—*Faulkner.*

RENUKA, daughter of king Renu, the wife of rishi Jamadagni, and mother of Parasurama; in S. India identical with the Gramma-deva, Ellammun.

REPOUSSÉ WORK in silver and gold is well made at Ahmadabad. It is beaten up first in small patterns, and holes are pierced to give effect to the pattern. At first sight, it might be mistaken for coarse filigree. Brass work of Nagpur, Jeypore, Moradabad, and in the south of the Peninsula has the body of the work in brass, and pure tin is hammered over it, leaving spaces of the ground as ornament. The white, bright tin resembles silver.

REPTILES are arranged by naturalists as the class Reptilia of the animal kingdom, and they are numerous in the south and east of Asia. The chameleons, the gecko, and others of them are interesting to all who would investigate the wonders of creation. The crocodile, the alligator, and the poisonous snakes cause great loss of human life; the marine turtles and their eggs, some of the frogs, some of the snakes, are used as food by several races; several of them, as the skinks, the iguanas, are used medicinally. The Greeks regarded snakes as good demons, and worshipped them; the emblem of their deified physician, Esculapius, is that of two snakes in congress; and from the earliest origin of Hinduism, its followers have worshipped the cobra, representing it in pictures and in sculptures with many heads as a protecting divinity overshadowing kings and deities and lingam idol. With Muhammadans, frogs, crocodiles, snakes, turtles, as also, indeed, crabs, are

not lawful food. The arrangement by naturalists of the reptiles of the South and East of Asia is as under :—

First Sub-class — Reptilia Proper.

The Order of Tortoises—Chelonia.

I. Land Tortoises—Testudinidæ.

Testudo elegans, *Schopff*, Peninsula of India, Ceylon.
T. Horsfieldii, *Gray*, Afghanistan.
T. elongata, *Blyth*, Cambodia, Arakan, Mergui.

II. Fresh-water Tortoises—Emydidæ.

Manouria emys, *M. and Schl.*, Penang, Arakan, Tenasserim.
Cuora Amboinensis, *Daud.*, Eastern India.
C. flavomarginata, *Gray*, China, Formosa.
C. trifasciata, *Gray*, China.
Cyclemys Oldhami, *Gray*, Mergui, Cambodia.
Pyxidea Mouhotii, *Gray*, Cochin-China.
Notochelys platynota, *Gray*, Singapore.
Geoemyda spinosa, *Gray*, Tenasserim, Pegu.
G. grandis, *Gray*, Cambodia.
Emys ocellata, *D. and B.*, Tenasserim, Pegu.
E. Bealii, *Gray*, Southern China.
E. Thurgi, *Gray*, Bengal, Penang.
E. mutica, *Cantor*, Chusan.
E. nigricans, *Gray*, Southern China.
E. Sinensis, *Gray*, Canton, Formosa.
E. crassicollis, *Gray*, Mergui, Malay Peninsula, Cambodia.
E. Reevesii, *Gray*, Cochin-China, Southern China.
E. trijuga, *Schweigg*, Peninsula of India, Ceylon.
E. macrocephala, *Gray*, Siam, Cambodia.
E. Hamiltonii, *Gray*, Lower Ganges.
Pangshura tecta, *Gray*.
P. tentoria, *Gray*, Dekhan, Indus.
P. flaviventer, *Gthr.*, Bengal?
P. Smithii, *Gray*, Panjab?
Batagur baska, *Gray*, Ganges, Irawadi, Penang.
B. lineatus, *Gray*, Nepal, Moulmein.
B. Ellioti, *Gray*, Kistna river.
B. affinis, *Cantor*, Malay Peninsula.
B. dhongoka, *Gray*, Nepal, Assam.
Platysternum megacephalum, *Gray*, China, Pegu.

III. Fresh-water Turtles—Trionycidæ.

Emyda granosa, *Schopff*, Hindustan, Sikkim, Bengal.
E. Ceylonensis, *Gray*, Ceylon.
E. vittata, *Peters*, Goa.
Trionyx Sinensis, *Weigm.*, China, Chusan, Formosa.
T. Gangeticus, *Cuv.*, Ganges, Penang.
T. Javanicus, *Schweigg*, Ganges, Dekhan, Penang.
T. ornatus, *Gray*, Siam, Cambodia.
T. subplanus, *Schweigg*, Singapore, Penang.
T. Guntheri, *Gray*.
Chitra Indica, *Gray*, Ganges, Malay Peninsula.

IV. Marine Turtles—Chelonidæ.

Caouana olivacea, *Eschsch*, Coasts.
Chelonia virgata, *Flem.*, Coasts.
Caretta squamata, *L.*, Coasts.
Dermatochelys coriacea, *L.*, Coasts.

The Order of Lizards—Sauria.

I. Crocodiles—Crocodilidæ.

Crocodilus palustris, *Less.*, Ganges, Peninsula of India, Ceylon.
C. Siamensis, *Schneid.*, Siam, Cambodia.
C. porosus, *Schneid.*, all rivers.
C. Pondicerianus, *Gray*, Pondicherry.
Gavialis Gangeticus, *Gm.*, Ganges.

II. Water Lizards—Varanidæ.

Varanus flavescens, *Gray*, Ganges, Indus, Penang.
V. dracæna, *L.*, from Bengal to Ceylon.
V. lunatus, *Gray*.
V. nebulosus, *Gray*, Bengal, Siam.
Hydrosaurus salvator, *Laur.*, China, Siam, Ceylon.

III. Land Lizards—Lacertidæ.

Tachydromus sexlineatus, *Daud.*, Rangoon.
T. meridionalis, *Gthr.*, Southern China.
T. septentrionalis, *Gthr.*, Northern China.
Cabrita Leschenaultii, *Edw.*, Coromandel.
Ophiops Jerdoni, *Blyth*, Mhow.

REPTILES.

Acanthodactylus Cantoris, *Gthr.*, Ramnuggur.
A. Neilgherrensis, *Jerdon*, Kunur.

IV. Cordyles—Zonuridæ.

Pseudopus gracilis, *Gray*, Khassya.

V. Skinks—Scincidæ.

Tropidophorus microlepis, *Gthr.*, Chartaboum.
T. Cochin-Chinensis, *Cuv.*, Cochin-China.
T. aspris Berdmorreii, *Blyth*, Mergui.
Euprepes Chinensis, *Gray*, China.
E. rufescens, *Shaw*, from Afghanistan to China.
E. monticola, *Gthr.*, Sikkim.
E. olivaceus, *Gray*, Malay Peninsula.
E. macularius, *Blyth*, Rungpur?
E. trilineatus, *Gray*, Carnatic.
Mabouia quadrilineata, *Blyth*, Hong-Kong.
M. Chinensis, *Gray*, China.
M. maculata, *Blyth*, Assam.
Eumeces bilineatus, *Gray*, Neilgherries.
E. Himalayanus, *Gthr.*, Himalayas.
E. Schlegelii, *Gthr.*, Sikkim.
E. modestus, *Gthr.*, Ningpo.
E. Reevesii, *Gray*, China.
E. ladacensis, *Gthr.*, Tibet.
E. formosus, *Blyth*, Mirzapore, Waziabad.
E. Indicus, *Gray*, Sikkim.
E. Taprobanensis, *Kelaart*, Ceylon.
E. chalcides, *L.*, Penang, Siam, Hong-Kong.
E. Siamensis, *Gthr.*, Siam.
E. Bowringii, *Gthr.*, Hong-Kong.
E. albopunctatus, *Gray*, Nellore, Mergui.
E. Hardwickii, *Gray*, Peninsula of India.
E. punctatus, *E.*, Peninsula of India.
E. isodactylus, *Gthr.*, Cambodia.
Hagria Vosmærii, *Gray*, Bengal.
Chiamela lineata, *Gray*.
C. anguis melanosticta, *Merr.*, Coromandel.

VI. Acontiads—Acontiadidæ.

Acontias Layardi, *Kelaart*, Colombo.
Nessia Burtonii, *Gray*, Ceylon.
N. monodactyla, *Gray*, Ceylon.

VII. Sand Lizards—Sepsidæ.

Sphenocephalus tridactylus, *Blyth*, Afghanistan.

VIII. Geckos—Geckotidæ.

Gecko guttatus, *Daud.*, from Southern India to China.
G. stentor, *Cantor*, Penang.
G. Smithii, *Gray*, Prince of Wales' Island.
G. monarchus, *D. and B.*, Malay Peninsula, Ceylon.
G. Japonicus, *D. and B.*, China, Chusan.
G. Swinhonis, *Gthr.*, Northern China.
G. subpalmatus, *Gthr.*, Chikiang.
Ptychozoon homalocephalum, *Creveldt*, Penang, Singapore.
Hemidactylus triedrus, *Daud.*, Ceylon, Pen. of India.
H. maculatus, *D. and B.*, from Ceylon to China.
H. Sykesii, *Gthr.*, Dekhan.
H. frenatus, *D. and B.*, from Ceylon to Siam.
H. Leschenaultii, *D. and B.*, Madras.
H. punctatus, *Jerdon*, Tellicherry.
H. coctæi, *D. and B.*, Penang, Bombay, Ceylon.
H. leiurus Berdmorreii, *Blyth*, Mergui.
Peripia Peronii, *D. and B.*, Penang, Ceylon.
P. Cantoris, *Gthr.*, Penang.
Nycteridium Schneideri, *Shaw*, Ceylon, Bengal, Assam, Siam, Penang.
Phelsuma Andamanense, *Blyth*, Andaman Islands.
Gymnodactylus triedrus, *Gthr.*, Ceylon.
G. pulchellus, *Gray*, Penang, Singapore.
G. frænatus, *Gthr.*, Ceylon.
G. Kandianus, *Kelaart*, Ceylon.
G. Mysoriensis, *Jerdon*, Bangalore.
G. Indicus, *Gray*, Neilgherries.
G. Malabaricus, *Jerdon*, Malabar.
G. littoralis, *Jerdon*, Malabar.
G. Dekhanensis, *Gthr.*, Dekhan.
G. variegatus, *Blyth*, Moulmein.
G. naultinus fasciolatus, *Blyth*, Subathu.
Pentadactylus Borneensis, *Gthr.*, Borneo.
P. felinus, *Gthr.*, Singapore.
P. Duvaucelii, *D. and B.*, Bengal.
Puellula rubida, *Blyth*, Andaman Islands.
Eublepharis Hardwickii, *Gray*, Peninsula of India.

REPTILES.

IX. Agames—Agamidæ.

Draco volans, L., Penang, Singapore.
D. reticulatus, *Gthr.*, Philippine Islands.
D. Timorensis, *Kuhl*, Timor.
D. cornutus, *Gthr.*, Borneo.
D. fimbriatus, *Kuhl*, Java.
D. maculatus, *Gray*, Siam, Penang, Tenasserim.
D. spilopterus, *Wiegm.*, Manilla.
D. Dussumieri, *D. and B.*, Peninsula of India.
D. quinquefasciatus, *Gray*, Penang.
D. tæniopterus, *Gthr.*, Siam, Tenasserim.
D. hæmatopogon, *Boie*, Java.
D. bimaculatus, *Gthr.*, Philippine Islands.
D. lineatus, *Daud.*, Amboyna, Celebes.
D. rostratus, *Gthr.*, Borneo?
Otocryptis bivittata, *Wiegm.*, Ceylon.
Lyriocephalus scutatus, *L.*, Ceylon.
Ceratophora Stoddartii, *Gray*, Ceylon.
C. Tennentii, *Gthr.*, Ceylon.
C. aspera, *Gthr.*, Ceylon.
Cophotis Ceylanica, *Peters*, Ceylon.
Japalura variegata, *Gray*, Sikkim.
J. Swinhonis, *Gray*, Formosa.
J. polygonata, *Hallowell*, Loo-Choo.
Sitana Pondiceriana, *Cuv.*, Western India.
S. minor, *Gthr.*, Madras, Ceylon.
Dilophyrus grandis, *Gray*, Rangoon.
Bronchocela cristatella, *Kuhl*, Malay Peninsula.
B. Smaragdina, *Gthr.*, Cambodia.
B. jubata, *D. and B.*, Pondicherry.
Calotes versicolor, *Daud.*, Ceylon, continent of India.
C. nemoricola, *Jerdon*, Neilgherries.
C. mystaceus, *D. and B.*, Pegu, Siam, Mergui, Ceylon.
C. Rouxii, *D. and B.*
C. ophiomachus, *Merr.*, Ceylon, Southern India.
C. platyceps, *Blyth*, Cherra Punji.
C. nigrilabris, *Peters*, Ceylon.
C. emma, *Gray*, Mergui.
C. maria, *Gray*, Himalayas.
Salea Horsfieldii, *Gray*, Neilgherries, Ceylon.
Oriocalotes minor, *Gray*, Himalayas.
Acanthosaura armata, *Gray*, Eastern India.
A. capra, *Gthr.*, Chartaboum.
A. coronata, *Gthr.*, Chartaboum.
Oriotiaris Ellioti, *Gthr.*, Sikkim.
Tiaris tiara subcristata, *Blyth*, Port Blair.
Physignathus Cochin-Chinensis, *Cuv.*, Cochin-China.
P. mentager, *Gthr.*, Chartaboum.
Liolepis guttatus, *Cuv.*, Eastern India, China.
Uromastix Hardwickii, *Gray*, Hindustan.
Charasia dorsalis, *Gray*, Southern India.
Stellio tuberculatus, *Gray*, N. Hindustan, Himalaya.
Trapelus megalonyx, *Gthr.*, Afghanistan.
Phrynocephalus Tickelii, *Gray*, Afghanistan.
P. caudivolvulus, *Pall.*, Tibet.
P. brachysaura ornata, *Blyth*, Sagur.

FAMILY OF CHAMELEONS—CHAMÆLEONIDÆ.

Chamæleo vulgaris, *Daud.*, Pen. of India, Ceylon.

THE ORDER OF SNAKES—OPHIDIA.

First Sub-order. Innocuous Snakes.

I. Blind Snakes—Typhlopidæ.

Typhlina lineata, *Boie*, Penang, Hong-Kong.
Typhlops nigro-albus, *D. and B.*, Penang, Singapore.
T. Horsfieldii, *Gray*, Khassya, Assam, Tenasserim, Cochin-China.
T. bothriorhynchus, *Gthr.*, Penang.
T. striolatus, *Peters*, Bengal.
T. Siamensis, *Gthr.*, Siam.
T. Braminus, *Daud.*, Indian Continent, Ceylon.
T. pammeces (tenuis), *Gthr.*, Madras.
T. mirus, *Jan.*, Ceylon.
Onychocephalus acutus, *D. and B.*, Pen. of India.

II. Short-tails—Tortricidæ.

Cylindrophis rufus, *Laur.*, Cambodia, Singapore, Tranquebar.
C. maculatus, *L.*, Ceylon.

III. Xenopeltides—Xenopeltidæ.

Xenopeltis unicolor, *Reinw.*, Malay Peninsula, Cambodia.

IV. Rough-tails—Uropeltidæ.

Rhinophis oxyrhynchus, *Schneid.*, Ceylon.
R. punctatus, *Mull.*, Ceylon.
R. Philippinus, *Cuv.*, Ceylon.
R. Trevelyanus, *Kelaart*, Ceylon.
R. sanguineus, *Beddome*, Wynad.
R. Blythii, *Kelaart*, Ceylon.
R. Pulneyensis, *Beddome*, Pulney Hills.
Uropeltis grandis, *Kelaart*, Ceylon.
Silybura macrolepis, *Peters*, Peninsula of India.
S. Beddomii, *Gthr.*, Peninsula of India.
S. ocellata, *Beddome*, Neilgherries.
S. Ellioti, *Gray*, Madras, Dekhan.
S. bicatenata, *Gthr.*, Dekkan.
S. Shorttii, *Beddome*, Shevaroy Hills.
S. brevis, *Gthr.*, Animallay Hills, Neilgherries.
Plectrurus Perrotetii, *D. and B.*, Madras, Neilgherries.
P. Guntheri, *Beddome*, Neilgherries.
Melanophidium Wynadense, *Beddome*, Wynad.

V. Dwarf Snakes—Calamaridæ.

Calamaria Siamensis, *Gthr.*, Siam, Cochin-China.
C. quadrimaculata, *D. and B.*, Java.
C. albiventer, *Gray*, Penang.
C. nigro-alba, *Gthr.*, Penang.
C. leucocephala, *D. and B.*
C. catenata, *Blyth*, Assam.
C. reticulata, *Blyth*, Assam.
Macrocalamus lateralis, *Gthr.*
Oxycalamus longiceps, *Cantor*, Penang.
Geophis microcephalus, *Gthr.*, Madras.
G. (Platypteryx Perrotetii), *D. and B.*, Neilgherries.
Aspidura brachyorrhos, *Boie*, Ceylon.
A. Copii, *Gthr.*
A. trachyprocta, *Cope*, Ceylon.
Haplocercus Ceylonensis, *Gthr.*, Ceylon.

VI. Oligodontes—Oligodontidæ.

Oligodon subgriseus, Peninsula of India.
O. spilonotus, *Gthr.*, Madras.
O. Ellioti, *Gthr.*, Madras.
O. subpunctatus, *D. and B.*, Malabar coast.
O. spinipunctatus, *Jan.*
O. fasciatus, *Gthr.*, Dekhan.
O. sublineatus, Ceylon.
O. affinis, *Gthr.*, Animallay Hills.
O. Templetonii, *Gthr.*, Ceylon.
O. modestus, *Gthr.*
O. dorsalis, *Gray*, Afghanistan?
O. brevicauda, *Gthr.*, Animallay Hills.
Simotes venustus, *Jerdon*, Peninsula of India.
S. Russellii, *Daud.*, Ceylon, Pen. of India, Himalayas.
S. binotatus, *D. and B.*, Peninsula of India.
S. albiventer, *Gthr.*, Ceylon.
S. signatus, *Gthr.*, Singapore.
S. cinereus, *Gthr.*, Cambodia.
S. Swinhonis, *Gthr.*, Amoy.
S. tæniatus, *Gthr.*, Cambodia, Bankok.
S. trilineatus, *D. and B.*
S. punctulatus, *Gray*, Himalayas.
S. Labuanensis, *Gthr.*, Borneo.
S. bicatenatus, *Gthr.*
S. albocinctus, *Cantor*, Assam.
S. fasciolatus, *Gthr.*, Pachebone.
S. Cochin-Chinensis, *Gthr.*, Lao Mountains.
S. trinotatus, *D. and B.*, Penang, China.

VII. Colubrides—Colubridæ.

Ablabes baliodirus, *Boie*, Penang.
A. tenuiceps, *Blyth*, Nepal, Darjiling.
A. fuscus, *Blyth*, Himalayas.
A. Rappii, *Gthr.*, Himalayas.
A. bicolor, *Blyth*, Khassya.
A. olivaceus, *Beddome*, Neilgherries.
A. sagittarius, *Cantor*, Penang, Bengal, Himalayas.
A. Humberti, *Jan.*, Madras, Ceylon.
A. collaris, *Gray*, Khassya, Nepal.
A. melanocephalus, *Gray*, Malacca.
Cyclophis major, *Gthr.*, China.
C. frænatus, *Gthr.*, Afghanistan.
C. calamaria, *Gthr.*, Ceylon, Peninsula of India.
C. nasalis, *Gthr.*
C. monticola, *Cantor*, Assam.
Odontomus nympha, *Daud.*, Vellore.
O. semifasciatus, *Gthr.*
O. gracilis, *Gthr.*, Madras Presidency.
Nymphophidium maculatum, *Gthr.*
Elachistodon Westermanni, *Reinh.*

Coronella orientalis, *Gthr.*
Coluber rufodorsatus, *Cantor*, China.
C. mandarinus, *Cantor*, Chusan.
C. porphyraceus, *Cantor*, Khassya, Assam.
Elaphis dione, *Pall.*, Northern China.
E. sauromates, *Pall.*, Ningpo.
E. tæniurus, *Cope*, China, Siam.
Compsosoma radiatum, *Reinw.*, Eastern India.
C. melanurum, *Schleg.*, Bengal, China.
C. reticulare, *Cantor*, Himalayas, Assam.
C. Hodgsonii, *Gthr.*, Himalayas.
Cynophis Helena, *Daud.*, Ceylon, Madras.
C. Malabaricus, *Jerdon*, Peninsula of India.
Ptyas mucosus, *L.*, all over the continent, Ceylon.
P. korros, *Reinw.*, Eastern India.
Xenelaphis hexahonotus, *Cantor*, Arakan, Penang, Singapore.
Zamenis diadema, *Schleg.*, Afghanistan, Sind.
Z. ventrimaculatus, *Gray*, Western India.
Z. gracilis, *Gthr.*, Dekhan, Sind.
Z. fasciolatus, *Shaw*, Peninsula of India, Bengal, Province Wellesley.
Zaocys fuscus, *Gthr.*, Borneo.
Z. carinatus, *Gthr.*, Borneo.
Z. dhumnades, *Cantor*, Chusan, Ningpo.
Z. nigromarginatus, *Blyth*, Himalayas.
Herpetodryas Sieboldii, *Gthr.*, Sikkim.
Tropidonotus quincunciatus, *Schleg.*, all over India.
T. annularis, *Hollowell*, China.
T. trianguligerus, *Reinw.*, Penang.
T. macrophthalmus, *Gthr.*, Himalayas.
T. dorsalis, *Gthr.*, Chikiang.
T. macrops, *Blyth*, Darjiling.
T. platyceps, *Blyth*, Himalayas.
T. subminiatus, *Reinw.*, Eastern India.
T. Himalayanus, *Gthr.*, Himalayas.
T. angusticeps, *Blyth*, Assam, Arakan.
T. stolatus, *L.*, all over the Indian continent.
T. monticola, *Jerdon*, Animallay Hills.
T. junceus, *Cantor*, Penang, Chikiang.
T. Ceylonensis, *Gthr.*, Ceylon.
T. Beddomii, *Gthr.*, Neilgherries.
T. nigrocinctus, *Blyth*, Pegu? Tenasserim.
T. flavipunctatus, *Hollow.*, Hong-Kong.
T. zebrinus, *Blyth*, Mergui.
T. tigrinus, *Boie*, Northern China.
T. leucomelas, *Gthr.*, Penang.
T. plumbicolor, *Cantor*, Madras Presidency.
Atretium schistosum, *Daud.*, Ceylon, Malay Penin.
Xenochrophis cerasogaster, *Cantor*, Malay Peninsula, Bengal, Assam, Khassya.
Prymnomiodon chalceus, *Cope*, Siam.

VIII. Fresh-water Snakes—Homalopsidæ.

Fordonia unicolor, *Gray*, Penang.
Cantorio elongata, *Gthr.*, Singapore.
Cerberus rhynchops, *Schneid.*, from Ceylon to Siam.
Hypsirhina plumbea, *Boie*, Eastern India.
H. enhydris, *Schneid.*, Bengal, Eastern India.
H. Jagorii, *Peters*, Siam.
H. Bennettii, *Gray*, China.
H. Chinensis, *Gray*, China.
Ferania Sieboldii, *Schleg.*, Bengal, Province Wellesley.
Homalopsis buccata, *L.*, Malay Peninsula, Cambodia.
Hipistes hydrinus, *Cant.*, Penang.
Herpeton tentaculatum, *Lacep.*, Siam.

IX. Desert Snakes—Psammophidæ.

Psammophis condanarus, *Merr.*, Peninsula of Indian.
Psammodynastes pulverulentus, *Boie*, Eastern India.

X. Tree Snakes—Dendrophidæ.

Gonyosoma oxycephalum, *Boie*, Penang, Tenasserim.
G. gramineum, *Gthr.*, Khassya.
G. frænatum, *Gray*, Khassya.
Phyllophis carinata, *Gthr.*, China.
Dendrophis picta, *Gm.*, all over India.
D. caudolineata, *Gray*, Penang, Singapore.
Chrysopelea ornata, *Shaw*, all over India.
C. rubescens, *Gray*.

XI. Whip Snakes—Dryiophidæ.

Tropidococcyx Perrotetii, *D. and B.*, North Canara.
Tragops prasinus, *Reinw.*, Eastern India.
T. dispar, *Gthr.*, Animallay mountains.
T. fronticinctus, *Gthr.*

REPTILES.

Passerita mycterizans, *L.*, Ceylon, Peninsula of India.
P. purpurascens, *Gthr.*, Ceylon.

XII. Dipsades—Dipsadidæ.

Dipsas cynodon, *Cuv.*, Malay Peninsula.
D. Forsteni, *D. and B.*, Animallay mountains.
D. boops, *Gthr.*, Bengal.
D. dendrophila, *Reinw.*, Malay Peninsula.
D. bubalina, *Klein.*, Assam, China?
D. multimaculata, *Schleg.*, Bengal, Eastern India.
D. trigonata, *Schneid.*, Peninsula of India, Bengal.
D. multifasciata, *Blyth*, Subathu.
D. gokool, *Gray*, Penang, Bengal.
D. Ceylonensis, *Gthr.*, Ceylon.

XIII. Lycodontes—Lycodontidæ.

Lycodon aulicus, *L.*, Ceylon and continent of India.
L. Laoensis, *Gthr.*, Cochin-China.
L. striatus, *Shaw*, Peninsula of India.
L. Animallensis, *Gthr.*, Animallay mountains.
L. rufozonatus, *Cant.*, Chusan.
Tetragonosoma effrene, *Cant.*, Penang.
T. atropurpureum, *Cant.*, Mergui.
Leptorhytaon jara, *Shaw*, Pen. of India, Bengal, Assam.
Ophites subcinctus, *Boie*, Penang.
O. albofuscus, *D. and B.*, coast of Malabar.
Cercaspis carinata, *Kuhl*, Ceylon.

XIV. Blunt-heads—Amblycephalidæ.

Amblycephalus boa, *Kuhl*, Penang.
Pareas carinata, *Reinw.*, Cochin-China.
P. monticola, *Cant.*, Assam.
P. lævis, *Kuhl*, Cochin-China, Khassya.

XV. Rock Snakes—Pythonidæ.

Python reticulatus, *Schneid.*, Malay Peninsula.
P. molurus, *L.*, Peninsula of India, Bengal, Nepal.

XVI. Sand Snakes—Erycidæ.

Gongylophis conicus, *Schneid.*, Pen. of India, Sikkim.
Cursoria elegans, *Gray*, Afghanistan.
Eryx Johnii, *Russell*, Pen. of India, Panjab, Sikkim.

XVII. Wart Snakes—Acrochordidæ.

Acrochordus Javanicus, *Hornst.*, Penang, Singapore.
Chersydrus granulatus, *Schneid.*, eastern coasts of S. India, Malay Peninsula.

Second Sub-order. Venomous Colubrine Snakes.

I. Terrestrial—Elapidæ.

Naja tripudians, *Merr.*, over nearly entire India.
Ophiophagus elaps, *Schleg.*, over nearly entire India.
Bungarus cæruleus, *Schneid.*, Peninsula of India, Bengal, Assam.
B. fasciatus, *Schneid.*, continent of India.
B. Ceylonicus, *Gthr.*, Ceylon.
B. semifasciatus, *Kühd.*, China, Formosa.
Xenurelaps bungaroides, *Cantor*, Assam.
Megærophis flaviceps, *Reinh.*, Penang.
Callophis bivirgatus, *Boie*, Malay Peninsula.
C. intestinalis, *Laur.*, Malay Peninsula.
C. gracilis, *Gray*, Panang and Singapore.
C. Macclellandii, *Reinh.*, Himalayas, Nepal, Assam.
C. annularis, *Gthr.*
C. trimaculatus, *Daud.*, Tenasserim, Bengal.
C. maculiceps, *Gthr.*, Malay Peninsula.
C. nigrescens, *Gthr.*, Neilgherries.

II. Sea Snakes—Hydrophidæ.

Platurus scutatus, *Laur.*, Indian Ocean, Pacific.
P. Fischeri, *Jan.*, Indian Ocean.
Aipysurus anguillæformis, *Schmidt*, Australia seas.
A. lævis, *Lacep.*, Northern Australia.
A. fuscus, *Tschudi*, Australia.
Disteria doliata, *Laceps.*
Acalyptus superciliosus, *D. and B.*, S.W. Pacific.
Hydrophis Jerdonii, *Gray*, Madras, Penang.
H. Stokesii, *Gray*, Northern Australia.
H. major, *Shaw*, Indian Ocean.
H. robusta, *Gthr.*, Indian Ocean.
H. Belcheri, *Gray*, New Guinea.
H. cærulescens, *Shaw*, Indian Ocean.
H. aspera, *Gray*, Singapore.
H. spiralis, *Shaw*, Indian Ocean.
H. cyanocincta, *Daud.*, Indian Ocean.
H. melanosoma, *Gthr.*
H. subcincta, *Gray*, Indian Ocean.

REPTILES.

H. nigrocincta, *Daud.*, Bengal.
H. elegans, *Gray*, Australia.
H. torquata, *Gthr.*, Penang.
H. chloris, *Daud.*, Madras, Bengal, Penang.
H. Lindsayii, *Gray*, China, Siam, Malabar.
H. atriceps, *Gthr.*, Siam.
H. latifasciata, *Gthr.*, Mergui.
H. coronata, *Gthr.*, Bengal.
H. diadema, *Gthr.*
H. gracilis, *Shaw*, Madras, Java.
H. fasciata, *Schneid.*, Vizagapatam.
H. Cantoris, *Gthr.*, Penang.
H. lapemoides, *Gray*, Ceylon, Madras.
H. longiceps, *Gthr.*, Indian Ocean.
H. stricticollis, *Gthr.*, Indian Ocean.
H. ornata, *Gray*, Indian Ocean.
H. Ellioti, *Gthr.*, Siam, Madras, Ceylon.
H. pachycercus, *Fisch.*, East Indian Archipelago.
H. viperina, *Schmidt*, Madras, Java.
H. ocellata, *Gray*, Australia.
H. anomala, *Schmidt*, Samarang.
H. curta, *Shaw*, Madras.
H. Hardwickii, *Gray*, Penang.
H. loreata, *Gray*, Borneo, Philippines.
Enhydrina Bengalensis, *Gray*, Indian Ocean.
Pelamis bicolor, *Schneid.*, Indian and Pacific Ocean.

Third Sub-order. Viperine Snakes.

I. Pit Vipers—Crotalidæ.

Trimeresurus gramineus, *Shaw*, E. parts of continent.
T. erythrurus, *Cant.*, China, Bengal, Siam, Java.
T. carinatus, *Gray*, Sikkim, Bengal, Rangoon.
T. purpureus, *Gray*, Penang, Singapore.
P. Animallensis, *Gthr.*, Animallay Hills.
T. monticola, *Gthr.*, Nepal, Sikkim.
T. Wagleri, *Schleg.*, Malay Peninsula.
T. strigatus, *Gray*, Neilgherries, Dekhan.
T. trigonocephalus, *Merr.*, Ceylon.
T. microsquamalus, *Cant.*, Assam.
Peltopelor macrolepis, *Beddome*, Animallay Hills.
Calloselasma rhodostoma, *Reinw.*, Siam.
Halys Blomhoffii, *Boie*, Japan, Formosa.
H. Pallasii, *Gthr.*, Tartary.
H. Himalayanus, *Gthr.*, Tibet.
H. Ellioti, *Jerdon*, Neigherries.
Hypnale nepa, *Laur.*, Ceylon, Southern India.

II. Vipers—Viperidæ.

Daboia Russellii, *Shaw*, Ceylon, S. India, Himalayas.
Echis carinata, *Schneid.*, Southern India.

SECOND SUB-CLASS—BATRACHIANS.

THE ORDER OF TAILLESS BATRACHIANS—BATRACHIA SALIENTA.

Oxyglossus lima, *Tschudi*, Siam, Cambodia, China.
Dicroglossus Adolfi, *Gthr.*, Himalayas.
Rana Kuhlii, *Schleg.*, Ceylon, Ningpo.
R. hexadactyla, *Less.*, Ceylon, Madras.
R. cyanophlyctis, *Schneid.*, Ceylon, Southern India, Lower Bengal.
R. tigrina, *Daud.*, Sikkim, Nepal.
R. Liebigii, *Gthr.*, all over India.
R. esculenta, *L.*, China.
R. sylvatica, *Lecomte*, Ningpo.
R. gracilis, *Wiegm.*, from Madras to Southern China.
Hoplobatrachus Ceylanicus, *Peters*, Ceylon.
Pyxicephalus breviceps, *Schneid.*, S. India, Himalayas.
P. rufescens, *Jerdon*, coast of Malabar.
Megalophrys montana, *Kuhl*, Penang, Ceylon.
Xenophrys monticola, *Gthr.*, Khassya, Sikkim.
Cacopus systoma, *Schneid.*, Carnatic.
C. globulosus, *Gthr.*, Russelconda.
Diplopelma ornatum, *D. and B.*, S. India, Ceylon.
D. pulchrum, *Hollow.*, Siam, China.
Bufo vulgaris, *Laur.*, China, Himalayas.
B. calamita, *Laur.*, Tibet.
B. Kelaartii, *Gthr.*, Southern Ceylon.
B. galeatus, *Gthr.*, Cambodia.
B. melanostictus, *Schneid.*, all over India.
B. asper, *Schleg.*, Mergui.
Hylorana macrodactyla, *Gthr.*, Hong-Kong.
H. erythræa, *Schleg.*, Malay Penin., south coast of Siam.
H. macularia, *Blyth*, Ceylon.
H. Malabarica, *D. and B.*, coast of Malabar.
H. temporalis, *Gthr.*, Ceylon.
Polypedates maculatus, *Gray*, all over the continent of India and Ceylon.
P. quadrilineatus, *Wiegm.*, Penang, Singapore.
P. microtympanum, *Gthr.*, Ceylon.
P. pleurostictus, *Gthr.*, Madras Presidency.
P. reticulatus, *Gthr.*, Ceylon.
P. eques, *Gthr.*, Ceylon.
P. Afghana, *Gthr.*, Afghanistan.
Ixalus variabilis, *Gthr.*, Ceylon.
I. temporalis, *Gthr.*, Ceylon.
I. femoralis, *Gthr.*, Ceylon.
I. leucorhinus, *Martens*, Ceylon.
I. schmardanus, *Kelaart*, Ceylon.
Rhacophorus maximus, *Gthr.*, Nepal, Sikkim, Afghanistan.
Hyla Chinensis, *Gthr.*, Southern China, Formosa.
Callula pulchra, *Gray*, Ceylon, Eastern India, China.
C. obscura, *Gray*, Ceylon.
Bombinator Sikkimensis, *Blyth*, Sikkim.

THE ORDER OF TAILED BATRACHIANS—BATRACHIA GRADIENTIA.

Cynops Chinensis, *Gray*, Ningpo.
Plethodon persimilis, *Gray*, Siam.

THE ORDER OF BURROWING BATRACHIANS—BATRACHIA APODA.

Epicrium glutinosum, *L.*, Ceylon, Southern India, Khassya, Siam, Tenasserim.
E. monochroum, *Blkr.*, Singapore.
Cœcilia oxyura, *D. and B.*, Malabar coast.

The reptiles of Southern and Eastern Asia have been described by Dr. Gunther in a volume published by the Ray Society, from information obtained from the museums in London, and from drawings and descriptions by Sir W. Elliot, Mr. B. H. Hodgson, Sir A. Smith, Sir J. E. Tennent, Captain Beddome, and Mr. L. S. Dillwyn; and the labours of Mr. Blyth, Drs. Jerdon, Kelaart, Cantor, Mason, Hooker, Shortt, Ewart, and Sir Joseph Fayrer have also been great. Notices will be given here of the more important species.

Reptiles are oviparous or ovo-viviparous vertebrate animals, with red, cold blood, with three cavities of the heart, breathing by lungs either during the whole period, or at least in the later stages of their growth. They are naked; but frequently the skin shows scale-like folds, or is tubercular, or forms osseous scutes.

The first sub-class, or Reptilia proper, have only one ventricle of the heart, incompletely divided; two atria; never possessing branchiæ at any period of life. One occipital condyle. Skin with scale-like folds, or tubercular, or forming osseous scutes. This sub-class comprises the order of tortoises (Chelonia), that of the lizards (Sauria), and that of the snakes (Ophidia).

The order of *tortoises*, or *Chelonia*, are reptiles with the bones of the thorax united into a carapace. The family Testudinidæ are the land tortoises, but only one species, Testudo elegans, the starred tortoise, occurs in India.

Emys, the Pond Tortoises, Terrapens, a genus of the Emydidæ, or fresh-water tortoises. The species of this genus inhabit all the temperate and tropical regions, except Australia. Formerly (between the latest geological and the historical periods) the genus had even a still greater geographical range than now, a species in a semi-fossil state being found in England and in other European countries, where it is extinct at present. The species undergo great changes in external appearance with age. The Terrapens abound in still waters and tanks in the southern parts of India; perfectly motionless, they rest on the

water, with the shell and the snout raised above its surface, suddenly disappearing at the approach of danger, and darting away with the swiftness of a fish. Their pointed claws enable them to crawl easily over slippery and steep places, and to dig little holes for a small number of elongate ovate, hard-shelled eggs, which in some species require as long a period as from 18 to 20 months before they are hatched. They are chiefly carnivorous, and the flatter the shell, the broader the interdigital web, the more denticulated the jaws, the more aquatic and carnivorous are the habits of the pond tortoises. The food of the carnivorous species consists of water insects, frogs, small fishes, small aquatic birds, and mammals; whilst, on the other hand, they are persecuted by crocodiles and large fishes, and the young and eggs are eaten by numerous other animals. They are not used as food by man, the flesh of most species having a very disagreeable smell, which is also perceptible when first taken out of the water in a net or by a hook baited with meat. Pegu, Sitang, Schwe Gyn, Tenasserim. 7½ inches long.

Batagur baska, the Batagur, another of the Emydidæ of India, is found in the Ganges and Irawadi, abounds at the mouth of the Hoogly; great numbers are brought to Calcutta, where they are eaten by particular castes, and are even kept for sale in tanks. Dr. Cantor caught one in the sea off Penang, with a small hook baited with a shrimp.

Emyda Ceylonensis, *Gray, Shield, Rept.* p. 64, tab. 29 A., is one of the Trionycidæ, or fresh-water turtles. Generally distributed in the lower parts of Ceylon, found in lakes and tanks. Several were kept alive for months in a tub filled with fresh water, fed freely on animal food, and also on bread and boiled rice. A large female laid three eggs, globular, about 1 inch in diameter, with a hard calcareous shell. This and Emys trijuga are put into the wells to act the part of a scavenger. Shell, in fresh specimens, smooth; in drying, the granular surface of the bony shell is apparent.

Trionyx Gangeticus, *Cuv., Regne, Anim.*, is found in the Ganges and its tributaries, upwards to Nepal; at Penang, in rivers and on the sea-coast. It is of fierce habits, defending itself desperately by biting, and emitting, when excited, a low, hoarse, cackling sound. It appears to be far less numerous at Penang than T. Javanicus and Chitra Indica. Shell 23 inches long.

The great Seychelles tortoise is miscalled Tr. Indica by Gmelin, but under that name Mr. Gray unites no fewer than seven of the supposed species admitted by MM. Dumeril and Bibron. According to Dr. Schlegel, the Indian tortoise, probably indigenous to Madagascar and the neighbouring isles, has been acclimated in the Gallapagos Isles, in California, and on several other points on the western coast of South America. But Blyth had been assured, on good authority, that numerous specimens kept in gardens in the Mauritius, have all been brought from the Seychelles Islands in the first instance, that they are still commonly brought from those islands to the Mauritius, and thence we believe the few in India have been imported. The largest seen in India measures 4 feet 4 inches in length over the curve of the carapace, or 3 feet 5 inches in a straight line; transversely 4 feet 2 inches over the high arch of carapace, or in a diameter line 2 feet 2 inches high; when not raised upon the legs, *i.e.* height of shell, 20½ inches; when walking, the shell is lifted fully 6 inches from the ground, if not more; circumference of hind foot, 17½ inches.

Chitra Indica, *Gray, Shield, Rept.* p. 70. Grows to a very large size, and, like the Trionyx, is eaten by the natives of S. Asia, particularly the Chinese. Found in the Ganges and in its tributaries, upwards into Nepal; frequent in the estuaries of the Malayan Peninsula, and said to be found in the Philippine Islands. Specimens weigh 240 pounds; they are very powerful, and of ferocious habits. Shell measures 37 inches.

The fourth family, or Chelonidæ, are Marine Turtles. Marine turtles are at once distinguished by long, compressed, fin-shaped, non-retractile feet, the toes being enclosed in a common skin, out of which only one or two claws project. The carapace is broad and much depressed, so that when these animals are on shore and are turned over on their backs, they cannot regain their natural position. They are thoroughly marine animals; their pinnate feet and their light shells render them the best swimmers in the class of reptiles; they sometimes live hundreds of miles distant from shore, to which they periodically return, in order to deposit from 100 to 250 soft-shelled eggs, which are buried in the sand. The food of some species consists exclusively of algæ; others subsist upon fish and mollusca. They are found in all the intertropical seas; sometimes they travel far into the temperate regions. The flesh and eggs of all the species are edible, although the Indian turtles are much less appreciated in this respect than those of the Atlantic. At certain seasons, the flesh of Chelonia virgata acquires poisonous qualities, and instances of death have been ascribed to its use.

Caouana, *Gray*, has 15 vertebral and costal shields, which are thin and not imbricate. The genus is carnivorous, eating fishes, mollusca, and crustacea; comprises an Atlantic species, the loggerhead, which does not appear to extend into the Indian Ocean; and C. olivacea, confined to the East Indies.

Caouana olivacea, Indian loggerhead. This species is distinguished from its Atlantic congener by the presence of only a single small claw to each of its feet. It is abundant at the mouth of the Hoogly, found in the Bay of Bengal, on the coasts of Malabar and Penang, and in the seas of the Philippine Islands and of China. Its flesh, though relished by the Chinese, is unpalatable to Europeans.

Chelonia, *Flem., Gray, Shield, Rept.* p. 74. Herbivorous, feeding on algæ. Species of Chelonia extend over nearly all the seas between the tropics. Ch. maculosa occurs on the Malabar coast.

Chelonia virgata, the Indian turtle or green turtle, is found on all the coasts of the East Indies. It is at all seasons plentifully taken in fishing-stakes in the Straits of Malacca; in size it equals the Atlantic turtle, which it rivals in flavour. About December and January the female lands to deposit her eggs in the sandy beach of some sequestered island, and then the fishermen watch during the moonlight nights to 'turn turtles.' The eggs are of a spherical shape, about 1 inch in diameter, covered by a soft semi-transparent membrane of a pale-yellow colour. The

expert eye of the fisherman baffles the pains with which the turtle conceals her eggs, and prodigious numbers are disinterred. They are very rich-flavoured, like marrow, and will keep for weeks although exposed to the air. The flesh of this species is sometimes found to be poisonous.

Caretta squamata, hawk-bill turtle, or caret. The hawk-bill turtle, so named from its rather elongated and compressed, curved upper jaw, does not attain to the same size as the other turtles; a shell 2 feet long is considered as extraordinarily large. It is found throughout the Eastern Archipelago, is plentiful only on parts of the coasts of Ceylon (Hambangtotte, Matura), of the Maldives, of Celebes, etc. As, however, turtles always resort to the locality where they were born, or where they have resorted to propagate their kind, and as their capture is very profitable, they become scarcer and scarcer at places where they are known to have been abundant formerly. Some specimens sell in Ceylon for as much as £4, the price depending on the quality of the shell. If taken from the animal when decomposition has set in, the colour of the shell becomes clouded and milky, and hence the cruel expedient is resorted to of supending the turtle over fire till heat makes the shields start from the bony part of the carapace, after which the creature is permitted to escape to the water, where they live; but reproduction of the epidermal shields to a great extent is improbable. At Celebes, whence the finest tortoise-shell is exported to China, the natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates; dry heat is only resorted to by the unskilful.

Dermatochelys coriacea. This turtle, although scarce, appears to be spread throughout almost all the seas of the tropical and temperate regions, having been found in the Mediterranean, on the south coast of England, in the West Indies, at the Cape of Good Hope, on the coasts of the United States, in Chili, in Japan, and in India. A female was caught on the coast of Tenasserim, of entire length 6 feet 2½ inches.

In the *Sauria*, or order of *lizards*, the integuments are with scale-like folds, or osseous scutes, or granular. The greater portion of the saurians are easily distinguished from the other orders of reptiles by their elongate form, by their moveable thorax covered with skin, by the presence of legs, and by their general integuments, which are either folded into scales, or granular, or tubercular, or shielded. Still there are many saurians which at a superficial glance might easily be taken for members of the order of snakes, and there is a gradual transition between both these orders. Many lizards have several layers of cells loaded with several pigments; the animal spreads or compresses these layers by more or less inflating its lungs, whereby the changes in the coloration are effected. Saurians are oviparous; a few ovo-viviparous. They have been divided by naturalists into many families.

The first family comprise the *Crocodiles*, or Crocodilidæ. Fresh-water saurians are found between the tropics wherever the country is watered by sufficiently large rivers or lakes. The most conspicuous characters of the crocodiles refer to their thoroughly aquatic life; but these characters are combined with an extremely powerful development of those organs which render the crocodiles the most formidable of all the carnivorous fresh-water animals. The back, the tail, and the belly are protected by a dermal armour composed of quadrangular shields, which are arranged in regular longitudinal and transverse series. A considerable proportion of the food of the crocodile is fish, the proverbial swiftness of which is of little avail when pursued by these reptiles. They fall an easy prey, especially to the young animals; the active old animals, requiring a greater quantity of food, attack every large animal which accidentally approaches them, and, in overpowering it, the whole of their powerful organization is called into requisition. Seizing the victim between their capacious jaws, and fastening their long, pointed, conical teeth into its flesh, they draw it, in one moment, by their weight and with a stroke of the tail, below the water, and drown it. Their gullet, however, is much too narrow to allow of the passage of the entire body of the victim; and their teeth being adapted for seizing and holding fast only, and not for biting, they are obliged to mangle the carcase, tearing off single pieces by sudden strong jerks. This is performed chiefly by lateral motions of the head and front part of the body; and the bones of the head of the crocodile are much more firmly united with one another, and the processes of the cervical vertebræ much more developed, than in any other saurian. Indian crocodiles inhabit rivers and estuaries, also the sea-coasts, and in calm weather may be seen floating at a distance of two or three miles from shore. Those inhabiting small inland waters which are dried up during a drought, are compelled to wander about in search of water, in which alone they can procure their food; they do this during the night. Some of them, however, especially large individuals, bury themselves in the mud, as many fresh-water tortoises and fish do, and remain in a state of torpor below the hard crust during the time of the drought. It is during that period shortly after they have been released from the state of an enforced fasting, that they are most formidable. A man seized by a crocodile has only one way of saving his life, if not his limb, namely, to force his fingers into the eyes of the beast, which immediately lets go its victim,—a practice equally known to the Indian of South America, to the Negro of Africa, and to the Hindu. It is not difficult to catch a single depredator by a hook baited with flesh or entrails, and made fast by a bunch of strong, thin cords, which it cannot gnaw asunder, as they sink into the spaces between the teeth. It is not easy to kill them on the spot, except by a ball sent through the eye into the brain, or through the neck to the spinal cord. Of course a severe injury to any of the vital parts will prove fatal to them, but not before days or weeks have elapsed. All the crocodiles are oviparous; the eggs have a hard shell, and resemble in size and shape those of a goose; from 20 to 60 are deposited in a hollow near the banks, and slightly covered over with mould or sand. The young crocodiles are of a rather rapid growth. One hatched at Madras in 8 years increased to the length of 8 or 9 feet, and was so powerful as to destroy a full-grown buck antelope, which had come to drink water at the tank to which it usually resorted. Alligators are

found only in the New World, but the British in India almost universally apply this name to the Indian crocodiles. Crocodiles are found in America, Africa, Asia, and Australia.

In rivers a single crocodile will often appropriate to himself a limited district, which, if it happen to be in the vicinity of a village, will soon be perceived in the loss of the grazing cattle. Instances are on record of Malays who, to avenge the loss of a relative, have watched the crocodile, and, by diving from below, plunged a kris into its heart. The eggs are white, the shell hard, of a cylindrical form, upwards of 3 inches in length, and about 1½ inch in diameter.

Crocodiles are numerous in all the tide-water streams of Burma. During a two hours' pull up a small river, Mr. Mason once counted 14 sunning themselves on the mud banks. They often carry off the natives; and a single animal, emboldened by his successes, will usurp dominion over a particular portion of a river, where he becomes the terror of every boat's crew that passes. The steersman occupies the most dangerous position, for the crocodile's mode of attack is to glide up silently to the bow or stern of a boat, then turn suddenly, when with one stroke of his powerful tail, close to the top of the boat, he sweeps into the water whoever is within its reach, and the stunned victim becomes an easy prey. A Karen chief, with whom Mr. Mason was acquainted, perished in this way at a point in the river Gaing which had previously been known as the demesne of one of these river monarchs. Persons sleeping on their boats moored to the shore, have sometimes awoke in the jaws of these monsters, and one carried off a Burman from the back of a buffalo that he was riding across a small stream, under the very shadow of the walls of Tavoy.

Crocodilus porosus, *Schn.* This, the larger and fiercer of the two crocodiles, is found in various localities both on the east and west coasts of the Peninsula of India.

Gavialis Gangeticus, the gavial or nakoo. The length of the snout equals that of 9 or 10 of the dorsal shields. Old male specimens have a large cartilaginous hump on the extremity of the snout. Ælian noticed that the Ganges is inhabited by crocodiles which have a horn on the end of the snout, perforated by the nostrils, and containing a small cavity for the reception of air, so that the males are enabled to remain under water for a longer time than the females. The gavial attains to a length of 20 feet. The correct term is garial.

The family of the Water Lizards are the *Varanidæ*. The family contains the largest species of lizards; the greater part of them live in the neighbourhood of large rivers, and are excellent swimmers, their long, compressed tail serving as a propeller; they are carnivorous, feeding on all different water animals and on the eggs of birds, and likewise on those of other large reptiles. Their movements on land are not much less rapid than in the water. Several species climb trees; they are active during a part of the night. They are found in tropical Africa, Asia, and Australia.

Varanus Bengalensis. The Karen are extravagantly fond of their flesh; they steal up the trees with a noose at the end of a bamboo, and often noose them while leaping for the water, or catch them in the boat, which is brought under the tree. The head of this species, the natives say, is venomous, and they discard it altogether; but the flesh of the other parts, which smells most odiously, is deemed by the Karens much preferable to fowls.

Varanus dracæna, common water lizard. A most common species in all British India, Bengal, Nepal, Southern India, and Ceylon. It is called in India the Iguana, is found in great abundance in all the maritime provinces of Ceylon, rarely in the higher Kandyan districts. This species of the water lizards can climb well both trees and walls, and it is popularly believed that thieves make use of it to effect an entrance into a building or over a wall, by allowing their guana to get hold by its fore-claws of the window-sill or wall, and pulling themselves up by it. It is eaten by the natives, who consider it highly nourishing and aphrodisiac, and many Europeans use it for soup, imagining it allied to the West Indian guana. It can always be procured in the Madras market.

Varanus salvator, *Laurenti.* During the day it is commonly observed in the branches of trees overhanging rivers, preying upon birds and their eggs and smaller lizards, and when disturbed, it throws itself from a considerable height into the water. When attacked on level ground, it attempts its escape by running, if possible towards the water. Its quickness, however, is not so great as to prevent a man from overtaking it, when it will courageously defend itself with teeth and claws, and by strokes of the tail. The lowest castes of Hindus capture these lizards commonly by digging them out of their burrows on the banks of rivers, for the sake of their flesh, which by these people is greatly relished. Some individuals attain to nearly 7 feet in length, but the majority are smaller.

Hydrosaurus salvator, *Gray*, ocellated water lizard, is an inhabitant of the Archipelago, East Indian continent, China, Siam, Ceylon. It is very numerous in hilly and marshy localities of the Malayan Peninsula. It is commonly, during the day, observed in the branches of trees overhanging rivers, preying upon birds and their eggs and smaller lizards, and when disturbed it throws itself from a considerable height into the water. It will courageously defend itself with teeth and claws and by strokes of the tail. Low castes in India dig them out of their burrows on the banks of rivers, their flesh being greatly relished. Some attain to nearly 7 feet in length.

The fifth family comprises the Skinks, or *Scincidæ*. The species of this family are exceedingly numerous, and inhabit almost every part of the tropical regions, some extending into the temperate zones. They are thoroughly land lizards, preferring dry ground, and hiding themselves in the sand, under stones, etc. None of them enter the water. They do not attain any considerable size.

Euprepes Chinensis. This is one of the most common and most widely-spread lizards of the East Indies. It occurs in almost every part of the continent as well as of the Archipelago, from Afghanistan to China and the Philippine Islands; it is even said to inhabit the Sandwich Islands. It is not found beyond an elevation of 8000 feet. Cantor says that it is exceedingly numerous in

the hills and valleys of the Malayan countries. They may be seen basking in the sun, in bamboo hedges, or on trees; and they fearlessly enter houses in pursuit of insects, in which they display great agility. The female deposits 6 to 12 yellowish-white, oval, cylindrical eggs, half an inch in length.

The eighth family are the Geckos, or Geckotidæ. The limbs are stout, of moderate length, with at least four of the toes well developed. They are found in almost every part between and near the tropics, frequenting houses, rocks, and trees; and some of the species are so numerous around and within human dwellings, that they are most familiar objects to the inhabitants. All the Indian species, with the exception of Eublepharis, are able to run up and along the surface of a wall or of any other perpendicular object, the lower surface of their toes being provided with a series of moveable plates or discs, by the aid of which they adhere to the surface over which they pass. No gecko has imbricate scales on the back. The geckos do not attain to any considerable size, the largest species being from 10 to 14 inches long. They are carnivorous animals, destroying insects, moths, and even the younger and weaker members of their own species. Geckos have even been seen devouring their own tail. They are of fierce habits, fighting between themselves, particularly when one has caught a larger insect than he is able to swallow at once. They make a spring at their victim. Their greediness has developed some intellectual faculties in the house geckos; accustomed to be fed at a certain time with rice, etc., these little lizards will punctually make their appearance, and fearlessly take proffered food. Another peculiarity of the geckos is that they are endowed with voice. In Gecko guttatus it is a shrill cry, sounding like 'to-kee;' in Gecko monarchus it resembles the monosyllable 'tok,' repeated six or eight times with increased celerity; in Hemidactylus frænatus it is a sharp, quick call, like 'chic, chic, chit,' etc. They have several vernacular names in imitation of these sounds, as Too-kai, To-kee, Cheecha, Gokee, Keko, Gecko.

Gecko monarchus, *Gray, Lizards*, p. 161, possesses the power of changing its ground colour in a greater degree than any other gecko. It is very numerous at Penang, swarming at night in rooms. They are pugnacious among themselves, two or more sometimes fighting for an insect.

Ptychozoon homalocephalum, the flying gecko, attains to a length of 7 inches, of which the tail takes one-half. It is found chiefly in Java and in a few other islands of the Eastern Archipelago. Penang, Singapore, and the island of Ramree appear to be the only other places where it has hitherto been found in India. The expansions of the skin have the same purpose as the wings of the dragons and of the flying squirrels. In leaping, these membranes are expanded by the pressure of the air from below, and act as a parachute. When the gecko is at rest, they are kept in close contact with the body by muscles attached to their interior surface. Like other geckos, they have in some degree the power of changing the ground colour from a darker to a lighter shade.

Hemidactylus coctœi, the common gecko or small gecko. The spider of the English Bible, Proverbs xxx. 28, was undoubtedly a small gecko represented by this species, and the word was so rendered in the Syriac version made in the 2d century, and in the Vulgate Latin made in the 4th century. Jerome translated, 'Stellio manibus nititur, Et moratur in ædibus regis,' into

> 'The gecko taketh hold with her hands,
> And dwelleth in kings' palaces.'

Hemidactylus frænatus is the cheecha of Ceylon. It scarcely ever exceeds the length of 4 to 5 inches, and is one of the most common house geckos; seen soon after sunset in search of prey, which consists of flies and other insects. It does not reject boiled rice and crumbs of bread, always returning to the spot where it has been thus before fed. It is also frequently met with on trees and on rocks. The female lays three or four eggs, in crevices of old walls or in the hollows of trees. This small species is of fierce habits, like several other Geckonidæ, destroying its own species.

The ninth family are the Agames, or *Agamidæ*. The agames are land lizards, spread over almost every part of the Old World and of Australia, being much less numerous in the temperate parts than in the tropical, — some with a compressed body, and with a long, more or less compressed tail, live on trees or bushes; whilst others, with a depressed body, and with a shorter tail, inhabit rocks or plains. The most slender and the most gaily-coloured forms belong to the former division, the heavier ones, with duller colours, to the latter. They do not attain to any considerable size, and none of the Indian species exceed a foot in length, the tail not included. The greater part are insectivorous, but many feed on vegetables (seeds, fruits, leaves), as well as on animals.

Draco, *Linn.*, the dragons, a genus of the Agamidæ, have a semicircular membrane, supported by the five or six posterior (false) ribs, which are much prolonged, forming a sort of wing or parachute on each side of the body. A vertical appendage is suspended from the middle of the throat; a smaller horizontal fold of the skin on each side of the gular appendage. The dragons are entirely confined to the East Indies; they are more numerous in the Archipelago than on the continent; they have not yet been found in Ceylon. The character by which they are at once recognised is the peculiar additional apparatus for locomotion formed by the much-prolonged five or six hind ribs, which are connected by a broad expansible fold of the skin, the whole forming a sub-semicircular wing on each side of the body. The dragons are tree lizards, and in jumping from branch to branch they are supported in the air by their expanded parachutes, which are laid backwards at the sides of the animal while it is sitting or merely running. If the hind extremities of a dragon were cut off, it would lie helpless on the ground; but it would still move with great velocity if it were merely deprived of its wings. The locomotion of the dragons is a series of leaps, and not a continuous running; they are the anoles of the Old World. The transcendent beauty of the colour of Draco volans baffles description. As the lizard lies in the shade along the trunk of a tree, its colours, at a distance, appear like a mixture of brown and grey, and render it scarcely distinguishable from the bark. Thus it remains,

with no signs of life, except the restless eyes, watching passing insects, which, suddenly expanding its wings, it seizes with a sometimes considerable unerring leap.

Sitana ponticeriana, *Cuv.* This common ground lizard is distributed over all India, but is rare in the wooded districts, frequenting the open country, field, and low copses. On the approach of danger, it runs with great rapidity, tail erect, and conceals itself in any crack in the ground or hole, or under a stone or bush. Notwithstanding its activity, it is the common prey of harriers, buzzards, hawks, and eagles.

Calotes are true tree lizards, some having the tail rather compressed at the base. C. versicolor is the blood-sucker. The ground colour is generally a light-brownish olive, but the lizard can change it to bright red, to black, and to a mixture of both. The bright changeable colours are peculiar to the male during the breeding season, in the months of May and June, and it then may be seen seated on a hedge or bush, with the tail and limbs black, head and neck yellow picked out with red, and the rest of the body red. This is one of the most common lizards, extending from Afghanistan over the whole continent of India to Ceylon and China; not extending into the temperate zone of the Himalaya. Ceylonese specimens are generally somewhat larger; one of them measured 16 inches, the tail taking 11 inches. It is found in hedges and trees. The name of blood-sucker, in the opinion of Kelaart, was given from the occasional reddish hue of the throat and neck.

A tenth family are Chameleons, or *Chamæleonidæ*. Africa is inhabited by numerous species; they extend to the northern shores of the Mediterranean and into South-Western Asia, into Hindustan and Northern Ceylon. The inflexibility of the neck is compensated by the wonderful structure of the eyes, which are so prominent that more than one-half of the ball stands out of the head; and not only can they be moved in any direction, but each has an action independent of the other, — one eye may be looking forward, whilst an object behind the animal is examined with the other. The faculty of changing colour possessed by the chameleons, although common to numerous other lizards, has become proverbial, and is so much developed that one side may assume a colour different from that of the other. They are oviparous, depositing under leaves from ten to twelve oval eggs with calcareous shells. The species have been left together in one genus; only one species is found in British India.

Most of the Indian specimens are of a green colour, uniform, or irregularly spotted and banded with dark green or brown; whilst in African species the ground colour is greyish, olive, yellowish, or brownish. This, however, does not appear to amount to a specific difference. In the Peninsula of India and northern parts of Ceylon it attains to a length of 10 inches, the tail taking more than one-half.

The *Ophidia* comprise the order of Snakes. There is no sharp boundary line between the order of saurians and that of snakes. Certain ophidians remind us, by several characters, of the saurian type; such as the snakes forming the first four families, which are distinguished by polished, closely-adherent, rounded, sub-equal scales, much resembling the smooth scales of some scincoids. A peculiar mobility of the jaw-bones enables snakes to extend the gape in an extraordinary degree, and to work their prey down through the collapsed pharynx. The Pythonidæ and Erycidæ have rudiments of hind limbs. Generally the snakes are provided with numerous teeth, which are elongate, conical, thin, and pointed like a needle, and more or less bent backwards. Non-venomous snakes' teeth are either entirely smooth, or only the last of the maxillary series is provided with a faint longitudinal groove, which is not intended to convey a poisonous saliva into a wound, as the saliva of these snakes has never been proved to be poisonous; the groove appears to increase the strength of the tooth. The poisonous snakes are armed with a long canaliculated tooth in front of the upper jaw; the channel terminates in a small slit at the extremity of the tooth, and is in connection with a duct which carries the poisonous fluid from a large gland to the tooth. At the moment the snake opens its mouth to bite, these muscles compress the gland, and force its contents through the excretory duct into the channel of the venom-tooth, whence it is injected into the wound. The structure of the venom-tooth is not the same in all poisonous snakes; in some it is fixed to the maxillary bone, which is as long, or nearly as long, as in the non-venomous snakes, and generally bears one or more ordinary teeth on its hinder portion. The poisonous snakes with such a dentition have externally a mor striking resemblance to the non-venomou ents, and on this account they are desig as venomous colubrine snakes, forming second sub-order of snakes (cobra, bungarus sea-snakes, etc.). In the other venomous s kes, the third sub-order, the maxillary bone is extremely short, and does not bear any teeth except an exceedingly long fang, with a perfectly closed, externally invisible, channel in its interior. Although this tooth also is fixed to the bone, the bone itself is very mobile, so that the tooth, which is laid backwards when at rest, can be erected the moment the animal prepares to strike. This tooth, like all the other teeth, is not only occasionally lost, but appears to be shed at regular intervals. The greater part of the snakes are oviparous, the eggs having an oblong form, and a soft, leathery shell. The pythons alone incubate their eggs, whilst all the other oviparous snakes leave them to the heat of the place where they have been deposited. Other snakes (the fresh-water and poisonous species) are viviparous, the embryos being developed in the oviduct of the mother. There may be distinguished—

Burrowing snakes, living under ground, only occasionally appearing above the surface.

Ground snakes live above ground, and only occasionally climb bushes or enter the water.

Tree snakes, or species passing the greater part of their life on bushes and trees, which they climb with the greatest facility.

Fresh-water snakes, distinguished by the position of the nostrils, which are placed on the top of the snout, and by a tapering tail. They inhabit fresh waters, and are excellent swimmers and divers.

Sea-snakes, distinguished by a strongly compressed tail, and by the position of the nostrils,

which are placed as in the last group. They live in the sea only, occasionally approaching the land, feed on marine fish, are viviparous and venomous.

Tropical India surpasses every other part of the globe in the number of ophidian forms.

The degree of danger from a bite by a poisonous snake depends but little on the species which has inflicted the wound, but rather on the bulk of the individual, on the quantity of its poison, on the temperature, and on the place of the wound. If a large blood-vessel be pierced by the fang, the poison is carried instantaneously into the mass of the blood, and sudden death is almost always the result. Although it is always possible to recognise the venomous nature of a snake from external characters only, yet this requires such a knowledge of snakes as can be attained only by a special study of them. The wound itself speaks for or against the venomous nature of a snake which has bitten. When there are numerous punctured wounds disposed in two lines, the snake is not poisonous. If the wound is on some part of the hand, arm, or foot, one or two ligatures should be made as tightly as possible at a short distance above the wound, to prevent the absorption of the poison. The ligature is left until the proper means are taken to destroy the virus in the wound, and until medicine is taken internally, or until great pain or swelling necessitate its removal. Punctured wounds should be enlarged by incisions at least as deep as the wounds, to cause a free efflux of the poisoned blood, and to facilitate its removal by sucking. The wounds should be sucked either by the patient himself or by another person whose mouth is free from any abrasion or wound; cupping-glasses answer the same purpose in cases where they can be applied. The wound should be washed with ammonia, and its vicinity rubbed with it. Cauterization with a red-hot iron, or with sulphuric acid, butter of antimony, nitrate of silver, etc., are of great advantage, if done before the virus has spread far beyond the place of the bite. Internally, ammonia should be taken in large doses,—one, two, or three wine-glasses of the eau-de-luce. Brandy may be taken at short intervals. Dr. Shortt believes that ammonia is useless, and has strong faith in liquor potassæ. To prevent a complete collapse, it is necessary to use these strong excitants, and to repeat them until the alarming symptoms are allayed. It would be a great risk in such a case to trust to the remedies of a snake-charmer.

The *Colubridæ* family comprises the greater part of the non-venomous snakes, namely, all those which do not present any striking character either in their general habit, in the shields of the head, in the dentition, or in any other part of their organization. They have numerous teeth in the jaws and on the palate, but no fangs in front or in the middle of the maxillary. Numerous species of Coluber, *sp.*, *Linn.*, are found in North America, Europe, and Asia; those in British India belong to the northern parts of this region, scarcely extending southwards into the tropical region.

Ptyas mucosus, *Cope*, is the Indian rat snake. It is light brownish-olive, scales with darker margins, is one of the most common species on the continent and in Ceylon, and appears to occur everywhere; it is scarce in the Archipelago, as its occurrence has been recorded in Java only; on the other hand, it is not rare in Chusan and Formosa. In the Himalaya it ascends to only 5240 feet above the level of the sea. It is a powerful snake, attaining to a length of 7 feet, the tail being one-third, or rather more. Its food consists of mammals, birds, and frogs; it frequently enters the dwellings of man, in search of mice, rats, and young fowls. It is of fierce habits, always ready to bite, and old specimens brought to Europe never become tame. Cantor says that it utters, when irritated, a peculiar diminuendo sound, not unlike that produced by a gently struck tuning-fork.

Tropidonotus junceus, *Cantor*, inhabits Penang, and, like most of the Asiatic species of this genus, is of fierce habits.

Tropidonotus quincunciatus and T. umbratus. The former is the most widely-spread species of the East Indies, ranging from Mesopotamia into the southern parts of China, and inhabiting most of the islands of the western half of the Archipelago. It abounds near rivers and pools, feeding on frogs and fishes; it attains to a length of 3 feet, and is of fierce habits. The ground colour of the upper parts is generally greyish or brownish-olive.

Tropidonotus macrophthalmus. This species may be at once distinguished by its large eye, and by its dilatable neck, the scales of which show an arrangement very similar to that of a cobra, for which it is frequently taken. Found in Khassya and Sikkim,—in the latter country at an elevation of 4000 feet. Attains to 39 inches, the tail measuring 7 inches.

Tropidonotus stolatus, *Boie*, *Isis*. This is perhaps the most common species of snake on the East Indian continent, ranging from Ceylon through the Peninsula, along the southern slope of the Himalayas to Southern China (Formosa); it is scarcer in the Malayan Peninsula and the northern parts of Siam, and appears to be entirely absent in the Archipelago. It is of very gentle habits, feeding on small frogs; it attains to a length of 2 feet, but generally smaller.

Another family are Fresh-water Snakes, the *Homalopsidæ*. All the Indian fresh-water snakes of this family have a grooved fang at the hinder extremity of the maxillary bone. They are aquatic, and are only occasionally found on the beach; several of them even enter the sea, and in several points of their organization approach the truly marine snakes, with which they have been associated in Gray's system. They may easily be recognised by the position of the nostrils on the top of the snout, which enables them to breathe by raising but a very small part of their head out of the water; it is the same arrangement as that in the crocodiles, sea-snakes, and other aquatic animals. Many have a distinctly prehensile tail, by means of which they hold on to projecting objects. Their food consists entirely of fish, and, in a few species, of crustacea also. All of them appear to be viviparous, and the act of parturition is performed in the water. They do not grow to any considerable size, are of a gentle disposition, and their bite would be by no means dangerous. They will not feed in captivity, and therefore die after a short time.

Psammodynastes pulverulentus, *Gunth.*, is one of the family *Psammophidæ* or Desert Snakes.

This one has a very repulsive aspect; its dark, undefined colours, short and thick head, and swollen lips, caused by large hidden fangs, give it the appearance of a venomous snake.

The tenth family are Tree Snakes, or *Dendrophidæ*. They are diurnal species, living in trees, and feeding chiefly on tree lizards; they are found in all the tropical regions.

The Whip Snakes, or *Dryophidæ*, are the eleventh family. Asiatic species have a long fang-like tooth in the middle of the maxillary, and all provided with a posterior grooved tooth.

The twelfth family are the Dipsades, or *Dipsadidæ*. All the Indian species with a grooved fang behind; and several, moreover, with fangs in front. The Indian dipsades are nocturnal tree snakes, with a vertical pupil, a short, broad head, and compressed, elongate body.

The thirteenth family are Lycodontes, or *Lycodontidæ*. Lycodon aulicus is one of the most common snakes of the Indian continent and Ceylon; it does not extend northwards to China, and becomes scarcer on the coasts of the south-eastern parts of India. It occurs in only a few of the islands—in the Philippines and in Timor.

The *Amblycephalidæ*, or Blunt-heads, is the fourteenth. Amblycephalus boa is one of this family. The head of this singular snake resembles much that of a mastiff, the lips being arched and tumid; it climbs with great facility, frequenting the roofs of the huts of the natives in pursuit of its food, which consists of insects. It belongs properly to the fauna of the Archipelago, inhabiting Java, Borneo, and the Philippine Islands. Cantor found it at Penang. It does not appear to be common anywhere. It readily bites; and attains to a length of 3 feet, the tail being one-third.

Rock Snakes, or *Pythonidæ*, are a fifteenth family. The rock snakes are found in the hottest parts of Africa, Asia, the East Indian Archipelago, and Australia. They climb as well as they swim; most of them prefer the neighbourhood of water. This family contains the largest snakes. Only one genus, the python, is found in British India.

Python reticulatus and P. molurus, two species of Indian rock snakes, are among the largest of living reptiles. Of snakes, only their African congeners and the American Eunectes murinus can be placed beside them. Their dimensions and their strength, however, have been much exaggerated; specimens of 18 to 20 feet in length are very rare, although isolated statements of the occurrence of individuals which measured 30 feet are on record and worthy of credit. Rock snakes from 15 to 20 feet long have the thickness of a man's thigh, and will easily overpower a small deer, a sheep, or a good-sized dog. The rock snakes must attain to a considerable age. A Python reticulatus lived in the menagerie of the Zoological Society of London for 15 years; when brought to England it was about 11 feet long, and in ten years it had attained to a length of 21 feet, after which no further growth could be observed. The males remain smaller than the females. The rock snakes will propagate in captivity,—the Indian P. molurus having bred in Paris, and the African P. sebæ in London. In both cases the eggs were incubated by the mother, and in the former successfully hatched.

Python reticulatus, *Gray*. It often takes up its abode in outhouses, preying at night, and is thus useful in destroying vermin, although plunder is occasionally committed in poultry yards. When kept in captivity, it is of importance to supply it with a small tank of water, in which it will frequently remain for days. Individuals of 16 feet in length are not of rare occurrence, and some about 30 feet long are on record. This species of the pythons of South-Eastern Asia is very numerous in the Malayan hills and valleys, feeding upon quadrupeds and birds. Dr. Montgomerie had seen in George Town, Penang, a young one which the inhabitants suffered to retain unmolested possession of the rice stores, in order to secure them against the ravages of rats.

Python molurus, *Gray*. The ground colour is light greyish-brown. This python, commonly known under the name of rock snake, and by some misnamed boa, is almost peculiar to the continent of India. Common in the Southern Peninsula and in Bengal, it extends northwards into the sal forest at the foot of the Himalaya, and probably to Southern China.

The Herpetodryas oxycephalus of Reinwardt has in a remarkable degree the power of laterally compressing the neck and the anterior part of the body, when the greyish-blue skin becomes visible between the separated scales. In such state of excitement, it raises nearly the anterior third vertically from the ground, continues fixed during several seconds with vibrating tongue, and bites. It then throws its [illegible], to rise to a renewed attack.

The seventeen[illegible]mily are Wart Snakes, *Acrochordidæ*.

Chersydrus gra[illegible]tus is found in the rivers and on the sea-co[illegible] of numerous islands of the Archipelago, exte[illegible]ng to New Guinea and the Philippines. It inhabits also the eastern coasts of Southern India and the Malayan Peninsula, and sometimes it may be seen three or four miles distant from the shore. It is not venomous, as has been stated by writers.

The terrestrial family of Elapides, or *Elapidæ*, are venomous colubrine snakes; the fang is grooved, with a foramen at its extremity; one or two small ordinary teeth at a short distance behind it.

Naja tripudians, *Merr.*, has eight varieties, forming but one species, which is widely spread all over the E. Indies. Its chief enemies are the jungle-fowl, which destroy the young brood, and the herpestes or ichneumons, which will attack and master the largest cobra. In districts where the cobras or other venomous snakes have too much increased in number, the most efficient way of destroying them is to protect their natural enemies. The cobra is the most common venomous snake of the East Indies.

Ophiophagus elaps. This remarkable snake is easily recognised by the large shields surrounding the occipitals. Although rather rare, it has a very wide geographical range: in almost every part of the Indian continent, the Andaman Islands, Java, Sumatra, Borneo, the Philippine Islands, and, according to Dumeril, also in New Guinea. It is one of the largest and most deadly venomous snakes, attaining to a length of more than 12 feet, of which the tail is about one-fifth. It inhabits hollow trees, and is sometimes found resting between the branches; it feeds on other snakes.

Bungarus species are not numerous in the Malayan countries, but B. candidus and B. fasciatus are of no uncommon occurrence in Bengal and on the Coromandel coast, where, however, it should be observed, a class of the natives ('serpent charmers') earn a livelihood by capturing and exhibiting serpents; this craft is unknown among the Malays. B. flaviceps, B. candidus, and B. fasciatus, like the rest of the venomous serpents, are very ferocious when attacked, but unprovokedly they are not known to attack man; on the contrary, when met in the jungle, they attempt to escape. When trod upon, or struck, their rage is instantly excited; in self-defence they will even turn from their retreat, and then their habitual sluggishness is roused to furious activity. Preparing to attack, the head is, by a short curve of the neck, brought closely to the body, and drawn far backwards, when, suddenly darting the anterior part of the body obliquely upwards, they bite. The height of the place where the wound is inflicted of course depends on the length of the serpent, which is capable of darting nearly the anterior half of the body. Notwithstanding the circular pupil, they appear to shun the light, hiding the head under the folds of the body; and they are singularly uncertain in their movements, often suddenly jerking the head or tail without any apparent object. Like all serpents of tropical Asia, they seldom expose themselves to the sun; when during the day they leave their hiding-places, they select [illegible] The genus Bungarus is terrestrial, feedi[illegible]s, mice, serpents (Col. mucosus, *Linn.*), [illegible]oads. Like other venomous serpents, when venom has been inflicted on their prey, they disengage it from the fangs, sheath and place them as horizontally as possible, in order that they may offer no resistance to the introduction into the mouth of the lifeless prey, which is now seized head-foremost. The innocuous serpents bite or strangle their prey, which, when life is extinct, is either swallowed at once, or, if it happen to have been killed in a position likely to render the deglutition difficult, is often disengaged from between the teeth, and seized a second time by the head. In captivity these serpents refuse food, but greedily lap up and swallow water. A fowl, four minutes after it had been bitten on the inner side of the thigh by a Bungarus fasciatus, fell on the wounded side, and was shortly after seized with slight purging. The eyes were half closed, the pupils alternately dilated and contracted, immobile. In 17 minutes slight spasms occurred, under which the bird expired 43 minutes after it had been wounded. Another fowl, wounded in the same place as the former, by the same serpent, but after an interval of seven hours, expired under similar symptoms, only more violent spasms, in the course of 28 minutes. Venom taken from another serpent, the fangs of which had been extracted, was inoculated by a lancet-incision in the right thigh; four minutes after, the fowl was seized with trembling, fell, and remained lying on the wounded side, with the eyes closed, but it gradually recovered, and rose, apparently recovered, 30 minutes after the inoculation of the venom. Other fowls were killed by different serpents of this species in 20 to 31 minutes. Fowls bitten by Bungarus candidus expired under similar symptoms, within 30 to 45 minutes; dogs from within 1 hour 10 minutes to 2 hours, under symptoms noted in Russell's Experiments. The venom of Naja lutescens, *Laurenti*, was carefully obtained, so as to avoid any admixture of saliva, by compressing the venomous glands. It issued from the lower aperture of the fangs in viscid drops of a syrupy consistency, and was received as it fell from the fangs in platina capsules. The serpents operated upon were an adult cobra di capello, Naja lutescens, *Laurenti*, and one of its varieties, Naja kaoutdia, *Belanger*. In every instance the venom readily changed the blue of litmus to red, and restored the bright yellow to turmeric paper that had been reddened by the application of caustic alkali,—an unequivocal proof of acidity. When left to spontaneous evaporation, it dried into a varnish resembling mucilage, or the glair of an egg, cracking in all directions; and on being heated, it deposited an abundant coagulum, apparently albuminous. In either instance, when redissolved it retained its acid property.

What the nature of this acid may be, it was impossible to determine from the small quantity operated upon; nor was Dr. Cantor prepared to say that the poison itself is an acid, although, if it be not so, it is certainly associated with one. The poison itself probably consists of some compound, which would be wholly disorganized under any attempts at detection by chemical means.

The *Hydrophidæ* are a family of Sea-snakes. The sea-snakes are inhabitants of the tropical parts of the Indian and Pacific Oceans, extending from the coast of Madagascar to the Isthmus of Panama; they are most numerous in the East Indian Archipelago, and in the seas between Southern China and North Australia, being represented on the outskirts of the geographical range we have mentioned by only one species, and that the most common, viz. Pelamis bicolor. The most striking feature in the organization of the sea-snakes is their elevated and compressed tail, the processes of the caudal vertebræ being much prolonged and styliform. The food of the sea-snakes consists entirely of small fish; all the species are viviparous, bringing forth, without leaving the sea, from four to nine young ones. They have very formidable and very numerous enemies in the sea eagles (Haliætus), in the sharks, and other large raptorial fishes. There is no other group of reptiles, the species of which are so little known, and the synonymy of which is so confused, as that of the sea serpents. Our present knowledge of the geographical distribution of most of the species is extremely vague.

The *Crotalidæ* are a family of Pit Vipers. The pit vipers are found only in Asia and America, those of the New World surpassing the Asiatic species in size, and therefore they are much more dangerous.

The *Trimeresures* are Tree Snakes, as is indicated by their prehensile tail and by their green or variegated coloration. In general they are sluggish, not attempting to move out of the way; and as they very closely resemble the branch on which they rest, they are frequently not perceived until they prepare to dart, vibrating the tail and uttering a faint hissing sound, or until they have bitten the disturber of their rest. The bite of larger specimens, from 2 to 3 feet long, is more dangerous and has occasionally proved fatal. When roused,

these snakes are extremely fierce, striking at everything within their reach; and Cantor says that in the extreme of fury they will fix the fangs in their own bodies.

Trigonocephalus Sumatranus, *Raffles*. In Malayan countries this variety is not of so rare occurrence as the species appears to be in Sumatra. Tr. puniceus is in general sluggish, but when roused is of ferocious habits; Tr. gramineus, Tr. Sumatranus, and Tr. puniceus resemble the genus Bungarus; their mode of attack is also similar; like Vipera Russellii, *Shaw*, when it prepares to dart, they vibrate the prehensile tail, and utter a faint hissing sound. As the pupil is vertically contracted by the light, they frequently miss their aim, and, like Bungarus, Naja, Vipera Russellii, and Hydrus, in the extreme of fury they will fix the fangs in their own bodies. In Bengal, most terrestrial serpents keep to the water during the hot season, but the rains send them abroad in search of dry localities. Although this genus has venomous organs as highly developed as Crotalus or Vipera, the effects produced by wounds of two species at least appear to be less dangerous.

Hydrus schistosus is incredibly numerous in the Bay of Bengal, at Penang, and Singapore, far more so than any known terrestrial serpent. The fishing-nets are hardly ever worked but that one or more are among the contents. The large individuals are very ferocious; the young ones are less so. Fortunately for the fishermen, the light blinds these serpents, which when out of their proper element become very sluggish and soon expire. This accounts for the safety of the class of men whose daily calling brings them in immediate contact with animals the wound of which is fatal. The fishermen in the Straits of Malacca are aware of their danger, and therefore take care to avoid or destroy these reptiles while landing the fishes. The Malays denominate them Ular Laut, *i.e.* serpents of the sea; among which, however, the innocuous Acrochordus granulatus, *Schneider*, is also comprised as an inhabitant of the coasts.

The incantation of serpents has usually been attributed to the power of music, and a late writer remarks that 'it is so strange that many have denied the fact, while others have asserted it to be a deception.' The general belief, however, 'is that serpents are extremely sensitive of impressions from musical notes or modulations, under the influence of which they wreathe their bodies from feelings of pleasure, while to these graceful contortions and undulating movements, the charmer, who plays on a pipe or some simple instrument, adapts the time.' This is the common theory,—that serpents are rendered docile by music; but Mr. Mason has seen the cobra dance in imitation of its Burmese master, while he sat upon his haunches before it, making the motions with his body and hands that he wished the snakes to imitate, and which it did perfectly without any music whatever, or any other sound except an occasional authoritative hay! A pair of cobras kept perfect time with their master, while no sounds were uttered, and allowed him to handle them as he wished. At his command they danced, and at his command they lay gracefully down as if asleep. The Burmese usually put a wild one, which they secure when half or two-thirds grown, with a practised tame one. These will dance and wreathe themselves at their master's pleasure. Sometimes darting at him, but at that moment he straightens himself up, with his eyes fastened upon the snake's eyes, and in a gruff voice commands them to perform. Following his motions, they stand almost upright with their hoods dilated and their colours all in play as they dance; now swift, now slow, now approaching, now receding; and he has seen the younger in his receding movements give unequivocal tokens of desiring to make his exit, but on hearing his master's call he turned again, though evidently with more reluctance than the old actors. The power of effecting all this is certainly attributable neither to magic nor music. It must, he thinks, be ascribed to fear, and to a very simple principle, the power of imitation,—a power possessed by different animals in different degrees. Serpents are by no means the least docile of the animal kingdom; nor are cobras the most intractable of serpents, the cobra and the bungarus being the favourites with the snake-charmers.

A large python, usually called a boa, is not uncommon in Tenasserim. Mr. Mason had seen the head of one that was killed by a drove of hogs, whose whole length measured 18 feet, and the natives say they grow much larger. The Karens have an apothegm that the largest python can swallow a full-grown buck rusa or sambur deer, horns and all, without inconvenience. They are often seen coiled up among the branches of trees on the banks of st[illegible] the interior, where they are frequently [illegible] by Karens, who regard them as valuabl[illegible] He has seen a Karen seize one 9 feet l[illegible] the tail in the water, and with the aid of h[illegible] ociates succeed in capturing him.

Hypnale nepa[illegible] found in Ceylon, but also in the Peninsula of Southern India, the Animallay mountains. The carawala is much dreaded, although its bite is but exceptionally fatal to man, and in such cases death does not occur before the lapse of some days.

The Vipers, or *Viperidæ*, inhabit the Old World and Australia, and are thoroughly terrestrial snakes.

Daboia Russellii is a native of Ceylon and of the Peninsula of India, the Animallay mountains, Waltair, Bombay, and Almora (5500 feet elevation), the Himalayas, in Kulu, at 3400 feet. Length 50 inches, tail measuring 7 inches; it is thoroughly terrestrial, feeding chiefly on mice. It is one of the most common venomous snakes, and, on account of its size and nocturnal habits, more dangerous than the Trimeresures and Hypnales. The far-famed, dreaded Cobra monil, or Cobra manilla of some, seems merely the young of this species. The old orthography is monil, which simply means a chain or necklace; and whoever looks at the markings of this snake, especially of the young one, must be struck with the resemblance thereof to a necklace.

Vipera echis, *Schlegel;* V. noratta, *Shaw, Russell*. Kuttavyrien, Tam. This little snake is very common in the Carnatic. Jerdon doubts that its bite would prove fatal to man. A dog bitten by one recovered. Of all the venomous land-snakes met with in Southern India, the only ones at all common are the cobra, the chain viper (Vipera Russellii), the Bungarus candidus, and the little Vipera echis. Most of the others

are peculiar to the forests of India. Trigonocephali are not usually fatal. Jerdon had known several cases of bites by Trigonocephalus Malabaricus and Tr. nepa, and none proved fatal.

Batrachians are a sub-class of reptiles. Moisture is as necessary for batrachians as food and air, hence they are found only in damp places or in the neighbourhood of water. When they dive, the lungs are emptied, and the respiration remains interrupted for one or two hours, after which time the animal is compelled to rise to the surface in order to breathe. Many batrachians live at some distance from water; all, however, as far as is known at present, enter it at the season of propagation. The males have also generally a distinctly more slender form than the females. The eggs are impregnated the moment they are deposited by the female in the water. The young ones, or tadpoles, have a thick ovate body without legs, terminating in a long, strong, compressed tail, which serves as an organ of locomotion in the water. The development is about a hundred days in the European Rana temporaria, but several years elapse before the young perfect batrachian attains its full size. None are poisonous.

REPTONIA BUXIFOLIA. *St.* Gurgura, Gurgara, Garar of Salt Range. The wood is small, but hard, fine-grained, and useful. It is common in the Trans-Indus districts. Exclusively a Panjab wood.—*Stewart.*

RESERVOIRS are common in many parts of India, and where water [illegible] from the surface, usually a bold flight of [illegible] to 40 feet wide leads down to the water. [illegible] are in the form of tanks, and of wells [illegible]n as baories or baolies.

RESIDENCY, in British India, a Political Agency at a native court; the political officer holding it is styled the Resident. In Netherland India, a province.

RESINS.

Other sorts, . . .	,, 11,814 ,,	15,056 ,,	14,371

These products are very abundant throughout the East Indies, and are largely utilized by the people, but they are carelessly collected and packed, and are presented to European commerce in unattractive forms. Also, in the course of trade, cutch and gambier, rosin, pitch, tar, and dammer, are imported into India and re-exported. Since the second edition of the Cyclopædia of India was published, Mr. E. J. Atkinson, in 1876, described the gums and gum-resins of the N.W. Provinces of India, and Dr. M. C. Cooke of the Indian Office in 1874 reported on all those of British India, referring several times to this Cyclopædia. He classed them as gums, gum-resins, true resins, and oleo-resins, but in commercial returns these substances are usually placed under one heading.

i. Gums, trees yielding them.

a. True gums.

Acacia Arabica, *Willd.*
A. catechu, *Linn.*
A. ferruginea, *D.C.*
A. leucophlæa, *Willd.*
A. modesta, *Wall.*
A. speciosa, *Willd.*
A. sundra, *D.C.*
A. vera, *Willd.*
Adenanthera pavonina, *L.*
Ægle marmelos, *Corr.*
Amygdalus Persica, *Linn.*
Anacardium occidentale, *L.*
Andersonia, *sp.?*
Anona squamosa, *L.?*
Armeniaca vulgaris, *P.*
Artocarpus integrifolia, *L.*
Azadirachta Indica, *Juss.*
Barleria prionitis, *Linn.*
Bassia longifolia, *Linn.*
Bauhinia emarginata, *Roxb.*
B. parviflora, *Ham.*
B. retusa, *Wall.*
B. Vahlii, *W. and A.*
Borassus flabelliformis, *L.*
Buchanania latifolia, *Roxb.*
Calyptranthes caryophyllæfolia, *Willde.*
Careya arborea, *Roxb.*
Cathartocarpus fistulata, *Pers.*
Cedrela toona, *Roxb.*
Celtis orientalis, *Linn.*
Chickrassia tabularis, *Juss.*
Citrus decumana, *Linn.*
C. limetta, *Risso.*
C. medica, *Linn.*
Cocos nucifera, *Linn.*
Conocarpus latifolius, *Roxb.*
Cordia Rothii, *Rœm.*
Elæodendron paniculatum, *W. and A.*
Elate sylvestris, *Linn.*
Emblica officinalis, *Gært.*
Erythrina Indica, *W. and A.*
Feronia elephantum, *W. and A.*
Garuga pinnata, *Roxb.*
Gossypium herbaceum, *L.*
Grislea tomentosa, *Roxb.*
Gyrocarpus Jacquini, *Roxb.*
Heritiera littoralis, *Dry.*
Jatropha curcas, *Linn.*
Melia azedarach, *L.*
M. sempervirens, *L.*
Michelia champaca, *L.*
Mimusops elengi, *Linn.*
M. kaki, *W.*
Morus Indica, *Willd.*
Nerium suaveolens, —?
Odina wodier, *W. and A.*
Poinciana elata, *W. and A.*
P. regia, *Bojer.*
Pongamia glabra, *Vent.*
Prosopis spicigera, *L.*
Prunus domestica, *Linn.*
P. puddum, *Roxb.*
Punica granatum, *Linn.*
Sapindus acuminatus, *Wall*
S. emarginatus, *W. and A.*
Schleichera trijuga, *Willd.?*
Semecarpus anacardium, *L.*
Soymida febrifuga, *Juss.*
Spondias mangifera, *P.*
Swietenia chloroxylon, *R.*
S. mahogani, *L.*
Tamarindus Indica, *Linn.*
Tamarix divica, *Roxb.*
Terminalia arjuna, *W. and A.*
T. belerica, *Roxb.*
T. catappa, *L.*
T. tomentosa, *W. and A.*
Thespesia populnea, *Cor.*
Tricosanthes cucumerina, *L.?*
Vachellia farnesiana, *W. and A.*
Wrightia antidysenterica, *Br.*
W. tinctoria, *Br.*
Zizyphus flexuosa, *Wall.*
Z. jujuba, *Lam.*

b. Pseudo-gums.

Ailantus excelsa, *Roxb.*
Cochlospermum gossypium, *D.C.*
Cycas circinalis, *Linn.*
Eriodendron anfractuosum, *W. and Arn.*
Grevillea robusta, *Cunn.*
Macaranga Indica, *W.*
M. tomentosa, *W.*
Moringa pterygosperma, *Gærtn.*
Opuntia rubescens, *Salm.*
Salmalia Malabarica, *W. and A.*
Sterculia urens, balanghas, campanulata, colorata, fœtida, and populifolia.
Uvaria tomentosa, *Roxb.*

c. Astringent gums.

Agati grandiflora, *Dees.*
Butea frondosa, *Roxb.*
B. parviflora, *Roxb.*
B. superba, *Roxb.*
Calyptranthes caryophyllæfolia, *Willde.*
Mucherus? Salmalia Malabarica?
PterocarpusIndicus, *Willd.*
P. marsupium, *Roxb.*

ii. Gum-Resins.

a. Emulsive gum-resins.

Gamboge plants.
Garcinia cambogia, *Desr.*
G. cowa, *Roxb.*
G. Griffithii, *And.*
G. mangostana, *Linn.*
G. morella, *Desr.*
G. pictoria, *Roxb.*
G. pedunculata, *Roxb.*
G. Travancorica, *Bedd.*
G. Wightii, *And.*
G. xanthochymus, *Hooker.*

b. Fœtid gum-resins.

Dorema ammoniacum, *Don.*
D. aureum, *Stocks.*
Ferula galbaniflua, *Buhse.*
F. hooshee, *Royle.*
F. orientalis, *Linn.*
F. Persica, *Willde.*
F. alliacea, *Boiss.*
F. Lehmanni, *Boiss.*
Galbanum Persian.
Gardenia lucida, *Roxb.*
G. gummifera, *Roxb.*
Narthex asafœtida, *Falc.*
Opoponax chironium, *Koch*
Sagapenum ferula, *sp.?*
Sarcocolla, —?

c. Fragrant gum-resins.

Balsamodendron mukul, *Hooker.*
B. myrrha, *Ehr.*
B. Roxburghii, *Arn.*
B. pubescens, *Stocks.*
Boswellia Bhau-dajiana, *Birdw.*
B. Carteri, *Birdw.*
B. Frereana, *Birdw.*

B. thurifera, *Coleb.*
Calamus draco, *Willde.?*
Dracæna draco, *Linn.?*
Mangifera Indica, *Linn.*
Myrrh.
Nagdana.
Olibanum.
Pterocarpus draco, *Linn.?*
Styrax benzoin, *Dryand.*
Terminalia angustifolia, *W. and A.*

iii. True Resins.

a. Copalline resins.

Canarium Bengalense, *R.*
C. strictum, *Roxb.*
Copal.
Dammara orientalis, *Lam.*
Dammar daging, rose dammer.
Dammer of Andamans.
Dammer of Borneo.
D. or Salangan putih, white dammer.
D. hitam or black dammer.
Diospyros glutinosa, *Roxb.*
Hopea micrantha, *Hook.*
H. odorata, *Roxb.*
H. parviflora, *Bedd.*
Pistacia Cabulica, *Stocks.*
P. Khinjuk, *Stocks.*
P. lentiscus, *Linn.*
Poon-yet or Pwai-gnet.
Shorea robusta, *Roxb.*
S. sericea, *Dyer.*
S. tumbuggaia, *Roxb.*
Trachylobium Mozambicense, *Peters.*
Vateria acuminata, *Heyne.*
V. Indica, *L.*
Vatica lanceæfolia, *Blume.*
V. Roxburghiana, *Wight.*

b. Elemi or soft resins.

Ailantus Malabarica, *D.C.*
Calophyllum calaba, *Jacq.*
C. inophyllum, *L.*
C. other species.
Canarium commune, *Linn.*
Cassia auriculata, *Linn.*
Dammar kejie.
Gutta Runghas.
Kunnee.
Maeshaksee.

iv. Oleo-Resins.

a. Balsams.

Balsamodendron Berryii, *Arn.*
Chloroxylon Swietenia, *W. and A.*
Dipterocarpus alatus, *Roxb.*
D. incanus, *Roxb.*
D. tuberculatus.
D. turbinatus, *Gært.*
Dryobalanops camphora, *Coleb.*
Hardwickia pinnata, *Roxb.*
Liquidambar altingia, *Bl.*
L. orientale, *Miller.*
Melaleuca minor, *Smith.*
Mesua ferrea, *Linn.*
Mohal balsam of Cachar.
Melanorrhœa usitatissima, *Wall.*
Odina wodier, *Roxb.*
Rhus succedanea, *D.C.*
R. vernicifera, *D.C.*
Semecarpus anacardium, *Linn.*
S. Travancorica, *Bedd.*

b. Natural varnishes.

Buchanania latifolia, *W. and A.*
Holigarna longifolia, *Roxb.*

c. Turpentine and tar.

Abies Smithiana, *Loudon.*
Cedrus.
Pinus excelsa, *Wall.*
P. Gerardiana, *Wall.*
P. Khassyana, *Brandis.*
P. Latteri, *Mason.*
P. longifolia, *Roxb.*
P. Massoniana, *Sieb. and Zuch.*
Sethia Indica, *W. and A.*
Tectona grandis, *Roxb.*

The gums of the East Indies have already been noticed under that head, and the following remarks will be restricted to a notice of the chief commercial resins.

Resinous substances are found in greater or less abundance in most plants. Many of the resins of commerce exude naturally from fissures in the bark or in the wood, or they are obtained from incisions made in the stems of certain trees and shrubs. As they exude they are commonly mixed with an essential oil, which either evaporates on coming in contact with the air, or is resinified by the action of oxygen. Such mixtures of volatile or essential oil with resins are sometimes called balsams. When gum is mixed with resins, another class of substances is produced, called gum-resins.

Resins soluble in spirit of turpentine are used for the most part in preparing dyes, varnishes, lacquers, sealing-wax, etc.

The rosin or common resin of Europe is obtained as a residuary matter in the process for obtaining oil of turpentine,—an oleo-resin by distillation of American turpentine with water.

Ammoniacum is the product of Dorema ammoniacum, *Don*, and an identical gum-resin is obtained from D. aureum, *Stocks*, of Sind.

Asafœtida is from the Narthex asafœtida, Ferula alliacea, *Boiss.*, F. Lehmanni, *Boiss.*, and it is said the F. Persica, *Willde.* It is used medicinally and as a condiment.

Balm of Gilead is an oleo-resin from the Balsamodendron Berryi, *Arnott*, a tree of N. Africa and Arabia, and is called by the Arabs Balsam Israeli. It is of syrupy consistence, limpid, and yellowish, but thickens and solidifies by age. It is used in surgery, but is rarely found pure. Mr. J. A. Murray says it is a product of B. Gileadense, *Kunth.*, and calls it Ood-i-Balisan and balsam of Mecca.

Myrrh, yielded by the Balsamodendron myrrha, *Ehr.*, of Africa and Arabia. The commercial varieties are Turkey myrrh, myrrh in tears, East Indian myrrh, and East Aden myrrh. B. Roxburghii, *Arn.*, of India, is supposed by Dr. Royle to yield part of the myrrh of commerce.

Googul of the bazars of India, the b'dellium of commerce, is obtained from Balsamodendron mukul, *Hooker*, also from the Balsamodendron pubescens, *Stocks*, and from the Boswellia glabra.

Ganda feroza, from Boswellia thurifera, is largely used as an application to indolent ulcers and wounds, and supposed to form the chief ingredient of Wroughton's ointment. Mr. J. A. Murray says it is produced from Boswellia papyrifera, *Hoch.*, gives it as names Luban and Ood, and says it is frankincense and olibanum.

Benzoin, the Ood or Luban of the Indian bazars, is obtained from the Styrax benzoin, *Dryand*, a tree of Borneo, Java, Siam, and Sumatra, in the form of tears, lumps, and translucent masses. That of Siam appears to be superior in fragrance to the Sumatra product, although both possess a delightful aroma.

Copals are known as soft Indian copal and oriental copal, also East[illegible]n copal, Bombay anime, East Indian a[illegible]d gum anime. These are names of the t[illegible]he Trachylobium Mozambicense, *Peters*, [illegible]rows in Madagascar, on the E. coast of Afric[illegible]n Zanzibar, and is known also as Hymenæa M[illegible]icensis, *Kleine*. It is a large tree, its average [illegible]gh is 30 feet, with 5 to 6 feet of girth, but canoes [illegible] feet long have been hollowed out of a single stem. The value of the copal exported from Zanzibar in 1863-64 amounted to 163,353 dollars, about six pounds being sold for one Austrian dollar. Nearly all of it was sent to British India, Great Britain, and Hamburg. The Arabs and Africans recognise two kinds, viz. the raw copal (copal vert of the French market), and called Sandarusiza miti, 'tree copal,' or chikaji, corrupted by Zanzibar merchants to 'jackass' copal. This chikaji is either picked from the tree or is found shallowly embedded in the loose soil. This is the only kind in Zanzibar island. And 'true or ripe copal,' called Sandarusi, the product of vast extinct forests, and found at depths beyond atmospheric influences, and has, like amber and similar gum-resins, been bituminized in all its purity.

Dammer.—The most important of all the solid resins produced in the East Indies are those which are included under the general Malay name of Dammer. The dammers are obtained from trees of the genera Vateria, Canarium, Shorea, and Vatica. Vateria and Canarium yield by far the largest part (if not the whole) of the dammers produced on the western coast of the Peninsula, whilst the Shorea and Vatica trees yield the greater part of that collected in the northern and eastern districts, and those of Further India and the Archipelago are chiefly from species of Canarium.

White Dammer of the western coast of India, called also Piney resin, is from the Vateria Indica. It is the Doopada resin of Mysore, and the Payanee or Piney of the Malabar people. Dupa maram, CAN.; Safed damar, HIND.; Vellai kundrikum, TAM.; Payanee, MALABAR; Piney maram, TAM.; Chadacula, TAM. This is a very large and stately tree, a native of Malabar and Mysore. The young shoots, and all tender parts except the leaves, are covered with fine stellate pubescence. The Piney resin occurs of all shades of colour between pale green

and deep yellow; the finest pieces are called kahruba or amber, and are sold as amber in the bazars of Bengal. Candles are made of this resin in Malabar, which diffuse, in burning, an agreeable fragrance, give a fine clear light, with little smoke, and consume the wick without snuffing.

One variety of it is the *Compact Piney Resin*, or first sort white dammer of the western coast, and occurs in large lumps of all shapes, and varying in colour on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard, and bears a great resemblance to amber. Its colour (internally) is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour, and amber-like appearance.

A second variety, the *Cellular Piney Resin*, or second sort white dammer of the western coast, occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell, and has a very cellular structure, which is attributable partly to the mode of collection, and partly to the age of the tree. Notches being cut in the trunk of the tree sloping inwards and downwards, the resin collects in the cavity, and is either permitted to dry on the spot, or is collected and dried by the application of heat. It is of all shades, from light green to light yellow or white, and is usually translucent. Specimens are sometimes seen in which, from the desiccation having been irregularly conducted, the resin is more opaque, of a dull green colour, and full of air-bubbles, presenting the appearance of having undergone [illegible] fermentation. This kind of resin may be recognised by its cellular appearance and balsamic smell; this latter, however, which is of course due to the volatile oil it contains, is gradually lost by long keeping or constant exposure to the air. In splitting open old and decayed trees, portions of a dark-coloured resin are often found, having the solid consistence of the first variety, but the inferior quality of the second. The inspissated juice of the Vateria Indica tree is used for mixing with beeswax in making candles. In Malabar, the fresh resin is called piney varnish. It is of a light grey colour, with a strong balsamic odour. The resin which first exudes is called Chengilium (this is white); that which flows subsequently is termed Coongilium (darker than the above), and when dried it is called dammer (black). The Vateria lanceæfolia of the Khassya mountains and Assam yields a similar resin, which is used as incense. V. acuminata yields the piney resin of Ceylon.

The dammers of the northern and eastern districts are from the sal tree, Shorea robusta, and other species. Shorea robusta is a native of Morung, the Palghat mountains, and Northern Circars. The sal tree of Northern India and its resins is called Guggilam in Telugu, and Tala-gotso in Uriya. It is the Rala, Doona, and Gugulam of Indian commerce, and occurs in brittle, stalactitic pieces. Shorea robusta yields abundance of dammer, the superior kinds of which are efficient substitutes for the pine resin of the European pharmacopœia. It occurs perfectly transparent and colourless, but in the bazars the colour ranges from pale amber to dark brown. It is devoid of taste and smell. Sp. gr. 1·097 to 1·123, easily fusible, partially soluble in alcohol (83·1 per 1000), almost entirely in ether, perfectly in oil of turpentine and the fixed oils; sulphuric acid dissolves and gives it a red colour. Two parts of colourless dammer and 2½ parts of oil of turpentine, make the best varnish for lithographic drawings. This occurs in sticks much resembling in shape the black dammer, but differing widely in colour and consistency. In colour it varies from a light yellow to a dark brown, the two colours being frequently blended in the same lump, and giving it the appearance of having a regular 'grain.' It is friable, and differs from the white dammer of the western coast in its inferior hardness, its opacity, and its peculiar form, and from the black dammer in its colour. There are extensive tracts of shorea forest in the Gumsur and Cuttack provinces. The Khond and Uriya races living in and near these jungles, wound trees in several places; the resin issues, and is collected when sufficiently solid. The dammer collected from the decayed parts of the tree is of a dark colour. The Khond and Uriya races make the leaves into plates, from which they eat their food, and also roll up tobacco in them to smoke like a cheroot. In time of famine, the above tribes live on a soup made from the fruit of this tree.

Shorea tumbuggaia grows on the western coast, but does not appear to produce much, if indeed any, of the resin collected for sale.

Poon-yet and *Pwai-ngyet* dammer of Burma is found on several different trees, sometimes also in a hollow among rocks, sometimes in the ground, and occasionally even in the hollow post of an old house, amongst them the Dipterocarpus lævis and Hopea odorata. The Rev. C. S. Parish says it is a combination of various gums and resins, probably also of oils gathered by the Trigona læviceps bee, and built up and moulded very much as wax is moulded, except that the wax formed by the honey bee is in cells of perfect and uniform symmetry, while the cells of Pwai-ngyet have no regular form. When it builds its nest in the hollow of a tree, the aperture is lined with Pwai-ngyet, and its rim is sometimes prolonged to a somewhat flattened trumpet-mouth shape, of a perpendicular diameter a foot or so, and 3 or 4 inches of transverse diameter. From 19 lbs. to 38 lbs. are obtained from one nest. Some of it is very like the dammer of the Hopea odorata. For caulking it is mixed with earth-oil or petroleum. One kind which this bee collects is very like the resin of Bursera acuminata, a tree of Canara.

Canarium Bengalense is a native of Sylhet and the adjacent mountainous countries, also Malabar, Tinnevelly, and Courtallum. It flowers in May and June, yields a large quantity of very pure, clear, amber-coloured resin, which soon becomes hard and brittle, and is not unlike copal. In the Calcutta bazar it sells at 2 to 3 rupees per maund of 86 lbs. C. nigrum, *Roxb.*, of the Amboyna and Molucca islands, yields a reddish, soft, viscid substance from wounds in its bark. C. strictum, *Roxb.*, of the alpine forest of Courtallum and Tinnevelly, is regularly rented for its dammer. When adhering to the tree it has a bright shining black appearance. From this the tree is called the black dammer tree, to distinguish it from the white dammer tree, Vateria Indica. The Canarium strictum is the Carpoo coongilium of Ainslie, the Dammara nigra legitima of Rumphius, and the Canari of the Malays. Its resin occurs in large stalactitic-shaped masses, of a bright shining black colour when adhering to the tree and viewed from a distance, but translucent and of a deep reddish-brown when held in thin laminæ between the eye and the light. It is perfectly homogeneous, and has a vitreous fracture. Its shape appears to be due to the fact of the balsam having exuded in a very fluid state, and trickled down the trunk of the tree, where it gradually hardens by exposure to the sun, the fresh resin continuing to flow over that already hardened, gives rise to the stalactitic appearance of the huge lumps of resin, the outside of which much resembles the guttering of wax caused by placing a lighted candle in a draught. It is insoluble in cold, but partially soluble in boiling alcohol on the addition of camphor; when powdered it is readily soluble in oil of turpentine. Powdered and burnt on the fire, it emits a most resinous smell, and burns with more smoke, than white dammer. The size of the lumps of this resin, together with its colour and the peculiarity of shape already mentioned, suffice to distinguish it from other Indian resins. Mr. Brown of Trevandrum says the black dammer of Canarium strictum seems to be a great favourite of several species of insects, especially of one resembling a bee, called

by the hill-men Kalliada, which lives in holes in the ground.

Under the names of elemi, also E. Indian elemi and Manilla elemi, a concrete resinous exudation is imported into Great Britain from Manilla. It is said to be from the Canarium commune, but this is doubtful. It is of a yellowish white colour.

Others of the dammers are obtained from the Hopea micrantha, yielding the Damar mata kuching and Damar batu of the Malays, and H. odorata, yielding the Thengan-tsi of the Burmese, the last named greatly resembling the E. I. dammer from Dammara orientalis.

Dammara orientalis, a huge tree of the Archipelago, has been designated by seven names by different botanists, viz. Abies dammara, *Poir.*; Agathis dammara, *Rich.*; Ag. loranthifolia, *Salisb.*; Dammara alba, *Rumph.*; Dammara loranthifolia, *Spach.*; Pinus dammara, *Lamb.*; and P. Sumatrana, *Hort. Belv.* It yields the Damar puteh (white) and Damar katu of the Malays. It hangs from the tree like icicles, and is sold in Great Britain as East Indian dammer, to be used by varnish makers. Externally it is whitish from the powder; below that, it is of a straw colour or pale amber.

Cassia auriculata gum is prized in India for its medicinal value.

Camphor and *Camphor Oil* of commerce are obtained from the Dryobalanops camphora of Sumatra and Borneo. The oil is employed in rheumatism and as a varnish.

Dragon's blood, in lump and in reed, is used as a pigment. It is supposed to be derived from Calamus draco of S. China, Java, Sumatra, and perhaps of Burma.

Galbanum is a product of the Ferula galbaniflua, *Buhse*, a plant of Persia, but other species are also indicated as yielding both it and sagapenum.

Gamboge.—Several of the Garcinia yield the gamboge of commerce, but G. morella, pictoria, and Wightii, of the best qualities, and the most abundantly.

Gardenia.—The Dika malli or Kumbi pisin of India, a resin valuable in native surgery, is from the G. gummifera and G. lucida.

Garjan oils, from the Dipterocarpus alatus, D. incanus, and D. turbinatus, are known also as wood-oils. They are large trees, natives of Burma and the islands in the Straits of Malacca. At the end of the dry season, in March or April, several deep incisions are made with an axe into the trunk of the tree, and a good-sized piece scooped out. Fire is placed into the cavity, and is kept burning till the oil begins to run. This when allowed to rest, separates into two layers, the upper consisting of a clear chesnut-coloured liquid balsam, and the lower, which is a flocculent deposit of the more solid resin, of a light ash colour. They are much used as natural varnishes for in-door work, but when dry are very brittle, and require constant renewal. The wood-oil of the D. tuberculatus, a tree of Chittagong and Burma, is known to the Burmese by the name of Eng.

Doona Zeylanica, Thwaites, yields Doona dammer. In colour and appearance it much resembles pine resin.

Kub, the resin of the Diospyros glutinosa, is used for caulking boats and canoes.

Hardwickia.—The dark red balsam of the Hardwickia pinnata is exactly like copaiba in appearance and properties. It is a tree of the Travancore Ghats and of S. Canara.

Liquidambar genus has two species, L. altingia and L. orientale, both of them furnishing useful balsamic products. That of the former, a tree of Tenasserim and the Archipelago, is the Rose Maloes of commerce, the Rasa-mala of the Javanese, a fragrant balsamic fluid. It is obtained by putting fire around the tree. The L. orientale of Anatolia and Asia Minor yields the liquid storax, an oleo-resin which is imported into India. It is not the storax of the ancients. Its liquid storax is obtained by pressing the inner bark. The outer bark is burned as a perfume.

Melanorrhœa usitatissima of Manipur and Burma yields a valuable natural varnish, which is extensively used.

The black varnish of Ceylon is from a species of Semecarpus. It is equal to the black varnish of China for lacquering.

Olibanum, also known as Luban, has been shown by Dr. (Sir George) Birdwood to be a product of Boswellia Carterii, B. Bhau-Dajiana, and B. Frereana. Indian olibanum is from B. thurifera, and its varieties glabra and serrata. The Nagdana [illegible] one of the Burseraceæ, yields also a luban [illegible] bazars. B. thurifera, *Coleb.*, of the Con[illegible] hills, S. Konkan, Belgaum, and Bundelkhand, is a gum-resin used as a grateful incense, but is used in medicine for its stimulant, astringent, and diaphoretic properties.

Turpentine of good quality is obtained by incisions in the trunk of the Pinus longifolia of the Himalayas. It is the Ganda-baroza of Indian commerce. It is used medicinally, internally, and oil of turpentine is extracted from it. Tar is obtained by burning chips of the wood. Tar is obtained also from chips of Pinus excelsa and of Cedrus deodara. Pinus Massoniana of Burma and Japan yields a crude turpentine.

The oleo-resin from the Cedrus deodara is the Kelon-ka-tel of the natives of Northern India.

Sarcocolla has been by some supposed to be a product of Penæa mucronata, but others think it is from an umbelliferous plant.

Ceylon fishermen pay their boats' bottoms with a tar obtained by the smothered combustion of chips of the Sethia Indica, a tree of S. India and Ceylon.

REUNION, formerly called Bourbon, an island in the Indian Ocean, discovered in 1545 by Mascarenhas, a Portuguese. It is 49 or 50 miles long, and 27 broad. Its highest peak, a volcano, [illegible] des Neiges mountain, [illegible]0,334 [illegible] Bernard, 9743 [illegible] feet high[illegible] lat. 20° 5[illegible]

India, at the close of the 18th and beginning of the 19th century, Sir Thomas Munro reported at length on the land revenue; and in Northern India, reports on the settlement of the land revenue in the North-Western Provinces, under the thirty years' regulation IX. of 1833, were drawn up by many of whom obtained a name for themselves as administrators. Thomason reported on the settlement of Azimgarh, Edward Thornton on Saharunpur and Muzaffarnagar, H. M. Elliot on Meerut, John Thornton on Aligarh, R. Money on Moradabad, R. H. P. Clarke on Rudaon, W. J. Conolly on Bareilly, J. W. Muir on Shahjahanpur, G. F. Edmonstone on Minpuri, C. G. Mansel on Agra, M. R. Gubbins on Etawa, H. Rose and W. Muir on Cawnpur, R. Montgomery on Allahabad, and E. A. Reade on Gorakhpur. Garhwal and Kamaon were reported on by J. H. Batten, Dehra Doon by A. Ross, Hamirpur by C. Allen, and the Calpee Parganas by W. Muir. Traces remain of the office of lord of a thousand villages, described in Menu as the head of the Hindu revenue system, but chiefly in the Dekhan and other southern parts. These are called in Maharashtra, Sir-Desmukh, their districts are called Sirkar or Prant, and their hereditary register is the Sir-Despandi. Below the pargana division is the lordship of ten or twenty towns, called Naikwari, Tarraf, etc., and the chain ends with individual villages.

RHAMNEÆ. *Lindl.* The buckthorn tribe of plants, comprising the genera Zizyphus, Berchemia, Sageretia, Ventilago, Rhamnus, Scutia, Hovenia, Colubrina, Gouania, Apteron, Helinus, Smythea. Hovenia dulcis, *Thunb.*, is cultivated in the Himalayas for its edible fruit, and it has a light-coloured wood. Ventilago maderaspatana, *Gært.*, is valued for the red dye obtained from its root, and for the fibre of its bark. The genus Rhamnus furnishes both woods and dyes, and fruits and timber are obtained from Zizyphus. Several species of rhamnus grow in the Himalaya and China. In Europe the juices of the unripe fruits of Rhamnus infectorius, catharticus, and virgatus, known as Turkey or French berries, are used for dyeing leather yellow. When mixed with lime and evaporated to dryness, it forms the colour called sap-green. M. Rondot's Notice du Vert de Chine contains specimens of calico and silk dyed with green, and engravings of two plants, Rhamnus utilis and Rhamnus chlorophorus, from which it is derived. These plants were new to European cultivators; they are, however, allies of the Rhamnus theezans, which has long been known as a tree from which the poorest class of Chinese pluck the leaves to use as a substitute for tea. The colour of the dyed silk is remarkably bright, a blue green,—one of that class of colours which increase in brilliance in the light. It contains, in fact, some immediate principle which can only be developed by light, and it was a nice task for chemists to discover what this is. M. Persoz says that light will have to be more and more regarded as an industrial agent; and of the Chinese green he remarks that it is sui generis, containing neither yellow nor blue. By experiments made at Lyons, it appears that six species of the European rhamnus will yield a green dye. See Dyes.

Rhamnus chlorophorus, *Lindley*, a superior green pigment, called Lo Kao, is prepared from the bark.

The bark of R. utilis, also from China, is similarly employed. It is particularly used for silk.—*Von Mueller.*

Rhamnus incanus, *Roxb.*, a tree of the Moluccas, with small, greenish-yellow flowers.—*Roxb.* i. p. 603.

Rhamnus nabeca, *Forsk.* The fruit, called Nebek, is eaten, and the leaves are used for the purpose of washing dead bodies.—*Burton's Mecca*, ii. p. 105.

Rhamnus pauciflora and R. staddo in Abyssinia, yield an ardent spirit.

Rhamnus Persicus, *Boiss.*

Sherawane, . . PUSHTU.	Kukai, Wurak, TR.-INDUS
Jalidar, . RAVI, SUTLEJ.	Nikki Kander, Nar, ,,

A common shrub at 2000 to 5000 feet on th Salt Range and the low hills beyond the Indu Its small black fruit is said to be sweet, but wh eaten in excess to affect the head.

Rhamnus purpureus, *Royle.*

Kari, Tadru, . CHENAB.	Kunje, Tunde, . . RA
Memarari, . . . ,,	Tunana, Madana, . ,

Grows all over the hill-sides at Attock; fruit boiled to boils.—*Powell; Stewart.*

RHE, Rhei, Re, or Rey, the Rhages of the Apocrypha. Its ruins are a few miles south of the city of Teheran. They cover a vast extent of ground, and have supplied materials for the modern capital of Persia. The scriptural accounts of the Rhe, Rhei, or Rhages, during the captivity of the Jews in this part of the Babylonian empire, appear prove that Rhei was a very considerable city at least two hundred years before the Jews' appearance. All oriental writers agree upon its antiquity, and it is called 'the mother of cities.' It was once a very large place, the capital of the Dail (the hills), and very rich and flourishing. A.D. 906, Rhages was taken by Ismail, founder of the Samanee dynasty. It ceased now to be a city of empire, and in A.D. 967 became the capital of the house of Shemgur, a race of petty princes who maintained a kind of independence, while the dynasties of Saman and Dilemee divided the empire of Persia. In A.D. 1027, Rhages was the last conquest of Mahmud of Ghazni.—*Porter's Trav.* p. 357; *Markham's Embassy*, p. 99; *Smith's Dict.*; *Malcolm's Persia*; *Ferrier's Journeys.*

China grass, . . .	ENG.	Keperit, Kapierit,	SUNDA.

The plant yielding this valuable fibre is the Urtica nivea, *Linn.*, the Urtica tenacissima, *Roxb.*, the Boehmeria nivea of later botanists, and the Ortie blanche sans dards de la Chine of French writers. The specific names characterize the snow-white, strong fibre, and the non-stinging nettle. It seems to be also known as the Boehmeria sanguinea, from the circumstance that though when growing the back of the leaf is white, with green veins, at maturity it assumes a reddish-brown hue. It is a native of Assam and of China, seemingly also of Japan, Java, and Borneo, and from it the China grass fibre is obtained, called in China Chu-ma or Tchou-ma. The preparation of the fibre is tedious, and is what causes the difficulty of sending the fibre at a cheap rate to market.

In 1869, the Government of India offered two prizes, of £5000 and £2000, for the best and second best machines for cleaning the fibre, but only £1500 was awarded for an inferior one. In 1872, out of thirty-two machines entered, only two were actually brought forward, and one of these was withdrawn. The remaining machine, belonging to Mr. J. Greig, jun., of Edinburgh, was worked during a period of three weeks before Colonel Hyde, the judge, in the presence of the owner, who had brought it to Saharunpur in person. The conditions were that the machine should turn out a ton of fibre at an expense not exceeding £15, including all items, such as interest, wear and tear, etc., and that the prepared fibre should be equal in value to at least £50 per ton in the English market. The machine was valued at £200. There are now two machines and two processes that claim to treat green fibre successfully. The cultivation of rhea has been successfully introduced into the south of France, Algeria, and the Southern States of America.

In the native process, Major Hannay writes, 'when the stalks have become brown for about 6 inches above the roots, the top is seized with the left hand, and the leaves are stripped off by passing the right hand to the ground, near which the stalk is cut. The outer bark has first to be scraped off with a blunt-edged knife, when the exposed fibre still attached to the woody part of the stalk is exposed to the hot sun to dry. On the third morning, after being exposed to the dew for several hours, the fibre is drawn off. This is done by breaking the woody stalk right through towards the thicker end, and then separating the fibre therefrom, drawing it off slowly towards the small end, and repeating the process as often as necessary, though much of the fibre remains, and may be taken off at a second breaking. The fibres are carefully washed. The hanks of fibre now require to be separately twisted at the upper end, and tied up in bundles. When the threads are required for spinning, they are prepared by drawing the single hanks several times with a blunt-edged tip of bamboo held in the right hand, when they are easily opened out to the required fineness with the fingers and thumb nails.' Dr. M'Gowan of Ningpo states that in China the last cutting is made in September, from which the finest cloth is made, the first being inferior, coarse, and hard. On being cut, the leaves are carefully taken off on the spot, the stalks taken to the house and soaked in water for an hour. In cold weather the water should be tepid. After this the plant is broken in the middle, by which the fibrous portion is loosened and raised from the stalk. Into the interstice thus made, the operator thrusts the finger nails, and separates the fibre from the centre to one extremity and then to the other. The stripping process is very easy. The next process is scraping the hemp, to facilitate which the fibre is first soaked in water. The strips of hemp are drawn over the blade of a small knife or scraper from within outwards, and, being pressed upon by the thumb, the fibrous portion of one surface, and the mucilaginous part of the other, are thus taken off. The hemp is then wiped dry, and the whitest selected for fine cloth. It is afterwards bleached.

The following directions for peeling the Chu-ma or Tchou-ma in China, are translated from the Chinese. When the stems are all got in, they are split longitudinally with knives of iron or of bamboo. The bark is first removed, then the lower layer (which is white, and covered with a shrivelled pellicle which comes off by itself) is scraped off with a knife. The interior fibres are then seen; they are to be removed and softened

in boiling water. If the Tchou-ma be peeled in winter, the stems must be previously steeped in tepid water, in order that they may be the more easily split. The first layer of Tchou-ma is coarse and hard, and is only good for making common materials; the second is a little more supple and fine; the third, which is the best, is used for making extremely fine light articles.

In China, this plant is of great value, in the Southern States of N. America the plant has flourished, but the 1880 Report on the Calcutta Botanic Garden doubts whether rhea fibre can be produced cheaply in that part of India.

In China, fields of rhea are said to last, with care and manure, for 80 to 100 years. It grows with the greatest vigour in damp warm climates. In the islands of the Indian Archipelago it is cultivated under shade. It requires a light but fertile soil, but it must be well drained. It is propagated from the separated roots, from layers, slips, or cuttings; in this way five cuttings of grown stems can be expected in the year after planting; from seed, no crop can be expected before the third year.

M. Favier describes the plant as giving out several stems, of which the number increases in proportion to the development of the root, which forms a kind of tuft or bush. The stems are woody, and have the appearance of thick, strong rods, the height varying from 5 to 12 feet. The roots, slips, or layers should be planted 18 inches apart, and after the first crop the alternate rows should be transplanted into new fields, leaving the remainder, about 3500 plants per acre, to spread and cover the ground. The yield in Java is said to be 44 stems per year from each stool, taken in four cuttings. Each stem in its green state weighs about 1 lb.; 100 lbs. weight of green stems yields 5 lbs. of a raw fibre or filament, which, by Muspratt's analysis, as quoted by M. Favier, contains 66 per cent. of pure cellulose. In the official reports to the India Office, with native hand treatment the crop is said to be 1000 lbs. of raw fibre per acre, taken in four cuttings. M. Favier states that in Algeria 1400 lbs. of fibrous thongs was the crop per acre, as calculated by Mr. Hardy, ex-Director of the Botanical Gardens there; while in the south of France as much as 1600 lbs. of filament have been obtained to the acre.

Mr. P. L. Simmonds, in 1873 (Journal, xxi. p. 762), stated that the crop gathered in Jamaica amounted to 300 lbs. per acre at each cutting, and that there had been five cuttings in the year, making the yield three-fourths of a ton per acre per year. While Mr. Bainbridge, in the discussion on Mr. L. Wray's paper, in 1869, stated that the result of his own experience in Assam was 750 lbs. green nettles, which gave 45 lbs. weight of fibre in each of three cuttings, making only 135 lbs. per acre per year (Journal, xix. p. 453). The yield appears to depend on soil, climate, and treatment. The properties of the rhea fibre place it in the first position among vegetable fibres; it is second to none in strength, while the fineness or attenuation of the fibre places it before flax, and it is equalled only by the pine-apple fibre. It can be used for any textile purpose, having been mixed with cotton, wool, and silk to advantage; it is in special demand for sailcloth, table napery, curtains, and tapestry; but from the very limited supply as yet available, the applications of this beautiful fibre are yet in their infancy.

Ban rhea, or Bun rhea, or Bon rhea is th
jungle rhea of the Lepcha of Nepal, and is sup
posed by some to be the Dom rhea or Chin
nettle in an uncultivated or wild state. But o
this there is no proof, and it is more than p
bable that it is a distinct species of Boehm
possessed of many of the same properties
ramee or rhea nettle. It grows very com
all the Assam province, but it is cultivated
by the hill tribes on the west of Yunnan
a small extent by the Singpho and D
tribes of the North-Eastern Frontier of In
be fabricated into a coarse cloth, but chie
nets. A five-inch rope of rhea fibre and
of Bon rhea each broke within a few pound
each other, after sustaining a weight of more t
nine tons. It is reported to be all that can
desired for either canvas or lines, and
requires to be known to be generally used
that purpose. The Bon rhea thrives best in
vicinity of water or of running streams.
unmolested, it grows into a tree, but by pr
management of it any quantity of young sh
can be obtained; and as the divided roots of
plant afford numerous shoots, it can be propag
by slips as well as by the seed. This fib
about 5 feet in length, brown in colour, st

described by Mr. Darwin and other natu
There are now known three distinct spec
this form of Struthious birds.

RHEEDE. Henry Van Rheede was Gov
of the Dutch Possessions in Malabar. The
Malabaricus, a botanical work in 12 vols.
was undertaken at his suggestion. The spe
were collected in 1674 and 1675 by Brahmans
and sent to Cochin, where drawings of them were
executed by Mathæus, a Carmelite missionary
corresponding descriptions were at the same tim
made in the Malabar language, which were after
wards translated into Portuguese by Emanu
Carneiro, a Cochin interpreter, and from that in
Latin by Hermann Van Douep, the secretary
the city of Cochin; the whole was under t
superintendence of Casearius, a missionary the
The work was published at Amsterdam betwe
1686 and 1703, in 12 volumes folio, with 7
plates, and was edited by Commelyn, who add
occasional remarks on the plants.—*Wight's P
dromus Floræ*, i. p. 7; *H. et Th.* p. 45.

RHEMBA, in Hindu mythology, one of Indr
court, who corresponds with Venus, the godde
of beauty. Rhemba was produced from the fro
of the churned ocean.

RHENIUS, an eminent Protestant missiona
who arrived in A.D. 1813, and laboured in the Tam

speaking parts of the Peninsula of India during the early part of the 19th century. In 1815 he engaged in revising the version by Fabricius of the Bible, and in 1816 completed his translation of the New Testament, completing a second revision 1827, and a third revision in 1831. He revised the translation by Fabricius of the Old ment, and died A.D. 1837.

EUM, a genus of plants belonging to the l order Polygonaceæ. Several species grow N.W. Himalaya, and the roots of some of ecies, known as rhubarb, are valuable in ne. One species grows in Kaghan, where nown under the name of Chotial. R. cap-, *Fischer*, is a plant of the Altai; R. com-um, *Linn.*, grows in Tartary and China; R. sinervium, *Fischer*, has heart-shaped leaves; leucorrhizon, *Pallas*, a plant of Tartary, is posed to yield some of the best rhubarb of merce; R. palmatum, *Linn.*, grows near the t wall of China and in the Himalaya; R. onticum, *L.*, grows north of the Caspian; R. s is the Riwash of Persia; R. spiciforme, le, grows in Kanawar and in the N.W. alaya; R. undulatum, *Lam.*, is a plant of a and Siberia; R. Webbianum, *Royle*, grows ,000 feet on the Chur mountain. Dr. J. L. art says that at least two species of rhubarb frequent in parts of the Panjab Himalaya, 6200 to 14,000 feet, R. Moorcroftianum ring still higher, from 15,000 to 17,000 feet. officinal ribas of the Panjab drug-sellers con- of the dried stalks from Kābul, which may y be produced by the Rivas, or R. ribes, ., a native of Carmel, also Eastern Persia, the Hindu Kush. In Afghanistan the plant ways wild, and appears to grow abundantly any parts. When green, the leaf-stalks are d riwash, and when blanched by heaping up es and gravel round them, are called chukri; n fresh (in which state they are sometimes ught to Peshawur in spring), they are eaten er raw or cooked, and they are also dried for to be eaten with other food, and are some- s made into a preserve. The root is imported Afghanistan and India, to be used as a tive. It is stated by Moorcroft that the a of Garhwal apply the powdered root to ds and bruises, and that they use it with cordifolia and potash for dyeing red. R. modi, *Wall.*, R. Moorcroftianum, *Meisn.*, R. spiciforme, *Royle*, yield the officinal rhubarb root. The genus has many useful plants.

Rheum australe, *Don.*

R. emodi, *Wall.* | R. Webbiana, *Royle.*

A plant of the N.W. Himalaya up to 16,000 eet. It is less active as a purgative, and ore spongy in texture. Honigberger mentions at it vegetates in wild luxuriance on the shmir mountains, is considered as one of the st rhubarbs, notwithstanding the coarse appear- ce of its exterior, and it can be had fresh and eap in any quantity, and at any time.

Rheum Moorcroftianum, *Meisn.*, was found by oorcroft near the Niti pass in the Himalaya at elevation of 12,000 feet. The root yields valuable medicine (chukri), while the leaf-stalks e agreeably acid and cooling; 'tror' are eaten a vegetable.

Rheum officinale, *Boullen*, W. China and E. bet, Turkey.

Rheum palmatum, *L.*, rhubarb.

Khagi, ... ARAB.	Chukri, Ribas, . . PANJ.
Ta-rok-tsha, . . . BURM.	Variatu kalang, . TAM.
Rewand Chini, . . HIND.	

The stalks are extensively eaten in Kābul. The root is used by Europeans as a stomachic and astringent in small doses, and as a purgative in larger ones, especially in dyspepsia and strumous affections. A variety from the Tanqut country yields the Kiakhta or Kan-su rhubarb of Maximowicz.

Rheum rhaponticum, *Linn.*, R. tataricum, *L.f.*, and R. undulatus, *Linn.*; their acidulous leaves and unexpanded flower mass are used for culinary purposes.—*Powell; Honigb.; Cleghorn, Report; Stewart; Royle's Ill.; Moorcroft's Tr.; Von Mueller.* See Rhubarb.

RHI of the Byansi or Hiunra, an avalanche.

RHINACANTHUS COMMUNIS. *Nees.*

Kabutar ka-jahr, . ,,	Pilkolu, ... TEL.

Grows throughout British India, where it is used as a remedy in snake-bite, and the root as an excitant. A tincture of the fibrous root is used in ringworm.—*O'Sh.; Riddell; Irvine.*

RHIND, a great race of 44 clans dwelling in Gandava in Baluchistan. They are not of the Brahui stock, and their traditions allege that they immigrated ages ago from Damascus and Aleppo. Their language is the Jetki, in common with that of the other inhabitants of Cutch Gandava, and Mard-i-Rhind means a brave man. Gandava is a great level tract, inhabited by three very distinctly marked races, the Jet or Jat, the Rhind, including the Maghazzi, and the Brahui. The Jat seem the original race, and they occupy the centre of the province. The Rhind, with their lawless subtribes the Jakrani, Dumki, Bugti, and Murree, are a more recent intrusive race dwelling on the skirts. The Doda, a division of the widely dispersed great Murree tribe, have, for the last three centuries, occupied the hill ranges east of the plain of Cutchi. The Murree are a brave race, and have long been distinguished as daring depredators. Harand and Dajil, in Cutch Gandava, but bordering on the Indus, are inhabited by the Gurchani tribe of Rhind, and have the Mazari on their south. The Rhind of Cutch Gandava are of the Utanzai division. The Rhind clans reside as under:—

Utanzai, at Suran.	Homorari, at Tambu.
Dumki, at Lehri.	Pushkh, at Johan.
Jakrani, at Lehri.	Jamali, at Rojan.
Doda Murree, at Kahan.	Kallui, at Lup.
Mandarari, at Rodbar.	Kuchik, at Kirta.
Bugti, hills E. of Lehrat.	Pugh, at Kajuri.
Sing Soloh, at Teriki.	

The Dumki, Jakrani, Bugti, and Doda Murree were always distinguished by their rebellious and predatory habits; they indulged these in attacks on the British armies west of the Indus. The Murree tribe is considerable, and inhabit the eastern hills of Cutch Gandava, and a peaceful and obedient portion of the tribe are in the hills west of the province below Jell. A large portion are at Adam Murree, on the S.E. frontier of Sind. The Murree of Cutch Gandava were notorious for their lawless habits, and for making frequent inroads on the plains. They and the Maghazzi seem to have

emigrated from Makran to Cutch Gandava at different periods, and to have become incorporated with the Jat cultivators. The minor Rhind tribes residing in the north-eastern hills of Saharawan are the—

Kallui, at Lup.	Mandarari, at Rodbar.
Kuchik, at Kirta.	Pugh, at Kajuri.
Pushkh, at Johan.	

The Gurchani inhabit Harand, and south of these are the predatory but nearly independent Mazari tribe. The Maghazzi are subdivided into four principal families or clans, of which the Butani of Jell are the most important, and give the chief or sirdar to the whole. They boast of being able to muster 2000 fighting men, and between them and the Rhind a blood-feud long existed. The Maghazzi and Rhind are alike addicted to the use of ardent spirits, opium, and bhang. The Bugti are on the west bank of the Indus near Shikarpur in the east of Lehrat.

RHINIDÆ, a family of fishes. Rhina squatina, *L.*, occurs in all seas.

RHINOBATIDÆ, a family of fishes, as under:

Rhynchobatus ancylostomus, *Bl.*, *Schn.*, E. Indies.
R. Djeddensis, *Forsk.*, Red Sea, Indian Ocean, Archipelago.
Rhinobatus thouini, *Lacep.*, Archipelago.
R. spinosus, *Gthr.*
R. halavi, *Forsk.*, China, Red Sea.
R. granulatus, *Cuv.*, E. Indies, Archipelago, Australia.
R. Philippi, *M. and H.*
R. obtusus, *M. and H.*, E. Indies.
R. Schlegelii, *M. and H.*, Japan and China Seas.
R. Banksii, *M. and H.*, Australia.
R. columnæ, *M. and H.*, Indian and Atlantic Ocean, Mediterranean.
R. Blochii, *M. and H.*, Cape.
R. brevirostris, *M. and H.*, S. Australia.
Trygonorhina fasciata, *M. and H.*, Australia.

RHINOCEROS, a genus of mammals belonging to the family Rhinocerotidæ, of which four or five species occur in Africa and in the East Indies,—R. Indicus, the great Indian rhinoceros; R. Sondaicus, the lesser Indian rhinoceros; and R. Sumatranus of Assam, Sandoway, and Sumatra. The rhinoceros was in Sind and the Panjab at least as late as Jordanus' time, and in Peshawur province 200 years later, to the time of Baber. The rhinoceros has been found fossil in Ava and Perim. Rhinoceros' hide is made into shields, sword handles, and ramrods, and its horn into goblets and drinking cups. Mr. Blyth has identified the two-horned rhinoceros of the Tenasserim Provinces with Rh. Crossii, *Gray*, and he refers the species to Rh. Sumatranus, auctorum, which attains a development of horn hitherto unsuspected. The skull of a one-horned rhinoceros shot by Dr. Hook near Tavoy Point, where there is a small isolated colony of the species, is that of Rh. Indicus and not Rh. Sondaicus. Seemingly all the species of rhinoceros attack the watch-fires of travellers. Fine horns of the Asiatic two-horned rhinoceros are difficult to procure, as they are bought up at extravagant prices by the Chinese, who call them Si-koh and Si-niu-koh, and their skins Si-pi. The inhabitants of the forests of Chantaburi chase wild beasts with firearms and nets; but they attack the rhinoceros armed with solid bamboos, of which one end has been hardened by exposure to the fire and sharpened. By loud cries and clapping their hands, they invite the animal to meet them, which he is wont to do by rushing violently upon them, opening and closing his wide mouth they attack him in front, and drive the bamboo violently into his throat with surprising dexterity taking flight on all sides. The animal, in it agony, throws itself on the ground, and, becomin exhausted by the effusion of blood and the extre ity of its suffering, it soon becomes the of its courageous assailants. In their h expeditions, all the passages to a distri closed with nets, and, fire being applied jungle, the wild animals are destroyed a seek to escape. The hairy-eared rhinocero Rhinoceros lasiotis. A nearly adult femal men, 'Begum,' as she is called, was c near Chittagong, in British Burma, by officers employed in the Kheddah department the capture of elephants. In January 1872 was brought to England by Mr. W. Jamra well-known dealer in living animals, and chased by the Zoological Society for the su £1250. The skin of the rhinoceros is made in jelly by the Chinese.

Rhinoceros horn is the Si-koh and Si- koh of the Chinese. Cups are made of the h which are imported from India, Cochin-C Siam, Sumatra, Sze-chuen, Kwei-chau, and suh. The black and pointed horns are esteemed.

Rhinoceros Indicus, *Cuv.*, *Blyth.*

R. unicornis, *L.*	R. Asiaticus, *Blum*
R. inermis, *Lep.*	
Gor, ... ASSAM.	Ganda, Genra, . .
Genda, Gonda, . HIND.	

The unwieldy great Indian rhinoceros, or s horned rhinoceros, has one horn; it is foun the forest swamps and dense jungles at the of the Himalaya, in the Terai from Rohilkhan the Nepal Terai and Sikkim Terai from Bhut Nepal, but is most abundant in Assam and Bhutan Doar. Its length is from 9 to 12 and its height 4½ to 5 feet; horn occasiona feet. It is herbivorous.

Rhinoceros Sondaicus, *Sol.*, *Müller*, *Blyth.*

R. Javanicus, *F. Cuv.*	Lesser Indian rhinocer
Warak, ... JAV.	Badak, ... M

This species has one horn, and is 7 or 8 long, and 3½ to 3¾ feet high. It inhabit Bengal Sunderbuns in the forest tract al Mahanadi river, and extending northwards t wards Midnapur and on the northern edge of the Rajmahal Hills near the Ganges. It occurs also abundantly in Burma and through the Malaya Peninsula to Java and Borneo.

Rhinoceros Sumatranus, *Raffles.* R. Suma trensis, *Cuv.* The Sumatran rhinoceros is n confined to that island, but occurs in the Ind Chinese territories, in Assam, and from Sandowa in lat. 23° N., to Sumatra. It has two horns. I Oldham, while with the embassy to Ava, shot o which attacked his watch-fire.—*Blyth in J. B. Soc.; Jerdon's Mammals; Horsfield*, p. 19 *Wallace's Archipelago; Ibn Batuta*, iii. p. 10 *Baber*, pp. 292, 316; *Journ. Asiat. Soc.* i. tom. p. 201; *Petis de la Croix, Timur*, p. 158; *Yu Cathay*, i. p. 194; *Bowring's Siam*, i. p. 26; *Gra P. Z. S.* 1854; *Phil. Tran.*, 1793; *Smith's Ch Mat. Med.*

RHINOLOPHUS, a genus of bats of the su family Rhinolophinæ. Several species occur

the East Indies. Drs. Jerdon, Kelaart, and Horsfield mention the following :—

R. affinis, *var.* rubidus, *Kel.*, Ceylon.
R. brevitarsus, *Blyth*, Darjiling.
R. fulvidus.
R. macrotis, *Blyth*, Nepal, Mussoori.
R. mitratus, *Blyth*, Central India, Mussoori.
R. Pearsoni, *Horsf.*, Darjiling, Mussoori.
R. per-niger, *Hodgs.*, Malabar, Himalaya?
R. Rouxi, *Blyth*, all India.
R. sub-badius, *Hodgs.*, Nepal, Himalaya.
R. tragatus, *Hodgs.*, Nepal, Mussoori.

These bats are said to hang with their body rolled up in their wings like a mantle. Their nose is furnished with a complicated apparatus, consisting of a cordate or semi-orbicular leaf.

RHINOPOMA HARDWICKII, *Gray, Blyth*, long-tailed leaf bat, is found over almost all lia, in Burma and Malayana, in old ruins, caves, clefts of rocks.—*Jerdon.*

RHIO, a Dutch settlement on the eastern side the Malay Peninsula, was obtained by them ut the year 1817, from the king of Johore, for onthly payment of 4000 guilders. Rhio Island, dering the Straits of Rhio, is about eight or miles in circumference, and being separated n the mainland of Bintang by Rhio Strait, a narrow channel, appears to form part of it. town of Rhio stands on its north-west point, was formerly a port of great trade, and seems to enjoy a considerable traffic by small els. The little trade enjoyed by the settlement iefly with Java, several native vessels arriving ually from that island, which bring rice for upply of the inhabitants, gambier being taken xchange. The population in 1882 was 87,767, hom 22,925 were Chinese.

HIPIDURA ALBOFRONTATA, one of the catchers of India. In habits it resembles the ad-tailed species, but the clearness of the ite on its body and forehead suffices to disguish it from the broad-tailed fly-catcher. Rh. coventris is plentiful in gardens and wooded alities. It is not shy for its size, but is bold fearless, and will attack birds much larger itself. The song of the male consists of a loud and pleasing notes, uttered while the creature is dancing along the branch with nd wings expanded like a fan.—*Adams.*

IZOPHORACEÆ, *Lindl.*, the Rhizophoreæ angrove tribe of plants, consists of trees, rarely shrubs, natives of salt swamps and marshes of the tropics, where they root in the mud, forming dense, most unhealthy, jungles down to the very edge of the ocean. The mangrove tribe comprises the genera Rhizophora, Ceriops, Kandelia, Bruguiera, Carallia, Anisophyllea, Gynocroches, Weihea, and Blepharistemma. The coasts of the Bay of Bengal and of the Indian islands, also the mouths of the Indus, abound in mangrove. The bark has been used for tanning purposes, for which it is probably more suitable than for cordage. The bark of Kandelia Rheedii is used by the Tavoy women in dyeing red, but Mason thinks only as a mordant. A species, called Kadol by the Singhalese, is found in the western and northern provinces of Ceylon, chiefly near the mouths of the rivers. Its wood weighs 65 lbs. to the cubic foot, and is used for common house-building purposes. A dye is extracted from the bark, and used for colouring leather, nets, sails, etc. Another Ceylon species, Hiri-koddol, SINGH., grows in the western and northern provinces of Ceylon, and it also is used for common house-building purposes. A cubic foot weighs 49 lbs. A dye is extracted from the bark.—*Royle's Fib. Pl.; Mason; Mr. Mendis; Roxb.; Voigt; Gamble.*

RHIZOPHORA CONJUGATA. *Linn.*

Rhizophora candelaria, *W. & A.* | Pyu, . . . BURM.

A small tree of Ceylon, Malabar, Tenasserim, and Java. Fl. middle-sized, white, faintly scented.

RHIZOPHORA GYMNORHIZA. *Rheede.*

Hendeb kakora, . . BENG. | Kayu-api-api, . . MALAY.

This tree grows to a considerable size where the spring tides rise over it, as in the delta of the Ganges. The pith of the wood, boiled in palm wine or with fish, is used as food. The wood is of a yellowish colour, hard, and durable. Its chief use is for fuel and for posts with which to construct the native houses. The seeds of Rh. gymnorhiza and Rh. mangle germinate on the branches, and, after increasing to a considerable length, fall into the mud, where they stick with their sharp point buried in the mud, and soon take root. The roots of these trees, springing from the trunk and lower branches, form a complicated series of loops and arches from five to ten feet high, making an incomparable breakwater. The bark and roots of both these species serve for tanning leather and as a black dye.

RHIZOPHORA MANGLE. *Reede.*

Oopoopoma, Bhora, BENG. | Pee-kandel, . . TAM., TEL.
Manggi-manggi, . MALAY.

This, the common black mangrove, is abundant on the shores of the ocean, within the delta of the Ganges, and in plenty at Arakan, Malabar, Singapore, and the Archipelago. The wood is dark-red, hard, and durable. In the Archipelago, a belt of it as deep as the reach of the tide wherever there is a shallow and muddy shore, rising to the height of 40 or 50 feet, and constituting a dense, almost impenetrable, forest. Each tree stands in a cradle of its own roots from five to six feet high, bare at low water, but at high water covered so as to give the appearance of trees growing in the sea. A mangrove jungle is the favourite resort of mosquitos and crocodiles, and affords a convenient and almost inaccessible retreat to the pirates. The bark is used to dye chocolate colour. This was one of the colours introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parliament. The great length of the seed of this species gives, in a very short time, a young tree, for if the apex from which the root issues is only stuck a little way into wet soil or mud, the leaves quickly unfold at the opposite end.

RHIZOPHORA MUCRONATA. *Lam.*

Kayu api api? . ,,	Uppu ponna, . . . ,,

Grows in Madagascar, Mauritius, Arabia, at Trincomalee, Calpentyn, Negumbo, and other parts of the Ceylon coast, along with Rh. conjugata, also in Malabar, the Sunderbuns, and Java. The wood is dark-reddish, hard, and durable. Weight, 70 to 75 lbs. per cubic foot. The flowers are large, white, and sweet scented. Bark used for tanning. —*Roxb.; Voigt; Thw.; W. Ic.; Crawfurd, Dict.; Rohde, MSS.; Gamble.*

RHIZOSTOMA, one of the Acalephæ, used by the Chinese as food. They solidify it by rubbing it over with alum.

RHODIA, an out-caste race in Ceylon, little numerous, forbidden to approach a temple or any of the higher castes. According to one tradition, these scarcely civilised beings were hunters who, on the eve of a solemn occasion, failing to obtain game, etc., murdered a child and sent its dismembered body to the king; but another tradition is to the effect that this caste persisted in eating beef after its use as food had been prohibited. The native laws forbade a Rhodia to approach a temple of Buddha or the gods, to build houses, or to live in any abode enclosed within walls,—and even to this day their dwellings are mere sheds,—nor even to cultivate the soil or possess land. They were forbidden to approach, much less to touch or breathe upon, a caste man; and all things they touch are unclean. The men wander about in parties or tribes seeking their precarious subsistence. Their women perform feats of legerdemain, and tell fortunes, their want of chastity being proverbial. Their numbers do not exceed a thousand, and they are principally in the Kandyan province, at Saffragam, Dombera, Wallepane, etc. Nominally Buddhists, they are also devil-worshippers. Rodeya or Rodda, in Singhalese literally means filth. In their social degradation, they resemble the Cagots and Caqueax, who from time immemorial have been held in abhorrence in the valleys of the Pyrenees and the plains of Bretagne, Poitou, and Guienne. They are living in small communities in kuppams or hamlets in different parts of Ceylon, but their language, customs, and observances are identical. They were formerly compelled to remain aloof from all other inhabitants, and even yet their very shadow is avoided, and held to contaminate and render impure any object on which it may happen to fall. They are mat weavers, beggars, thieves, and scavengers, and fall on their knees with uplifted hands before any Singhalese.—*Sirr's Ceylon*, ii. p. 215.

RHODODENDRON, a genus of plants belonging to the Ericaceæ. There are many species in the mountainous regions of the E. Indies, the better known being Rh. anthopogon, arboreum, campanulatum, Aucklandii, Blandfordiæflorum, Campbelli. Edgeworthii, Falconeri, grande, formosum, Hodgsoni, Maddeni, puniceum, and purpureum. Perhaps the most gorgeous of the native plants of Borneo are the various species of rhododendron, which there assume a peculiar form, being found epiphytal upon the trunks of trees. A species known as Brah in the N.W. Himalaya bears a bright red flower. Its wood is soft, used for charcoal and in zamindars' buildings. At Laghep, near Tumlung, Dr. Hooker gathered, in two days, seeds of 24 kinds, in the following order in ascending:—

Commencing at 6000 feet—Dalhousiæ, vaccinioides, camelliæflorum, arboreum.
Above 8000 feet—argenteum, Falconeri, barbatum, Campelliæ, Edgeworthii, niveum, Thomsoni, cinnabarinum, glaucum.
Above 10,500 feet—lanatum, virgatum, campylocarpum, ciliatum, Hodgsoni, campanulatum.
Above 12,000 feet—lepidotum, fulgens, Wightianum, anthropogon, setosum.

Several species occur a little north of Cherra. On the hill above Choongtam village, in Sikkim, Dr. Hooker gathered, at 5000 to 6000 feet, Rh. arboreum and Dalhousiæ, which do not generally grow at Darjiling below 7590 feet. Dr. Hooker collected here ten kinds of rhododendron, which, however, are not the social plants that they become at greater elevations. Still, in the delicacy and beauty of their flowers, four of them, perhaps, excel any other; they are Rh. Aucklandii, whose flowers are five inches and a half in diameter; Rh. Maddeni, Rh. Dalhousiæ, and Rh. Edgeworthii, all white-flowered bushes, of which the two first rise to the height of small trees. In the Tonglo mountains, in Sikkim, the trees in order of prevalence were—the scarlet Rhododendron arboreum and barbatum, the latter 30 to 40 feet high, as large as bushy trees, both loaded with beautiful flowers and luxuriant foliage; Rh. Falconeri, in point of foliage the most supurb of all the Himalayan species. Next in abundance to these were shrubs of Skimmia, Laureola, Symplocos, Hydrangea, and there were still a few pu magnolias, very large Pyri, like mountain-ash, the common English yew, 18 feet in circumference, the red bark of which is used in Nepal as dye and for staining the foreheads of Brahmans.

Rhododendron anthopogon. Poh, BHOT. flowers in June; the whole plant is very fragrant and is exported to Hundes for the Lamas, use it for incense. This and Rh. setosum are dwarf species with strongly scented leaves, occur at an elevation of 12,000 feet near Wa chun in East Nepal.

Rhododendron arboreum, *Sm.*

Mandal . . . of CHEN.	Urvail, . . . JH
Brah, Bras, Broa, DEAS.	Chiu, Dru, ...

Tree rhododendron, ENG.	Bilbe, Poo-maram,
Buraus, ... HIND.	Trikh, . . TR.-IN
Ardawal, . . JHELUM.	Gandere, . ,,

This very gorgeous tree grows up to 8000 in the alpine Panjab, and in the mountains in south of India. It has lanceolate leaves, ac silvery beneath, tapering to the base. It is on the most beautiful of all trees, but too delicat bear the open air in England. It is very com all over the Neilgherry Hills, either forming clumps or dotted about. It grows 20 feet having a gnarled trunk and deep crimson flo in masses. The variety roseum, of Rh. arbo grows to the height of thirty and forty Sikkim, bears bright red, sub-acid flowe are made into jelly; wood brown, soft, used fo charcoal and in zemindars' buildings; tree gives posts 6 inches in diameter.

Rhododendron argenteum, the white-flowered rhododendron, is found in Sikkim at an elevation of 8671 feet. It is a tree 30 feet high, having leaves very beautiful in the leaf-buds, erect an silky. The flowers are 2 to 3 inches long, 2 to 2 inches in diameter, always white. The scarl rhododendron (Rh. arboreum) is outvied by th great Rh. argenteum, which grows as a tree fort feet high, with magnificent leaves twelve to fiftee inches long, deep green, wrinkled above an silvery below, while the flowers are as large those of Rh. Dalhousiæ, and grow more in a cluste Few plants exceed in beauty the flowering branc of Rh. argenteum, with its wide-spreading foliage and glorious mass of flowers.

Rhododendron aromaticum. Its leaves, called Talesfur, are highly fragrant and stimulating; they are brought from Kābul.

Rhododendron barbatum, *Royle*, a tree from 40 60 feet high, branched from the base. It is ne of the most beautiful of the Himalayan species, nd is readily distinguished by its having bristly etioles and numerous branches floriferous at their pices. Dr. Adams observed the hill-sides covered h the scarlet-flowered Rhododendron bar- in full blossom.

is, ...	KASH.	Patti, Patr, . .	,,
spatr, Nik, .	,,		

s found in the Sutlej valley between Rampur Sungnam at an elevation of 10,000 to 14,000 t. It vegetates on the Kashmir mountains; leaves are officinal in Kashmir and Lahore, re they are administered as errhine, to pro- e sneezing. The leaves are imported from et and Kashmir, under the names Barg-i-Tibet Hulas-i-Kashmiri, and are used by the hmir natives as a snuff. Its bark is used for r-making; the plant is very abundant.

hododendron cinnabarinum, the Kema Ke- ng of the Lepcha (Kema signifying Rhododen-), is said to be poisonous, and when used as it causes the face to swell and the eyes to me; of this Dr. Hooker observed several nces.

hododendron Falconeri, a white-flowered ies, never occurring at less than 10,000 feet e the level of the sea, is one of the most king and distinct of the genus. It occurs in t Nepal, and in point of foliage this is the t superb of all the Himalayan species, with ks forty feet high, and branches bearing at ir ends only, with leaves nineteen inches long. se are deep green above, and covered beneath h a rich brown down.

hododendron Hodgsoni. Its foliage is of a iful bright green, with leaves sixteen inches Its bark is as delicate as tissue paper and ale flesh colour.

odendron epidotum, alpine rhododen-

Tsuma	of BHOT.	Talsur, ...	PANJ.
Talesfar, . .	N. INDIA.	Tsaluma, ...	,,

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 10,000 to 14,000 feet. Leaves highly stimulant.

Rhododendron nivale spreads its small rigid branches close to the ground. It is the most alpine of woody plants, and was found by Dr. Hooker at an elevation of 17,500 feet.

Rhododendron puniceum, a common tree on the lower ranges of the Himalaya; the bark, called kaephul, is brought to Ajmir from Dehli and Mirzapore, and is used as a rubefacient and sternutatory. Dr. Irvine found Kaephul and pounded ginger, mixed, the best substance with which to rub cholera patients to promote reaction; one pound costs five rupees. The fresh flowers are pleasantly acid, and are eaten by the hill-men to quench thirst during their ascent of the hills; the flowers are also made into a jelly.

Rhododendron Wallichii is a very distinct and handsome species, with lilac-coloured flowers. Its leaves are quite unlike any Indian species, and the flowers in colour and size resemble those of the much-cultivated Rh. ponticum.—*Royle, Ill.; Hooker, Journ. and Sikkim Rhodod.; Adams, Naturalist; Cleghorn, Rept.; J. L. Stewart; Eng. Cyc.; Honig.; Beddome; Irvine; Voigt; Low's Sarawak*, p. 65.; *W. Ic.*

RHODYMENIA JUBATA. *Grev.* One of the sea-weeds, a genus of the order Ceramiaceæ.

RHUBARB, Rheum radix.

Tahoan, .	COCH.-CHIN.		

The rhubarb of commerce is obtained from a wide extent of country, from Ladakh, in long. 77½° E., to the Chinese province of Shen-si, 29 degrees farther east, and it receives distinguishing names according to the country from which it is exported. The names given to it by the European nations are modifications of rhubarb. About 50 tons are annually imported into Britain.

The Turkey rhubarb of commerce is called also Russian rhubarb, but in Russia is called Chinese rhubarb; it is imported into the frontier town of Kiachta, thence into Moscow and St. Petersburg, whence it is distributed to the rest of Europe.

Bucharian rhubarb makes its way to Vienna by Brody and Nischny, and is supposed to be the inferior sorts of Tu[illegible]hubarb.

Chinese rhubar[illegible] also East India rhubarb, is produced in th[illegible]ains of Kan-su, but comes into the market[illegible]e three forms of Dutch trimmed or Bat[illegible] rhubarb, half-trimmed or Chinese rhubarb, [illegible]Canton stick rhubarb.

Siberian rhubarb[illegible]alled also Siberian rhapontic root, is supposed to be the product of R. rhaponticum.

Himalayan rhubarb is a product yielded by R. Moorcroftianum, *Royle*, by R. Webbianum, *Royle*, and R. spiciforme, *Royle*. A variety of rhubarb, termed riwash, is more or less plentiful in all the hills from Kalat in Baluchistan to Kandahar, and again from that place to Kābul. Attention is paid to its growth only by the inhabitants of Lughman, who supply the bazars of the city of Kābul. They surround the choicer plants with conical coverings of stones, so as to exclude light and air, and thereby produce that whiteness of stem so much prized. The unblanched plant is called chukri, and is also exposed to sale. It makes an excellent preserve, by being first saturated in a solution of lime and then boiled with shirar, or the inspissated juice of grapes, losing, however, in this case, its characteristic flavour. Rhubarb grows in abundance and to a large size in Barmor, and the valley through which the Ravi and its tributaries flow before reaching Dalhousie. A smaller variety, deemed by the natives to be superior in quality, grows in the crevices of the gneiss rocks forming the peaks above Dharmsala. The common dock, Rumex obtusifolius, is not so conspicuous in the waste places of a highland glen as is the officinal rhubarb on the bare rocks in the valley of Asrang. It extends five or six miles down the valley, and ascends the slope to 500 feet above the river's bed. Captian Houchen and the Lama of Asrang said that it is equally abundant in the adjoining valley of Dingering. The following

are four Himalayan species:—R. emodi, *Wall.*, Pindree glacier, etc.; B. Webbianum, *Royle*, Chur mountain; R. spiciforme, *Royle*, Werang pass; R. Moorcroftianum, *Royle*, Niti pass, and yield part of the Himalayan rhubarb. The Pen-ts'au, a Chinese work on medicines, places rhubarb at the very head of poisonous plants, and undoubtedly Chinese rhubarb, in China, is a very poisonous drug, causing severe purging and some prostration. It grows in Kink-chau-fu, in Hu-peh-li; Sui-teh-chau, in the N.E. of Shen-si; Lung-si-hien, in Kan-suh; Mau-chau and Ching-tu-fu, in Sze-chuen. —*Voigt; Smith's Mat. Med.*

RHUS. Of this genus of plants some species are poisonous, as R. venenata, perniciosa, radicans, and toxicodendron; but they are much cultivated as ornamental shrubs, especially on account of the beautiful red colour of their leaves in autumn. Many of them are used for the purposes of dyeing and tanning, as an astringent principle, to which is frequently added an acid, is common to the whole genus. R. suaveolens and R. aromatica exhale a pleasant odour; and some have acid berries, as R. coriaria and R. Buckiamela. Rhus cotinus has wood, called young fustic, which, as well as the berries, is astringent, and R. coriaria, known by the name of sumach, is a powerful astringent, chiefly employed in tanning leather. The seed of R. parviflora, tuntereck, is frequently substituted in India for that of the sumach. R. glabra is considered a febrifuge. Rhus vernix, a Japanes[illegible] exudes a whitish resinous juice, which so[illegible]mes black in the air. R. succedanea a[illegible] vernicifera, both common to the Himalaya[illegible]apan, are said, in the latter, to yield a simi[illegible]duct. Species of other genera, as of Schinu[illegible]ontain a resinous matter. A Rhus, the Coon[illegible]iya maram of the Tamils, grows in Coimbatore, very nearly allied to Roxburgh's R. Buckiamela, but distinct. Its outer sap-wood is white, fine-grained, and heavy, apparently very good. In the N.W. Himalaya, titar, titri, and tatri are generic names for most of the species. Other species are R. Griffithii, insignis, Khassyana, Mysorensis, and paniculata.—*Royle's Il.* p. 179; *Wight in M.E.J.R.; Thun.*

RHUS ACUMINATA. *D.C.* Sumach tree.

Arkhar, Rikhul, . Beas.	Kurku, . . Kanawar.
Lakhar, Titar, . . Chen.	Kakur-singi, . ,,
Kakkar, . . Kanawar.	Arkhol, . . Kangra.

This tree is not uncommon in the Kashmir valley, and occurs more sparingly to the eastward from 4000 to 7000 or 8000 feet. Vigne states that the juice of the fresh leaves blisters the skin, and the Kashmirians said the same to Dr. Stewart, but on his showing that his had not been blistered, they declared it only affected those who feared it. The wood is not valued. Bears are said to eat its fruit, which seems to be the officinal Habat-ul-khizra administered in phthisis.

RHUS BUCKIAMELA. *Roxb.*

R. amela, *G. Don.*; R. semialata, β Roxburghii, *D.C.*

Titri, ... Hind.	Hulashing, . . . Kasia.
Rashin, . . Kanawar.	

Grows in Kamaon, Srinuggur, and the Peninsula of India.—*Roxb.; Voigt; Wight.*

RHUS CORIARIA. *Linn.* Sumach.

Tumtum, ... Arab.	Tatri, ... Panj.
Mutchlee h'sot, . . Hind.	Shumuk, Mahi, . Pers.

A native of Persia, Syria, Palestine, and the south of Europe, about 8 or 10 feet high, divided into numerous irregular branches. All parts this plant have a styptic taste; to the abundan of tannic acid it owes its properties and valu in the arts. The leaves are extensively used i Britain for tanning purposes. M. Tromsdo found in the berries a large quantity of bi-mala of lime. Used by natives in cholera and indi tion.—*O'Sh.; Powell.*

RHUS COTINUS. *L.* Venus sumach

Baura, Tung, . . Chen.	Ban, . Jhelum,
Titri baghuna, . . ,,	Tung, ...
Paan, Jhelum, Kangra.	Larga, ...
Bhan, Bana manu, ,,	

A shrub of Kaghan, Himalaya, Salt Range 2300 to 6000 feet; grows three feet in Wood yellowish, resembles that of Pistacia tegerrima, used by the modern Greeks for dy wool; small twigs used for baskets, leaves bark in tanning.—*Cleghorn; Stewart.*

RHUS DECIPIENS. *Wight.*

Pehunbive, . . . Singh.	Kattu puvarasu, . . T

Grows in the central province of Ceylon in the south of India. Dr. Wight says it yiel very fine, close-grained, light-coloured wood, if procurable of good size, the wood must b considerable value.—*Wight; Mr. Mendis; M.E.*

RHUS PANJABENSIS, *Hooker*, is a mode sized tree of the N.W. Himalaya, growing u 8500 feet. Weight, 36 lbs. to the cubic foot.

RHUS PARVIFLORUM. *Roxb.* Kakur Tung, of the Panjab; found in the Sutlej valley tween Rampur and Sungnam at an elevatio 5000 feet. Wood hard and yellow. Both this R. acuminata yield beautiful wood, the n name, 'Kakur-singhee,' is from the long cu excrescences. The fruit of this species is c tantarik, and is used as medicine by the Hindu *Roxb.; Cleghorn.*

RHUS SEMIALATA. *Murray.* Sumach

Hulug, Butairi, . Panj.	Tung, Titar, Titri, P

A scarce tree of the N.W. Himalaya. No ornamental as other woods of this family.—*C horn.*

RHUS SUCCEDANEA. *Linn.*

Choklu, Halashi, . Chen.	Hala, Halai, Halashi
Nu-ching, . . . Chin.	Kakrin, Kulashing,
Titar, Tatri, . Jhelum.	

This tree appears to be found on most great rivers of the Panjab, from 3000 up feet. It does not grow to a great size, nor its wood valued. The juice of its leaves is stated to blister the skin. Its seed yields, on being pressed, an oil which soon congeals to the consistence of tallow, called Japan wax, from which in Japan candles are prepared. It is a substanc of medium consistence between beeswax and th ordinary vegetable tallows. It is softer, mo brittle and fatty than beeswax, is easily kneade and melts between 40° and 42° C. It contai twice as much oxygen as beeswax, and has different composition, consisting of palmitic ac united with oxide of glycerile. It has been us in England as a substitute for wax and for ha neutral fat, and, after conversion with the ac both for candles and night lights.—*Roxb.* ii. p. 9 *Cleghorn's Report; Oliphant; Thunberg, Tr.* iv. 93; *Smith's Mat. Med.*

RHUS VENENATA. *D.C.* The poison sumac or swamp sumach of North America and Japa is so exceedingly poisonous that it is said to affe some persons by merely smelling it; a touch w

metimes produce violent inflammation. It is a eautiful shrub, and well worthy of cultivation, ut great care should be taken to prevent its eing carelessly handled.

RHUS VERNICIFERA. *D.C.*

Rhus juglandifolia, *Wall.*

har, Rikhali, . BEAS. | Orrosino-ki, . . . JAP.
mbal, . . . CHEN. |

varnish tree of Japan, is common in the ya, in Kamaon, Nepal, and Garhwal. Its re very large and beautiful, rendering it the handsomest of shrubs. Rhus vernici- Japan is met with all over the main island, is from Tokio northwards that it princi- flourishes, growing freely on mountains as as on plains. Sowing the seed one year, on following spring the young trees are trans- nted about six feet apart, and in ten years average tree should be ten feet high, the meter of its trunk 2½ to 3 inches, and its yield acquer enough to fill a three-ounce bottle. A re speedy method is, however, often adopted. roots of a vigorous young tree, in pieces six es long, and the thickness of a finger, are nted out in a slanting direction, a few inches rt, one inch being left exposed above the nd. These cuttings throw out a strong shoot rom 18 to 20 inches the first year, and are wise planted out the following spring. Under lly favourable circumstances these trees would n years be nearly 25 per cent. larger in girth, would yield nearly half as much more sap as rees raised from seed. The usual age at which e is tapped for its lacquer is ten years; but sionally a tree is tapped when only three our years old. The best lacquer for trans- nt varnish is obtained from trees from 100 to years old, as their sap has more body and is e glutinous. The whole country produces at sent on an average about 120,000 to 140,000 lons per annum. The first tapping takes place ut the middle of June, the standard number of s allotted to a tapper for the season being 0, if the trees are about ten years old. The are first notched, the notches being about n inch long, and seven or eight inches apart. four days the tapper goes round again pro- with the bark scraper, the ordinary scraping a summer spatula, and the pot to hold the and first smoothing the bark where re- d, gives one cut above and one cut below the two lower marks, and one cut above the remainder of the other marks, the cut being in each case about an inch and a half long. After iving the cut the instrument is reversed, and the nife is run along the incision to insure the bark eing entirely cut through. This process is re- eated every four days, each incision being made little longer than the preceding one, up to the fth tapping inclusive, after which the remaining cisions are made of the same length. At each ound, when all the requisite incisions have been ade on the tree, the workman gathers the sap hich has exuded with the spatula, beginning ith the two lowest incisions, and so on to the ppermost cut. Twenty-five is considered the ormal number of cuts, which, at the rate of one ncision at each place every four days, occupy 100 orking days. The branches are afterwards apped, and the last operation is to make a umber of incisions completely encircling the tree wherever the workman perceives a likely place. All the branches are cut off, and any sap which may remain in the larger ones extracted, the small branches which have not yet been tapped being tied in bundles and steeped in water for ten days. When taken out and dried, the bark is cut with a knife, and the sap which exudes is collected. These operations kill the tree in one season, but frequently the tree is made to last two years or more, by giving only half the number of incisions, and reserving the final cuts for the second or third year. The roots of the young trees throw out from three to five shoots the following spring, and these can be used in six or seven years.

RHYNCHOCINETES TYPUS, a shrimp of the Indian Ocean.

RHYSICOSIA VESTITA, a beautiful purple-flowered leguminous plant with small tuberous roots, cultivated to some extent in the Khassya Hills.—*Hooker's Jour.* ii. 287; *Oliphant*, ii. 136.

RHYZOMYS CHINENSIS, the Chinese bamboo rat or chuck-shu, is found in the western part of Kwang-tung.—*Williams' Mid. King.* 257.

RI. JAPAN. A long measure of 2·442 miles; about 30 go to a degree of latitude.

RIAL, in Turkish Arabia and Persia, a silver coin, nearly equivalent to two French francs, or about twenty pence English.—*Ouseley, Tr.* ii. 218.

RIBBON.

Ruben de soie, . . . FR.	Nastro di seta, . . . IT.
Band, ... GER.	Cinte de seda, . . . SP.
Pheet, . . GUJ., HIND.	Kordela, Sherid, . TURK.

Silken bands of various widths and colours, both plain and flowered, and distinguished into sarsenet, satin, etc., according to the manner in which they are made; used for trimming bonnets, caps, and other purposes.—*Faulkner.*

RIBBON FISH. One of these is the silvery hair-tail, Trichiurus lepturus, *Linn.*, of China and Corea. It averages 5 feet; it is edible.

RIBES, a genus of plants belonging to the natural order Grossulariæ, including the gooseberry, the currants. Among the species known in the East Indies are—

R. glaciale, *Wall.*	R. leptostachyum, *Dne.*
R. grossularia, *L.*	R. nubicola.
R. Griffithi, *H. and Th.*	R. rubrum.
R. laciniatum, *H. and T.*	R. villosum.

R. nubicola, R. glaciale, and R. grossularia, the currant and gooseberry, grow in N.W. Himalaya at 10,000 and 11,000 feet, but the fruit is tasteless. Dr. Cleghorn also mentions a small, sour, woolly gooseberry called bilitsi in Lahoul. To these species add the gwaldakh, or gooseberry of Kaghan, and the rasta, or currant of Lahoul, also R. nubicola and R. acuminata. R. leptostachyum, *Dne.*, the yellow currant, and R. nigrum, the black currant, are not uncommon from 7000 to 14,000 feet in the Himalaya, and the former at least grows in Tibet, and was found by Dr. Bellew at about 10,000 feet near the Safed Koh. The fruit of the latter is very like the cultivated black currant, and very fair eating. Ribes nigrum is used in preparing the liquor called ratafia.

Ribes glaciale, *Wall.*, Mangle, BHOT., is found in the Sutlej valley between Rampur and Sungnam at an elevation of 11,000 feet. Several varieties occur, but the fruits are without flavour.

Ribes Griffithii, *H. and T.*, grows in the N.W. Himalaya at 10,000 to 13,000 feet elevation. Its berries are austere.

Ribes grossularia, *L.*, gooseberry.

R. Himalensis, *Royle.*	Pilsa, Teila, . . CHEN.
Amlanch, Kansi, CHEN.	Sur-ka-chup, . SUTLEJ.

This is found on the Upper Sutlej, Chenab, and Jhelum; in Tibet, in the Sutlej valley, between Rampur and Sungnam, at an elevation of 8000 to 12,000 feet. Also near the Safed Koh at 10,000 feet.

Ribes rubrum, *Linn.* (R. Himalense, *Dne.*).

Hadar, Khadri, . BEAS.	Red currant, . . ENG.
Rade, Ans, . . . CHEN.	Dak, Dagh, . . JHELUM.
Phulanch Nangke, ,,	Warawane, . TR.-INDUS.

Occurs frequently in the Panjab Himalaya from 5800 to 11,000 feet, up to the Indus and probably beyond; it has a sweet, acid, nearly worthless fruit.—*Royle; Stewart; Cleg.; Powell.*

RIBEYRO. Juan Ribeyro, a captain in the Portuguese army, who went to Ceylon A.D. 1640, and returned to Portugal by an order of the court in 1680, after 40 years' residence there and in other parts of the East Indies. He was engaged in all the wars between the Dutch and Portuguese, was taken prisoner when the Dutch took Colombo in A.D. 1656, and was in the small remnant of 140 Portuguese whom the Dutch transported to Batavia on the 24th June 1658. He wrote a history of Ceylon, which he presented to the king of Portugal in 1685. It was translated into French by Abbe Le Grand, and from that into English in 1847 by George Lee, Postmaster-General of Ceylon. The work was first published in Portuguese in 1836.—*Tennent.*

RIBHU, in the Vedas, celestial artists; analogue of the Greek Orpheus.

RIC, an ancient title applied to the highest class of Hindu priests. Ric, Ricsha, Riciswara were even applied to royalty in old times. It is in accordance with the peculiar rules of Sanskrit euphony that the stem ric (more properly rc) becomes rik when standing by itself, and rig before a sonant letter.—*Oriental Linguistic Studies*, p. 9.

RICCI. Matthew Ricci was born at Macerata in the March of Ancona, in 1552. He entered the Jesuit Society in 1571. He reached Goa in 1578, but speedily left it for Macao, on being chosen by Father Valignan, the founder of the Jesuit Mission in China, as one of his aids. Ricci reached Pekin in 1597, but was obliged by an accidental excitement among the Chinese to withdraw to Nankin. In 1600 he was enabled to revisit it, carrying presents which had come from Europe for the emperor. Having acquired the emperor's favour, he devoted himself to the mission at the capital. Some striking conversions were made, and Ricci's science and literary works in Chinese gained him much esteem among the most eminent persons at Pekin. He died 11th May 1610, leaving Adam Schall to succeed him. The chief literary men of the city attended his funeral. His name appears in the Chinese annals as Lu-mateu. The principles of Ricci as a missionary appear to have been to stretch conciliation as far as possible, and to seek the respect of the educated Chinese by the display of superior scientific attainments. As regards the former point, he is accused of having led the way in those dubious concessions which kindled the disputes that ended in the downfall of the missions. He was the first European to compose books in Chinese. His works of this kind were fifteen in number, and one of them is said to have be included in a collection of the best Chinese writ ordered by the emperor Khian-lung.—*Remusat Biog. Universelle; Yule, Cathay*, i. p. 536.

This is one of the most extensively diffused useful of grain crops, and supports a great nu of the human race.

The exports from British India, and the im into Great Britain, have been rapidly increas The imports into Great Britain from 184 to ranged from 38,529 to 78,658 tons. In 1 Britain imported 412,486 tons, value £3,297 In the eleven years 1850-51 to 1860-61 inclu the quantity of rice exported from British I varied from 777,572 quarters, value £672,43 1850-51, to 32,014,220 quarters, value £2,598, in 1855-56. In 1878-79, after India began recover from a famine, the total export of rice 2½ million tons, valued at Rs. 12,66,000. An ex duty is levied on rice in India at the rate of 3 a per maund, or about 6d. per cwt. A similar d on wheat was repealed in 1873. The export rice from British India were—

1878-79, . .	2,692,000 tons	Rs. 12,66,000
1879-80, . .	4,362,480 ,,	,, 24,36,00
1880-81, . .	3,468,930 ,,	,, 4,82,1
1881-82, . .	4,148,000 ,,	,, 14,24,0
1882-83, . .	7,420,000 ,,	,, 12,14,1

Three species and numerous varieties rice plant are enumerated by botanists, may be resolved into the lowland or aquatic (Oryza sativa), and the upland or mountain rice (Oryza Nepalensis). Oryza is the name by which rice was known to the ancient Greeks and Romans and has been adopted by botanists as the generi name of the plant that yields this valuable grai The term paddy is applied to the rice in its natur state—that is, before it is separated from the out husk. In this state the natives of Hindustan c it dhan, as well as the plant; the clean rice th distinguish as chawul. The common or aquat rice (O. sativa) is a native of the East Indies, an unlike many cultivated grains, is still found gro ing wild in and about the borders of the lakes in t Rajamundry Circars. A kind with broader leav (O. latifolia) is indigenous in Brazil, and Bat mentions having seen it growing wild in abund ance on some of the tributaries of the Amazo The common rice is cultivated in tropical cou tries, wherever there is a plentiful supply of wat for irrigation, and succeeds well on land that

too low and moist for the production of other useful plants. Although grown principally within the tropics, it flourishes well beyond them, yielding even heavier and better filled grain. Under favourable conditions, it will mature in the east as high as the 45th parallel of north latitude, and on the Atlantic seaboard of North America as far north as 38°. On the west coast it will grow as high up as 40°. It does not necessarily require a very great degree of heat, but it must have moisture so abundant that the fields on which it grows require to be repeatedly laid under water by irrigation. Without its due degree of moisture it proves almost wholly unproductive. But the dry or mountain rice of Cochin-China and Nepal is raised upon a comparatively dry soil, without irrigation. It has been introduced into the United [illegible]tes, and grows several degrees farther north [illegible] the Carolina rice; it has also been cultivated [illegible] success in Hungary and Westphalia. At the [illegible]don Exhibition there were displayed many [illegible]ous specimens and varieties of rice grown [illegible]out irrigation, at elevations from 3000 to [illegible]) feet on the slopes of the Himalayas, where [illegible]lampness of the summer months compensates [illegible]he want of artificial moisture. The upland [illegible] flourishes on high and poor land in the [illegible]ed States, and produces more than Indian-[illegible] on the same land would do, giving 15 bushels [illegible] acre where the corn yields but 7. The [illegible]p rice is more prolific, often yielding in [illegible] region as much as from 30 to 70 bushels [illegible]cre.

[illegible]is grain was first introduced into Virginia by [illegible]Villiam Berkeley in 1647, who received half a [illegible]el of seed, from which he raised 16 bushels [illegible]xcellent rice, most or all of which was sown [illegible]following year. It is also stated that a Dutch [illegible] from Madagascar came to Charleston in 1694, [illegible] left about a peck of rice in the husk with [illegible]ernor Thomas Smith, who distributed it among [illegible] friends for cultivation, from the produce of [illegible]ich no less a quantity than 60 tons was shipped [illegible] England in 1698. It soon after became the [illegible] staple food of the colony. Its culture was [illegible]uced into Louisiana in 1718. The present [illegible]e of rice in the United States is chiefly con-[illegible] South Carolina, Georgia, Florida, Alabama, [illegible]ssippi, and Texas. The average yield per [illegible]cre is from 20 to 60 bushels, weighing from 45 [illegible]o 48 lbs. when cleaned. Under exceptionally favourable circumstances as many as 60 bushels per acre have been realized. The American rice, although originally introduced from the Old World, [illegible] now the finest in quality. That imported from [illegible]atna is more esteemed in Europe than any other [illegible]nd of eastern rice. The low estimation of Java [illegible]ce was not attributable to any real inferiority of [illegible]e grain, but to the careless method of preparing [illegible] for the market.

[illegible]The common rice being an aquatic plant, is best [illegible]own in such low, moist lands as are most easily [illegible]ndated. The ground is first ploughed super-[illegible]ially, and divided into squares of from 20 to 30 [illegible]rds each way, separated from each other by [illegible]kes of earth about a foot high, and sufficiently [illegible]ide for a man to walk upon. These dykes are [illegible]r the purpose of retaining the water when [illegible]quired, and permitting it to be drawn off when [illegible]o longer necessary. So soon as the ground is [illegible]epared, the water is let on, and the several compartments of the rice fields are thus flooded into a depth of about 6 inches. The rice that is to be used as seed must remain in the husk, it having previously been put into sacks, and kept under water until the grain has swelled and begun to show signs of germination. The sower, walking through the inundated field, scatters the seed with his hands, as he would do if he were sowing wheat; being rendered heavy by its previous soaking, it immediately falls to the bottom, and even sinks a little way into the mud. After the lapse of about a fortnight, the young crop begins to show itself above the surface of the shallow water. As the plant grows, the depth of the water is increased, so that the stalks may not bend with their own weight. When they become stronger and less flexible, the water is drawn off for a few days to allow of hoeing, after which it is again let on, and maintained to about half the height of the plant, until the crop ripens and the straw begins to turn yellow. Then the water is emptied, and the harvest commences, the crop being reaped with a sickle. It is then bound up into bundles, and thrushed or trodden out and winnowed. The husk of the grain is removed in some countries by means of a mill constructed of two large cylinders of very hard wood, and obliquely furrowed, which are turned by the hand. Americans employ a rice-threshing mill with steam-engine attached. The rice in sheaf is taken up to the thresher by a conveyer; it is threshed, the straw [illegible] thrice winnowed and twice screen[illegible]he result in some cases exceeds a thousa[illegible]s a day.

Paddy, as it c[illegible]om the ear, has a rough, silicious outer cove[illegible]r husk, which is impervious to water, and is u[illegible]n America for horse-beds, and for packing cr[illegible]kery-ware and ice, being far better than sawdust for the latter purpose.

At the mouths of the river Indus, large patches of alluvial deposit accumulate, consisting of very muddy, swampy soil, almost on a level with the sea, and exposed equally to be flooded both by it and the fresh water of the river. These swamps form the principal rice fields of Lower Sind. There is little doubt but that the extensive mud flats, covered with flags and bulrushes, that border the lower portion of the river Murray in South Australia, might easily be made available for the culture of rice. The delta of the Mississippi is remarkably adapted to the growth of this grain, the river being always available for the purposes of irrigation, and two crops of rice a year can be reckoned upon in that region.

The wild rice found in the Madras Presidency, in and on the borders of lakes in the Circars, on the marine lagoons of Travancore, near Allepey, and other places, is never cultivated, though the richer classes near Rajamundry gather and eat it as a great dainty. It is white, palatable, and wholesome, and sells at a high price.

Rice cultivation prevails in all the river valleys and on all the coasts of Eastern and Southern Asia, in the Japan Islands, on all the sea-coasts of China, the Philippine and other large islands of the Eastern Archipelago, in Ceylon, Siam, India, on both shores of the Red Sea, in Egypt, on the shores of the Mozambique Channel, in Madagascar, on the shores of the Mediterranean, in some parts of Western Africa, South Carolina, and Central America. Throughout the greater part of British

India and China rice is preferred as food by nearly all classes, and the Negro domiciled in the New World similarly appreciates it. But it is essentially the food of the well-to-do classes. The races of Northern India, and the Chinese of the provinces of Ho-nan, Shen-si, Shan-si, and Shan-tung, prefer wheat, and in India the millets and pulses form the food-grains of all the labouring people, with whom rice is a luxury.

Rice is always substituted by the physician, when practicable, as the food best adapted to the digestion, in diarrhœa and other similar diseases; and if the clean rice be ground and bolted, a meal is produced which can be made up into various forms of cake and other bread forms of unrivalled sweetness and delicacy.

Rice possesses the advantage attending wheat, maize, and other grains, of preserving plenty during the fluctuations of trade, and is also susceptible of cultivation on land too low and moist for the production of most other useful plants.

Where inundation is practised, ordinarily the ground is squared off in beds, generally 30 to 40 yards in length and breadth, separated by small dykes 2 feet high and 1 foot broad. This bed, after being thoroughly saturated with water, is ploughed up and manured with wood-ashes, or from dung-heaps, or green herbs or shrubs are ploughed in, the most favourite being the Calotropis gigantea, which is eagerly sought after by the cultivator at the ploughing season. The ground thus prepared is [illegible]ater, 2 to 4 inches deep, thoroughly to di[illegible] soil, and a few days afterwards it is ag[illegible]ghed into a deep muddy mixture. A piece [illegible]d, tied on to the yoke of a pair of bullock[illegible] drawn over the puddle to level it, after w[illegible]h it is ready to receive the seed, which is t[illegible]n sown broadcast. The following day, so soon as the seed has settled into the soil, the flood water is let off, and the soil allowed to dry for three or four days, during which the seedlings will have sprung up about 2 inches high, on which the field is irrigated, and the water allowed to stand a couple of inches above the soil, and is so maintained until the harvest.

With some varieties of rice the field is ploughed up after rain, and the seeds sown. When the sprouts are between four and six weeks old, the field is irrigated for the first time, and the water supply maintained until the grain ripens and the stalks are ready for the sickle, which is seen by the whole field lying down. Nurseries are frequently prepared in the manner previously described, and the seed sown. Six or eight weeks afterwards, the plants are transplanted into fields prepared in the same way to receive them.

During the first and second months, the fields are hand-weeded by women and boys; any crowding or failure is remedied by transplanting, so as to leave 4 to 6 inches of space between each plant. If the plants shoot up in a lanky manner, 8 or 10 inches of the tops are cut off by the sickle, which makes them more fruitful. In the Tamil-speaking countries, the varieties called Kado Kaluthan, and Vellai, Sirumani, Pompalui, Esarakova, Pall, Thiruvarangam, and Nirvala Sumbah are sown in July or August, and cut in January or February, taking six months to ripen. Vaday Sumbah, August to December, five months; Vallai kar, August to November, four months.

American rice is of two kinds,—the red and the white, from the colour of the pellicle which encloses the seed, on the removal of which both are alike white. The former was accidentally introduced in 1694 by a ship captain from Madagascar, and the latter was transmitted in 1647 to America by Mr. Doubois, treasurer of those days to the E. I. Company.

The growth of rice in North America is almost wholly confined to two States, nine-tenths of the whole product, indeed, being raised in the States of Carolina and Georgia. A little is grown in North Carolina, Florida, Alabama, Texas, Louisiana, and Mississippi.

The cultivation is carried on in South Carolina in the marshy flats, which are periodically covered by the floodings of the rivers, and for such culture that State possesses peculiar advantages, which only enable the cultivator to produce his grai[illegible] a trifling cost of labour, but also of a much fi[illegible] quality than in those lands which are a[illegible] ficially irrigated. Carolina rice has a fi[illegible] handsomer grain than that which is grown in [illegible] country of its original production.

The yield per acre varies in South Carolina f[illegible] 20 to 60 bushels, weighing from 45 to 48 [illegible] when cleaned. Under favourable circumsta[illegible] as many as 90 bushels to an acre have [illegible] raised.

A variety of rice, discovered in South Car[illegible] in 1838, was called the big-grained rice. [illegible] proved to be unusually productive. One far[illegible] in 1840, planted not quite half an acre with[illegible] seed, which yielded 49½ bushels of clean winn[illegible] rice. In 1842 he planted 400 acres, and in [illegible] he sowed his whole crop with this seed. His [illegible] parcel when milled was 80 barrels, and ne[illegible] half a dollar per cwt. over the primest rice [illegible] on the same day. Another cultivator also pla[illegible] two fields in 1839, which yielded 73 bushels [illegible] acre. The average crop before, from the s[illegible] fields of 15 and 10 acres, had only been 33 bus[illegible] per acre.

Rice in Carolina is sown as soon as it c[illegible] veniently can be after the vernal equinox, [illegible] which period until the middle, and even th[illegible] of May, is the usual time of putting it [illegible] ground. It grows best in low marshy la[illegible] should be sown in furrows 12 inches asunde[illegible] requires to be flooded, and thrives best if 6 inche[illegible] under water; is occasionally drained off, and [illegible] turned on again to overflow it, for three or four [illegible] times. When ripe the straw becomes yellow, and [illegible] it is either reaped with a sickle or cut down with [illegible] a scythe and cradle, some time in the month o[illegible] September, after which it is raked and bound [illegible] or got up loose, and threshed or trodden ou[illegible] and winnowed in the same manner as wheat [illegible] barley.

In the south of India, and along the sea-coas[illegible] rice is the favourite food, but from the expens[illegible] attending the necessary irrigation, it is dea[illegible] than other cereals, and the labouring people li[illegible] on dry grains, millets, and pulses. But the[illegible] again take more time to prepare, more firewo[illegible] to cook, and so strongly are the people of Southe[illegible] India impressed by the superiority of rice as foo[illegible] that it indicates their well-to-do or impoverish[illegible] condition by their telling that they can have ri[illegible] twice or only once daily, or once weekly. Neve[illegible] theless, for the labouring man, the value of t[illegible]

rm of worship, to distinguish it from the Vami
r Vamachari, the left-hand worshippers, or those
who adopt a ritual contrary to that which is usual,
nd to what, indeed, they dare publicly avow.
He says the left-hand sect worship Devi, Lakshmi,
raswati, the Matri, the Nayika, the Yogini, and
en the fiend-like Dakini and Sakini are admitted
a share of homage. Siva with the two hands
an object of veneration, especially in the form
Bhairava, with which modification of the deity
s the object of the worshipper to identify him-
f. The worship of the Vamachari is derived
m a portion of the Tantra. It resolves itself
o various subjects, apparently into different
ts, of which that of the Kaula or Kulina is
lared to be pre-eminent. The object of the
rship is, by the reverence of Devi, who is the
ti or female power of Siva, to obtain super-
ural powers in this life, and to be identified
r death with Siva and his sakti. All the forms
his impure worship require the use of some or
f the five Makara, Mansa, Matsya, etc., flesh,
wine—'women and wine are the five-fold
ara, which take away all sin.' There is
hing of all this in the Peninsula of India;
it may be safely said, anywhere now in
ish India.

IG VEDA, SANSK., from Ric or Rich, an
ntation, and Veda, from Vid, knowledge. It
e of the first or oldest of the inspired Vedas,
sacred books of the ancient Aryans, and still
gnised by all Hindus. Rig signifying the
nce of divination, of which it principally treats,
so teaches astronomy, astrology, natural philo-
y, and gives a particular account of the for-
ion of matter, and the creation of the world.
ontains 1017 hymns and 10,580 verses, doubt-
the work of many men at long intervals of
e. The language is archaic, involved, and
ptical; the hymns contain very little poetry of
agreeable or elevated kind, a few mixed with
ost ignoble and unsuitable allusions.

e deities which the Rig Veda invoke are
ental, *i.e.* personifications of earth, fire, and
r, and the winds, etc. In the 3d Ashtaka,
has 44 hymns addressed to him; the next
mber comes Indra with 48; and after
Marut, or the personified winds, have
number of hymns.

lculated that the mere Sanhita or
portion of the Vedas, as distinguished
the Brahmana or later ritual appended to
ch, contains not less than 30,000 couplets, of
hich 11,000 go to the Rig Veda.

The Rig Veda is the chief of the four Vedas,
he others, the Sama Veda, Yajur Veda, and the
tharva Veda, come after it. The hymns of the
ig or Rich Veda are repeated entirely in a dis-
inted form in the Sama, and with little altera-
on in the Atharva also. The Yajur Veda con-
ins principally forms of prayer. The Atharva
eda evidently belongs to a much later age than
he rest. Each hymn is called a sakta, of which
here are about 1000, arranged into 8 ashtaka or
handa of unequal extent. Another division is
nto 10 mandala, subdivided into 100 anuvaka.
Each hymn has a rishi or inspired writer for its
uthor. Portions of the Rig Veda had been
anslated by F. Rosen, M. Langlois, and Professor
Wilson; but Professor Max Muller rendered the
hole of it into English, and published the text,
mantra. In the hymns of the Rig Veda the Brahmanical or East Aryan tribes are shown advancing step by step along the rivers of the Panjab into the plains of the holy land, Brahmavarta, often at war with mighty kings, or engaged in hostilities with each other, each immigrating tribe pushing those in advance of them farther and farther to the south.—*Garrett; Max Muller; Rep. Brit. Ass.* 1847. See Sanhita; Veda.

RIGYAL, TIBETAN, lit. mountain king, is the origin of Plutarch's Mount Argillos (De Fluviis), the name of the mountain on which Bacchus was born. Riga, TIBETAN, a mountain, is the same term as Mount Righi in Switzerland. Rigyal is one of the Trans-Himalayan range. The peaks of this range are from 20,786 to 21,000 feet in height. Its general direction is from south-east to north-west, and its extreme length is upwards of 850 miles. It forms the natural boundary of Ladakh, Balti, and Rongdo on the north, and Rukchu, Purik, Dras, and Astor on the south. Its passes on the eastern half of the range are from 16,495 to 18,746 feet in height, and on the western half from 12,000 to 16,000 feet.

RIHL. ARAB. A book-stand, used for supporting a Koran or prayer-book in mosques.

RIJAZ. ARAB. A war song.

RIKAB. HIND. The second note of the musical scale, 'Re.'

RIKSHA. SANSK. A bear. In Hindu astronomy the general term for a constellation. Maha-Riksha may therefore be understood either as the constellation of the Great Bear, or as the great constellation. Whether the former denomination (which is the same as the name given by Europeans to the asterism called the Great Bear) be merely accidental, or whether by that term both Europeans and Hindus mean the same object, is uncertain.—*Warren, Kala Sanhita.*

RIKSHAVAT. Name of a mountain—literally, bear-having (from Riksha, a bear, and Avat, suffix of possession)—part of the Vindhya chain, separating Malwa from Kandesh and Berar.—*Williams' Nala*, p. 131.

RINCHOR, from Rin, the field of battle, and Chorna, to abandon. Hence Rinchor, one of the titles under which Krishna is worshipped at Dwarica, is most unpropitious to the martial Rajput. Kal-Yamun, the foe from whom he fled, and who is figured as a serpent, is doubtless the Tak, the ancient foe of the Yadu, who slew Janmeja, emperor of the Pandu.

RIND, a section of the Baluch race. See Baluch.

RING.

Mahbas, Khatim,	ARAB.	Anello,	IT.
Khal-khal,	,,	Circulo, Anillo,	SP.
Bague, Anneau,	FR.	Moderam,	TAM.
Ring,	GER.	Ungaram,	TEL.
Angotha,	HIND.	Halka, Yuzuk,	TURK.

Rings are used in Southern and Eastern Asia as signet rings, with a seal engraved, or for ornament, worn on the fingers, toes, wrists, ankles, or in the nose and ears. A ring is used as a marriage token in Europe; and amongst all nations and in every age the ring has been chosen as the aptest emblem of time, and such names as 'annus,' ενος, ετος, ενιαυτος, and year, from Yar, to surround, mark the most recurrent period known to men.

Medicinal rings were at one time very seriously believed in. Physicians were wont to wear finger-

rings in which stones were set, and these stones were credited with the possession of many virtues. Sometimes the patient was simply touched with the ring; sometimes he put it on his finger for awhile. Many a patient has worn such a ring to stop a hæmorrhage, which sedatives, absorbents, and astringents had alike failed to allay; if the desired result followed, the ring was unreservedly regarded as the healing agent; if the cure did not follow, we are told nothing about it, for in these matters 'what is hit is history, but what is miss'd is mystery!' A wine-coloured amethyst, set in a ring, was a specific against intoxication and its consequences; a hyacinth stone, similarly set, acted as a charm to produce sleep; an agate had wonderful power in curing amaurosis and other diseases of the eye; a jasper showed its value in cases of dropsy and fever; while a coral was an antidote against nervousness and causeless fears.

The ring, with the title or name on it of the owner, is used throughout the South and East of Asia to be applied to documents in the place of a signature; this is mentioned in chapter viii. 2 of Esther, where the king Ahasuerus took off his ring, and gave it to Mordecai. It is so used by Hindus and Muhammadans, even though they can write.

RINTIMBUR, a fort in the Jaipur (Jeypore) State of Rajputana, in lat. 26° 2′ N., and long. 76° 30′ E. It is situated on an isolated rock, the summit of which is surrounded by a massive stone wall, strengthened by towers and bastions.—*Imp. Gaz.*

RIPPLES occur in the [illegible] of Bengal, the Banda Sea, and other seas [illegible] the Archipelago. Also in the tract between t[illegible] Nicobar Islands, Malacca, Penang, and Acheen [illegible]ead, they have been seen 2 to 5 miles long, 200 to 400 yards broad. In their general appearance they resembled the waves of the sea breaking on a shallow, sandy shore. Some seen in 1814 by H.M. ship *Minden* advancing from the west were very gentle, so that the surface of the sea was scarcely whitened by them, their approach being indicated only by a faint noise. Others were heard several miles off, and advanced towards the ship boiling and foaming in an extraordinary manner; some of them not only dashed the water many feet up the side of the ship, but actually shook the ship. In the Straits of Singapore they presented the appearance of a shallow stream rippling over a stony bed.—*Jameson's Ed. Journ.*, 1820, ii. pp. 7–9.

RISALA-i-KHAIRATIYAH, or the Charitable Treatise. It contains a diatribe against Sufiism, and especially against the great Sufi teacher of the 12th century.

RISALDAR. HIND. A native officer in the native army of India.

RISAM and Rejam, Pharaoh's magicians, called by the Jews Jannes and Jambres.

RISHABHA. SANSK. A bull, vehicle of Siva. Rishabha signifies excellent. Rishabanatha, 10 miles S. of Prasad, on the Udaipur and Ahmadabad road, a place of pilgrimage.

RISHI, a priesthood of Muhammadans in Kashmir who do not marry, and who abstain from animal food.

RISHI, an important term in Hindu astronomy, which, in its scientific sense, means a line or great circle passing through the poles of the ecliptic, and the beginning of the first solar sidereal sign an[illegible] first fixed lunar mansion of the respective zodiac[illegible] and which said circle is supposed to cut some o[illegible] the stars in the Great Bear, which most com[illegible] mentators take to be Dhube, or β Ursæ Majoris[illegible] and ζ Piscium, although in reality no such circ[illegible] could be made to intersect exactly these thr[illegible] points. This line or circle being thus invaria[illegible] fixed, and the four (fixed and moveable) zodia[illegible] conceived to coincide at a particular epoch, [illegible] variation of the moveable ones may easily [illegible] reckoned by its means, as if it were an ind[illegible] Thus, suppose that the line of the Rishi sho[illegible] have intersected the beginning of the fixed lu[illegible] mansion Magha, as was supposed to be the cas[illegible] the 1910th year of the Caliyug (1192 B.C.), [illegible] that at the beginning of the said year the lin[illegible] the Rishi was found by observation to inters[illegible] the middle of the moveable mansion Magha, t[illegible] it would be said truly that the Rishis had got [illegible] 6° 40′ $\left(\frac{13° 20'}{2}\right)$ of the moveable Magha, and t[illegible] 6° 40′ would mark the absolute precessional va[illegible] tion which had accumulated at that epoch s[illegible] the time that the fixed and moveable Maghas c[illegible] cided. The above explanation of the term R[illegible] is clearly justified by all the Hindu treatise[illegible] any weight which have hitherto fallen into [illegible] hands of Europeans; and here it may not be[illegible] of the purpose to observe that when Hippar[illegible] (later than the 135th year B.C.), on comparing[illegible] observations of Spicæ Virginis (the Harshan[illegible] the Indians) with those that Simocharis had n[illegible] at Alexandria about a century before, and [illegible] ceived by the results that the stars appeare[illegible] have advanced (though slowly) from west to [illegible] relatively to the equinoctial points, he was [illegible] from imagining that Indian astronomers (perh[illegible] several centuries before his time, and in all p[illegible] bability by observations of the same star) [illegible] already noticed the same variation, on which, [illegible] after ages, Sir Isaac Newton resolved and e[illegible] lished the great problem of the equinoctial [illegible] cession. The celebrated Indian astron[illegible] Aryabhatta, probably puzzled how to account [illegible] the change of the position of the line of [illegible] Rishis, which, he admitted, had int[illegible] middle of the moveable lunar mansio[illegible] the year of the Caliyug 1910, and [illegible] pretended to cut (when he wrote) the [illegible] of Aswini, imagined a curious system on [illegible] stars of the Great Bear, to which he suppos[illegible] proper motion to the eastward, at the rate [illegible] 13° 20′ (a lunar mansion) in 100 years, whi[illegible] amounted to 159,999 revolutions in a calpa, an[illegible] which squared his account. But this absur[illegible] doctrine has long since been abandoned by a[illegible] manner of Indian astronomers, many of whom i[illegible] existence in 1810 had never heard of it.—*Lt.-C[illegible] J. Warren, Kala Sankalita*, pp. 85, 245.

RISHI, amongst the Hindus, a sage, a see[illegible] an inspired poet. In the epic period of t[illegible] Hindus, a Rishi is merely a title for a historic[illegible] personage; in the Puranic period, the Rishi a[illegible] seven primeval personages, born of Brahma[illegible] mind, and presiding, under different forms, ov[illegible] each manwantara. They correspond to the Praja[illegible] pati, or progenitors of the human race. Thr[illegible] lists of Rishis are given in the Upanishad of t[illegible] Yajur Veda, called 'Vrihad Aranyaka,' each li[illegible] differing from the other. Other names are giv[illegible]

ter in the Sathapatha Brahmana, Mahabharata, d the Vayu and Vishnu Puranas—

Agastya.	Jamadagni.	Pulastya.
Angiras.	Kanwa.	Valmiki.
tri.	Kasyapa.	Vashishtha.
haradwaja.	Kratu.	Vibhandaka.
hrigu.	Manu.	Visvamitra.
aksha.	Marichi.	Vyasa.
utama.	Pulaha.	

he names of several of the Rishi are prefixed the hymns of the Vedas. Vashishtha is the ted author of some of the most touching ns of the Vedas, simple, genuine utterances, essing sin, and yearning after an unknown l. On the other hand, Visvamitra, son of hi, was a king, a powerful soldier, and is ed to be the originator of the great religious monies. According to Hindu mythology, by devotion he became a Rishi and capable of ting as well as Brahma. These two men me typical in ancient Hindu story, and they made to reappear in the long subsequent ayana.

e term Rishi is also applied to the Vanaprastha mans, or inhabitants of the desert. Of these most ancient and celebrated were the seven t Rishi, or Maha Saptaite Rishi astadha, who etired in the territory washed by the Indus; t was to them, it is supposed, that Alexander Great applied for instruction after invading country.

stronomically the Rishi are the husbands of six Pleiades, but how six and seven can accord ay be difficult to understand, yet they have the honour of becoming the seven bright stars e Great Bear; and in Hindu mythology they fabled to be married to the Pleiades, are hipped at the festival of Shashti, and at the fice called Chitra Ketu, Swar Yaga, and a -offering is poured out to them at the Magha ing festival.—*Ward*, iv. p. 20.

IVEA FRAGRANS. Boodthee-keeray, TAM. eautiful variety of the convolvulus tribe, found lges, called the clove-scented creeper by eans; transparent white flowers, opening at and perfuming the air with a very pleasant leaves used as greens. Wight gives R. hosa, hirsuta, ornata, pomacea, speciosa, .—*Jaffrey; Wight.*

The Persian Gulf and the Arabian Sea receive the rivers Shat-ul-Arab, Indus, Lunee, Nerbadda, Myhie, Tapti, and numerous streams and torrents from the Western Ghats. The Himalaya gives

forth five great rivers,—the Ganges, Brahmaputra, Indus, Sutlej, and Kurnali or Gogra. These are called by the Tibetans, Tam-jan-khamba or Horse's Mouth, Shingh-gi-khamba or Lion's Mouth, Lang-chan-khamba or Bull's Mouth, and Mabja-khamba or Peacock's Mouth. The last four rivers drain the Kailas group of mountains. They rise close to the great Kailas Purbut.

The *Euphrates*, the Forat or Forath of the Hebrews, and the Perath or Phrath of the Arabs, rises near the shores of the Black Sea, and joins the Tigris after a course of 950 miles. It has two great sources in the Armenian mountains, the more northern of which is the Anti-Taurus, 25 miles N.E. of Erzerum.

The *Tigris* river is known to the people as the Dijlah. It is formed of three main branches,—the Diarbeker stream or true Tigris, the Myafarekin river, and the Bitlis-chai or Centrites of Xenophon. It enters on the low country near Jazirah; at Argunna is but a little brook; whilst the Euphrates, even at Malatea, is a very noble river, about a hundred yards wide. The Tigris varies as much in the rapidity as in the depth of its stream, both being governed by the periodical waters that rush from the mountains of Armenia, where its sources are about 50 miles north-west of the valley of Diarbeker. It flows thence with a swiftness that gave it the ancient Persian name of Tir, the arrow, which is descriptive of its course. The average rate of its current is about seven knots an hour. It begins to rise in March, is highest in May, and in June returns to its natural level. Its first swell is produced by the melting of the winter snows on the mountains; its second appears towards the close of October or the beginning of November, and rises immediately after the annual rains in those high regions. But it is only during the spring torrents that a complete inundation covers the land, and the city of Baghdad stands like a castellated island in the midst of a boundless sea. It has an average width of 200 yards from Mosul to Baghdad, with a current in the high season of about 4¼ miles per hour. The country is highly cultivated from Mosul to Nimrud on both sides of the river, but from the latter place to Tekrit all cultivation nearly ceases; and it is but partially found in the tract along the river between Tekrit and Baghdad. The Tigris is navigable for rafts at certain seasons from the bridge of Diarbeker to Mosul, a distance of about 296 miles. Below the latter place it is more or less so throughout the year, and the descent to Baghdad is performed with ease and speed. Large rafts, supported by 200 or even 300 inflated skins, are much in use for the transport of goods, and when the merchants are on board, a small room is raised on the raft in order to give shelter from the sun and rain. Since the middle of the 19th century a steamship company has been trafficking on the Tigris. The lands on either side of these two rivers are occupied by nomade tribes of Arabs. The two rivers unite near Kurnah, and form the Shat-ul-Arab, which disembogues into the Persian Gulf.

The *Kum Feroz* river, across which Amir Azan Delemi built the Band-i-amir (Bend-amir). It is the Aras, a modern name of the ancient Araxes, the Awerma of the Puranas. It laves the foot of the rock Istakhr. The snowy Ardegan mountains are the same with those which presented so formidable a barrier to Alexander's progress, and by whose slopes he descended into Persia in his advance on Persepolis. The sources of the Araxes and those of the north branch of the Euphrates are about ten miles from one another. Pliny stated that those sources are in the same mountain, and 600 paces asunder. This river at its commencement, owing to its many affluents, bears the Persian appellation of Hazara. It springs from the side of the Bin Gol, or Mountain of a Thousand Lakes, about 30 miles south of Erzerum, nearly in the centre of the space between the eastern and western branches of the Euphrates. Its course, from its first spring near Jabal Seil, is almost north-east for about 145 miles through Armenia, when it turns eastward, being then on the frontier of Kars. This proximity continues for 110 miles. In modern times, the north-eastern districts, along the banks of the Araxes, in the vening between Aderbijan and Georgia, have been in general subject to the sovereigns of Persia.

Central Asia, between India and Tartary, one broad mountain range, the Himalaya, forming the southern crest, and the Kouen Lun the northern. The interior has some lovely valleys like Kashmir, but it is more usually broken by rocky ravines, through which affluents of the Indus force their way towards the plains; or stretches away in those vast treeless uplands which are one of the chief characteristics of the range through its whole extent. The direction of this range is from east to west, trending slightly to the north, while the parallel chain that bounds Siberia to the south, and the outer one of which is the Tian Shan, trends somewhat to the south; so that at a short distance to the west of Yarkand and Kashgar, the great interior depression of Chinese Tartary terminates, and the boundary ranges coalesce in the elevated table-land of Pamir. The ascent from Yarkand and Kashgar westward to the table-land of Pamir is almost imperceptible; and when the lofty position is gained, where the average elevation is probably as much as 15,000 feet above the sea, a vast open plain is seen, which stretches from the valley of the Jaxartes (Syr) in one direction, across the head of the Oxus (Amu Darya), to the Kashgar or Chitral valley in another. The plateau may be 700 or 800 miles in [illegible] is studded throughout with lakes, and [illegible] descend four great river systems. The Nary which is the main stream of the Jaxartes, runs through a long, luxuriant valley, between the culminating ridge and outer range of the Tian Shan, and drains all the northern range of the plateau. The Oxus, rising in the Sari Kul or Yellow Lake of Pamir, at least 300 miles to the south of the Jaxartes, receives from its right bank a multitude of small streams, which run to the south through rugged valleys, on the southwestern face of the Pamir uplands. The western face of Pamir between the Jaxartes and the Oxus is far more precipitous than the eastern. Ridges run out as far as Samarcand and Karshi, and the streams from the upland which twine among these ridges form the Zar-afshan and Karshi parts of the water system of the Oxus, though before they reach that river they are entirely consumed in irrigation.

The Indus water system is formed on

th-eastern extremity of Pamir, where the le-land is lost in the rocky summits of Muz gh, and a number of streams drain off to the hward, forming two subsidiary Indus systems. minating ridge, Pusht-i-khar, or Ass's Back, runs out from the south-east corner of , is the true watershed between Tibet and , the streams flowing to the southward separated by the shoulder which joins the u Kush from the streams descending through an and Badakhshan to the Oxus, and forming Kābul river, which falls into the Indus at k; while those that flow to the south-east are divided by the Muz Tagh range from ry, descend through a series of rocky valleys precipitous gorges into the Upper Indus at Tibet.

m the eastern face of the Pamir, again, slopes off very gradually into the plains of ry, is supplied a fourth water system, in the of a series of small streams, which, passing arkand and Kashgar, are ultimately lost e sandy desert, or in some cases reach the l lake of Lob Nor.

e basins of the Amu and Syr Darya are in Russian, partly in Persian territory, and in that of Afghan Turkestan, under chiefs dinate to the Amir of Kābul, and are largely ied by Turk, Turkoman, and Iranian races, o former being almost all of them nomades redatory. The sources of these rivers are table-land of Pamir, and those of the Amu, n by Lieutenant Wood in the early part 19th century, have since been visited by xplorers.

Indus is a magnificent river; it rises in the or Gangri range, in lat. 31° 20′ N., and 80° 30′ E., 1700 feet above the sea, and has se of about 1977 miles. It is known in the of Ladakh as the Tsang-po, the Sam-po- e Chinese Pilgrim Hiwen Thsang. A few om Leh it receives the Zanskar river, and at Pitak below Leh is 10,500 feet above At Mittunkot, the Indus is often 2000 road, and near this place, in lat. 28° 55′ N., g. 70° 28′ E., it is joined without violence e Panjnad, a large navigable stream, llected waters of the Sutlej, Beas, Ravi, ab, and Jhelum, after which its bed never ws in the dry season to less than fifteen and seldom preserves so great a breadth as a mile. The whole length of its mountain rse from its source to Attock is about 1035 s, and the whole fall is 16,000 feet, or 15·4 t per mile. From Attock to the sea, the length 042 miles. Its maximum discharge, above the fluence of the Panjnad, occurs in July and gust, when it is swollen by the seasonal rains, it then reaches 135,000 cubic feet, falling to minimum of 15,000 in December. Up to this fluence it is known by various names, viz.:

-po-ho,	CHIN.	Saind'hava,	SANSK.
Tow,	,,	Sing-ge-chu,	TIBETAN.
ng-po,	LADAKH.	Sin'h-ka-bab,	,,
Sin,	,,		

Sing-ge chu means the lion river, and Sin'h-bab the lion's mouth. From the confluence, its route through Sind, it is known as the , Siro, or Sera, down to Sehwan; as the cholo or central from Sehwan to Hyderabad; as the Lar from Hyderabad to the sea. The races occupying the countries near are the Bhot, the Afghan, the Jut, the Baluch, the Brahui, the Rajput, and the Lar. The Indus guards the western frontier of British India, and in all the military operations of the British since 1834, in Afghanistan and Sind, the Indus has been of great value as a means of communication. During the war of 1845–1846 in the Panjab, a bridge of boats was carried up the river as far as Bahawulpur, and thence despatched up the Gharra to Ferozpur; and another branch of the river, the Chenab, was in a subsequent war navigated up to Multan.

The *Tarim* debouches into Lob Nor, an inland sea, into which the waters of several rivers flow. The Tarim is about 800 miles long; the lake is in a considerable depression, not more than 2000 feet above sea-level.

Three large rivers flow through Kafiristan from north to south, and augment with their waters the river of Kābul and Jalalabad, which ultimately falls into the Indus. The two westerly rivers unite at Tirgari of Lughman, and the joint stream, after a short course of eight or ten miles, falls into the Kābul river at Lergah, in the same district, about a mile to the east of Mandarawar. The easterly river, known as that of Kameh, falls into the Kābul river east of Jalalabad, and at a distance of about twenty-five miles from Kergah. The Kameh flows through Chitral, and its source is more remote. On the east it may be considered the boundary of the Sishposh territory, as the river of Nadjil and Alishang forms the boundary on the west. The sources of the Nadjil river are said to be not very distant, and it is the smallest of the three rivers.

From the central axis of the Himalaya, a succession of secondary ranges take their origin, which descend on the one hand towards the plains of India, and on the other towards the northern rivers. These secondary chains on the Indian side separate great rivers which flow towards the plains of India, and which, successively uniting in their courses through the plains, ultimately discharge their waters into the Indus and Brahmaputra, from which they are at first separated by the whole breadth of the Himalaya. The great rivers from west to east in succession are the Jhelum, the Chenab, the Ravi, the Beas, the Sutlej, the Jumna, the Ganges, the Gogra, the Gandak, the Kosi, the Tista, the Monas, and the Subansiri. All these are separated by chains at first of great elevation, but which terminate at last abruptly in the plains of India.

The rivers of Northern India are shallow, turbulent streams, traversing a vast extent of more or less level country, the bottom usually of sand or mud, which as a mass is constantly on the move towards the sea, the channel consequently always shifting its position, and the depth very uncertain. The navigable channel, although deep enough, is often difficult to discern in a wide expanse of waters, or among sandbanks intersected in every direction by blind channels, among which the open one is undistinguishable. The current often presents whirls or eddies running contrary to the stream, which frequently shoots from an abrupt turning at such an angle to the course of the stream as to deprive the rudder of its command, and throw a boat violently across the stream, or even turn her round.

The richest and altogether most important part

of British India is that which extends from Calcutta to Peshawur, and comprises the whole valley of the Ganges and the Panjab. The course of the great rivers through this region marks the prevailing slope of the land, which falls on every side from the Himalayas, the Rajputana uplands, and the Vindhyan plateau towards the seaward opening of the Arabian Sea and of the Bay of Bengal.

The chief rivers of the N.W. Provinces are the Ganges, the Jumna, and the Gogra. Among minor streams, the E. and W. Kali Nadi and the Hindan flow through the Doab. The Chambal intersects the Trans-Jumna tract in Etawa. The Betwa and the Ken are the principal streams of Bundelkhand. The Ganges, with its tributary the Jumna, collects the rainfall from the southern slopes of the mountain wall, and pours it down upon the plains of Bengal.

Towards the delta of the Ganges and Brahmaputra, when the volume of water, increased by the Himalayan snows, is swelled by ordinary or abnormal rains, all channels are united in one huge expanse of water, miles in breadth. The surrounding country is an inland sea, over which communication is maintained in skiffs and canoes between one village and another. By the month of October the waters subside. In the dry season huge masses of earth can be seen falling under the action of an undermining current, and the noise can be heard several hundreds of yards off. Owing to the annual overflow of its network of rivers, the level of the plains of Lower Bengal is gradually rising.

The *Jamuna* or Jamoona river of Northern Bengal in Rennell's time joined the Brahmaputra, whereas it now joins the main stream of the Ganges near the railway station of Goalundo. On the Jamuna is situated the important mart of Sirajganj, perhaps the richest of all the centres of trade in the interior of Bengal. Till about 1840 this capital of the trade in jute stood on the banks of the river. In 1848 the floods carried the town clean away, whereupon the traders formed a new bazar on the new bank, five miles from the original spot. When the stream, in another sudden caprice, went back to its old bed, the traders, warned by experience, preferred remaining where they were. Huge boats are now moored in the mid-stream miles from the bank, and business is done by merchants and brokers, who move about in small boats, or traverse what, in the hot season, is a blinding waste of sand some miles in extent. The real Sirajganj has been happily described as a town without houses. But it has a population of 18,000, and an aggregate trade, imports and exports, of $3\frac{1}{4}$ millions.

The *Tista* rises in Independent Sikkim or in Tibet, or in both countries. Its upper reaches display rocky pools, huge boulders, wooded banks, and picturesque scenery. When it descends to the plains, these peculiarities are exchanged for a fine channel often 800 yards wide, which, even where the volume is least, will float boats of three and four tons burden. The history of the freaks of this stream is very suggestive. In the survey by Major Rennell, the Tista flowed due south, joined another river in Dinajpur, and finally emptied itself into the main stream of the Ganges. In 1787 the Tista was choked by excess of silt, and burst its banks, when the accumulated waters

forced their way into a small branch, which, a flooding the country and causing immense dama they gradually so enlarged as to form a junct with the Brahmaputra, which still exists.

The *Mahanadi*, in the province of Cut rises in a mountainous and wooded region after a tortuous course between ridges of and over ledges of rocks, divides into two or main channels, and has often threatened to s away the town of Cuttack. But the volu waters has been confined and utilized by engi ing skill. A series of canals, at a conside outlay, will guarantee the province agai recurrence of the terrible famine of 1866.

Except the Nerbadda and Godavery, u great engineering skill be applied, there are of the rivers of the Peninsula of India lik prove navigable. The waterfalls on the Ner river are those of Kapila-dhara and Dudh near its source,—the former of 78 feet. The is at Umaria in the Narsinghpur district, of 10 feet. At Mandhar, 90 miles below Hos abad, and about 25 below Handia, there is of 40 feet; at Dadri, near Punasa, 25 below Mandhar, there is another fall of 40 fe

The British Indian Government tried to the Godavery navigable. The rivers emb under the Godavery navigation project are Godavery, Wardha, Pranhita, Wain - G Indrawati, Sabari, and Pain - Ganga. three first, however, are the principal str The Wardha takes its rise in the Baitul dis west of Nagpur, and, after flowing fo distance in a south-east direction, is jo the Wunna, which, passing under Hing falls to the south, and forms its junction wi Wardha, at a place called Sweet, 18 miles of the latter place. At this confluence a falls of Zoourate, and under them is the of Chuhmunder, which was supposed to limit of the contemplated engineering ope The Wardha flows on to the south-east, little before reaching Chanda, it is joi the Pain - Ganga, when, losing the na Wardha and Pain - Ganga, the united continues under the name of Pranhita junction with the Godavery, a few miles the station of Sironcha. Midway between confluences is situated the third or Dewala barrier, extending round in a curve for abo miles, and midway down this barrier the Ganga discharges itself into the Pranhita. the confluence of the Godavery and Pra below Sironcha to the sea, the river carries former name, although joined at intervals by Indrawati and other tributaries above specifi Thirty miles below Sironcha is the second Enchampally barrier, and eighty miles below again is the first or Sinteral barrier.

The *T'san-pu*, or Brahmaputra, like the Su rises near to the sacred lake of Manasaro Indeed, the Indus, the Sutlej, and the Brahmap may be said to start from the same water-part After receiving several tributaries from the fines of the Chinese empire, the river (B maputra) bends round a lofty eastern range the Himalayas, and enters British territory un the name of the Dihang, near Saddiya in Ass A few days' journey from Saddiya, the fron town of Assam, there is a station called Bo where Roman Catholic missionaries have t

itary home. Here is the meeting-place of the ntiers of India, Burma, China, and Tibet, king our stand at this spot, and looking south, have five great rivers, all destined to play a part in the future trade of Europe, and in egeneration of the people who swarm on banks. To the west is the Brahmaputra, bears the tea of Assam to its destina- to the extreme east is the Yang-tse, the river of China; and flowing directly south almost parallel at distances of about 200 from each other are, in order from the -tse, the great Mei-kong or Cambodia the Salwin, and the Irawadi. On the a of the first the French have planted them- es, and already their steamers have sailed up rds China and Burma, till stopped by the s.

e T'san-pu river rises close to the sources e Indus and Sutlej at a height of 16,000 feet. ing eastward it falls to 14,200 feet at Tadum, 0 feet at Shigatze, and 11,300 feet near sa. It is almost certain that this river joins Brahmaputra in Assam under the name of Dihang. This mighty river runs from the of India, from Brahmakund to Goalpara, mean length, exclusive of its numerous curves, of more than 400 miles. The level Brahmaputra at Saddiya is 210 feet. A little south of the entrance of the Tista begins part of the river where the stream branches the shape of a delta, and shortly joins with f the Ganges. The ebb and flood of the tend, in the season when the river is low, s beyond Dacca; the fall from Saddiya to ta consequently amounting to half a foot ile. The Brahmakund is a very deep basin- d enlargement of the river, just before it es from the mountains to descend into the of Assam. The velocity of the current, oth above and below the Brahmakund is eat, suffers a great diminution at this In this S.W. course, along the whole f the left shore of the Brahmaputra, and parallel to the broad valley through which , we meet with a longitudinal range of ary hills, inhabited by the various scattered of the Naga, Khassya, Jaintia, and Garo. embogues into the Bay of Bengal through mouths, after a length, in the plains, of miles. It receives in its long course the -pu, 1000; Dihang, 140; Noa Dihang, 100; Dihing, 150; Subansiri, 180; Manas, 189; ni, 150; Guddala, 160; Dharla, 148; Tista, ; Barak, 200; Gumti, 140 miles.

The delta branches of the Brahmaputra and nges intersect Lower Bengal in such a variety directions as to form a complete system of nd navigation. The Brahmaputra begins to in April, owing to the melting of the snow at lpine sources. About the 1st July it is at flood, and all the level country is submerged, ls of buffaloes, deer, and hogs then swim for ge to the hills. The Brahmaputra drains m in every direction. It is known in Assam the name Hiranya or golden. In the rainy son it rises 30 or 40 feet above its lowest level, rflows its banks, and inundates the country an inland sea. In the dry season it is a rinth of half-filled channels, rendering the igation intricate and fit only for steamers of light draught. It is not navigable higher than Dibrughar. As seen from Ogri Hill near Tezpur, the river is sweeping along in a bed of from ten to twelve miles in breadth, with numerous islands covered with canes and shrubs. The chief towns on the banks of the river are Bishnath, Durrung, Gowhatty, Goalpara, Nasseerabad. It is navigated from the Bay of Bengal to Dibrugarh, near the head of the Assam valley, within 500 miles of Pengshaw, on the Yang-tse-kiang river. Of these 500 miles 300 are known. Megna and Brahmaputra are names of the same river in different parts of its course; the Megna falls into the Brahmaputra, and though a much smaller river, communicates its name to the other during the rest of its course.

The Aryan Hindu and the non-Aryan races who occupy British India continue to worship springs and fountains and other natural objects. This has been a custom with many races. The fountain of Egeria, the Fontinalia Romana, the Aquæ Ferentinæ, and the sacred wood where the Feriæ Latinæ were celebrated, were under the especial protection of some divinity. Pansanias says that at Phocis in Achaia, there was a fountain called Hama, consecrated to Hermes, near which thirty enormous straight stones had been erected at a very remote period, when instead of images the Greeks adored blocks of stone. Such was also the religion of pagan Ireland.

And still the Ganges river by Hindus is esteemed sacred. Many persons, whose relations die at a distance from the Ganges, at the time of burning the body preserve a bone, and at some future time send or bring this bone and commit it to the river. The work called Kriya-yogasara contains the following curious story:—'A Brahman, who had been guilty of the greatest crimes, was devoured by wild beasts; his bones only remained. A crow took up one of these bones, and was carrying it over Ganga, when another bird darting upon it, the crow let the bone fall. As soon as the bone touched Ganga, the Brahman sprang to life, and was ascending to heaven, when the messenger of Yama, the judge of the dead, seized him as a great sinner. At this time Narayana's messengers interfered.'

The confluence of rivers, called Sangam by Hindus, is held sacred by these religionists; the forks of the Ganges and Jumna at Allahabad, of the Ganges and Gandak at Patna, may be mentioned, and pilgrims visit them in large numbers. The tongue of land where the Ganges unites with her great sister river the Jumna, is the true Prayag, the place of pilgrimage to which hundreds of thousands of devout Hindus repair to wash away their sins in her sanctifying waters. A legend tells us that at Allahabad or Prayag the clear and undimmed glance of Hindu faith can discern a third stream, besides those visible to ordinary mortals, the Jumna and the Ganges, which there unite just below the fort. But the Ganges at her estuary is not less sacred than her source. Saugor Island, at her mouth, is annually visited by a vast concourse of pilgrims, in commemoration of her act of saving grace, when, in order to cleanse the 60,000 damned ones of the house of Saugor, she divided herself into a hundred channels, thus making sure of reaching their remains, and so forming the delta of Bengal. Devout Hindus make a six years' pilgrimage from

the source of the Ganges to the mouth and back again. It is known as a pradakshina, or a circumambulation, and is still performed by many; and a few of the devotees may be seen wearily accomplishing the meritorious penance of measuring their length along certain parts of the route. To die and be buried on the river bank is the last wish of millions of Hindus. Even to exclaim Ganga! Ganga! at the distance of 100 leagues from the river, say her more enthusiastic devotees, may atone for the sins committed during three previous lives.

Karnafuli, a river of Chittagong, which disembogues into the Bay of Bengal.

Irawadi.—The sources of this great river are between lat. 27° and 28° N., and long. 97° 30′ E. The transverse-range, which separates the upper part of the western branch of the Irawadi from the valley of Assam, is of moderate elevation, varying probably between 5000 and 6000 feet. The slope of its valley is greater than that of the Indus or Ganges. The valley of Hukum is said to be 1000 feet above the level of the sea. The central branch of the Irawadi at Manchi, in lat. 27° 20′ N., is 1800 feet; at Bhamo, in lat. 24°, about 500 feet. Along its bank, hills frequently approach, and some of them close to the river are 3000 or 4000 feet high. Amongst the high mountains at its source the rainfall is considerable; at its centre, the fall of rain is comparatively small, but much rain falls at its delta. The valley of Manipur is drained by the westerly tri[illegible]y of the Irawadi. The valley of the Irawadi at its lower end unites with that of the Sitang to form an extensive plain stretching from Cape Negrais on the west to Martaban on the east. The water-parting between these two streams is the Pegu Yoma range, which, running north and south, terminates in low hills at Rangoon. The valley is about 80 miles broad at the frontier line, counting from chain to chain. It flows for 660 miles before reaching the British possessions, and thence its waters roll on for 240 miles to the sea in a S.S.W. direction. As it nears the coast it divides, converting the lower portion of the valley into a network of tidal creeks. A little above Henzadah, about 90 miles inland, it sends off its first branch to the westward, which, flowing past Bassein, receives the waters of the Pammawadi and of the Penglaygalay, and, bifurcating, enters the Bay of Bengal by two main mouths, the Bassein and the Thekkay-thoung rivers. The waters of the Irawadi commence to rise in March, and continue to rise till September, when, or in October, they commence to fall again, having risen 37 or 40 feet. Just below Rangoon it is joined by the Pegu and Puzundoung rivers, flowing from the east and north-east. The Pegu and the Puzundoung rivers rise close together in the Yoma range, about 58 miles above the town of Pegu, the capital of the ancient Talaing kingdom conquered by the Burmese under Alompra, and which gives its name to all this portion of the country.

The *Sitang* river rises far north of British territory, which it enters just above Tounghoo. Here it is narrow, and navigable with difficulty for large boats during the dry season.

The *Menam* river empties itself into the bottom of the Gulf of Siam. It washes Bankok, the capital of Siam.

Mei-kong, or Cambodia river, empties itself in the China Sea, at the entrance of the Gulf Siam.

The *Hoang-ho* of China rises in the Kouen L range, from springs which the Chinese figure themselves as the starry sea. After bu through several water-partings, making won bends near the base of the Mid Asia plate traverses Northern China, and confers agricu prosperity on 120 millions of souls. Its c within the plateau is about 400 miles, an water-supply is there perpetually snow fed.

The *Yang-tse* of China has its source i Kouen Lun. It is undoubtedly one of the rivers in the world; it takes its rise on north-eastern edge of the plateau of Ti and, after traversing the Koko-Nor, en China at the province of Kan-su; it leaves it again to water the sandy plains a foot of the Alechan mountains, surrounds country of Ortous, and, after having wa China from south to north, and then from we east, goes on to throw itself into the Yellow The waters are pure and beautiful at their so and only assume their yellow tint after pa the Alechan and the Ortous. The river almost always to the level of the country th which it flows; and to this is to be attribute disastrous inundations which it occasions. floods, so very fatal to China, are of little quence to the nomadic Tartars, who h strike their tents and move off elsewh

After quitting the plateau of Mi[illegible] [illegible]gh provinces of China so th[illegible] they have been estimated to [illegible] people, supplying the means of irrigati water traffic; and, after a course of 700 enters China proper. Its water-supply is im and unfailing, obtained largely from the snow and ice-bound regions at its source. It with the Hoang-ho, a twin basin to whi most advanced and powerful eastern civi owes its development.

Ho T'u Loh-Shu of the Chinese me plan (or diagram) of the Yellow River, writing (or book) of the river Loh. phrase are designated the systems of di and arrangement of the ordinal numbers. according to ancient tradition, were re to the sages Fuh-hi and Yu in a supern manner. Kung Ngan-Kwui gave form t legends, which relate that a dragon-horse symbols on its back, and a tortoise with a s of writing on its back, came out of the r which Yu interpreted and made the basis o ninefold division of philosophy.—*Schlagentw General Hypsometry of India*, ii. p. 98; *Renne Memoir*, pp. 337, 361; *Fraser's Himalaya Mo tains*, p. 468; *Herbert; Hodgson; Tod's Rajast* i. p. 16; *Rep. ROADS have existed in India from the n ancient times, but since artillery has been use war, and since parts of India have been in possession of the British, the French, the Du the Portuguese, and the Danes; efforts have b made to extend them. Roads were made by

eks and Romans, but never by the Arab or the
v. The British, on assuming the government
the country, found that the roads which the
ghul emperors were said to have made had not
paved. In 1850, Lord Dalhousie commenced a
rom Hindustan to Central Asia, from which,
n an unfinished state, benefits have arisen.
riginal idea was that the road should be avail-
r wheeled carriages through its entire length.
l Trunk Railway, the Via Appia of India,
0 miles, from Calcutta to Lahore. The
Tal, Ranikhet, and Darjiling roads
f the Himalayas; and the Ganges,
Kistna canals are triumphs of
neering s India is traversed by railroads
side to side, and from sea to sea, by several
st parallel lines. Each of the seaports of the
sula is the terminus of at least one line, and
in the whole length and breadth of the land
will not be two places of prime importance
one to the other of which passengers and
handise may not be carried by rail.

OALA, an Arab tribe in Syria, who have a
radle, a car composed of ostrich feathers, in
the most beautiful of their maidens is carried
e them in their fights.

BERTS, an American missionary who, in
with an earnest Chinese disciple, kindled
great evangelical movement amongst the
se, which the Tae-ping blended with a national
le.—*Bunsen, God in Hist.* i. p. 270.

BERTS, MAJOR-GENERAL SIR FREDERICK,
, V.C., C.I.E., Bart., a highly-distinguished
of the Royal (Bengal) Artillery, who earned
me in Hindustan and Afghanistan. He
throughout the Indian Mutiny of 1857-58 as
t. Qr.-Mr.-General of Artillery, including the
and capture of Dehli from the 28th June to
th September (wounded 14th July, horse
th September), in the actions of Baland-
horse shot), Alighur, Agra, Kunoj (horse
and Bandhara; present in the skirmishes
and throughout the operations connected
relief of Lucknow by Lord Clyde; opera-
Cawnpur from 28th November to 6th
er 1857, and defeat of the Gwalior Con-
; action of Khudagunge, re-occupation of
ghur, storm of Meangunge, action of Koorsee,
e various operations ending with the capture
icknow (thanked by the Governor-General,
ria Cross, brevet of major, medal with three
s). Employed on special service with the
dition of 1863 against the tribes on the N.W.
tier of India, and was present at the storming
aloo, capture of Umbeyla, and destruction of
lkah (medal with clasps). Served in the Abys-
an campaign from January 1868, as Assistant
rtermaster-General with the Bengal Brigade;
as Senior Officer of the department at Zoulla,
erintended the re-embarkation of the whole
y; was selected by Sir Robert Napier as the
er of his final despatches (brevet of Lt.-Colonel
medal). Served as Assistant Quartermaster-
eral and Senior Staff Officer with the Cachar
mn, Lushai expeditionary force in 1871-
and was present at the capture of the Kholel
ages, and attack on the Northlang range.
manded the troops engaged at the burning
he village of Taikoom, 26th January 1872
3.). Has been twenty-three times mentioned
lespatches. Commanded the Koorum field force from the commencement of the Afghan war in 1878, and was present at the storming and capture of the Peiwar Kotal, and the pursuit of the Afghan army to the Shutargardan, at the affair in the Maugaor pass, and during the operations in Khost (received the thanks of both Houses of Parliament, and K.C.B.). Commanded the Kābul field force during the advance on and occupation of Kābul in the autumn of 1879; and present in the engagement at Charasiab, and throughout the operations at Sherpur during the winter of 1879-80. Commanded the Kābul-Kandahar field force which marched from Kābul to Kandahar in August 1880, relieved the Kandahar garrison, and on the 1st September defeated and dispersed the army under Ayub Khan (G.C.B., baronet, medal with four clasps, and bronze decoration). He was appointed Commander-in-Chief of the Madras army.

ROBIN. The Indian black robin, or dayal bird, Thamnobia fulicata, *L.*, is generally distributed over most parts of Hindustan, and always found near the habitation of man. In manner and habits it is the oriental representative of the red-breast, just as the migratory thrush takes the place of the thrush with the Canadian emigrant. In the elevations of the Kandyan country there are a few birds, such as the robin of Newera ellia, and the long-tailed thrush, whose song rivals that of their European namesakes; but, far beyond the attraction of their notes, the traveller rejoices in the flute-like voices of the oriole, the dayal bird, and some others equally charming, when at the first dawn of day they awake the forest with their clear reveillé. The Ceylon dayal bird, Copsychus saularis, *Linn.*, is called by the Europeans in Ceylon the magpie robin, but is not to be confounded with the other popular favourite, the Indian robin, Thamnobia fulicata, *Linn.*, which is never seen in the unfrequented jungle, but, like the cocoanut palm, which the Singhalese assert will only flourish within the sound of the human voice, it is always found near the habitations of men.—*Tennent's Ceylon; E. L. Layard.*

ROBINIA AMARA. Ku-san and Ti-hwai, CHIN. A plant of Ho-nan in China; roots medicinal. R. macrophylla, GANJ., HIND., is a huge climber, common a little to the west of the Jumna.

ROC, Rukh, or Rokh, a bird of gigantic stature, supposed, if not wholly fabulous, to be now extinct, and to have inhabited Madagascar; mentioned in Sinbad and Ibn Batuta's voyages. It has been said to be the Si-murg'h, and has been supposed to be the same as the Garuda of the Hindus. It may have been the Dodo of the Mauritius. Madagascar has furnished from very modern strata the leg-bones and two eggs of an extinct wingless bird, named Epyornis, probably larger than an ostrich. The egg of this bird is 2½ feet in girth and 3 feet in its longest circumference, and its liquid contents equal more than two gallons. New Zealand had many species of the Moa or Dinornis. Professor Owen has described eighteen, and D. elephantopus, *Owen*, D. giganteus, *Owen*, and D. didinus, may be named, varying in size from 3 to 10 feet in height.—*India in the 15th Century.*

ROCELLA, a genus of lichens of the natural order Lichenaceæ. These are largely exported from Ceylon, Bombay, Mozambique, Angola, Lima, and Cape Verde, under the term orchella-weed.

They are used in dyeing, and are popularly called orchill or archill, terms derived from the oricello of the Italians or the Spanish orchella, often corrupted in commerce into rochilla-weed. Rocella fuciformis, the flat-leaved orchill, is found on maritime rocks, or on dry-stone walls exposed to the influence of the sea breeze, as well on the coast of Britain as on the shores of the Mediterranean and the East Indies. The more arid the situation, the better is the quality of the lichens. The presence of the colouring matter is ascertained by steeping the weed broken into small pieces in diluted solution of ammonia, in a bottle half filled with liquid, which should be kept corked, but frequently opened in a temperature not exceeding 159° Fahr. Rocella tinctoria, *D. C.*, the dyer's rocella or orchill, when good, has a mealy white powder on its surface towards the centre; the under surface is of a grey colour, and is not hairy; if wetted, it does not turn of an orange colour; its edges are flat and thin. Various lichens, from Tenasserim and other parts of India, were introduced into Britain by the East India Company. Lichens used in the manufacture of cudbear, orchill, and litmus, and of the dye substance obtained from them, were shown in the Exhibition of 1851.—*Simmonds; Hogg.*

ROCK-CRYSTAL.

Shwin-tsing, Shwi, CHIN.	Koreh, ... HEB.
[illegible], . . . ,,	Balur, ... HIND.

[illegible] common name for the trans-

Rock-crystal is the co[illegible] it is the purest parent crystals of quartz, of w[illegible] form, being composed of 99·34 per cent. of silica, with a trace of alumina. The crystal alluded to in Genesis xxxi. 40 as frost, and in Job vi. 16 as ice, and the Persian word Balur, seem to be applied indifferently to ice and rock-crystal. Rock-crystal occurs abundantly in many parts of India, and that of the south of the Peninsula is known as Vellum stone, from the place of its occurrence. Near Tanjore the mines are of great value, and the stone is cut into a great variety of ornamental objects.

The districts in British India richest in quartzose minerals are those of Dowlatabad, along the banks of the Scena river, and the neighbourhood of Rajpipla. It is found at Madagoolah.

The village of Aurangpur is situated in a small valley surrounded by hills, and the roads leading to it from all sides are, for a distance of three miles at least from the village, impassable to any but foot passengers and cattle, from their rocky and precipitous character. Its mines of rock-crystal are situated about two or three miles to the south-west of the village, and can only be approached by paths like those just described. The deposit of crystal occurs in a small valley or basin among these hills, about two or three miles to the south-west of the village of Aurangpur. The valley is about 500 yards long, and from 50 to 100 yards broad, and dips towards the north. The only part of the deposit which has been worked is the south end. If made red-hot, and plunged repeatedly into the tincture of cochineal, it assumes a ruby colour; if into a tincture of red sandal, it takes a deep red tint; into tincture of saffron or a tincture of turnesol, a yellow like the topaz; into juice of nerprum, it takes a deep violet like the amethyst; and into a mixture of tincture of turnesol and saffron, it becomes an imitation of the emerald. Steeping the crystal in oil of turpentine saturated with verdigris [illegible] spirits of wine, holding dragon's blood or oth[illegible] coloured resins in solution, depth of tints a[illegible] produced proportioned to the time of steepin[illegible] Crystals can be coloured if heated in a cr[illegible] with orpiment and arsenic. Crystal coloure[illegible] as false rubies, are known in France as ruba[illegible] *King*, p. 178. See Precious Stones.

RODA. ARAB. Literally a garden. In[illegible] and Hindustan pronounced Roza, a buri[illegible] also an island in the Nile near Cairo[illegible] meter is at its southern extremity.

RODENTIA, the gnawing trib[illegible]

Fam. Sciuridæ, Squ[illegible]

RODUNG. HIND. In the trade lists o[illegible] N.W. frontier of India, are two kinds of ma[illegible] one called rodung kuhree, grown at Kand[illegible] which is superior, and the other kind, r[illegible] white [illegible] require[illegible] phurreah. The plant is stated to [illegible] years to come to maturity. The value of [illegible] brought through the Baluch and Afghan [illegible] tains is stated to be £12,228. Multan is a [illegible] emporium for madder. The Kābul merc[illegible] come thither direct from Dehra Ismail Kha[illegible] Leia, and exchange their madder for cott[illegible] indigo.—*Powell's Handbook*, i. p. 463.

RODYAH, a forest race amongst the Ka[illegible] They are skilful in the manufacture of ro[illegible] the black fibre of the leaf-stalk of the [illegible] urens. Physically speaking, they are mu[illegible] finest race in Ceylon, but they are looked u[illegible] the rest as out-castes, unfit to be commu[illegible] with. At one time they were liable to be [illegible] death if they touched or approached the h[illegible] castes.—*Egerton's Tour in India*, i. p. 121.

ROE, SIR THOMAS, was sent as ambass[illegible] from James I. of England and VI. of Scotlan[illegible] the Emperor Jahangir. He sailed from Grave[illegible] 24th January 1615, and landed at Surat [illegible] great pomp, with eighty men-at-arms in his tra[illegible] and arrived at Ajmir on the 23d December, a[illegible] was received at the court with unusual honour [illegible] the 10th January 1616. After a residence of [illegible] years, he obtained permission of the emperor [illegible] the English to trade at Surat. He accompa[illegible] the emperor to Mandu, and left him in the en[illegible] 1618. He praises the magnificence of the co[illegible] speaks in high terms of the courtesy and hospita[illegible] of the nobility, and he was treated by the emp[illegible] as a friend, joining the emperor's drinking par[illegible] He says the great men, as a class, were all open[illegible] corruption. His Journal of his Voyage to the E[illegible] Indies, and Observations there during his Reside[illegible] at the Moghul Court in 1615-18, was published[illegible] Paris in 1663.—*Elphinstone*, pp. 490-92.

ROE. Fish roe, red fish, and sardines

alay condiments, and the species used in the eparation are Alausa toli (Ikan trubok), En- aulis Brownii (Bunga ayer or badah), Dussu- ieria acuta (Tamban-bulat), and Clupeonia erforata (Tamban-nepes or batub).—*Cantor.*

OE-BALL of Europeans in Bengal is their e for species of Polynemus, P. uronemus, *Cuv.*, tradactylus, *Shaw*, and P. teria, *Buch.*

OH. PUSHTU. A mountain. Rohilla, a moun- er, a highland and highlander, a dialectal ge from Koh; applied to the Suliman and bar range. Brahui is said to be a term from two words Buan and Roh. Kala-Roh is a ant range of hills, literally black hill; Baga , a near range, literally white hill. Roh is a rict bounded on the east by Swat and Kash- west by the Helmand, north by Kashgar Chitral and Kafiristan. Roh-coj of Sanskrit ers is Arachosia; it includes Ghazni and dahar. Roheyl, in the Heerthur Hills, is N.W. ehwan.—*As. Res.* vi. p. 517, viii. p. 336.

OHILKHAND, a division or commissioner- for administrative purposes of the N.W. inces of British India, comprising the dis- s of Bareilly, Bijnour, Badaon, Moradabad, Jahanpur, and the Terai. Area, 11,805 re miles; population (1872), 5,436,314. 27° 35′ to 30° 1′ N., and long. 78° 1′ to 26′ E. Rohilla Afghans had held a large in those provinces ever since Ahmad Shah's dating invasion in 1761. The Rohillas were gners, and had cruelly lorded it over the try. The Pathan race form only a small the population. The first settlers of ohilla Afghans were two brothers, Shah nd Husain Khan. The son of the first of Daoud Khan, achieved some distinction in the part of the 18th century. But the rise of mily is owing mainly to his adopted son, Ali mad Khan. On the cession of Rohilkhand British in 1801, the family were continued in ssessions. Ahmad Ali Khan died in 1839. cession of his only daughter was rejected, next heir, Muhammad Sayed Khan, the son of Gholam Muhammad Khan, was put in sion of the estate. For his services during bellion of 1857, the nawab received a grant d yielding 1,04,400 rupees on the Moradabad Bareilly frontier. He also received the dignity Knight of the Star of India. In Rohilkhand, Muhammadan landlords rose in the revolt of , and not the Hindu. The *Boksa* are a forest in Western Rohilkhand, and in part of the sts of the Siwalik Hills of Dehra Doon. They of short stature and spare habits, with broad es, depressed noses, prognathous jaws, thick s, very scanty beard and moustaches, but not ker in colour than the ordinary Hindus of the ntry. They are reputed to be skilful in witch- ft. They are very ignorant and indolent, but ple, inoffensive, and good-humoured. They e a scanty, rude cultivation, and collect forest duce and wash gold, but they have no caste, l eat almost anything. They have no separate guage. They are supposed to be dying out. ey are said to enjoy a wonderful immunity m the effects of malaria. The *Bhihar* are an original tribe of the Upper Doab, called in the ab, Bheimhar, and in Rohilkhand, Behar. ey were expelled from Nirauli and the neigh- uring districts by the Bir Gujar Rajput. The *Bhar* of Northern India, called also Bharat, Raj- bhar, and Bharpatwa, are an aboriginal race fol- lowing the meanest of avocations, especially that of swineherds. In the hills east of Mirzapore, there are some Bhar rajas. Tradition ascribes to them the whole country from Gorakhpur to Bun- delkhand, and many old stone forts. Professor Wilson supposes it possible that the name comes from Bharata, an ancient name of India.

Aharwarah is a territory which contains many districts in the north-east frontier of Malwa. The tribe or caste are the *Ahar*, from whom the terri- tory derives its names of Aharwarah, and the Aharat are spread through Rohilkhand and other districts in the N.W. Provinces, following pastoral pursuits. They claim to be descended from the Yadu race of Rajputs.—*Aitcheson; Imp. Gaz.*

ROHILLA. PUSHTU. A term by which Afghans in N.W. India are known. From Roh, a mountain; hence Rohilla, an inhabitant of the mountain, also Rohilkhand. They were fine gallant men, and when managed by good officers, as Colonel Skinner, made excellent and orderly soldiers. The Rohilla, who conquered the exten- sive territory in which the city of Bareilly stands, and bestowed on it the name of Rohilkhand, were a tribe of Afghans. Their intolerance drove the greater part of the Hindu inhabitants from the tract; but successive swarms from Afghanistan supplied the place of the fugitives, and kept the country in a high state of cultivation. The rest- less and enterprising character of the Rohillas led to constant encroachments by them on the possessions of the Nawab Vizir of Oudh. The latter, wearied with resistance, claimed British aid as his allies; and the Governor-General, Mr. Hastings, undertook the war. The Rohillas were subdued, and their country was made over to the Nawab Vizir; a portion of it, containing the city of Rampur, with some dependent towns, being assigned to the heir of Hafiz Rahmat as a jaghir, which was to be held of Oudh on feudal condi- tions. Subsequently the provinces in question were ceded to the British by the Nawab Vizir, and the fealty of the nawab of Rampur was trans- ferred to the British Government.—*Rennell's Memoir*, p. 19; *Marquis of Hastings' Journal*, ii. p. 114; *Wilson's Gloss.; Mr. G. Campbell*, p. 47; *Malcolm's Centr. Ind.* i. p. 325; *Tod's Rajasthan*, i. p. 672.

ROHINI. In the ancient Hindu times, there were several women of this name, one the mother of Bala Rama, one a wife of Krishna; also a constellation personified as one of the wives of Soma, the moon.

ROHITA, the son of king Harichandra, was given by Varuna, but subsequently required as a sacrificial victim by the same. A deified person mentioned in the Atharva Veda.

ROHRI, written also Rori and Lohri, a town on the left bank of the Indus, in lat. 27° 42′ N., and long. 68° 56′ E. It is built on an anciently occupied position, a rocky emi- nence of limestone, terminating abruptly on the western side by a precipice 40 feet high, rising from the bank of the river. It gives its name to a sub-district forming part of Shikarpur collec- torate, lying between lat. 27° 7′ and 28° 32′ N., and between long. 68° 52′ and 70° 15′ E. Area, 4258 square miles; pop. (1872), 217,515 souls. Bounded on the north-east and east by the states

of Bahawulpur and Jaisalmir (Jeysulmir), and on the south by Khairpur. The Muhammadans are chiefly of the Kazi, Sayyid, Bhuta, Kori, Patoli, Muhana, Khati, Memon, Shaikh, and Shikari tribes. The Sayyids of Bukkur and Rori have held lands in gift from about 1290 A.D. Grants of land were also made to them in 1712 by Jahandar Shah, on condition to pray for their imperial masters, and to guard the country from marauders.

The War-Mubarak, a building about 25 feet square, situated to the north of the town, was erected about 1545 by Mir Muhammad, the reigning Kalhora prince, for the reception of a hair from the beard of Mahomed. This hair is set in amber, which again is enclosed in a gold case studded with rubies and emeralds, the gift of Mir Ali Murad of Khairpur. The relic is exposed to view every March, when the hair by some mechanical process rises and falls, which the devotees are led to believe proceeds from supernatural agency.

Rori is sometimes distinguished as Rori Bukkur. When a locality is designated by two names mentioned together, it is either because there are two places bearing these names respectively close to each other, as Hoti Mardan, Taru Jabba, or else, where there is a river, because they are on the opposite banks of the river, as Rori-Bukkur, Thut-Naka, Daghi-Banda, etc.

Bukkur, a fortified island in the Indus river, is in the centre of the stream, nearly opposite the town of Rori, which is on the eastern bank, and on the western bank is Sukkur. Near these places is the site of Arore or Alore, a capital of Sind in remote antiquity. On its site the shepherds of the desert have established an extensive hamlet, on a ridge of silicious rock, 7 miles east of the insular Bukkur, and free from the inundations of the Indus. The Soda, a powerful branch of the Pramara race, ruled in these countries from remote antiquity, and, to a very late period, they were lords of Omra-Soomra, in which division was Arore. Sehl and his capital were known to Abul Fazl, who thus describes it: 'In ancient times there lived a raja named Sehris (Sehl), whose capital was Alore, and his dominions extended north to Kashmir, and south to the ocean.' Sehl or Sehr became a titular appellation of the country, its princes, and its inhabitants, the Sehrai. Alore appears to have been the capital of the kingdom of Sigertis, conquered by Menander of Bactria. Ibn Haukul, the Arabian geographer, mentions it as Azore. D'Anville, quoting Abulfeda, says, 'grandeur d'Azour est presque comparable à Multan.'—*Imp. Gaz.*; *Masson's Journeys*, i. p. 362.

ROHTAK, a town of 14,153 inhabitants, in the Rohtak district of the Panjab, and 42 miles N.W. of Dehli. Rohtak district has an area of 1823 (or 1811) square miles, and a population over 536,959. There are 30,831 Banya traders, a large number of whom profess the Jain creed. Jats, 186,646 of the Hindu faith, and 1458 converted to Islam. They are divided into two principal clans, which entertain towards one another a singular animosity; Gujar (2909), Pathans (5521), and Baluch (2225). Scarcity pressed upon the district in 1824, 1830, 1832, and 1837, a severe famine in 1860–61, and the season of 1868–69 was one of the most disastrous on record. During the mutiny of 1857, Rohtak was for a time completely lost to the British Govern ment. Its Muhammadan tribes united with other in Gurgaon and Hissar, under the nawabs o Farrakhnagar, Jhajjar, and Bahadargarh, and the Bhatti chieftains of Sirsa and Hissar, and the plundered the Rohtak civil station. But be the fall of Dehli, a force of Panjab levies brought across the Sutlej, and order was rest with little difficulty. The nawabs of Jhajjar Bahadargarh were captured. The former executed at Dehli; his neighbour and rela escaped with a sentence of exile to Lahore; t estates were confiscated, and portions w assigned to the rajas of Sind, Patiala, and Nab as rewards for their services during the mutiny

ROHTANG, a mountain pass in the Kan district of the Himalaya, in lat. 32° 22′ 20″ and long. 77° 17′ 20″ E., between Koksar Lahoul and Palchian in Kulu. Its crest is at elevation of 13,000 feet above the sea.—*Imp. G*

ROHTAS, the ancient Rohita, so called f its having been the chosen abode of Rohitas son of king Harichandra of the Solar dynasty. is a hill fort in the Shahabad district of Benga lat. 24° 37′ 30″ N., and long. 83° 55′ 50″ E. image of Rohitaswa was worshipped here, u destroyed by Aurangzeb.—*Imp. Gaz.*

ROHU. HIND. Labeo rohita, *Ham. B* The Ro-hoo and the Mirgah resemble each o in size and habits; they are very much like salmon, but have tiny little mouths with no te The ro-hoo in season has very pretty red fins, th have ash-coloured backs, with silvery b bo they attain to the weight of 20 lbs., and the angler excellent sport at bottom f sometimes engaging him for an hour bef can attempt to land his fish.

ROHUN, also Rohuna and Rohitaka. Soymida febrifuga, *Juss.* Its bark, Rohu chilke, is not spotted with rusty patches, a inside is dark, reddish brown; nitric aci not stain it of a bright scarlet. These te tinguish it from the poisonous bark of t vomica tree (Kuchila), which is commonl for it in the bazars of Bengal.—*Beng. Phar.*

ROLA. HIND. A powder made of the bispinosa flour, coloured with kussumba kamila, etc. It is used by Hindus during holi festival to throw at one another. is also a compound of rice, turmeric, alum, an acid, used to make the tilak or sectarian m on the foreheads of Hindus; powder of chandan or sandal-wood is also used.—*Powell.*

ROLLER, the name of Indian birds of the fam Coracidæ, viz. Coracias affinis, garrula, and Indic They are large, showy, handsome birds, with ri blue colours.

ROLLERS, waves which occur in the Sou Atlantic, at St. Helena, Fernando, Noronho, a Ascension Island. All is tranquil in the distan the sea-breeze scarcely ripples the surface, when high swelling wave is suddenly observed rolli towards the island, to break on the outer ree with a violence as great as if a furious tempe raged. Their cause is unknown. See Ripples.

ROLONG, the hard central part of whea grains, callen also soojie. When rolong is crush in a smooth, suitable vessel, such as an aga mortar, and examined with a power of about 3 diameters, it is seen to contain a very large pr portion of small cells running down to one-four

he size of those of *rice*, and which appear to exist mbedded in cellular tissue, which is seen broken p, and to portions of which the cells are still ttached. In fine flour the cells are very conrably larger, if anything more tenticular, and h more clearly marked. See Bread; Soojie; cat.

OMA-KA-SIDHANTA, an astronomical trea- by an ancient Hindu, supposed to be from Greeks of Alexandria.—*Elph.* p. 131.

OMAN, a name applied to the rulers and ple of ancient Rome, who succeeded the eeks in their Asiatic territories. The Romans nquered most parts of Europe, the northern t of Africa, Syria, and Palestine, and left last- improvements in the roads and education of countries which they occupied. The official guage was Latin, and the modern Romance guages, viz. Italian, Wallachian, Provençal, nch, Spanish, and Portuguese, are closely ted to each other, all derived from Latin. ording to the author of the Periplus of the Sea, Aden had been destroyed by the nans shortly before his time; and Dean cent is of opinion that the Cæsar in whose n this event took place was the emperor dius. The object of destroying so flourishing ort is not difficult to determine. From the e that the Romans first visited Arabia under us Gallus, they had always maintained a foot- on the shores of the Red Sea, and it is pro- e that Claudius, being desirous of appropriating dian trade to the Romans; sought a pr[illegible] text rrel with Aden, in order that he might by struction divert the Indian trade to the of Egypt. Valerian, a Roman emperor, been conquered by Shahpur in a fort near h, was led into Susiana, where the Persian ch, undertaking some extensive structures ushter), obliged his captive to assist in the by procuring experienced artists from Rome ce, and he promised that liberty should be ward of the co-operation. The task was ned, and Shahpur observed his promise, rst cut off the Roman emperor's nose, to him with an indelible mark of captivity.

mong the Hindus of India are many social oms similar to those of the ancient Romans. ong the religious rites of the ancient Romans, ir lustral ceremonies and their worship of apus were the same with those of the modern dus. The village community of India, also, t once an organized patriarchal society and an emblage of co-proprietors. The personal rela- ons to each other of the men who compose it are distinguishably confounded with their propriery rights, and to the attempts of British funcnaries to separate the two may be assigned me of the most formidable miscarriages of itish Indian administration. So soon as a son a Hindu is born, he acquires a vested interest his father's substance; and the domain thus ld in common is sometimes administered by an ected manager, but more generally by the eldest presentative of the eldest line of the stock. he village community, however, is more than a dy of co-proprietors; it is an organized society, ving its staff of officers for internal govern- ent. This seems the type of the Gens or House the ancient Romans; and although both in dia and at Rome each community was assumed to have sprung from two common ancestors, the fact was that these houses and villages were recruited by new members, who were admitted by adoption, or by some analogous process. The researches of Haxthausen and Tengoborski have lately proved that the Russian villages are organized communities of a similar character. And the same principle seems to prevail in Servia, in Croatia, and the Austrian Sclavonia—in fact, wherever feudality has had small influence, and wherever there is the nearest affinity between the western and the eastern world. The colonists of New Zealand have been long engaged in disputes with the natives, which turned upon the precise point under discussion. While the Colonial Government insisted that any member of a tribe is entitled to sell his land to whomsoever he pleases, the natives insist that although one member may transfer it to any other member of the same tribe, he cannot transfer it to any person who is not a member without the consent of the whole tribe, because of the existence of what has been called a tribal right. Thus showing that in the mind of a New Zealander the idea of joint ownership precedes that of separate ownership. By the Roman law, the father was certainly regarded rather as a steward than a proprietor of his goods, and accordingly was not, at first, permitted to dispose of his property as he pleased after his death, and on many of these points the R[illegible] law and the Hindu l[illegible] Roman gener[illegible] assimilates. The Romans [illegible]y burned, [illegible] they sometimes buried their dead, as Hindus now do; children who died in infancy were interred in the immediate neighbourhood of their former homes. Their sepulchral urns with the ashes of the dead were commonly buried about two feet below the surface, and their memorial stones were often inscribed. They used the sarcophagus or massive stone coffin, and also the tumulus or barrow. The Romans bore their dead with much lamentation to the funeral pile, on which, after being lighted, they cast the robes and arms of the deceased, as well as the slaughtered bodies of his favourite animals. The Romans had peculiar modes of divination,—their dies fasti, nefasti, their auguries, etc. Amongst the Hindus are the village gods, of which each village adores two or three, as its special guardians, but sometimes as its dreaded persecutors and tormentors. They bear some resemblance to the penates or lares of the Romans; and, like them, they are sometimes the recognised god of the whole nation, either in their generally received characters, or in local incarnations, but much oftener they are the spirits of deceased persons, who have attracted the notice of the neighbourhood.

The writing character of the ancient Romans is now used by most of the people of Europe, and by the British and their colonies. It is one of great value, and should be everywhere introduced. With much in common, in several of the Indian tongues it at first seems an easy matter to become acquainted with them. But at the first step there is this difficulty, that every language has its separate alphabet, and every province has six or eight alphabets in use. The various nationalities cannot use each other's books, nor write to each other. Even were it possible, out of the fourteen current alphabets of India, to select one for universal use, there is not one of them which it is not extremely difficult to read, difficult to write,

and difficult to print. The natives themselves cannot read them fluently. Even pandits and moonshis are continually obliged to pause for the purpose of spelling the words. A fluent reader of any of the native characters is almost unheard of; but a mere boy who is taught the Roman characters, will, in the course of a few months, read without stopping anything that is given to him. As a general rule, it is impossible to write fast in any of the native alphabets without making so many blunders and omissions that the manuscript becomes an unintelligible scrawl. The greatest difficulty of all, however, occurs in printing. For one language a fount of type is required consisting of not less than 700 letters, simple and compound; another requires 900 letters; a third, 1000, and so on; the cost of preparing such a fount, and the difficulty which a compositor has to contend with in having a 'case' before him with this prodigious collection of characters, are great. With one character in common use, it would be comparatively easy to frame two dictionaries,—one with words common to the Aryan family, the other with Dravidian words; but the many written characters has rendered that impossible, and before the end of the 19th century, if no unexpected change occur, the English language will have become the chief medium of intercourse between the various races [illegible] India.—*Muller's Lectures*, p. 163; in Bri[illegible] *Ed. Jour.*, July 1867; *Ouseley's Travels*, i. p. 287; [illegible] *Origin Elphinstone's India*, p. 179; [illegible] *nedy on the* [illegible] *of Languages*, p. 16.

ROMAN CATHOLIC, a sect of Christians who recognise the Pope of Rome as their spiritual, and many of the sect regard him also as their temporal, chief. They form in India the largest body of the native Christians. Their total number in British India in 1881 was 963,058. The priests of the Portuguese Roman Catholics and of the Society of Jesuits are spread from Goa over all the Peninsula of India. The Italians occupy Hyderabad and Native Burma; the French occupy Mysore, and they have missions in Siam, Cambodia, China, and Japan. The greatest of all their missionaries was Saint Francis Xavier, who laboured in India, the Malay Peninsula, and Japan. Beschi, a great writer, laboured in the south of the Peninsula and Mysore; and in 1871 there were upwards of half a million Roman Catholics in the Tamil country, and only about 24,000 in the vicariates of Eastern and Western Bengal. In 1881, of the total number, there were, in Bombay districts, 115,515; in Cochin, 120,919; in Travancore, 153,815; and in Madras, 473,352; leaving only 99,457 for all Northern India. The dates of Romish doctrines are—

Indulgences introduced n the 15th century, but not sanctioned by a council till 1563.—*Churchman's Magazine for Jan.* 1846.

ROME, a city of Italy, formerly renowned, and styled the 'Mistress of the World.' It is situate in the Campagna di Roma, and is the residence of the Pope. It is built on seven hills and the intermediate valleys along the banks of the Tiber, over which it has bridges; there are squares, fountains, or obelisks in their area. The church of St. Peter, which was finished in 1621, is entirely covered, both within and without, with marble. The length is 730 feet, the breadth 520, and height, from the pavement to the top of the cr that crowns the cupola, 450. The Panthe erected above 120 years before the Christian to the honour of all the gods, is the most per of the Roman temples that now remain; but Colosseum is the most stupendous monumen antiquity. The Pope has three superb pala of which the principal is the Vatican, ne St. Peter's Church; the library of this pala is deemed the largest and richest in the wor Besides the university, which consists of seve colleges, there are numerous academies, liter societies, etc.

RONDELETIA TINCTORIA. *Roxb.*

Ta-ma-yok, . . Burm. | Toora lodh, . . Hi

A small tree of the Kotah and Mewar jungl wood dark-brown. The bark is used in dye red.—*M'Clelland; Irvine.*

RONGDO, meaning the district of defiles, is elevated district on the bend of the Indus, and the frontier of the Gilghit and Hasora countr It is to the westward of Balti, and has an are 1440 square miles. It is about 8000 feet ab the sea, the mean of its villages being 6200 f The people are of Tibetan habits.

The Rongdo villages are mostly small; t have abundance of fruit-trees, of which the a [illegible] the commonest. All over the R [illegible] cot [illegible] Hills the juniper is rather common, and seen quite at home both on the higher ridges a the bottom of the ravine close to the river. excelsa grows there. The fields are manured.—*Thomson's Tr.* p. 256.

RONG-GENG. Burm. Burmese dancing

RONGUEDUE, Ronkedor, or Runkedor. A rogue or solitary elephant.

ROOSA OIL, Grass Oil, or Ginger obtained from the Andropogon calamus ar icus, *Royle* (A. Martini, *Roxb.*), a native low hills at the base of the Himalaya; found at Asirgarh, in Malwa, Gujerat, and Dekhan. Twenty seers of the grass are m with two seers of sesamum oil, and slowly distilled. The oil thus becomes hig impregnated with the peculiar roosa flavo and is sold as such at Rs. 4 a seer. Gr oil is never taken internally by natives, but th have a great faith in it as a stimulant to functions of the several organs, when rubbed externally. They also use it as a liniment i chronic rheumatism and neuralgic pains, but i expense prevents its being used generally. has a fragrant, aromatic smell, persistent, ar very agreeable at first, but after a time the odo becomes unpleasant, and gives many people feeling of sickness with headache. They use for slight colds; also to excite perspiration, rubbing in a couple of drachms on the che before the fire or in the heat of the sun. T pure oil has been used by many European office with wonderful effect in cases of severe rheu matism, but two good rubbings produced suc severe burning as to render a third applicatio impracticable. The oil is chiefly imported in Bombay from Surat, and is re-exported in co siderable quantities to England, China, and th

Arabian and Persian Gulfs. This oil differs but little either in appearance or quality from the lemon grass oil; it is a good substitute for the more expensive cajaputi oil.—*Faulkner; M.E.J.R.*

ROPE.

Habl, Khoit, . . ARAB.	Rasan, ... PERS.
Corde, ... FR.	Cuerda, Soga, . . SP.
Seil, ... GER.	Cordel Sarta, . . ,,
Doodah, . . . GUJ.	Kaur, ... TAM.
Rassi, ... HIND.	Daram, ... TEL.
Corda, ... IT.	Khalat, ... TURK.
Talikalat, . . . MALAY.	

Ropes are made of fibrous materials, spun into [illegible] yarn, of which several strands are twisted [illegible]er, usually by means of a wheel. In common all the different kinds of rope, from a [illegible]-line or whipcord to a cable, go by the [illegible] name of cordage. Among the cordage [illegible]o the Great Exhibition of 1851 were ropes [illegible]cellent quality made of Jubbulpur hemp, at [illegible]qual, if not superior, in strength to that of [illegible]an hemp. When a Petersburg hemp broke [illegible]160 lbs., one of Jubbulpur hemp did not [illegible] with less than 190 lbs.

[illegible]India the mode of making ropes is singularly [illegible]e. One man sits on the ground and lets out [illegible]yarn; another retires half-bent, and spins it [illegible]means of a spindle, the yarn being passed [illegible]ough a wooden hoop hung round his neck. [illegible]gives the spindle a jerk betwixt the palms of [illegible]hands, and keeps its motion up at a very con[illegible]rable degree of speed indeed. When several [illegible] of fine yarn are to be twi[illegible] [illegible]with a spindle is placed at [illegible] whole series are supported [illegible]es of bamboo; a spinner [illegible] [illegible]emity twists all the strands into one, [illegible] [illegible]t piece of board is being passed along, whe[illegible] [illegible]cords are meant to be hard plaited and strong, [illegible]p them from running too rapidly together. [illegible] case of ropes, after the single strands are [illegible]gether, the rope is made up by men twisting [illegible]ger strands by a stout piece of wood,—a [illegible]stronger and longer piece being used for [illegible]tire rope, a man sitting by a board with [illegible]through which the several strands pass, to [illegible]at all go properly together.

[illegible]ndel straw rope is made from Eleusine [illegible]aria. The straw is flat and excessively [illegible]h, so much so that in gathering the crops the [illegible]s are pulled off by hand, leaving the whole [illegible]v standing.

[illegible]anilla rope is made of plantain fibre, and used [illegible]running rigging for ships, or tackling for land [illegible]oses.

Hemp rope from the Cannabis sativa is used for [illegible]nding rigging for ships, or for use in water.

Rope of Sesbania aculeata is used as running [illegible]ging for ships, and tackling for land purposes.

Coir rope from the cocoanut fibre is used for [illegible]ats' and ships' running gear, and for hawsers and [illegible]bles, also for all tackling purposes when exposed [illegible]wet, especially salt water.

Ropes made of Crotalaria juncea are employed [illegible]tackling in dry places without exposure to wet.

Ropes are made at Lahore of a fibrous plant [illegible]lled Chuyan, from Sunn Okra, from the Dib [illegible]d the Putta, from a fibre called Bugar, from [illegible] leaves, Dah grass, and plantain leaves.

[illegible]e of Saccharum moonja is made near the [illegible] Jumna, and Indus. Twine is made from [illegible] of the leaf-sheath; a little thicker kind is used for towing boats; when dry it does not possess much strength, when wet it is strong and durable. The moonja is used also for thatching, etc.

A rope is made at Balasore of Sealee fibre.

Rope of rattan made at Penang, Malay Peninsula, used for drawing water, and as halters for cattle.

Cotton rope is used for hanging and pulling punkahs and tent ropes.

The principal cordage plants of British India are enumerated under the heading Fibrous Plants, *q.v.*, to which the following may be added, viz. :—

Æschynomene cannabina.	Saccharum spontaneum.
Ailanthus Malabaricus.	Smilax ovalifolia.
Aloe vulgaris.	Sterculia fœtida.
Arenga saccharifera.	S. ramosa.
Arundo donax.	Strychnos potatorum.
Bignonia coronaria.	Urtica heterophylla.
Boehmeria argentea.	U. atrofusca.
B. dichotoma and other *sp.*	U. crenulata.
Broussonetia papyrifera.	U. dolabriformis.
Calamus rotang.	U. heptandra.
Celtis caucasica.	U. filiformis.
C. capsularis.	U. funicularis.
Cordia myxa.	U. longispina.
C. angustifolia.	U. nivea.
C. Rothii.	U. paniculata.
Crotalaria tenuifolia.	U. pentandra.
Eleusine coracana.	U. reticulata.
Leptadenia, *sp.*	U. tenacissima.
Morus Indica.	U. virulenta.
Nussiessya hypoleuca.	

ROR. HIND. Kunkur, or broken brick, used in Bengal for gravelling roads.

RORI BAROLLI has a grand temple 58 feet in [illegible]and in the ancient form peculiar to the [illegible] The body of the edifice, in [illegible]um of the god, and over which [illegible]dal sikr, is a square of only 21 [illegible] addition of the domed vestibule [illegible]nd portico makes it 44 by 21. The whole [illegible]s covered with mythological sculpture, without as well as within, emblematic of Siva as Mahadeo, who in Saiva Hindu belief is the giver as well as the destroyer of life. In a niche outside, to the south, he is armed against the Dytes (Titans), the roond mala or skull-chaplet reaching to his knees, and in seven of his arms are offensive weapons. His cap is the frustrum of a cone composed of snakes interlaced with a fillet of skulls; the cupra is in hand, and the victims are scattered around. On his right is one of the Jogini maids of slaughter, drunk with blood, the cup still at her lip, and her countenance expressive of vacuity; while below, on the left, is a female personification of death, mere skin and bone; a sickle (koorpi) in her right hand, its knob a death's head, completes this group of the attributes of destruction.

To the west is Mahadeo under another form,—a beautiful and animated statue, the expression mild, as when he went forth to entice the mountain-nymph Mera to his embrace. His tiara is a blaze of finely-executed ornaments, and his snake-wreath, which hangs round him as a garland, has a clasp of two heads of Sehesnag (the serpent-king), while Nanda below is listening with placidity to the sound of the damroo. His cupra and kharg, or skull-cap and sword, which he is in the attitude of using, are the only accompaniments denoting the god of blood. The northern compartment is a picture disgustingly faithful of death and its attributes, vulgarly known as Bhooka Mata, or the personification of

famine, loud and bare; her necklace, like that of her lord, is of skulls. Close by are two mortals in the last stage of existence, so correctly represented as to excite an unpleasant surprise. The outline is anatomically correct. The mouth is half open and distorted, and although the eye is closed in death, an expression of mental anguish seems still to linger upon the features. A beast of prey is approaching the dead body, while by way of contrast a male figure, in all the vigour of youth and health, lies prostrate at her feet.

Such is a faint description of the sculptured niches on each of the external faces of the mindra, whence the spire rises, simple and solid. In a Hindu temple is the mindra or cella, in which is the statue of the god; then the munduf, in architectural nomenclature, is the pronaos; and third, the portico. Like all temples dedicated to Bal-Siva, the vivifier, or sun-god, it faces the east. The portico projects several feet beyond the munduf, and has four superb columns in front. The ceilings, both of the portico and munduf, are elaborately beautiful; that of the portico, of one single block, could hardly be surpassed. The exterior is a grand, wonderful effort of the silpi or architect, one series rising above and surpassing the other, from the base to the urn which surmounts the pinnacle. The sanctum contains the symbol of the god, whose local appellation is Rori Barolli, a change from Balrori, from the circumstance of Balnath, the sun-god, being here typified by an orbicu[lar] stone termed rori, formed by attrition [in] chooli or whirlpools of the Ch[ambal] the temple stands, and to wh[ich] probably owed its foundation. [The] is not fixed, but lies in a groove [in] ring of the Yoni; and so nicely is it [bal]anced with a very moderate impulse it will continue revolving while the votary recites a tolerably long hymn to the object of his adoration. The old ascetic, who had long been one of the zealots of Barolli, amongst his other wonders, gravely told Colonel Tod that with the momentum given by his little finger, in former days, he could make it keep on its course much longer than now with the application of all his strength.—*Tod's Rajasthan*, ii. p. 706.

ROSARIES.

Tasbih, Masbaha, . ARAB.	Rosenkrans, . . . GER.
Rosaire, ... FR.	Rosario, ... IT.
Rosenbeet, ... GER.	Rosaro, ... SP.

Rosaries are used by Buddhists, Christians, Muhammadans, and Hindus. The Muhammadans, as each bead passes through their hands, recite one of the hundred attributes of the Creator. Their rosary has 100 beads; that of the Burmese Buddhists, 108. The thousand names of Vishnu and Siva are strung together in verse, and are repeated on certain occasions by Brahmans, as a litany accompanied sometimes with the rosary. As each name is mentally recited, with the attention abstractedly fixed on the attribute or character of which that name excites the idea, a bead is dropped through the finger and thumb; such operation is supposed to assist or promote abstraction, an attainment which enthusiastic Hindus think exceedingly efficacious. Brahmans and pious men of other castes are often seen with rosaries in their hands. These are composed of amber or of the rough seeds of fruits which are sacred to the gods. Images and pictures of Brahma and of Siva are frequently to be see[n] with a rosary in the hand, and the hand is some[times] times seen enclosed in a loose bag. There is n[o] authority for supposing that the Jews or th[e] earlier Christians used rosaries. The Christia[n] rosaries are of beads and seeds. The seeds of th[e] Abrus precatorius and of the olive, and beads of wood made by the turner, are used. Muham[madans] madans use beads made of quartzose mineral. Rosaries and charms are made at Kandahar fr[om] chrysolite, a silicate of magnesia quarried from hill at Shahmaksud. It is generally opaqu[e] varies from a light-yellow to bluish-w[hite]. *Bellew; Moor's Pantheon*, p. 24.

ROSCOEA, a genus of showy plants [belong]ing to the Zingiberaceæ; species occur[ring] 9000 feet in the Himalaya and on the Nei[lgherry] mountains, viz.:—

[The] Rose tribe of plants of [the] the genera Agromonia, Dalib[arda], Geum, Hotelia, Neillia, Potentilla, [Rubus], Rubus, Schizonotus, Sibbaldia, Sieversia, Spiræa. Rose trees grow in India, both wild cultivated, and the flower is much prized. yellow roses are found in Kashmir, Laho[ul] Tibet. Lowther states they are sometimes and Thomson mentions double yellow r[oses] 11,000 feet in Ladakh. The yellow Persi[an] finds its eastern limit in Lahoul, but Fortun[e] China yellow rose in the gardens of the ma[rch] during the early months of the year. The had something of buff in it, which gave the f[low]er an uncommon appearance. It was a most b[eau]ful double yellow climbing rose from the northern districts of the empire. Another which the Chinese call the 'five-coloured,' also found in one of these gardens at this [time]. Sometimes it produces self-coloured blooms, b[ut] either red or French-white, and frequently ha[s] flowers of both on one plant at the same ti[me] while at other times the flowers are striped w[ith] the two colours. The rose was known in early tim[es] and was as great a favourite among the nations antiquity as it is in modern times. It is found almost every country of the northern hemisphe[re] both in the Old and New World. All the spec[ies] are included between lat. 70° and 19° N. I[t] found more generally on dry and free soils t[han] on those which are wet and tenacious. In north of Europe it occurs with single flowers, in Italy, Greece, and Spain more frequen[tly] double. The flowers of the rose have a gr[eat] variety of colours, from the deep-red to yellow and white, with every intermediate In India, the easiest mode of propagatio[n] layers at almost all seasons, or by cuttin[gs]

commencement of the rains. The Persian varieties, ed and white, require to have their roots opened nd the plants cut during the early part of the cold season, after which they must be watered well every second or third day. The roots must then be covered up with manure, when they will throw out flowers. The Rose Edward, which blossoms a great part of the year, requires pruning bout a month after it ceases to blossom, and hould be allowed to rest a short time without atering, when a fresh supply of water and anure round the roots will cause it to bear wering shoots immediately. This rose, and e Egyptian, are amongst the few that give seed-os, being perfectly formed on both. Some of e roses in China are peculiar from having trans-rent dots on their leaves, resembling those of myrtles, and with the Chinese the roots and its of rose trees are officinal.

Rosa brunonis, *Lind.*

o, Kuji, Gangari, BEAS,	Gulab-ghuri, . . PUSHTU.
ar, ... CHEN.	Kajer, Kui, Kajri, SUTLEJ.
liari, Chal, . JHELUM.	Gulab-ghurei, TR.-INDUS.
lwari, Krur, KANGRA.	

This fine wild white rose climbs luxuriantly r bushes and even tall trees. It is common in outer Himalaya from 2400 to 7000 feet, up to probably beyond the Indus. It furnishes a ll-sized wood, which makes walking-sticks. Murree they call it 'chal;' but this they also ly to the jasmine.

ose canina, the dog rose, Kin-ying-tsze, CHIN., in Kiang-si and ot[illegible] ; fruits large and [illegible] edicine.

osa centifolia, *Linn.*

rovincialis, *Miller*.	R. centifolia muscos.

rose, . . ENG.	Gul-i-sad-barg, . . PERS.

a native of Syria, is cultivated through-rope, British India, Persia, and China, and rose-water and atr or otto of roses are red. The stem or kubjak is used by the Hindu icians in medicine. Its fragrance is but par-destroyed by desiccation, and according to hereau is remarkably augmented by iodine. less astringent than the Provence rose, and e laxative. The petals are used as laxatives children, and also made into the conserve of s or gul-khand. The petals of this as well as the R. gallica are preserved with salt by the ropean apothecaries for the preparation of the tilled water.

Rosa damascena, *Mill.*, the damask rose, is cultivated in gardens in India for the sake of its owers; it is supposed to have been originally rought from Damascus, and to be a native of yria. It has many varieties. The essential oil f the petals sells at 2 rupees per tola.

Rosa eglanteria, *L.* Native country unknown.

Rosa gallica, the French rose, Provence red rose, supposed to be the species to which Pliny refers (Hist. Nat. xxi. pp. 18, 25, 72, 73). Is a native of ersia, found wild about Montalbanum, Walzen-erg, and Geneva, in Austria, Piedmont, and the aucasus; it has equal small prickles, erect wers, ovate sepals, and globose fruit. Hundreds varieties of this rose are found cultivated in dens. A great number of varieties of them e hybrids between R. gallica and R. centifolia. They mostly combine the long graceful shoots of the latter with the rich crimson hues of R. gallica. Hybrids are also produced between R. gallica and R. Indica, but differ from the last in not being perpetual. The petals contain tannic and gallic acid, essential oil, oxide of iron, and other unimportant principles. The petals are gathered before becoming quite ripe; they are deprived of the calyx and central attachments, and dried before the sun or in a stove. When dried they are sifted in order to separate the stamina and pistil. They are then gently compressed and kept in a dry place. From the cabbage rose, a variety of this species, a very fragrant distilled water is prepared in England.

Rosa glandulifera is the Gul seoti or Sewati of the Panjab.

Rosa inserta is the Nasrin kubjak.

Rosa macrophylla.

Gulab jikjik, . . CHEN.	Ban-kujru, Yal, . SUTLEJ.
Phulwar, Phulian, HIND.	Trind, Tumbu, . ,,
Ban-gulab, Akhiari, RAVI.	

This great red rose tree grows over a wide range in the N.W. Himalaya up to the Indus from 4500 to 10,500 feet. Its fruit is eaten, and is stated by Madden to become very sweet when black and rotten. In Kanawar, a perfume is extracted from the flowers for export towards the plains. It is one of the most beautiful Himalayan plants. Its single flowers are as large as the palm of the hand.

Rosa moschata, [illegible] the musk rose, is found native [illegible] frica, and in the temperate and [illegible] Spain.

[illegible] sweet-briar or gul-nasrin, is [illegible] ndian gardens; it sometimes [illegible] on the Persian rose stock. [illegible] propagation is by layers, but a much quicker and easier method is to bud it on the stock of a rose. Tenasserim residences are often filled with sweet odours from the graceful eglantine or sweet-briar, but the plant is kept alive with difficulty when exposed to the south-west monsoon.

Rosa semperflorens, the Yueh-ki-hwa of the Chinese, is the Chinese monthly rose, a common scrambling shrub bearing a regular profusion of red flowers, mostly barren, but used medicinally.

Rosa sericea is an erect, white-flowered rose, and is the only species occurring in Southern Sikkim. It is very abundant. Its numerous inodorous flowers are pendent, apparently as a protection from the rain, and it is remarkable being the only species having four petals, instead of five.

This rose is found chiefly in the rat[illegible] tracts of the Panjab Himalaya from 500[illegible] feet, up to near the Indus, and in Ladakh 13,500 feet. Its fruit is eaten, and [illegible] Spiti the stems are largely used for [illegible] *horn; Fortune's Wanderings*, p. 31[illegible] *Journ.* i. p. 168, ii. p. 43; *Mason; O[illegible] Riddell; Smith; Stewart; Roxb.* ii.

ROSE, HUGH, LORD STRATHN[illegible] guished politician, commander, an[illegible] In Europe public attention was [illegible] affairs of Syria, where Lord [illegible]

hazard of a war with France, effectually checkmated Thiers, drove Ibrahim Pasha back into Egypt, and restored Syria to Ottoman rule. The part taken by Sir Hugh Rose in that brilliant line of policy was prominent, and as a reward for his services he received from Great Britain the Companionship of the Bath, from Prussia the Cross of St. John of Jerusalem, and from the Sultan a sword of honour. After passing many years in the diplomatic service, he acted as British ambassador at Constantinople, in the absence of Stratford Canning, and at a critical moment he ordered the British fleet to the mouth of the Dardanelles, for which he received the thanks and support of the British Government. Subsequently, and throughout the whole of the Crimean war, Sir Hugh Rose served as Commissioner with the French army, and gained the respect of the British authorities, and also of the principal officers in the French army. For his services in the war with Russia, he was created K.C.B., and received the Crimean medal and clasps, the rank of Commander of the Legion of Honour, the third class of the Medjidi, and the Turkish medal.

When he landed at Bombay in the autumn of 1857, Lord Elphinstone at once gave him the command of the force to which was confided the duty of crushing rebellion in Central India, and of marching to join Sir Colin Campbell's army in Bengal. He took command of the field force [illegible] December 1857, captured Ratgurh 29th January 1858, Garrakota 13th February, and Chandaree 17th March; defeated Tantia T[illegible] 1st April; stormed Jhansi, 3d [illegible] mutineers at Golowlie, 22d A[illegible] 23d April; defeated the Gw[illegible] June; restored the Mahara[illegible] 1858; and became Comman[illegible] 4th June 1860.

This small column, few in numbers, was constantly engaged with vastly superior forces of the enemy, and marched for months from victory to victory, suffering fearfully from overexertion, terrific heat, and constant combats, until finally it joined Sir Colin Campbell's troops upon the banks of the Jumna at Calpee.

Leaving Indore at the end of 1857, Sir Hugh Rose first encountered the enemy at Ratgurh, which fort he captured in a few days, and again defeated the raja of Banpore on the Bina. This opened to him the road to Saugor, the garrisons of which had long been hemmed in by the enemy, and which he relieved in February 1858. Still advancing, Sir Hugh Rose's column again met the rebels at the fort of Gangakota, which he took, and he then closely pursued the enemy with loss [illegible] Beas. His next operation was in storming [illegible]ss of Mudunpore, and by his success there, [illegible] smaller forts fell into his possession, the [illegible] Jhansi was opened, and the territory of [illegible]h annexed. Sir Hugh Rose then marched [illegible]si, and on his way took the strong fort of [illegible] by storm. Arriving before Jhansi on [illegible] March, he found himself in the presence [illegible]ed city defended by a large army of [illegible] siege guns were few, and his troops [illegible]tly engaged and much overworked. [illegible]teen days the cavalry and artillery [illegible]ort and guarded the ground round [illegible]ok off their clothes, saddles, or [illegible] meantime, whilst the siege progressed and the artillery were endeavouring [illegible] make a breach, Tantia Topee, with an army [illegible] 20,000 men and 20 guns, appeared on the Betw[illegible] Still maintaining his investment of the city, an[illegible] withdrawing as few troops as possible, Sir Hug[illegible] Rose drew up his small force in two lines in orde[illegible] of battle, and by a masterly flank attack utterly[illegible] defeated and routed the rebel army in the fiel[illegible] capturing all their artillery, and pursuing them f[illegible] sixteen miles. In two days after the battle of t[illegible] Betwa, he assaulted and captured Jhansi by sto[illegible] and escalade, with a loss to the enemy of 5[illegible] men. In April, giving the rebels no rest, [illegible] Hugh again advanced towards Calpee, which [illegible] their great depot and arsenal on the Jum[illegible] On his way there he again met the rebels [illegible] Koonch at daylight, defeated and pursued th[illegible] throughout the day, capturing fifteen guns. [illegible] force, however, was becoming perfectly prost[illegible] from constant marching, fighting, over-exert[illegible] and heat. The thermometer stood at 120° in [illegible] shade. Many men dropped down dead from [illegible] stroke. Although to avoid the excessive heat[illegible] marches were made at night, the men wer[illegible] utterly exhausted that even during short halts [illegible] whole force would fall down into a deep sl[illegible] from which they were aroused with difficulty. [illegible] this jaded condition the column arrived, in [illegible] at the banks of the Jumna near Calpee, when [illegible] enemy attacked them at noon on the 23d, [illegible] after a severe encounter were repulsed, a po[illegible] of the Rifle Brigade Camel Corps from t[illegible] [illegible]na having come to the ass[illegible] [illegible]ose at a critical moment. [illegible]s day made Sir Hugh Rose mast[illegible] [illegible]with its arsenal and material of war. [illegible] [illegible]rwards it was announced that Sindia had [illegible] from his capital, and that Gwalior was in th[illegible] of the rebel army. Rapidly retracing his s[illegible] Hugh Rose again met the enemy in a batt[illegible] the walls of that great fortress, and by his [illegible] on that occasion restored the maharaja to his [illegible]

ROSE-ATTAR, the Atr of Asiatics a[illegible] of the English. In India, the perfumed [illegible] attar are obtained in the following manner. [illegible] layers of the jasmine or other flowers, four [illegible] thick and two inches square, are laid on the g[illegible] and covered with a layer of sesamum or any [illegible] oil-yielding seed. These are laid about the [illegible] thickness as the flowers, over which a second l[illegible] of flowers like the first is placed. The se[illegible] wetted with water, and the whole mass cov[illegible] with a sheet held down at the ends and sides [illegible] weights, and allowed to remain for 18 hours in [illegible] form. It is now fit for the mill, unless the pe[illegible] fume is desired to be very strong, when the fad[illegible] flowers are removed and fresh ones put in th[illegible] place. The seed thus impregnated is grou[illegible] in the usual way in the mill, the oil express[illegible] having the scent of the flower. At Ghazipur t[illegible] jasmine and bela are chiefly employed; the oil[illegible] kept in bottles of hide, called dubbers, and s[illegible] for about four shillings a seer. The newest [illegible] afford the finest perfume. In Europe a fixed [illegible] usually that of the bean or morunga nut, is employ[illegible] Cotton is soaked in this, and laid over layers [illegible] flowers, the oil being squeezed out so soon [illegible] impregnated with perfume. Dr. Jackson [illegible] describes the culture of the rose in India, [illegible] manufacture of rose-attar or rose-water. Ar[illegible] the station of Ghazipur, there are about 300 big[illegible]

or about 150 acres) of ground laid out in small detached fields as rose gardens, most carefully protected on all sides by high mud walls and prickly-pear fences, to keep out the cattle. These lands, which belong to zamindars, are planted with rose trees, and are annually let out at so much per a for the ground, and so much additional for rose plants,—generally 5 rupees per bigha, and rupees for the rose trees, of which there are 0 in each bigha. The additional expense for ltivation would be about 8 rupees 8 annas; so t for 38 rupees 8 annas you have for the season igha of 1000 rose trees. If the season be good, s bigha of 1000 rose trees should yield 1 lakh roses. Purchases for roses are always made at much per lakh. The price, of course, varies ording to the year, and will average from 40 to rupees. The rose trees come into flower at the inning of March, and continue so through April. ly in the morning the flowers are plucked numbers of men, women, and children, and are veyed in large bags to the several contracting ties for distillation into rose-water. The culti- rs themselves very rarely manufacture. The ve apparatus for distilling the rose-water con- of a large copper or iron boiler well tinned, able of holding from 8 to 12 gallons, having a e body with a rather narrow neck, and a mouth t 8 inches in diameter; on the top of this is l an old pot or deghchi, or cooking vessel, a hole in the centre to receive the tube or n. This tube is composed of two pieces of boo, fastened at an acute angle, and it red the whole length with a strong binding rded string, over which is a luting of earth t the vapour from escaping. The small t two feet long, is fixed into the hole in e of the head, where it is well luted with nd water. The lower arm or end of the arried down into a long-necked vessel or called a bhubka. This is placed in a pot which, as it gets hot, is changed. The the still is luted on to the body, and the n of the tube in the bhubka is also well d with a cushion of cloth, so as to keep in our. The boiler is let into an earthen e, and the whole is ready for operation. s a great variety of rose-water manufactured bazar, and much that bears the name is more than a mixture of sandal oil. The se-water, however, procurable in the bazar e computed as bearing the proportion of oses to a seer of water; from 1000 roses enerally a seer and a half of rose-water is d, and perhaps from this even the attar has emoved. The boiler of the still will hold 000 to 12,000 or 16,000 roses. On 8000 from 10 to 11 seers of water will be placed, seers of rose-water will be distilled. This, distillation, is placed in a carboy of glass, exposed to the sun for several days to be- puckah or ripe; it is then stopped with and has a covering of moist clay put over coming hard, effectually prevents the escaping. This is the best that can be d the price will be from Rs. 12 to 16. re the attar or otto of roses, the roses nto the still, and the water passes over ly, as in the case of the rose-water process; he whole has come over, the rose-water is in a large metal basin, which is covered with wetted muslin tied over to prevent insects or dust getting into it; this vessel is let into the ground about two feet, which has been previously wetted with water, and it is allowed to remain quiet during the whole night. The attar is always made at the beginning of the season, when the nights are cool. In the morning the little film of attar which has formed upon the surface of the rose-water during the night is removed by means of a feather, and carefully placed in a small phial; and day after day, as the collection is made, it is placed for a short period in the sun, and after a sufficient quantity has been procured, it is poured off clear, and of the colour of amber, into small phials. Pure attar, when it has been removed only 3 or 4 days, has a pale greenish hue; by keeping, it loses this, and in a few weeks' time it becomes of a pale yellow. The first few days' distillation does not produce such fine attar as comes off afterwards, in consequence of the dust or little particles of dirt in the still and the tube being mixed with it. This is readily separated, from its sinking to the bottom of the attar, which melts at a temperature of 84°. From one lakh of roses it is generally calculated that 180 grains, or 1 tola, of attar can be procured; more than this can be obtained if the roses are full-sized, and the nights cold to allow of the congelation. The attar purchased in the bazar is generally adulterated, mixed with sandal oil or sweet oil. Not even the richest native will give the price at which the purest attar alone can be obtained, and the purest that is made is sold only to Europeans, selling at from 50 to 90 rupees the tola.

In India, native stills are let out at so much per day or week, and it frequently occurs that the residents prepare some rose-water for their own use as a present to their friends, to secure their being provided with that which is the best. The natives of India never remove the calyces of the rose flowers, but place the whole into the still as it comes from the garden. The best plan appears to be to have these removed, as by this means the rose-water may be preserved a longer time, and is not spoiled by the acid smell occasionally met with in the native rose-water. It is usual to calculate 100 bottles to 1 lakh of roses. The rose-water should always be twice distilled; over 10,000 roses, water may be put to allow of 16 or 20 bottles coming out; the following day these 20 bottles are placed over 8000 more roses, and about 18 bottles of rose-water are distilled. This may be considered the best to be met with. The attar is so much lighter than the rose-water, that previous to use it is better to expose the rose-water to the sun for a few days, to allow of its being well mixed; and rose-water that has been kept six months is always better than that which has recently been made. At the commencement of the rose season, people from all parts come to make their purchases, and very large quantities are prepared and sold. There are about 36 places in the city of Ghazipur where rose-water is distilled. These people generally put a large quantity of sandal oil into the receiver; the oil is afterwards carefully removed and sold as sandal-attar, and the water put into carboys and disposed of as rose-water. At the time of sale, a few drops of sandal oil are placed on the neck of the carboy to give it a fresh scent, and to many of the natives it appears perfectly immaterial whether the scent arise solely

from the sandal oil or from the roses. Large quantities of sandal oil are every year brought up from the south of India and expended in this way.

The chief use the natives appear to make of the rose-water, and the sandal-attar or sandal-oil, is at the period of their festivals and weddings. It is then distributed largely to the guests as they arrive, and sprinkled with profusion in the apartments. A large quantity of rose-water is sold at Benares, and many of the native rajas send over to Ghazipur for its purchase. Most of the rose-water, so soon as distilled, is taken away, and after six months from the termination of the manufacture there are not more than four or five places where it is to be met with. The value of the roses sold for the manufacture of rose-water may be estimated at 15,000 to 20,000 rupees a year; and from the usual price asked for the rose-water, and for which it is sold, there may be a profit of 40,000 rupees. The natives are very fond of using the rose-water as medicine, or as a vehicle for other mixtures, and they consume a good deal of the petals for the conserve of roses, or gul-kand, as they call it. The delightful fragrance from the Ghazipur rose fields can be scented at 7 miles distance on the river Ganges. The most approved mode of ascertaining the quality of attar is to drop it on a piece of paper; its strength is ascertained by the quickness with which it evaporates, and its worth by its leaving no stains on the paper. The best otto is now manufactured at Constantinople, and it is largely made in France.—*O'Shaughnessy*, p. 326.

ROSE CHAINS, made of gold at Trichinopoly, are perfect marvels of the goldsmith's art. So minute is the chasing of the pattern of the rose in each link, that, unaided by a magnifying power, the eye is unable to trace its delicate outline and beauty of form. In some, the little links are drawn so close together as to be only visible on the closest inspection. It is difficult at first to believe that it is anything but a mere length of solid gold wire, and only when examined in the hand does its perfect flexibility betray its manner of construction. Waistbands are made, consisting of eight and sixteen of these fairy-like chains, which appear as bunches of golden thread, and they are fastened with gold clasps, set with emeralds and rubies for ornamental purposes.

ROSELLE.

Kaserica, . . . HIND.	Pulchay kiray, . TAM.
Hibiscus subdariffa, LAT.	Yerra gogu, . . . TEL.

This plant is cultivated in most gardens all over India, for its fleshy calyces, which have a pleasantly acid taste, and make excellent tarts and jelly; and in the West Indies, for refreshing drinks. The stems, if cut when in flower, and the bark stripped off and steeped immediately, a mass of minute fibres is displayed, of a fine silky nature.

Like to ironwood, blackwood, redwood, etc., sewood is a commercial term given to the timbers several trees. Those used in Britain are produced in the Brazils, the Canary Isles, the East ndies, and Africa. They are imported in very large labs, or the halves of trees, which average 18 ches wide. The best is from Rio de Janeiro albergia, *sp.*), the second quality from Bahia, l the commonest from the East Indies; the last called East India blackwood, although it happens be the lightest and most red-coloured of the e; it is devoid of the powerful smell of the e rosewood, which latter Dr. Lindley considers be from a species of mimosa. The pores of East India rosewood appear to contain less or e of the resinous matter from which the odour, that of the flower of Acacia armata, arises. of the rosewoods contains so much gum and that small splinters make excellent matches. colours of rosewood are from light hazel to purple, or nearly black; the tints are some- s abruptly contrasted, at other times striped nearly uniform. The wood is very heavy; e specimens are close and fine in the grain, reas others are as open as coarse mahogany, ther are more abundant in veins. The black ks are sometimes particularly hard, and very ructive to the tools employed on it. Next to ogany, it is in England the most abundant he furniture woods. A large quantity is cut veneers for upholstery and cabinet work, and pieces are used for the same purposes, and great variety of turned articles of or- umption. Mr. Poole, in his [illegible] ordinary merce, describes it as a highly-esteemed, dark- coloured fancy wood, principally used in ng and making costly furniture. That de- ed in England, he says, is imported chiefly Bahia and Rio de Janeiro, into London and rpool. It is in the form of the halves of trees aging 18 inches wide, and in weight 2½ cwt., d planks, of which the import in 1851 was 0 tons. Price, ordinarily, £9 to £19, but g occasionally to £90 per ton. The rosewood he Tenasserim Provinces is a very beautiful, l, compact timber, resembling Andaman wood, is occasionally seen in the bazar of Calcutta. m Siam and other places, a rosewood is largely orted by the Chinese. These woods are gener- esteemed according to the degree in which darker parts are distinct from the purple which form the ground. One rosewood was d Lignum Rhodium, Aspalathus, whence the m Rhodii is obtained; heavy, oleaginous, ewhat sharp and bitter to the taste, of a ong smell, and purple colour. The Chinese ewood, called Tze-tau, is odorous, of a red- h-black colour, streaked, and full of fine ns, which appear as if painted. The manu- tures of this wood are more valued in China n the varnished or japanned. There are baser ds of rosewood of inferior value. East Indian ckwood or rosewood, from the Dalbergia lati- a and D. sissoides, is an excellent heavy wood, ted for the best furniture. It can be procured large quantities, and of considerable size; the od contains much oil. In large panels it is ble to split.—*Faulkner; Morrison's Compendious scription; M. E. Jr. Rep.; Mason's Tenasserim; ltzapfel; Poole's St. of Commerce; M'Cul-*

ROSIN.

Ral, Rala, Ralla, . HIND. | Coongilium, . . . TAM.
Damar, ... MALAY. | Gugalam, ... TEL.

The rosin or common resin of Europe is obtained as a residuary matter in the process for obtaining the oil of turpentine. Turpentines are oleo-resins. In their natural state they are either solid or semi-fluid, the oil of turpentine being obtained by distillation of American turpentine with water, and is from the Pinus palustris; partly also from the Pinus tœda, and perhaps some other species inhabiting the Southern States, from North Carolina and the south-eastern part of Virginia. A hollow is cut in the tree a few inches above the ground, and the bark removed for the space of about eighteen inches above it. The turpentine runs into this excavation from about March to October; more rapidly, of course, during the warmer months. It is transferred from these hollows into casks. Old and concrete American turpentine is often sold as frankincense. Its imports into India are diminishing. See Dammer; Resin.

ROSMARINUS OFFICINALIS, Rosemary.

Aklil-ul-Jabl, . . . ARAB. | Hasalban-achsir, . ARAB.

A shrub three to four feet high, densely leafy, an inhabitant of the south of Europe and parts of Asia Minor. It is the colou[illegible] ingredient of gree[illegible]ring

ROSS, DANIEL[illegible]ms.—*O'Sh.*

[illegible], a naval officer who rose to the rank of captain in the Indian navy. Between 1828 and 1840, he surveyed the east coast of the Bay of Bengal, from the mouths of the Hoogly to the Straits of Malacca. He succeeded Captain Court in 1823 as Marine Surveyor-General at Calcutta, where he introduced a really scientific method of survey, and earned the title of the Father of the Indian Survey. He was succeeded by Captain Lloyd, on his resigning the office in 1833, and he became Master Attendant at Bombay until before his death.—*E. I. Marine Surveys, P.P.* 1871.

ROSS. Captain Sir James Clark Ross, an officer of the British navy, who discovered the north magnetic pole. He left in September 1839 with the *Erebus* and *Terror*, and voyaged along the antarctic continent, naming Mount Erebus, 12,400 feet, and Mount Terror, 10,900 feet. The former is volcanic, hurling columns of smoke 1500 and 2000 feet above the crater. He made other two voyages, and in the last discovered the south magnetic pole.

ROSTELLARIA PROCUMBENS. *Nees.*
Justicia procumbens, *Linn.*

Nireiputi, ... TAM. | Naka puta, . . . TEL.

A shrub common on the Coromandel coast of India, used in medicine. There are other species.

ROT, a name given to a disease in the coffee plant. In this disease the young coffee leaves and shoots turn black and wither, caused generally by too much wet and cold, and is to be remedied by draining the ground well, laying down also, if possible, mana grass two to three inches thick. When grubs attack the tap-root, the coffee trees are observed to die off, and on digging round, grubs will be found about the tap-root. Grasshoppers (locusts?) cut down young trees close to the ground, and saw off the branches of the older trees.—*Hull*, p. 274.

ROTANG, a pass in the Himalaya, in lat. 32° 24' N., and long. 77° 10' E., is 13,200 feet above the sea. The Rotang pass near Dharmsala leads to the heart of Central Asia. The Beas river rises in a sacred pool, called Vyas Rikhi, in the Rotang pass, at the head of Kulu valley. The scenery of the river valley is very beautiful, and is unlike that of the Chenab or Sutlej. The river is fringed with trees, and studded with green islands. There is a good riding path close along the bank, which does not exist upon any other river in the Panjab. Besides deodar in the Upper Beas valley, kail, P. excelsa, elm, maple, oak, and walnut are abundant; on the Parbati, box occurs; also olive and the twisted cypress (C. torulosa) are found in small quantity.—*Powell's Handbook; Lord Elgin.*

ROTH. Several prominent learned men of this name have had relations with India.

A. W. Roth, author of Novæ Plantarum Species, præsentim Indæ Orientalis.

Heinrich Roth, a German missionary, about A.D. 1650, resided in India. He was able to dispute in Sanskrit with the Brahmans.

Rudolph Roth, in 1844 published three dissertations on the literature and history of the Vedas. He was editor of the Atharva Veda.—*Sayce*, i. 44.

ROTHIA TRIFOLIATA. *Pers.*

Trigonella Indica, *Linn.*

Nullu [illegible]nithen kiray, TAM. | Ubbukada, ... TEL.

An annual, native of [illegible] Coromandel coast, with small yellow flowers. It is a small procumbent weed with trifoliate leaves, used by the natives as greens; abundant everywhere.—*Jaffrey.*

ROTI. HIND. Any bread; the chapatti or flat cake. Leavened bread is called nan, also rôti. Roti is also sweetened wheaten cakes besmeared with sandal, but is properly unleavened bread. Roti raughandar are wheaten cakes with a superabundance of ghi in them. See Bread; Sooji; Rolong.

ROTTBŒLLIA EXALTATA. *Linn.*

Stegosia Cochin-Chinensis, *Lour.* | Buru-Shunti, BENG.

A plant of British India, Cochin-China, and N. Holland.

ROTTBŒLLIA GLABRA. *Roxb.* Buska, Buksha, BENG. A grass of the family Panicaceæ, acceptable to cattle.—*Roxb.*

ROTTEN-STONE, a mineral, occurring massive; colour greyish, reddish, or blackish brown; dull, earthy, and opaque. Soft, soils the fingers, and is fetid when rubbed or scraped. It is employed in polishing metal, etc.; in 100 parts, alumina 86, silica 4, carbonaceous matter 10. Very fine silicious and magnesian earths, such as rotten-stone, alkaline loam, and Armenian bole, occur near Sundur, Bangalore, and Cuddapah.—*Eng. Cyc.; Mad. Ex. Jur. Rep.*

ROTTLER, Dr. A., a Danish missionary long resident at Tranquebar, in the south of India, who wrote a Tamil dictionary and collected a herbarium. He was esteemed the father of Indian botany.

ROTTLERA, a genus of plants, named in honour of Dr. Rottler. Its species are found in the tropical parts of Asia and throughout India, and contain handsome moderate-sized trees. R. tetracocca grows in Sylhet, and yields a hard and valuable timber; R. digyna, *Thw.* (Chloroxylon digynum, *Wight Ic.*), is a small tree growing at Caltura in Ceylon; R. eriocarpa, *Thw.*, grows in the hot and drier parts of Ceylon, but is not v[illegible] common; and R. fuscescens, *Thw.*, another sm[illegible] Ceylon tree, is not uncommon up to an elevat[illegible] of 2000 feet. In Ceylon, also, are found R. mu[illegible] cata, *Thw.*, R. oppositifolia, *Blume*, and R. rhomb[illegible] folia, *Thw.*, all small trees. Other defined speci[illegible] of India are R. alba, barbata, ferruginea, Indi[illegible] laccifera, and peltata. Some botanists h[illegible] arranged the species under the genus Mallo[illegible] and name above twenty of them. One of un[illegible] termined species, the Ya-gi-ne of the Burmes[illegible] a moderate-sized tree, common on the low gr[illegible] near streams; breaking weight from 153 to 170[illegible] A cubic foot weighs 35 lbs.; average girth, 6 f[illegible] The Mimasko, qu. Mimasho? is a Tavoy spe[illegible] furnishing a timber. The Keoun-lae, BURM. [illegible] large tree in Tavoy, the timber of which is [illegible] for rudders. The Otte of the Singhalese, an[illegible] species, is used for common house-building[illegible] poses; the tree grows in the western provin[illegible] Ceylon. It weighs 36 lbs. to the cubic foot, [illegible] little durable, lasting only 10 years.—*Dr. Wa[illegible] Thw.* p. 272; *Dr. Brandis, Cal. Cat. Ex.*, 18[illegible]

A large tree, with alternate, ovate, oblong lea[illegible] of a ferruginous colour beneath; flowers in [illegible] cold weather. It is common in many parts [illegible]

tish India, from Peshawur, Assam, to Ceylon, rma, Java, Philippines, and China. The stellate bescence covering the 3-coccus capsule of this ge tree is collected for sale for dyeing silk. e colouring matter does not require a mordant, that is necessary being to mix it with water aining about half its weight of carbonate of

The colour imparted is a rich flame or ge tint of great beauty and extreme stability; material supplied by commerce contains 78 cent. of colouring matter, and the powder ists of hairs obtained from the outer part of first capsule, and when the fruit is ripe it rushed off and collected. It is also found ingly on the leaves, petioles, and flower- s of the plant. The powder is of a dark -red colour, with a peculiar heavy odour, ased on its being rubbed between the fingers. varieties of it are sold in the bazars in the ab, the one having been passed through e cloth to free it from impurities, such as ons of the withered flowers, dust, or insects, he only appreciable difference is that this quality is cleaner than the other. To cold the powder does not impart its yellow , but either floats on the surface or falls in quantities to the bottom. Boiling water es slightly tinged by it. If the powder iled in water to which any of the alkalies been added, a complete solution of the ing matter takes place, and it is by means property that the natives of India avail s as a dye. Alcohol and ether elves of it ve it with equal facility. All these pre- ons of the powder have a dark-red colour, e yellow colouring matter is only separated addition of certain re-agents. Thus, when ineral acids are added to the alkaline tion or infusion, a thick flocculent precipitate gamboge yellow colour is thrown down, and me effect is produced on the alcoholic and al tinctures on the addition of water or the al acids. Contact with the atmosphere to cause the development of this yellow it, as on exposing on glass a thin film of of the tinctures, before evaporation of the is completed, the previously transparent g becomes opaque and of a light-yellow r. The process of dyeing seems also to on this idea, as silk or cloth is merely d in a hot alkaline solution which is of a red colour, and on the drying of the cloth characteristic yellow colour is developed. esinous deposit, on which the active pro- es of the plant both as an anthelmintic and ve depend, is obtained in a large quantity an alkaline decoction of the powder by ng eight ounces of the powder in two pints ater, along with one ounce of the bicarbonate da. Filter when cool, and to the filtered d add nitric acid till the solution becomes al. A considerable quantity of yellow er then forms in the fluid, which is again ed, and this yellow residue, when dry, is d to weigh one and a half ounces, is of isky yellow colour, and adheres in lumps of iderable consistence. The substance pro- y exists in the plant as an essential oil, and formation of the yellow-coloured deposit, on neutralization of alkaline solutions, and the tion of water or the acids to the alcoholic and ethereal solutions, or by the action of air, consists in the change of the essential oil to a resin, by the loss of hydrogen and the absorption of oxygen. The silk dyers of Southern India use the following method:—4 parts of the powder, 1 part of powdered alum, 2 parts of salts of soda, rubbed well together with oil of sesamum and then boiled in water; it is sufficient, however, to mix it with water containing half its weight of carbonate of soda. The powder, as found in the bazars, is much adulterated, but some collected carefully by the Madras Forest Department, realized a high price in the English markets. In the process of dyeing, as pursued in Amritsar, where a large trade in silk is carried on, barilla, a coarse preparation of carbonate of potash, obtained by burning a herbaceous species of salsola common in the uncultivated portions of the Panjab, is mixed with water, in the proportion of one ounce of barilla to four ounces of water. To this solution, when filtered, the kamila is added, and they are then boiled together. When the boiling has been continued long enough to extract all the colouring matter, a small quantity of lime is dissolved in the fluid. The dye is then ready for use, with the exception of the addition of few grains of alum, in order to fix the colour. In some parts of India, gum is occasionally mixed with the fluid, but in the Panjab this is never considered necessary. The characteristic yellow colour is not developed in silk, etc., until after two or three immersions in the dyeing fluid. The kamila dye is sold in the drug mart of Amritsar at Rs. 18 a maund for the first quality, and Rs. 10 for the second. (This is at the rate of 2 lbs. for 6d.) It contains a yellow resin, rottlerine, soluble in carbonate of soda, and precipitated by acids. It acts as a purgative and very sure anthelmintic in cases of tapeworm, in doses of from one to two drachms. It is in some districts used as an application to cutaneous diseases, especially for itch and fevers, and it is said to be also an aphrodisiac.—*Cleghorn; Ind. Annals Med. Sc.* i. 85; *Irvine's Med. ROTTO or Rotti and Lando are islands near Timor. Rotto is about 45 miles long, and of moderate height, with undulating hills, and its S.W. end extends to about lat. 11° 2′ S., and long. 122° 51′ E.

ROUGE. Yen-chi, CHIN.; Carmine, ENG. Rouge is a pigment of a beautiful rose colour. The Chinese rouge is wholly of vegetable origin; safflower is made into a paste, from which the colouring matter is extracted by repeated washing with acidulated water. For toilet purposes, the colouring matter is spread upon squares of paper, or laid on the surface of little saucers, the constant accompaniment of a Chinese lady's toilet. The lips and cheeks are coloured with this, the face is dusted with white powder, and the outline of the eyebrows and front of the wiry hair are often brought out with Chinese ink. The higher officers of the Chinese provinces use safflower rouge, to distinguish them from the ordinary vermilion stamp of the interior officers.

The common rouge of the theatres of Europe is prepared by pounding benzoin, red sandal-wood, Brazil wood, and alum in brandy. The mixture is then boiled until three-fourths of the

liquid has evaporated; a paint of an intense red colour remains, and this is applied to the face with a piece of soft cotton. Vinegar is sometimes substituted for the brandy; but as both fluids injure the skin, the colouring matter is sometimes extracted from the dye-woods, and unguents formed therewith, by means of balm of Mecca, butter of cacao, or spermaceti. If the colour be too intense it is mixed with chalk.

Rouge dishes are small saucers containing a layer of dry rouge. Those which are prepared in Portugal probably contain genuine carmine; clumsy imitations of these dishes are prepared in London. Spanish wool and oriental wool are also rouge vehicles. Wool is impregnated with the colour, and formed into cakes about the size of a crown piece by the Spaniards, and somewhat larger by the Chinese; the latter is most esteemed. Beautifully painted and japanned colour-boxes are imported from China. Each box contains 24 papers, and in each paper are 3 smaller ones, namely, a lovely blushing red for the cheeks, an alabaster white for the face and neck, and a jet black for the eyebrows. Rouge, used by jewellers for brightening gold, is a peroxide of iron.—*Smith.*

ROUMIA HEBECARPA. *Poit.* Katambilla, SINGH. A moderate-sized Ceylon tree, at Condasalle, Maturatte, etc.; prized in Colombo on account of its fruits, which are about the size of large cherries, somewhat ac[illegible]lous, with a very agreeable flavour.—*Wight's Ill.* i. p. 37; *Thw*[illegible]

ROUSHANAI, a Muhammadan sect which made a great noise among the Afghans in the 16th century, but by the beginning of the 19th century it was almost extinct. It was founded in the reign of the emperor Akbar, by Bayazid Ansari, who was called by his enemies the Pir-i-Tarik (or Apostle of Darkness), in derision of the title of Pir-i-Roushan (or Apostle of Light), which he had himself assumed, Roushanai meaning the Enlightened. He held the same tenets with the Sufi sect, but as he added a belief in the transmigration of souls, it is probable he derived his creed from the Yogi sect of Hindu philosophers, who add some of the dogmas of the religion in which they were educated to those of the Sufi school. On this, however, he ingrafted some doctrines of his own. Bayazid was a man of great genius, and his views spread rapidly among the Bardurani, till he was able to assemble armies, and to enter on a regular contest with the government.—*Elphinstone's Caubul*, p. 210.

ROVUMA, a river which disembogues on the east coast of Africa; its mouth, in lat. 10° 27′ 40″ S., and long 40° 29′ 39″ E., is a mile wide, but its navigable channel is narrow.

ROXANA, a Turkomani wife of Alexander the Great.

ROXBURGH, WILLIAM, M.D., a medical officer of the Madras army, in the service of the E. I. Company, who was their botanist in the Carnatic, and subsequently in charge of the gardens in Calcutta. He entered the Madras Service 1766, and died in 1815. He was author of Coromandel Plants, and of the Flora Indica. The former work was published by the order of the E. I. Company, in three folio volumes, under the direction of Sir Joseph Banks, Bart., in 1793 and 1816, with three hundred coloured plates, and it was the first contribution of the British Indian Government to the illustration of botani[illegible] science. His Flora Indica remained in manuscri[illegible] for some years after his death. Two editions of [illegible] have since that event been published; one, whi[illegible] is incomplete, was edited by Drs. Carey an[illegible] Wallich; it extends to the end of Pentand[illegible] Monogynia, but contains many additional pl[illegible] not contained in Roxburgh's manuscript; [illegible] other, which is an exact reprint of the manusc[illegible] as left by its author, is in three volumes, [illegible] was published in 1832. A new edition of [illegible] appeared in 1878? Rubia cordifolia is a native of Siberia, but is cultivated largely in China, Assam, Nepal, Bombay, Sind, Quetta, etc., for its dye-stuff. A small quantity is exported from China and India. It fetches in the London and Liverpool markets from 20s. to 30s. per cwt., duty free. In 1851, at the Great Exhibition, the jury remarked that some of the colours dyed with it are quite as permanent as those dyed with madder, and even more brilliant. Botanists have been inclined to regard R. cordifolia and R. munjistha as distinct in habit, form of stem, etc.; there are differences sufficient to make them distinct species. R. munjistha, Dr. Gibson observes, is not such a large climber as the other; Bancroft was informed by Dr. Roxburgh that the stem of R. munjistha, unlike the stem of R. tinctorum, seemed to be preferred to the roots for dyeing; Roxburgh, in his Flora Indica, adds that, not only the roots and the stems, but the large branches also, are used to dye red with. It is imported into Bombay, of an apparently inferior quality, from Muscat, and into the Panjab from Afghanistan, forming a considerable part of the large annual investments of the Lohani merchants. From the Panjab, as well as from Afghanistan direct, it goes to Sind, and thence to Bombay, where it realizes 40 per cent. more than the Muscat article, and is re-exported to England. It is extensively used in the Panjab, in Sind, and in the North-Western Provinces, as a dye-stuff, and is found in every bazar of any extent.

The munjit brought from Afghanistan answers exactly to the description given in Ure's Dictionary of Arts. It is either the true madder of Europe, or is produced by a species of rubia found in almost all parts of India distinct from R. munjistha.

An infusion of it is given as a grateful and strengthening drink to weakly women after lying-in. Camel loads of madder are brought from Banu and Tonk, on the west side of the Indus, to Lahore.—*Roxb.; Smith; Stewart; Mason; Irvine; Ains.; Honig.*

RUBIA TINCTORUM. Madder. This tree has a diffuse brittle-branched stem, angular, very rough, with sharp hooks, and madder is the product of the long slender roots. The tree is only known in its cultivated state in Asia. Dr. Brandis first found it being grown in small quantity on the Sutlej at about 8000 to 8500 feet, for home consumption to dye wool red. Dr. Stewart found it in Kanawar. Irvine mentions that a little is collected in Gandaya, Baluchistan, and parts of Turkestan, but that the chief tract for its cultivation is from Kābul to near Kandahar. According to Cleghorn, madder has been grown in the Panjab from French seeds.

It is a native of Europe and Asia Minor, is extensively cultivated in Holland and France; the culture has likewise been successful in Great Britain, but it is largely imported, though cochineal has become cheaper, and is much used for

the same purposes. The principal supplies are obtained from Holland, Belgium, France, Turkey, Spain, and the Balearic Isles, the Italian States, India, and Ceylon. The plant is generally raised from seed, and requires three years to come to maturity. It is, however, often pulled in eighteen months without injury to the quality; the quantity only is smaller. A rich soil is necessary for its successful cultivation, and when the soil is impregnated with alkaline matter, the root acquires a red colour; in other cases it is yellow. The latter is preferred in Britain, from the long habit of using Dutch madder, which is of this colour; but in France the red sells at two francs per cwt. higher, being used for the Turkey-red dye. Madder does not deteriorate by keeping, provided it be kept dry. It contains three volatile colouring matters,—madder purple, orange, and red. The latter is in the form of crystals, having a fine orange-red colour, and called alizarin. This is the substance which yields the Turkey-red dye. The slender creeping roots are the thickness of the little finger, very long and branching, provided with numerous articulations, and tough fibrils; epidermis thin, pale brown; bark and meditullium intensely red. The odour is weak and peculiar, taste bitter and styptic. According to Kuhlman's analysis, the roots contain red colouring matter (alizarin, *Robiquet*), yellow do. (xanthine, *Kuhl.*), woody fibre, mucilage, gum, sugar, bitter matter, resin, salts, and ulmin, etc. Alizarin occurs in orange-red crystals, tasteless, inodorous, little soluble in cold, but soluble in boiling water, also in alcohol, ether, the fixed oils, and alkalies. The alcoholic solution is rose-coloured, the ethereal golden, the alkaline violet or blue. A solution of alum added to a solution of alizarin, and precipitated by potash, gives a rose-lake of the most charming tint. Xanthine is yellow, very soluble in water and alcohol, slightly in ether; the solution passes to orange-red by contact with alkalies, to lemon-yellow by acids. It is devoid of odour, but has a sweetish-bitter taste. The red-colouring matter of madder tinges the bones, milk, and urine of animals if fed on the roots. The great consumption of madder is as a dye-stuff for giving a red colour to wool, silk, and cotton. In pharmacy the roots are sometimes used for colouring ointments.—*O'Shaughnessy.*

RUBINA, once the most celebrated tribe in Arabia, is now a small broken clan. The Anazah Arabs come of this race.—*Rich's Kurdistan.*

RUBRUQUIS, WILLIAM DE, made a journey in A.D. 1253-1256 to Kara-korum, in the reign of Louis IX. of France, and of Mangu Khan, the grandson of Chengiz Khan.

While St. Louis of France was engaged in the seventh crusade, A.D. 1248-50, and the lieutenants of Octai or Okkadai Khan were at the same time attacking the Saracens from the side of Persia, the Tartars and the Crusaders became united in a common interest. To cement their connection, the general who commanded the Tartar forces in Persia sent an embassy to the French king, expressing the respect he felt for Christianity, and recommending that they should make common cause against their Saracen enemies. A French embassy was at once sent into Persia; and at the same time the pious St. Louis, anxious to lose no opportunity, sent the Minorite Friar William de Rubruquis to the Tartar chief Sartakh, whose territories bordered on the Black Sea. Fro Constantinople, Rubruquis sailed to Soldaia in t Crimea, one of the entrepots at that time of Black Sea trade in Russian furs, and Indian spi drugs, and silks, through Constantinople, w the rest of Europe; and thence he journe northward through the region of Comania, u he came to the camp of Sartakh, by whom he sent on to the court of his father Batou at S or Sarai. Here he was furnished with a guid the court of Mangu, who had succeeded his co Kuyuk as Khakan or Great Khan at Kara-kor on the verge of the great Mongolian desert. F the Mongol capital he returned to the court Batou on the Volga, and thence to Europe, by the Crimea, but over the Caucasus, thro the country of the Lesgi (Lesghis) and G (Georgians), Armenia, and Iconium, where had an interview with the Ottoman Sultan, by the Cilician port of Ayas to Cyprus, wher Nicosia, he found his provincial.

Rubruquis described Turkey (*i.e.* the king of Iconium) at this time as having 'no treasure, warriors, and many enemies.' He also stro deprecated the system of sending poor friars himself as ambassadors to the Great Khan, w out office, presents, or any of the things command the favour and respect of the pro From his report, Nestorian Christians abound the courts and in the territories, as well of B Khan as of his superior Mangu Khan; that had great influence with many at court, es with the wives and daughters of these and chiefs. Rubruquis relates that the reply of M Khan to the letter of king Louis was writt the Mongolian language, but in the charact the Jugures or Chakars, which had been i duced by Nestorian Christians, and was de from the Syrian, but written in lines down page, commencing from the left. Mongolian written at the present day.—*Prinsep's Tibet, tary, and Mongolia.*

RUBUS, a genus of plants of the order R ceæ. The following East Indian species are better known, viz.:—

R. asper, Nepal.
R. biflorus, *Sm.*, Panjab.
R. ellipticus, *Sm.*, Nepal.
R. distans, Nepal.
R. gowreephul, *Roxb.*, Neilgherries and other m tains of India.
R. gracilis, *Roxb.*, Nepal.
R. hexagynus, *Roxb.*, Peninsula.
R. micranthus, Nepal.
R. Moluccanus, *L.*, Tavoy, Moluccas, Khassya.
R. lasiocarpus, *Sm.*, Neilgherries.
R. paniculatus, *Sm.*, Nepal.
R. parviflorus, *L.*, China, Nepal.
R. pauciflorus, *Wall.*, Nepal.
R. rugosus, *Sm.*, Peninsula, Mahabaleshwar.
R. Wallichianus, *W. and A.*, Peninsula.

Griffith says there is a species of rubus in Tenasserim Provinces, and Wallich found one the Irawadi.—*Roxb.* ii. p. 517; *Voigt; Mason*

Rubus biflorus, *Sm.*

Ankren, ... BEAS.	Karer, ... R
Kantanch, . . CHENAB.	Bumbal, Iasra, . SU
Khariara, ... ,,	Batang, Kalkalin, ,,

Common from 5000 to 10,500 feet up to Indus in the Panjab Himalaya. It has a coloured, palatable fruit. Its stem is covere a white pulverulent epidermal layer, lookin though whitewashed.

The true oriental ruby, the sapphire, the topaz, … the emerald, though differing greatly in …earance, are chemically the same substance, pure alumina; but jewellers give this name to several other minerals possessing brilliant red colour. The oriental ruby is the most valuable of all gems when of large size, good colour, and free from flaws. The ruby in colour varies from the highest rose tint to the deepest carmine, but the most valuable tint is that of pigeon's blood, a pure, deep, rich red, and generally occurs in 6-sided prisms.

The best come from India, Burma, and Ceylon; Bohemia furnishes an inferior article. They are found in Ava, Siam, the Cupelam mountains, ten days' journey from Syrian a city in Pegu, Ceylon, India, Borneo, Sumatra, on the Elbe, on the Espailly in Auvergne, and Iser in Bohemia. The ruby and sapphire mines of Burma are 25 miles south of Moongmeet. Many of the rubies and other precious stones that the Shans bring with them in their annual caravan from the north of Burma, are made of rock-crystal, coloured artificially. These are heated and plunged into coloured solutions. Fine rubies have from time to time been discovered in many of the corundum localities of Southern India, associated with this gem, particularly in the gneiss at Viralimodos and Sholasigamany. It occurs also in the Trichingode taluk and at Mallapollaye, but it is, comparatively speaking, rare.

In Ceylon, at Badulla and Saffragam, and also, it is said, at Matura, rubies, sapphires, and topaz are found. Badakhshan has been famed since the time of Marco Polo as the country producing the true balas ruby. Its ruby mines are in the Gharan district, 20 miles from the small Tajak state of Ishkashm, on the right bank of the Oxus. They have not been worked since the Kunduz chief took Badakhshan. Irritated by their small yield, he marched the inhabitants of the district, 500 families, to Kunduz, where he sold them as slaves.

Of the accounts of the ruby mines of Burma, one was written by Père Giuseppe D'Amato, an Italian Jesuit missionary to Burma, a translation of which appeared in the Journal of the Asiatic Society of Bengal in 1833; and another account by Mr. Bredmeyer, who about 1870 was in charge of some minor ruby mines within 16 miles of Mandalay. The mines visited by Père D'Amato are said to be 60 or 70 miles distant from Ava in a north-east direction, and separated from the Irawadi valley by the Shoay-doung or Golden Mountain range, which are only occasionally visible from the town of Male, owing to the constant fogs and mists that hang around, and snow lies on them for four months of the year, beginning with the middle or end of November. They are situated north-east from Mandalay, and distant about 60 or 70 miles. The principal road to them leaves the Irawadi at Tsinguh-Myo, and passes through Shuemale. There are other roads, from Tsampaynago and other villages to the north. The mines lie nearly due east from the village. The villages in the immediate neighbourhood of the mines are Kyatpen, Mogouk, and Katheyuwa. The gems are procured over an area of probably 100 square miles. The mode of seeking for them is simply sinking pits until the gem-bed or ruby earth is met with; this is then raised to the surface and washed. The gem-bed is met with at various depths, sometimes not more than two or three feet from the surface, and occasionally not at all.

When the layer of earthy sand containing the rubies is met, lateral shafts are driven in on it, and the bed followed up, until it either becomes necessary to sink another pit in it, or it becomes exhausted. It varies in thickness from a few inches to two or three feet. The rubies are, for the most part, small, not averaging more than a quarter of a rati, and when large are generally full of flaws. Well-marked crystals occasionally occur, but the vast majority of stones are well rounded and ground down. It is very rare to find a large ruby without flaws; and Mr. Spears states that he had never seen a perfect ruby weighing more than half a rupee. The same authority mentions that sapphires are also found in the same earth with the rubies, but are much more rare, and are generally found of a larger size. Stones of ten or fifteen rati without a flaw are common, whereas a perfect ruby of that size is hardly ever seen. The largest perfect sapphire he ever saw weighed one tikal. It was polished, but he has seen a rough one weighing 25 tikal. For every 500 rubies, he does not think they get one sapphire. You see very small sapphires in the market, while small rubies are abundant and cheap. The value of the gems, rubies, and sapphires obtained in a year may be from £12,500 to £15,000. They are considered the sole property of the king, and strictly monopolized, notwithstanding the care that is taken, but, nevertheless, many are smuggled. There are considerable quantities are smuggled ones about 20 lapidaries or polishers of the at Amarapura; they are not allowed to carry on their trade at the mines. For polishing, small rubies and worthless pebbles brought from the mines, being pounded fine and mixed up with an adhesive substance, and then made into cakes some ten inches long by four broad, are employed to rub down the gem. After it has been brought to the form and size required, another stone of finer grain is employed. The final process is performed by rubbing the ruby on a plate of copper or brass until it is thoroughly polished, when the gem is ready for the market. Rubies of Burma are not exported to any large extent, and then only stones of inferior value. But a pink spar found in the ruby district is a more important item of export. It is believed to be used for one of the classes of distinctive mandarin cap-knobs. Great numbers of these gems are brought down to Rangoon for sale, but a heavy price is always demanded for them, and it requires an experienced eye to purchase them with a view to profit. Topazes are also found in the vicinity of the rubies and sapphires, but they are scarce, and fetch a higher price in Burma than they would realize in England. Recently, rubies and sapphires have been found in Siam, about four days' journey from Bankok, in a very feverish locality. The stones, though inferior to those obtained in Upper Burma, are said by the Burmese to be so plentiful near Bankok, that even women are anxious to proceed to the mines. Ceylon ruby is a term applied in England to the garnets and carbuncles which come from Siam through Ceylon, and also to peculiar tinted almandines. The stones are of a rich red tinged with yellow. They are superior to those of the mine of Zobletz in Silesia, from the Tyrol, and from Hungary. Under the designation Ceylon rubies, jewellers obtain a large price for them from the ignorant. A stone of a fine rich tint, free from flaws, of a ce will range from £8 to £10.

Balas ruby is a term used by lapi designate the rose-red varieties of spinel is seen of all shades,—blood red, the pro ruby; rose red, the balas ruby; oran rubicelle; and voilet-coloured or almandi

Red tourmaline is sometimes mistaken ruby, and the pink topaz for the balas Spinel and balas rubies are found in Ceylon, Mysore, Baluchistan; the spinel ruby is compar ively of little value, but they are often sold a true ruby, and the true ruby is occasiona parted with as a spinel ruby.

Tavernier gives the figures of a ruby that longed to the king of Persia. It was in sh and bigness like an egg, bored through in middle, deep coloured, fair, and clean, except flaw in the side. They would not tell what cost, nor what it weighed; only it had b several years in the treasury. He likewise gi the figure of a balas ruby, sold for such Giafer Khan, uncle of the Great Moghul, who 9,50,000 rupees = 1,425,000 livres for it. But old Indian jeweller affirming afterwards tha was no balas ruby, that it was not worth al 500 rupees, and that Gaifer Khan was cheated, his opinion being confirmed by Shah Jahan, most skilful in jewels of any person in the emp Aurangzeb compelled the merchant to take it ag and to restore the money back. Tavernier gives the figure of a ruby belonging to the king of V pur. It weighed fourteen mangelin, or seven carats and a half, a Visapur mangelin being five grains. It cost the king 14,200 new pag or 74,500 livres. Also, he figures a ruby th Banya showed him at Benares; it weighed 58 or 50¾ carat, being of the second rank in bea in shape like a plump almond bored through end. He offered 40,000 rupees or 6000 livres it, but the merchant demanded 55,000 rupees.

The largest oriental ruby known was brou from China to Prince Gargarin, governor Siberia; it afterwards came into possession Prince Menzikoff, and now constitutes a jewe the imperial crown of Russia.—*Eng. Cyc.; K* p. 56; *Emmanuel; Tavernier's Tr.* p. 149; *A slie, Cal. Cat. Exh.*, 1862; *Newbold in Madr L. and Sc.; Mason; Ferrier's Jour.; Da Ceylon.*

RUDHI, also Vriddhi, TEL., are two diffe names of the ashta varga or eight roots, celebr in the Indian Materia Medica. They are from Nepal or Northern India, and have n been identified.—*As. Res.* xiii. 410.

RUDIKI, about the close of the 9th centu translated the fables of the Pancha-Tantra Bed-pai from Arabic into Persian, and receiv 80,000 dirhams for his labours. He was a ce brated poet. See Abul Hasan.

RUDOK, a district in the neighbourhood Lake Tso Mognalari, lat. 33° N., and long. 80°

RUDRA, in the Rig Veda, is spoken of as inferior god, the god of storms, from Rud, to c one of a kind of semi-divine beings (eight number), who, in the Vedic ages of Hindu myt ology, were connected with the worship of Vayu the wind. Brahmanical Hinduism considers Ru to have been the god Siva, and he is first call Mahadeva in the White Yajur Veda; and t Vishnu Purana says the god Rudra

rehead of Brahma, and multiplied himself. Rudra enumerated in the Vishnu Purana udra, Bhava, Sarva, Isana, Pasupati, Bhima, Mahadeva, most of which are regarded now erely other appellations for Siva. Brahma led to have assigned to them as their respect- stations, the sun, water, earth, air, fire, ether, ministering Brahman, and the moon. These their types or representatives in this world. her places the Rudra are described as eleven umber, and as children of Kasyapa and Sur- i.—*Williams*, p. 40; *Vishnu Purana*, p. 58.

RUDRA BHATTA, author of Sringara Tilaka, mark of love, on the emotions and sentiments lovers, as exhibited in poetry and the drama.—*wson.*

RUDRA BHUMI. TEL. The place of incre- ion of deceased Hindus.

RUDRAKSHA, the fruit of the Elæocarpus erculatus, also of E. ganitrus, made into a ry, and worn by the Saiva Hindus.

RUDRA PRAYAG, a temple in the Garhwal rict of the N.W. Provinces of India. It is at junction of the Alaknanda with the Manda- , which drains the southern slopes of the arnath and Badarinath peaks. It is one of five sacred prayag or confluences of the dus, and a halting-place for pilgrims to Hima- . A dome-shaped rock, 30 feet in height by diameter, bears the name of Bhim-ka-chūlha, he kitchen of Bhim, a famous giant of Hindu nology. It is completely excavated, and has tures at the top, where they believe that used to place his cooking utensils.—*Imp.* viii.

UDRA SAMPRADAYI, a sect of Vaishnava dus, founded by Vallabhacharya, who origin- the worship of Bala Gopala, the infant hna. This worship is very widely diffused ngst all ranks of Indian society, but is perhaps known as the religion of the Gokalastha ains, the title of its teachers. Vallabha was son of a Telinga Brahman. He taught that ation was not sanctity, and that it was the of the teacher and his disciples to worship r deity, not in nudity and hunger, but in ly apparel and choice food; not in solitude mortification, but in the pleasures of society the enjoyment of the world. The gosains or hers, like Vallabha, are always married men, ys clothed with the best raiment, and fed with intiest viands by their followers, over whom have unlimited influence. The followers of order are especially numerous amongst the rcantile community, and gosains are constantly velling over India under the pretence of pil- mage, but reconcile to themselves on these asions the profits of trade with the benefits of otion. Zealous disciples devote to the guru threefold Samarpana, Tan, Man, Dhan, or dy, mind, and wealth. The temples and houses the sect have metal, often gold, images of pal, of Krishna, and Radha, and other divine ms connected with the incarnation. The idol richly decorated and sedulously attended in ly ceremonials. Besides their public demon- ations of respect, this sect keep pictures and ages of Gopal in their houses; and before sitting vn to any of their meals, they take care to offer ortion to the idol. Those of the disciples who e performed the triple Samarpana, eat only from the hands of each other; and the wife or child that has not exhibited the same mark of devotion, can neither cook for such a disciple nor eat in his society. Vitala Nat'h, the son and successor of Vallabha, had seven sons, all of whom were teachers, and their followers, though in all essential points the same, form separate communities. Those of Gokalnath, however, look on their own gosains as the only legitimate teachers of the faith. The worshippers of this sect are very numerous and opulent, the merchants and bankers, especially those from Gujerat and Malwa, belonging to it. Their temples and establishments are numerous all over India, but particularly at Muttra, and many hundreds at Bindraban. But at Sri Nat'h Dwar, at Ajmir, is the most celebrated, most highly venerated, and most richly endowed of all the gosain establishments. It is a matter of obligation with members of this sect to visit Sri Nat'h Dwar at least once in their lives, and the head gosain presents them with a certificate to that effect. The indecent and immoral character of this sect was notoriously brought before the public of India in a trial for libel instituted in 1862, at Bombay, by one of the teachers of the sect, and known as the 'Maharaja case.' It was shown by the evidence then adduced that the women of the wealthiest of this sect deemed it an honour to receive their priest's attentions, for which the priest withdrew [illegible] woman of his selection, selected in the midst of and from amidst hundreds of her fellow-worshippers, and it was also in evidence that the maharaja allowed people to see him associating with his selection. In 1868, in Bombay, during the holi, indecent pantomimes were shown by this sect before a concourse of men and women. It is the Banya and Bhattya races who chiefly support this sect.—*Rev. Dr. Wilson; Times of India.*

RUDRAYA-MALA and Jati-mala, a book containing an enumeration of castes and professions.

RUE, Ruta. IT., LAT.

Raute, ... GER.	Ruda, ... SP.
Sadab, Saturi, . . HIND.	Arooda, ... TAM.

In India, this name is given to the herbs of Ruta angustifolia, R. graveolens, and R. Indica. R. graveolens, an evergreen shrub, grows freely in any good soil, propagated by cuttings in damp weather, used for fowls in the roup. Leaves dried and burnt are much used in Southern India for the purpose of fumigating young children suffering from catarrh; also used fresh, bruised and mixed with arrack, as an external remedy in the first stages of paralytic affections. When dried in the shade and powdered, the vytians prescribe this substance in conjunction with certain aromatics in cases of dyspepsia; they entertain the same notion regarding it that Dioscorides did of old, viz. that it is inimical to the fœtus in utero when given together with camphor and the sugar of the palmyra toddy. In making confection of rue, the herb of dried rue, the sadab of the bazars of N.W. India, may be substituted.—*Jaffrey; Ains.; O'Sh.; Beng. Phar.*

RUELLIA, a genus of plants of the natural order Acanthaceæ. From one wild species, called in Assam Room, a very valuable dye is prepared after the manner of indigo. This plant (or a species very nearly allied to it) is also cultivated with the same object in all parts of Burma, under the name of Mai-gyee. It is believed that the

room contains indigo allied to that produced by species of Isatis and Wrightia. The source of this dye has been referred to Ruellia comosa, also to R. indigotica. That produced at the hills occupied by the Murree and Dofla tribes of North Assam, and produced at the hills occupied by the Mishmi and Abor tribes, Suddiya, Luckimpore, Upper Assam, is of value R. 1½ per lb. The room is employed in its raw state by the Khamti and Singpho to dye their clothes of a deep blue. It was described by Griffiths as a valuable dye, and highly worthy of attention. It might perhaps be usefully employed as the ground for black dye. Ruellia cernua, *Roxb.*, grows in Mysore; R. comosa, *Roxb.*, is a plant of the Moluccas; R. hirta, *Vahl*, grows in Telingana; R. indigofera, *Griff.*, is the Mai-gyee of the Burmese.—*Roxburgh; Voigt; Wall.; Hooker.*

RUELLIA INDIGOTICA. *Fortune.* The Room of Assam and Tien-ching of China. In one part of the Che-kiang province of China, and also amongst the Fung Hwa mountains to the westward of Ningpo, large quantities of a blue dye are produced, which is, in fact, the indigo of that part of the country. Fortune (Wanderings, 1846) gives an account of a valuable kind of indigo, made from a species of woad (Isatis indigotica), which is cultivated extensively in the level country a few miles to the westward of Shanghai. The kind in Che-kiang is equally valuable, if not more so. It is made from a species of Ruellia, which until it gets a better name may be called R. indigotica. The same plant apparently has been discovered in the Assam country in India, where it is also cultivated for the blue dye it affords; alongside of the Chinese kind, they bear a most striking resemblance. This Ruellia seems to be easily cultivated, it grows most luxuriantly, and is no doubt very productive. In the province of Che-kiang it is planted, in the highland valleys, in the end of April or beginning of May, after the spring frosts are over, and is cleared from the ground in October before those of autumn make their appearance. During this period it attains a height of a foot or a foot and a half, becomes very bushy, and is densely covered with large green leaves. When the stems are cut down for the manufacture of indigo, a sufficient quantity have their leaves stripped off, and are afterwards taken into a house or shed to be properly prepared. The leaves thus stripped from the cuttings are thrown into the tanks with the stems and leaves, so that nothing is saved except what is actually required for the purposes of propagation. The stems are now tied up firmly in large bundles, each containing upwards of 100, and the ends of each bundle are cut across, so as to leave them perfectly neat and even both at top and bottom. These bundles are each about a foot long, and, of course, nearly round. They are carried to a dry shed or outhouse, where they are packed closely and firmly together, and banked round with very dry loam. A portion of the dry soil is also shaken in between the bundles, and this being done the operation is complete. Should the winter prove unusually severe, a little dry straw or litter is thrown over the surface of the cuttings, but nothing else is required. During the winter months, the cuttings remain green and plump; and although no leaves are produced, a few roots are generally found formed, or in the act of forming, when the winter has passe
the season for planting has come round.
state they are taken to the fields and pl
The weather during the planting season is g
ally showery, as this happens about the chan
the monsoon, when the air is charged with n
ure. A few days of this warm showery wea
is sufficient to establish the new crop, which
goes on growing with luxuriance, and requ
little attention during the summer; indeed n

water is kept up for a few minutes longer.
the lime and water have been well mixed in
way, the circular motion is allowed to c
Four men now station themselves round
tank, and commence beating the water
bamboo rakes made for this purpose. The bea
process is a very gentle one; as it goes on
water gradually changes from a greenish hue
dingy yellow, while the froth becomes of a bea
ful bright blue. During the process the l
workman takes a pailful of the liquid out of
tank, and beats rapidly with his hand. Under
operation it changes colour at once, and its v
is judged of by the hue it presents. The bea
process generally lasts for about half an h
At the end of this time the whole of the sur
of the tank is covered with a thick coating of f
of the most brilliant colours, in which blue
dominates, particularly near the edges. At
stage, it being desirable to incorporate the
with the liquid below it, there is made a most b
ful chemical operation. A very small porti
cabbage oil, only a few drops, is thrown on
surface of the froth, the workmen then stir a
beat it gently with their flat brooms for a seco
or two, and the whole disappears as if by so
enchanter's wand. So small a quantity of oi
necessary for this purpose, that even when
cup has been emptied, and has only the oil t
is necessarily adhering to its edges, it is thro
into another tank, and produces the desired eff
The liquid, which is now darker in colour
allowed to stand quiet for some hours, until
colouring matter has sunk to the lower stratu
when about two-thirds of the surface is drawn
and thrown away. The remaining third part
then drawn into a small square tank on a lo
level, which is thatched over with straw, and h
it remains for three or four days. By this t

he colouring matter has separated itself from the ater, which is now entirely drained off, the dye ccupying three or four inches of the bottom, in he form of a thick paste, and of a beautiful blue olour. In this state it is packed in baskets, and exosed for sale in all the country towns in that part China, at rates varying from 50 to 100 cash a y, say from 2d. to 4d. per lb. Some is sold as as 30 cash, but this is very inferior; the greater t produced is sold at from 60 to 80 cash a ty, and it must be of a very superior quality if cash is paid. Like the Shanghai indigo made Isatis indigotica, it is called Tien-ching by inese. During the season of its preparation ery mountain stream is coloured and polluted h the refuse liquid drawn off from the tanks, the stench which fills the air is almost unenable.—*Fortune's Residence*, p. 189; *Fortune's nderings.*

RUELLIA RINGENS. *Linn.* Upu-dala, MAL juice of the leaves of this plant, boiled a little salt, is supposed, on the Malabar st, to correct a depraved state of the humours. llia intrusa, *Vahl*, R. secunda, *Vahl*, R. lanica, *Roxb.*, are syns. of Asystasia Coromanna.—*Nees.*

ndio tagarum, SANSK. | Kirendinyagum, . TAM. he small purple-coloured leaves and berries of low-growing plant are sub-acid and bitterish he taste. When bruised and mixed with or-oil, they form a [illegible] application [illegible] s of children's carp[illegible] abar.

UG, this kind of carpet is in extensive use for carpeting of rooms and for individual use ughout all Central and Southern Asia, those otton being usually styled Bisat, Shatranji, and rri, and the woollen fabrics Gallicha. The rri or dharri of Shahabad are made wholly otton, and almost invariably striped. They cool and pleasant, and are in invariable use he richer natives of India, and by all Euros. The smaller kinds are used as quilts for s, and European soldiers use them for that pose. The manufacturers are called Kalleeun , and are almost invariably Muhammadans, who e carpets of any size and pattern given, and in stripes. The two local seats of manufacture Shahabad are Bubbooah and Sasseram. In former place, from Rs. 10,000 to 12,000 th are yearly manufactured and sold, and he latter from Rs. 30,000 to 40,000. The rris generally made for sale are either 6 ds long and 2 yards broad, thick, and strong, any colour, sold at from Rs. 6 to 6.8 each, or mall kind used as quilts, or to spread in lieu of other bedding on the ground. They weigh m 2 to 3 lbs. each, and are 1¼ to 1½ yards ad, by about 2 yards long; they sell at from annas to 1 rupee 8 annas each, according to kness and quality.

The Hauzhassica is a better kind of carpet, and en displays much taste in the arrangement of e striped colours. It is made of any size to fit y room, and is always sold by weight. The ce varies according to quality from Rs. 1.4 to 2, and sometimes as high as Rs. 2.4 per r. It is sold in all the fairs and in all the ge cities around, and no merchant or banker's p, and no rich native's reception room, is complete without these being spread. This kind is generally used by Europeans for their drawing and public rooms.

The Dhurri panch rangha is a small kind for use in small cutcherries, and much used from its portability. It is from 3 to 4 yards long, and from 1½ to 2 yards broad, and sells at from Rs. 3 to 4 each carpet.

Gallicha carpets are almost always woollen, of florid but neat patterns, in imitation of the Persian carpet. They are used to a considerable extent by the rich natives in their zananas, and by Europeans also. The size usually manufactured is 2 yards long by 1 yard broad, and they sell at from Rs. 2 to 4.8 per carpet. Any other sizes and patterns can be made, and some of the patterns are extremely pretty. The wool costs but little; the coarse local wools, which would not pay for exportation, answer for carpet work, and the native dyes answer admirably. The colours are harmonious. A principal site of the manufacture of the woollen rugs was long the town of Ellore, but they are made in the Dekhan and in Mysore, of any size, to order. They are usually 3 feet broad and 6 feet long, and much used as sleeping rugs, and rugs for the drawing-room. They have been exported largely to Europe, where they are employed as hearth-rugs; they are of various colours, prettily arranged, and sell at from Rs. 4 to 14, according to size. With some felted [illegible] the patterns are [illegible] produced by laying on the [illegible] loured [illegible] and felting them into the substance of the carpet.

Serviceable and cheap woollen rugs and very substantial cotton rugs can be got at Multan. Many carpets are made at the jails at Lahore, Agra, Allahabad, Bhagalpur, Tanua, and Mirzapore. Warangal was long famous for its silk carpets, and the harmony of colours and speciality of pattern are notable. The woollen carpets from the same place are also peculiar. The craftsmen at Warangal claim Persian descent, and their patterns seem to be of Persian origin.

RUGTRORA, in the Bombay side of India, a vernacular name of several plants, the Tecoma undulata, *Don;* Rhamnus Wightii; Soymida febrifuga; Maba nigrescens, *Dalz.;* and Polygonum glabrum.

RUH. ARAB. The spirit, the soul, the countenance. Ruh Allah, the spirit of God, Jesus Christ. Ruh-ul-Qadas, the Holy Spirit, supposed to mean the angel Gabriel, whom Muhammadans call also Ruh-ul-Amin, the faithful spirit. Ruh-i-sifiin is lower spirit; Ruh-i-Jari, travelling spirit; Ruh-i-Moqeen, a resident spirit; Ruh-i-Aowlee, the lofty spirit.

RUKAIAH BEGUM, Akbar's first wife. She died at 84 years of age, about a year and a half before Jahangir's death.—*Cal. Rev.*, Jan. 1871.

RUKCHU, in lat. 33° 14′ N., long. 77° 50′ E., in Ladakh, a pasture ground in an old lake basin between the Lacha Lung and the Takelang pass. The mean height of the lake basin is 15,764 feet above the sea. Rukchu is the most elevated district of Ladakh, and one of the loftiest inhabited regions of the known world, the mean height of its plains being 15,634 feet.—*Schl.*

RUK-HARA, a Saiva religious sect of mendicants, similar to the Ukhara, but do not carry a stick nor wear the Rudraksha ear-rings, but in their place metallic ones. See Ukhara.

RUKHENG, the name given to the language of Arakan.

RUKMINI, the only lawful wife of Krishna. According to the Harivansa, Rukmini was the daughter of Bhishmaka, king of Kundina, and was solicited in marriage by Krishna, of whom she was enamoured; but the son of Bhishma, Rukmi, jealous of Krishna's fame, and being incensed by the death of Kansa, his friend, was hostile to the match, and negotiated his sister's marriage with Sisupala, king of Chedi, likewise inimically disposed towards Krishna. All the kings of India were invited to the wedding, and amongst them came Krishna, who, seeing Rukmini proceed to offer her devotions at a temple, waylaid her on her return, and, with the assistance of his brother Bala Rama and his kinsmen, carried her off to Dwaraka. A hot pursuit followed, and an engagement took place, in which Rukmi was struck to the ground by Kesava, but his life was spared at his sister's intercession, and Krishna remained possessed of his prize. The marriage was solemnized at Dwaraka, and Rukmini remained the chief of Krishna's wives. He had ten sons by her, of whom Pradyumna is the most celebrated. The rape of Rukmini is also narrated nearly in the same words as in the Harivansa, in the 5th section of the Vishnu Purana, and more in detail in the tenth book of the Bhagavat, and in the Krishna Janma Khanda of the Brahma Vaivarta Purana. —*Cal. Rev.* p. 41; *Hind. Theat.* ii. 82.

RUKNABAD, a brook near Shiraz, c[illegible] by Hafiz. It is an insignificant stream.

RUKSAT. ARAB., HIND., PERS. Dismissal of a visitor; permission to depart; the Muhammadan etiquette being for a visitor to await dismissal, on the principle that he came at his own pleasure, but should await his host's time to depart.

RUKU. ARAB. Plural, Rukat, prostrations in Muhammadan prayer ritual; the stooping posture in prayer. Ruku-ki-tasbeeh, beads held in the hand at prayers. In Muhammadan ritual, reading or repeating a number of prayers from the Koran, accompanied with prostrations and genuflections. Rukat dogana, two rukat prayers.

RUM, a spirit distilled from the sugar-cane. The best is made from molasses, and it is preferred when well kept, of good age, considerable body, smooth oily taste, and a brownish transparent colour. Bengal, the West India Islands, and Guiana are the countries chiefly distinguished for the produce of rum.—*Faulkner.*

RUM or Room. The Persians designate Asia Minor by this term. The Muhammadans of India apply it to the Turkish dominions generally, also to Constantinople. Kaisar-i-Rum, the 'Cæsar of Rome,' always meant the Byzantine emperor, and the title was transferred to the Turkish Sultan.

RUMAL, a pocket-handkerchief (Ruh, the face, Mal, wipe); also a square shawl, used as veils in Peshawur by women. The term applies to any handkerchief, the soft silk one of Bokhara, etc., and to square shawls. A rumal is used in the place of a turban by all the poorer natives of India.

RUMEX ACETOSA. *Linn.* Sorrel.

Swan-mo, . . . CHIN. | Chuka, Kautli, . HIND.

It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 to 8000 feet, also in Kaghan. It is widely distributed. It is cultivated in Ajmir; the seed is considere[d] cooling and astringent.

Rumex Alpinus (Swan-mo, CHIN.), or Monk[s] rhubarb, is found on the European Alps, th[e] Crimea, and Mount Caucasus. The roots ar[e] large and purgative like rhubarb, and the whol[e] plant so resembles the rheum that Linnæus hi[m]self mistook one for the other.

Rumex dentatus, *W.*, is the Gul-Hamaz [of] Persia; R. hydrolapathum, *Smith*, is the Chin[ese] Yang-ti and Ye-ta-hwang; and R. undulat[us] *Royle*, is the Hamaz or Pulki. One species [is] known to Europeans as Indian red sorrel. F[rom] the decoctions of the dried roots of various so[rts] of sorrel, by the addition of alum, a fine r[ed] colour can be obtained at a low price, and va[ry] able to painters.

Rumex obtusifolius vegetates in Kashmir, [and] is eaten by the natives. Its root, under the na[me] of Radix spathiacuti, was formerly used a[s a] purifier of the blood in chronic cutaneous disea[ses] but is now obsolete both in India and in Euro[pe] its active principle, Lapatin, must, however, h[ave] peculiar properties.

Rumex vesicarius, *Willde.*

Hamaz, ... ARAB.	Tursha, Hamaz, . [illegible]
Humbæjt, . . . EGYPT.	Shutavedhi, . . SA[NS.]
Sorrel, Bladderdock, ENG.	Suri, ... SI[ND.]
Chuka, Chok, . HIND.	Sukh gu kire, .
Chuko, ... ,,	Sukan kire, . .

Cultivated for greens, etc., but it grows pl[entifully] [illegible] fields dr[y] [illegible] ing the ra[ins] [illegible] sorrel from the Bi[rit.] in India, owing to its great resemblance to Rumex acetosa in taste and other natural qual[ities]. It is an article of diet, and is considered by natives as cooling and aperient. This, w[here] water is abundant, may be had for eight mo[nths] in the year; it is sown in drills, or on the e[dges] around other beds; the leaves are sold in bun[dles] from one to two pice a seer.—*Cleghorn; Ir[vine]; O'Sh.; Riddell; Ains.; Honig.* p. 338.

RUMI KHAN, a Turk of Constantinople, [who] was commandant of the artillery of Bahadur S[hah] of Gujerat. He afterwards served under Huma[yun] at the siege of Chunar, which he conducted. Portuguese early endeavoured to obtain posses[sion] of Diu. Their first effort was defeated by R[umi] Khan, commander of the Gujerat army. In 15[34], however, Bahadur Shah of Gujerat permitted th[em] to erect a fortress there. It was complete[d] 1538, from which time the Portuguese bec[ame] the terror of the sea, and were able to resist [the] efforts made to subdue them by the empero[r] Turkey, the kings of Bijapur and Ahmadnagg[ar] and the Zamorin of Calicut. He afterwards ser[ved] under the Nizam Shah dynasty at Ahmadnagg[ar] and is buried there. He cast there the gr[eat] gun now on the ramparts of Bijapur.

RUMINANTIA, the ruminants or ruminat[ing] animals, such as camels, deer, horned cattle, [and] sheep. The ruminants are a tribe of mammal[s of] the order Ungulata, which comprise the fami[lies] Bovidæ and Cervidæ, *q.v.*

RUMPA, a tract of country situated on a p[lain] of the northern frontier of the Rajamundry d[is]trict. It is very thinly populated, wild, a[nd] mountainous, and the climate during most part [of] the year unhealthy. It formed part of the Kottapille taluk, which, under the new territo[rial] arrangement of the district, was included un[der]

ajamundry, with a sub-magistrate, however, esident, not far from the Rumpa border.

RUMPH, GEORGE EVERHARD, native of anau in Hesse Cassel, was born in 1626, and in Amboyna in 1693. He studied medicine, ent to Batavia when 28 years old, and red the service of the Dutch East India Com- at Amboyna, where he passed the remainder life. At the age of 42, when contemplating t to his native country, he suddenly became d, and therefore never left his island home. t he continued to prosecute his favourite studies natural history till his death in 1693, when he d attained the age of 67. His great work on shells of Amboyna was not published till . His chief work, however, was the Hortus boinense, which was only rescued from the tch archives and published some years after his th. D'Amboinische Raritertkammer, fol. 1705, passed through several editions. It has never n translated into English. It contains all con- ted with the plants of that region. Drs. ker and Thomson say that having become d, he obtained the assistance of some young in completing the work, and translated the riptions into Dutch; it was finished in 1690. manuscript remained upwards of thirty years he possession of the Dutch East India Com- y, but was at length rescued from oblivion Professor John Burmann of Amsterdam, who ed it between the years 1741 and 1754, illustrated it with several remarks and nyms, besides giving a translation into Latin Rumphius' original one appears to have lost. This work consists of six volumes, supplemental or seventh one not published 1757, and contains 696 plates, representing e than twice that number of plants. The es are much less valuable than those of ede, but the descriptions, on the contrary, much superior. A most elaborate commen- on the Herbarium Amboinense was com- ced by the late Dr. Francis Buchanan Hamilton he Transactions of the Wernerian Society of nburgh; what is printed only extends to the dle of the second volume, but the remainder he manuscript was presented to the Society ore his death. He had at the same time pre- ed a commentary on the Hortus Malabaricus Van Rheede, which is in the possession of the næan Society of London; that on the four volumes is all which has yet appeared in r Transactions.—*Wight's Prodromus Fl.* i. p. 8.

RUNDUR or Kyampo, lawless tribes of bers in the middle districts of Tibet.

RUNGIA REPENS. *Nees.*

sticia repens, *Linn.* | Dicliptera repens, *R. et S.*
cliptera retusa, *Juss.* | Kadag saleh, . . TAM.

A plant used in medicine growing in Peninsular lia. Its leaves resemble those of thyme in te and appearance. R. parviflora, *Nees*, also ws throughout British India.

RUNN, a flat tract lying between Sind and tch, which is inundated with brackish water ring the three monsoon months, and is covered salt incrustations when dry. Salt is manu- tured on it at Janjorra and Patri. The Runn Rin is a remarkable feature of the Rajputana sert. It is 150 miles broad; into it the Loni Looni or salt river enters, and then runs on the sea. The Looni rises in the Aravalli, and in Marwar it separates the fertile land from the desert, afterwards runs through the Chohan territory, dividing it into the eastern part called Raj-Bah or Sooi-Bah, and the western part called Park'har or 'beyond the Khar or Looni.'

The word Runn or Rin is a corruption of Aranya, or 'the waste;' nor can anything in nature be more dreary in the dry weather than this parched desert of salt and mud, the peculiar abode of the khar or wild ass, whose love of solitude has been commemorated in Job. That this enormous depository of salt is of no recent formation, we are informed by the Greek writers, whose notice it did not escape, and who have preserved in Erinos a nearer approximation to the original Aranya than exists in our 'Rin' or 'Runn.' Although mainly indebted for its salt to the Looni, whose bed and that of its feeders are covered with saline deposits, it is also supplied by the overflowings of the Indus, to which grand stream it may be indebted for its volume of water.

The Runn of Cutch has been subjected to repeated upheavals and depressions within even historic times. A vast space from the Indus eastward, which is now dry land, was, in the time of Alexander, covered by the waves. The ruins of Balabhipura, near Bhownaggar, are 10 to 15 feet below the surface of the soil. On the 16th June 1819, the Runn was partly submerged during an earthquake, and is now in part a lake and in part a salt-water marsh.

North of the Runn, in the collectorate of Ahmadabad, are the Null and Bohe, two hollows some distance apart, containing salt water, which they receive from rivulets, but give off none.

The Runn extends from the Indus to the western confines of Gujerat, a distance of full 200 miles. In breadth, from the islands, it is about 35 miles, and, taking into consideration its different belts, its area, exclusive of the elevated tracts called Bunni and the islands, is about 7000 square miles; including Bunni and the islands of Pacham, Khuren, etc., it is 9000 square miles. It is a dry, sandy flat, without herbage, and during a great part of the year a few tamarisk bushes alone are seen on it. Fresh water is only to be had on its islets. The mirage is there witnessed in all its surprising beauty. So long as the sun shines, the Runn resembles a vast expanse of water, which only those accustomed to it can distinguish from the reality. Its islands are Carir and Pacham. Bunni, south of Pacham, is a tract of grass land. Lieut. M'Murdo, writing in 1815, and Lieut. Burnes, writing shortly afterwards, pointed out that the Runn had formerly been an inland sea; and about the middle of the 18th century a vessel was found at Wawania sunk 15 feet deep in the mud.

During the S.W. monsoon, water is driven up its eastern inlet from the Gulf of Cutch, and up the eastern branch of the Indus, and covers its whole surface, augmented by the freshes which come down the Looni and Banas rivers.

The Runn of Cutch is called the Great Runn. The Small Runn commences near the Great Runn in the N.E., and continues to the Gulf of Cambay, and in the N.W. a narrow Runn separates the district of Okhamandul from the rest of the peninsula of Kattyawar, connected only by a narrow bank of sand at Mudhe.—*Tod's Rajasthan;*

Memoirs of Lieut. M'Murdo, 1815; *Lieut. Burnes*, 1827–28; *Captain Grant, Geol. of Cutch; Capt. G. Le Grand Jacob.*

RUPA, author of Vidaydha Madhava, a drama in seven acts on the loves of Krishna and Radha, written A.D. 1533.

RUPA. HIND. Silver, but generally means alloyed silver, debased by the addition of copper or zinc, or both.

RUPA-MATI was born at Sarungpur, a town in Malwa, 55 miles N.E. of Ujjain and 80 miles west of Bhilsa. Malcolm describes her as a dancing girl, and famed more for her good sense than her beauty. Malwa, for a short time in the middle of the 16th century, became independent under Baz Bahadur, and he made Rupa-mati one of his wives, and they passed through seven years of great happiness, hawking in the day, with poetry and music at night. But in A.D. 1560 Akbar sent Adam Khan to re-occupy Malwa, and Baz Bahadur, deserted by his soldiers, fled. Rupa-mati destroyed herself by poison or the dagger. Her songs are in the Hindi dialect of Malwa. Their style is simple and natural, and are the outpourings of a fervent heart, and many of them are still sung by professional songsters and musicians all over the province of Malwa. She had more than a common share of the poet's power.—*Tr. of Hind.* ii. p. 198.

RUPAR, a municipal town in the Ambala district of the Panjab, in lat. 30° 57′ N., and long. 76° 33′ E.; pop. (1868), 8700. The Sirhind canal draws its waters from the Sutlej at this point. A Muhammadan fair is held at the tomb of Shah Khalid, in the month of Jaishtha, attracting 50,000 persons; and another fair at a Hindu bathing festival on the banks of the Sutlej.—*Imp. Gaz.* vol. viii.

RUPA SIDDHI, a work by Buddha Priya. See Pali.

RUPEE, a coin of India, value under 2s. The Sicca rupee, the Madras or Arcot rupee, and the Bombay rupee, have been displaced from British India by the Indian rupee of 1835. The following are the assay reports of Shah Jahan, Multani, Kābuli, and Duraniwall rupees:—

Description of Coin.	Weight.		Touch.		Pure Metal.		Value of 100 in Company's Rupees.	
	Grs.	Dec.	P. c.	Dec.	Grs.	Dec.	Rs.	Dec.
Shah Jahan,	177	15	97	76	173	181	104	958
Multani,	171	89	94	90	163	123	98	862
Kābuli,	144	80	93	63	135	576	82	167
Duraniwall,	145	17	78	30	113	668	68	889

The weight and intrinsic purity of the British rupees were as under:—

	Troy grains.	Pure contents.

Rupee of Nepal is worth 13 annas; it is calle after an ancient dynasty, the Mahendra Mall and commonly Mohāri.

The Bhoti rupee is called the Kala Mohāri, an ought to be the same as that of Nepal. Nanak Shahi rupee had a pipal leaf as a sy

The purchasing value of the rupee has la greatly diminished. In Madras, from un rupees the maund of rice in 1859–62 to and above 4 rupees from 1863 to 1868; i Panjab, from over 3 rupees in 1853 to u and over 5 rupees since 1861. From 1835 1854, paddy per maund in Madras sold fro half to three-quarters of a rupee, and since th till 1868 has ranged up to 2 rupees. Wheat maund in Dinapur has risen from over 1 rup above 2 and 3 rupees; in the Panjab, from a 1 rupee to above 2 rupees; and in Bombay average from 1842 to 1855 was Rs. 1.9.8 maund; and from 1856 to 1868 it was Rs. 3.1

RUPNATH, a famous place of pilgrimag the foot of the Kaimur Hills, 35 miles N. Jubbulpur. It has one of Asoka's rock insc tions.

RUPPELL, a botanist who described Hortus of the Red Sea, and southwards to Moz bique, and the fishes near the Cape.—*Dr. Sm*

RURKI, a small modern town of 10,778 habitants, in the Saharunpur district of the Me division of the N.W. Provinces. It is situate one of the most elevated sites in the Doab betw the Jumna and the Ganges, in lat. 29° 52′ 25 and long. 77° 55′ 40″ E.; distant 68 miles N E. of Meerut, 1000 miles from Calcutta. The tricts of Meerut division are Aligarh, Bul shahr, Dehra Doon, Muzaffarnagar, and S runpur. It has a college organized by Mr. Ja Thomason and Colonel Maclagan, at which subordinate engineers of the Bengal Presid are trained. It was opened in January 1848. has a museum of economic geology, 997 above the sea, a lithographic and typogra press. Rurki stands on an elevated ridge o looking the bed of the Solani river, 22 miles of Saharunpur city.—*Imp. Gaz.*

. The different Indian names of Hippelapl Aristotelis, Equinus are applied to the sam stag, the great Indian stag, originally describ by Aristotle under the designation of Hippelaph and discriminated as such by M. Duvaucel the Asiatic Researches, xv. p. 174. The ho of different individuals present great diversities form. The only common characters are those a basal antler, springing directly and equally w the beam from the burr; and the beam termin ing in a bifurcated extremity, formed by a bran or snag separating posteriorly, and pointi obliquely to the rear. But Mr. Elliot met wi instances of medial antlers with trifurcated extre ities, and in one case with the extremities sho ing a fourfold division. The size of the rusa large, sometimes exceeding 14 hands in heig The colour varies from dark greyish-black

ate-black, with the chine, the inner sides of the nbs, the under part of the tail, and the space tween the buttocks yellowish-white, passing to orange-yellow, but never extending into a re circular disc on the buttocks. In several ces he met with hinds of a pale yellow or esnut colour. These were young indi- t the shikaris always declared them to as the common kind, and no other erceptible. The cranium of one of oured females presents no structural rom that of a young black female. have canine teeth in the upper jaw, from the suture between the maxillary r-maxillary bones. The neck and throat othed with a long mane. The suborbital s is very large. When the animal is excited, or ry, or frightened, it is opened very large, and be distended at pleasure. The new horns are and tender during the monsoon from June to tember, about which time the rutting season mences. The stags are then fierce and bold. Elliot had seen one, when suddenly disturbed, the intruder for a moment, shaking his head, tling his mane, distending the suborbital s, and then dashing into the cover.—*Tennent's lon*, p. 59.

USHES, grasses, and sedges are extensively in India for the manufacture of mats, ropes, ets, and thatching. The Cyperus textilis, and er kind of grass called kooray or koaray, are for making mats. The celebrated mats of hat and Cochin are of several species of a, juncus, and saccharum, which abound, and applied to useful purposes. The Phrynium otomum of Bengal is used for making the sital e mat.

utch rushes (Equisetum hyemale, *L.*) are used scouring and polishing. Their roughness is to a deposit of silicious particles in the epi- is. A species of rush called sweet rush or el's hay is sometimes brought into China from key and Arabia, tied up in bundles about a long. The stalk, in shape and colour, re- bles a barley straw. It is full of fungous pith, the British rush; leaves like those of wheat. en in perfection, it has a hot, bitterish, not leasant taste, and a very fragrant smell. It formerly used in medicine.—*M. E. J. R.; p. Descr.*

USOT. HIND. Extract of the bark and l of the barberry (Berberis), several species; yellow colour, totally soluble in water. It e Lykionendikon of Dioscorides.—*Beng. Phar.*

USSELCONDAH, 736 miles from Madras, 50 miles from Ganjam, in lat. 20° 56′ N., and g. 84° 37′ E., a military cantonment, named r Mr. Russell, who was Commissioner during Gumsur war of 1835-36-37. It lies at the of a hill.

USSELL, DR. PATRICK, a Madras medical er who succeeded Koenig as botanist to the I. Co. He devoted much time to the investi- ion of snakes and fishes, and edited Roxburgh's romandel Plants. In 1802, there appeared Dr. trick Russell's book in two volumes, containing descriptions and figures of 200 fishes collected Vizagápatam, on the coast of Coromandel; and 6 to 1801, Account of Indian Serpents collected the Coast of Coromandel, 2 vols. folio.

USSIA, a great dominion in Europe and Asia, ruled by an autocrat emperor from St. Petersburg. The historical and geographical future of Russia impels her farther and farther towards the south, in spite of all obstacles; and, yielding to these natural impulses, she has advanced, on one side, from the Irtysh to the upper courses of the Syr Darya or Jaxartes and Amu Darya or Oxus; on the other, from Orenburg to the Sea of Aral, thus incorporating within her boundaries the greater portion of the steppes dividing Europe from Asia proper. A necessity arose for connecting her Central Asia settlements firmly together, and with this object roads were contructed, stations erected, steamers introduced, as on the Amur and Syr Darya, and telegraphic lines established from the Chinese frontier to St. Petersburg. The Amu Darya (Oxus) is for many reasons of greater importance to Russia than even the Syr Darya. It disembogued at one period into the Caspian, and its bed to that sea still remains. Many are of opinion that the course of the river can be again directed to its ancient bed. The importance of this connection will readily be understood when it is remembered that a water route, in continuation of the Volga, will be thus created, which will extend for 3000 versts into the interior of Asia, and that the extreme points of this uninterrupted water-way will be St. Petersburg and the northern slopes of the Hindu Kush, almost reaching the boundaries of the British possessions, and very closely approaching the Indus. The number of Turkoman, Kirghiz, Kazak, and other nomade hordes in Central Asia is computed at 3 millions, and the settled population at more than 5 millions.

Russia's Asiatic dominions are estimated at 6¾ million square miles, with 18,000,000 of population. Russia has pushed forward her outposts to within 300 miles of the British frontier on the north. But there intervenes between the Russia in Asia and British India the barriers of the Hindu Kush and Kouen Lun, which rise like a wall, 17,000 feet high, with scarcely a crest or depression throughout their entire extent,—none certainly practicable for an army with the material and appliances of war as waged by the 19th century civilisation. In the far east, a settlement of the Amur was effected in much the same manner as Muhammad Toghlúk once attempted to transfer the population of Dehli to Dowlatabad in the Dekhan, but with a more successful issue. Whole colonies of Cossacks, men, women, children, and household goods, were moved from their homes, and settled at distances varying from 100 to 500 miles.

In Europe, the people ruled by Russia are of various races. In Finland, the people are Scandinavians, if not altogether by blood and language, at least by long-cherished traditions, by culture and habits. In Esthonia, Livonia, and Courland — the Russian Baltic provinces — the native races exhibit engrafted, far-advanced German civilisation. In St. Petersburg, there is an amalgam of all European nations, with little, if anything, in its trade, in its various social ranks, in the court itself, that is not of alien birth, or at least descent. On the Volga, Tartar, Kalmuk, and other Asiatic tribes mix everywhere with the crowds of the cities, and are still at home throughout a vast extent of the country. In the Caucasus, what has been rescued from its savage tribes is either a desert, or is being seized by Arme-

nians, everywhere superseding the less energetic and thrifty Georgians. In the Crimea and the adjoining mainland, what has been taken from the Tartars belongs in a great measure to German, Bulgarian, Greek, and other settlers. Odessa is a cosmopolitan commercial town, formerly Greek and Italian, now mainly Jewish. Between Odessa and Kief the Polish element preponderates. According to Russian official statistics, the population of the empire amounted at the last census, in 1872, to 86,952,347, which may at the present time have risen to 98,323,000. Of these, 55,000,000 is assigned to the 'ruling race,' the East Slavs, divided into 'Great' and 'Little' Russians.

'Great Russia,' or Russia proper, extends from the walls of Smolensk to the neighbourhood of Viatka, from the Gulf of Onega to the Kazak settlements on the Don. It covers an empire fifteen or sixteen times as large as France, the empire of Ivan the Terrible, that Russia which lay around the four ancient capitals,—Novgorod the Great, Vladimir, Pskow, and Moscow.

South of these boundaries, in Southern Russia, is 'Little Russia,' the ancient Ukraine or borderland, Kief, Chernigoff, Poltava, Charkoff; and farther south are the provinces of 'New Russia,' Bessarabia, Kherson, Tauris, or, as the Russians call it, Taurida, comprising the Crimea and the adjoining mainland, and Ekaterinoslaf. West of Little Russia, again, is the 'Black Earth country,' Podolia, Volhynia, and part of Kief.

In Great Russia, the ruling race is thoroughly modified by the admixture of at least 3,000,000 Fins (exclusive of those in Finland) in the north, and of 2,500,000 Tartars in the east, the former rapidly blending with the Slavs, who have squatted among rather than invaded or conquered them; the latter, as Muhammadans, resisting amalgamation with the Christians in recent ages, but have left deep traces of their features and character among the Slavs at the time of their all-sweeping inroads, at the end of which the court, the army, and the nobility of the victorious Ivan the Terrible were more than half Tartarized; when the king and his Boyars kept their wives and daughters shut up in their harams, some of which may still be seen in some odd wings of old Russian mansions, and buried them in separate cemeteries. Even in Russia proper, the population is, Scandinavia alone, perhaps, excepted, a mixture of various Slavo-Finnish-Tartaric races. But the mixing is far more observable in the other two divisions of European Russia: in Little Russia, the mass of the people are Ruthenes or Russines, long swayed over by the West Slavs, the Poles, and Lithuanians, who still constitute the aristocracy of the land; and in New Russia, where the Tartars are still at home, at peace with Germans, Greeks, Roumanians, Bulgarians, and other colonists, flourishing among them; while over both roam the Kazak, exhibiting the features and roughly adopting the habits and manners of the various peoples among whom their lot is cast,—nomades among Tartars, wasteful husbandmen in settled districts, wild marauding soldiers whenever their old trade is allowed to them.

The Statesman's Year Book for 1872 gives the estimated population of Russia in Europe, including Finland and Poland, at 68 millions and a quarter. That empire in 1722 stood at 14 millions; in 1803, at 36 millions; in 1829, at about 50 millions; and in 1863, at 65 millions. In the time of John III., that is to say, in the second half of the 15th century, its area occupied only 18 million square miles. In the reign of Alexis in 1650, its extent had already reached 237 millions; under Peter the Great, 280 millions; Catherine II., 335 millions of square miles; now the area of the Russian empire, Finland, Poland, Russia, and Siberia, nearly 370 millions of square miles; the Caucasus add nearly 9 millions; lation of the entire empire, which th nearly as possible, at 77 millions.

Russia in Central Asia has a popula millions, including in this the Kirghiz 1¼ million, and Russian Turkestan, 1½ mil Siberia has 3¼ millions, Russian Caucasus, u 5 millions; total, 12 millions.

In 1879, the entire dominion in Europe and Asia was—

		Grand total,	21,739,728	98,32

Russia has been conquering to the east s the latter part of the 15th century. In 1487, Kasan was made subject to Ivan IV., reigned from 1533 to 1584, subdued the Ta khanates to the south, with the exception of Crimea. Astracan fell in 1554; the Bashkir 1556. Peter the Great, in 1727, conquered provinces to the west of the Caspian Sea, w Russia lost again in 1734. In 1806, the great te tory of Darbend came into her possession; in 1 two Caspian provinces, Daghestan and Shir were restored to her. In 1828, she acqui Arran, and by 1868 she had advanced in Cen Asia till conterminous with the Chinese emp To secure her Asiatic conquests over a popu tion of 12 millions, she requires to keep an a of 163,759 men,—one soldier for every 70 of population. Britain garrisons India with its millions of souls by an army of 180,000, of wh 60,000 are British, being one to every 1400 s

Asiatic Russia is bounded on the north the Arctic Ocean, in a coast line of 7 English miles. On the east the shores of Pacific, from Cape Chukotst to the mouth Tumen ula, are 6067 miles. The shores of Caspian and Aral Seas extend 1167 miles. T land frontier on the south, from the Caspian a Aral Seas to the mouth of the Tumen ula, about 6667 English miles, viz. 2200 along course of the Jaxartes, Charyn, Argun, Amur, a Usouri, about 2233 by the Celestial, Alat Altai, and Sayan mountains, and an equal part open land frontier.

Russia in Asia has about 3,768,000 mi unfitted for a settled life, and only 1,930,0 square miles of culturable land. The unsuita steppes in W. Siberia and in the Orenburg reg are 753,000 square miles. The tundra or mars and frozen land in W. and E. Siberia are 2,584,0 square miles, and the mountainous country

highlands in the Tian Shan, Alatau, Sayan, Altai, Yablonoi, and Stanovoi mountains, 431,000 square miles. There are numerous lakes, the largest of [illegible] are—

[illegible], . .	12,400 sq. m.	Piasino, . .	2,410 sq. m.
[illegible]ash, .	8,530 ,,	Zaisau, . .	1,490 ,,
[illegible]i, . .	1,420 ,,	Alakul, . .	600 ,,
[illegible], . .	1,270 ,,	Dengiz Citter,	560 ,,
[illegible] . .	410 ,,	Abyshkau, . .	540 ,,
[illegible]ndonsk,	280 ,,	Chukchagyr,	260 ,,
[illegible]-kul,. .	2,500 ,,	Barun-torei,	210 ,,

[illegible]e northern half of Central Asia consists of [illegible] Kirghiz desert, which is mountainous and [illegible]d on the east, and full of saline steppes on [illegible]t. In the midst of the southern half lies [illegible]Sea of Aral, on the western side of which, up [illegible]he Caspian Sea on the west, there stretches a [illegible]d tract of desert. But it is in a fertile tract [illegible]t the conquests of Russia were made between [illegible]4 and 1868. After long years spent in forti[illegible]g posts, in 1864 Russia made a sudden [illegible]ption into the upper valley of the Jaxartes or [illegible] Darya, and in that year took three forts of [illegible]okand, viz. Aoulietta, Turkestan, and Chem[illegible]d. In the spring of 1865, the chief of Khokand [illegible]in battle, and in June 1865 the city of Tash[illegible]d was stormed. On the 20th May 1866, they [illegible]ght and won the battle of Irdjar, against the [illegible]hariotes, and later in the year captured the [illegible]s of Oratepe and Juzak, within 40 miles of [illegible]arcand. On the 13th May 1868, a great [illegible]le was fought under the walls of Samarcand, [illegible] the city surrendered, and later in the year [illegible]hara yielded.

[illegible]reat Britain has so recently become paramount [illegible]ughout India, that this approach of Russia to [illegible]orders may inspire hopes among martial races [illegible]e who would welcome any change from the [illegible]ongenial quiet of civilised settled life. Cir[illegible]stances may drive Russia on, as, in 2500 [illegible]s, Scythic Getæ, Alexander, Arabs, Shahab-ud[illegible] Ghori, Chengiz Khan, Timur, Baber, Ahmad [illegible]h, and Great Britain have been. The only [illegible]sible routes for Russia would be from Balkh by [illegible]y of Kābul and the Khaibar pass, or through [illegible] Kara-korum pass, or to establish her base at [illegible]at, march via Kandahar and the Bolan pass. [illegible] this may be a dream for many centuries to [illegible]e. — *Russians in Central Asia, Capt. Valinof and M. Vemukof; J. R. Mitchell*, p. 4.

RUSSIA LEATHER.

[illegible]o di Russia, .	,,		

The tanned hides of oxen, manufactured in a [illegible]culiar manner. The leather is soft, has a [illegible]ongly prominent grain, a great deal of lustre, [illegible]d a powerful and peculiar odour. The colours [illegible] principally red or black; the former is much [illegible]eemed for binding books and making articles [illegible]ere a fine durable leather is required; the latter [illegible]hiefly in demand in Russia for shoe and boot [illegible]king. It is occasionally brought to Peshawur. [illegible]nother kind of leather, having a metallic lustre, [illegible]lled kimsana, is imported also from the north[illegible]st; also a beautiful leather, used in the manu[illegible]ture of the bright blue-green shoes from Kash[illegible]r and Peshawur, which is called kimakht. This [illegible]not made in the Panjab. Peshawur sword scab[illegible]rds are often covered with a black leather, looking like morocco; it is probably an imitation. Russia leather is said to be made of horse's skin; it is thick but pliant, and of most grateful fragrance. The skins are much valued for the preservation of merchandise, as insects will not attack them.—*Faulkner.*

RUST, red rag, red robin, red gum, Uredo rubigo and U. linearis, are fungi which attack wheat in England.—*Hassel.*

RUSTAM, a king of Persia, who was born in Segistan, B.C. 1072; established the Seoraja dynasty at Kanouj, where the worship of the sun was introduced. The dynasty survived 286 years. —*Prinsep*, p. 283.

RUSTUM, a hero famed in Persian romance. Felamorz, son of Rustum, was defeated by Behram near the fort of Fessa, between Shiraz and Darab. Behram caused Felamorz to be hanged, and his tomb existed in the village until, it is said, a European traveller removed it away as a relic.

RUTA ALBIFLORA, white-flowered rue, is common on the Himalaya, at an elevation of 5000 to 8000 feet; is sometimes cultivated, and very common, truly wild, at elevations of 3000 to 7000 feet. It is generally used for roup and all diseases of fowls, mixed with their food. The rue tribe of plants, Rutaceæ, comprise—3 Ruta, 2 Cyminosma, 1 Aplophyllum, 1 Evodia, 1 Dictanonus.

Ruta graveolens, *Linn.*, Rue.

Secale cereale, . .	LAT.		

The grain of Secale cereale comes nearer in its properties to wheat than any other grain. It is the bread corn of Germany and Russia; being of less value to the English farmer than barley, oats, or peas, it is in consequence very little cultivated

in Great Britain. The seeds are met in the market, deprived of husk. Rye flour is said to be somewhat laxative. The roasted grains are not unfrequently employed in the adulteration of coffee. Rye flour does not form a paste like wheat flour.—*Hassel; Faulkner; M'Culloch.*

RYOT. ARAB., HIND., PERS. A cultivator, a client, subject, but is more especially applied to the agricultural population; properly Raiat, plural Riaya.

RYOTWARI, a revenue term applied to a system under which the land taxes are collected, in all those parts of India in which the village communities have been broken up by the distracted state of the country for generations, or in which the exclusive title of the representatives of the old proprietors has been superseded by the prescriptive rights acquired by the actual cultivators.

In Madras and Bombay, generally, the normal state of the ryot is to hold under the Government.

In Coorg, the janam or hereditary ryot pays direct to Government at a light rate, but on condition that he shall not alienate or sublet the land or even cultivate it otherwise than by his own household or by his slaves.

In Coimbatore and south of Madras generally, the Nutamkar or Gour ryot is recognised as the absolute proprietor of the soil.

In Tanjore, the mirasdars have a transferable right of property in their holdings, and they have sub-tenants, called parakudi, who cultivate on their own stock, but are liable to be ousted.

In Malabar, the janam tenure is a fee-simple or hereditary right of possession, which can be leased or mortgaged. The janam kār assigns a portion of land to be fenced and stocked, in consideration of which the holding is enjoyed free of charge for twelve years. If resumed, which is seldom done, compensation for improvements is given, otherwise the tenure is maintained on easy terms. Kai kanum patum, or a usufructuary tenure by labour, also prevails.

In Canara, the mulgueni or proprietory tenants are of the two classes,—Nair Mulgueni, whose tenure is by ancient prescription; and Shud Mulgueni, by purchase. The Chailgueni is the tenant-at-will, from whom the landlords may get additional rent whenever there is a higher offer.

In Peddapur and Cuttamur a right is vested in the ryot, which partakes more of what is termed in the southern provinces the Pashangary tenure, in which no sale of the right of occupancy is customary, than of the Adhkari tenure, under which the right of occupancy is considered transferable, subject to the obligations annexed to the possession of it.

In the Tamil country, under the mirasdar, there are non-proprietary tenants, who are divided into oolcoody or permanent, and paracoody or temporary, cultivators. The oolcoody farmer has rented the same farm at a given rent (in money or grain) for several generations, and enjoys a right by prescription; he cannot be ousted so long as he pays the rent, which cannot be raised. The tenure is hereditary, and can be mortgaged, but not sold.

The paracoody farmer has no privileges beyond the terms of his contract.

Where there are no mirasdars, the ryots are considered as ool-paracoody, holding from Government.

The Pycary tenure is of two kinds,—resident where there is a continuing interest, and non-resident where there is no such interest, and where the stranger is tempted by low rents. The tenure of the first of these is like that of the copyholder of England. It is hereditary by prescription, but they cannot alienate, for the [illegible] extends to the use of the soil only, and not to substance.

The Pariah, Puller, and Pulli of the [illegible] country, who are predial slaves and serfs [illegible] the Hindu landowners, claim hereditary property landed property as the incident of their villeinage, and it is generally allowed to them and their descendants on proving former residence in the village.

In Bombay, there are three classes of ryots: (1) Mirasdars or landed proprietors, possessed of watans, which are privileged holdings that command a price in proportion to the lightness of the assessment. Half the produce is the Government rent of an ordinary cultivator. (2) Oopree or permanent tenants; and (3) Warwunda-kurri or temporary tenants. The rights of these can be traced to the remotest antiquity. It may be conferred by the heads of villages, and implies a hereditary right so long as the ren[illegible] village usage is paid. The second, bating some privileges, is almost as valuable.

In Sind every man in the south who hol[illegible] few acres, is called a zamindar. In the north there is a class of hereditary cultivators called mari, who pay lapa to the zamindar over and above the Government assessment.

In Malwa there are three classes—(1) the Janmi or Watani Kursan, (2) the Sukbasi, and (3) Pykashti. The first of these can sublet, and possess a title to the fields their forefathers cultivated, which is never disputed so long as they pay the Government share. The second are settlers, who at first have no immunities, but after two or three generations their descendants may rise into the first class. The third are non-resident, and have no rights beyond their contract.

In Nimar, cultivating occupancy resembles that of other Mahratta districts, but is weaker, as in Oudh, under native rule; the ryot, if not properly treated, moves off to an adjoining village under another farmer, and cultivates there.

In Mewar the ryot is proprietor of the soil. He compares his rights to Dubh grass (Cynodon dactylon), which no vicissitudes can destroy. He calls his land his bapota, which is the watan of the Mahrattas, and the miras of the south of the Peninsula. The military vassal in Rajputana called bhumia, the caniatchy of Malabar.

In the Himalaya, besides the proprietors, there are khaekur, with rights of occupancy so long as they pay the Government share of the revenue, and a few serthan who hold a lease.

In Orissa the ryots are divided into—(1) Thanees, who seldom hold under a patta or lease, and (2) Pahee, who always do so. The Thanee hold a hereditary non-transferable right of occupancy, and their rent is usually restricted to that portion of the Government demand that remained due when the Pahee payments had already been appropriated to its liquidation.

In Benares are resident and non-resident ryots, and the farmer or proprietor could not disturb the former, so long as they paid the stipulated rent, but the latter were cultivators-at-will.

In Saharunpur right of occupancy prevails, and the rent could not be raised above the customary ates; the rents on non-proprietary cultivations djusted according to the different kinds of ce.

Moradabad rents in kind are the rule, money the exception, and the only real Khudt ryots were of the zamindar's family, and not be dispossessed.

Bareilly, on the expiration of a lease, the ord was generally considered free to let the to whom he pleased, but it was generally to the last tenant.

Shahjahanpur, if a higher rent be offered what the resident ryot may choose to pay, he be ousted.

Muttra the proprietor has the rights of oust- the tenant if he refuse to pay the estimated e of rent.

Agra the proprietor cannot oust a cultivator essing the right of inheritance in the soil; those who have no such hereditary right can dispossessed in favour of another willing to more.

Mynpuri, Farrakhabad, Etawa, Gorakhpur, Allahabad, the proprietor cannot dispossess any on having a right by inheritance in the soil; hose who have only a tenancy can be put out vour of another person willing to pay more, latter how regularly the tenant may have paid ent.

Bundelkhand the cultivators are all pro- ors, and (apparently even if sold out) have t of occupancy at customary rates.

Cawnpur the ryot is a tenant-at-will, culti- g from year to year; popular opinion prevents tion.

tenant is also called in the Mahratta districts, r, Kunbawa, or Kul. They are distinguished eir holdings as Thulwaluk, Mundwaluk, Oopri, Owundkari. Cultivators of Central Oudh who y rent privileges are styled Amnek. A family elatives cultivating their own lands are called yachara or Bhayad. Ordinary cultivators are d ryot, plural ryaya, or arzal, meaning humble mmon.

the Bengal Presidency, during the administra- of Lord Cornwallis, in the provinces of Bengal, r, and Benares, the Government settled, anently, the persons' names, and the amount x to be raised, solemnly engaging never to ase it. The persons thus raised to a social ion similar to the landlords of Britain, were ed zamindars. There is no doubt that many hem were persons of hereditary influence and us in the country, and that their connection h the land, of which they were then recognised the proprietors, had in general been of a per- nent character. But their position, neverthe- was essentially that of middlemen, collecting revenue, not for themselves, but for the Moghul ernment, accounting to that government for r receipts, and remunerated by a percentage he collections. It is now, however, universally nitted that they never had the power of dis- ing arbitrarily of the land. There were every- ere at least large classes of tenants whom they ld not lawfully eject, except for non-payment revenue, and from whom they could not law- y exact more than the customary payments.

The ryotwar system of Madras was principally followed out by Colonel Reade and Sir Thomas Munro. Under this system, the peasant himself, the cultivator or farmer, is regarded as the proprietor of the soil, subject to the payment of the Government demand. The position which the Madras ryot holds is somewhat similar to that of the feuars of Scotland, whose feu is held in perpetuity, subject to a permanent feu-duty; with this difference, that in Scotland the rent or tax or feu is permanent, or for a long lease of 999 years, but in Madras the amount charged is settled annually. And this has given rise to the term Annual Settlements in Madras, as the system introduced by Lord Cornwallis has been named Permanent Settlements, the latter leaving the farmer entirely at the mercy of the landlord, as was the case until after the middle of the 19th century, when Government passed Acts to protect the ryots. The Madras ryot can increase or diminish his holding annually, and has thus all the benefits of a perpetual lease, without its responsibilities, inasmuch as he can at any time throw up his lands, but he cannot be ejected so long as he pays his dues. He also receives assistance by remission of assessment in unfavourable seasons. The practical disadvantages of the ryotwar system consist in the annual meddling and supervision required on the part of Government for valuation of cultivated lands. The advantages are this, that as the land furnishes in India the great bulk of the revenues, and as the taxes of a country must ever be regulated by the wants of the State, the annual collection affords the best opportunity for realizing moneys for State purposes.

In the North-Western Provinces the lands were acquired principally in consequence of Lord Wellesley's Mahratta wars, but the settlement of their land revenues was commenced and completed between 1834 and 1844, principally by Mr. Robert Mertens Bird. It is called the village system or settlement, and has been acted on, in the belief that the village community consists of the descendants or representatives of those by whom the village was, at some remote time, conquered or reclaimed from waste. In most cases these are a part, and in some form the whole, of the agricultural population of the village; but the ordinary peasants or cultivators are descendants of persons who have settled in the village with the permission of the proprietors. But some of them have by grant or prescription acquired a fixity of tenure, while others have remained tenants-at-will. The village proprietors formed prescriptively the municipal government of the village,—a fact of great importance, village government being the only institution properly so called which the Hindus possessed. The time occupied in thus settling the N.W. Provinces was about ten years, and the expense incurred in it was upwards of £500,000. It comprehended a detailed survey of a country about 72,000 square miles in extent, containing a population of more than 23,000,000, producing a land revenue exceeding £4,000,000. The proprietary rights, as ascertained and recorded at the survey, were confirmed in perpetuity; but the Government assessment was fixed for twenty, and in some cases for thirty years.

The Panjab Settlement was on leases for terms of years, usually shorter than in the N.W. Provinces, and the cess does not exceed one-fifth of the gross value of the produce in rich tracts, and one-sixth or

one-eighth, or even less, in poor. In the Bombay Presidency the Madras ryotwar system was introduced after the Mahratta wars terminating in 1818; but since a recent survey, the land, cultivated and waste together, is divided into fields of an extent cultivable by one yoke of bullocks, and on each field the Government demand is fixed for a period of years, at a very moderate rate. While the contract is binding on the Government, the ryot, on his side, can throw up his engagement at pleasure, and he is not required to pay the assessment for any year on any field which he has not cultivated or undertaken to cultivate in that year. This assessment holds good for a term of thirty years. The ordinary rates vary in different districts, from 4s. 6d. an acre in the rich black-soil lands of Gujerat, to 10d. an acre in the hills of the Konkan. In the Madras Presidency, a great improvement was introduced in the year 1837, by ruling that the land tax should not be increased because on such land a more valuable article was cultivated; and in 1855 an entire revision of the Madras cess was undertaken and carried out during the administration of Lord Harris.

Nearly two-thirds of the revenue of India consists of the rent, or cess, or tax on land; the second in amount is from opium, a third is from salt.

The land in the south of India belongs firstly to the family, secondly to the village community. Joseph bought up the whole land of Lower Egypt for the king; every man sold his field, and the whole soil, except that which belonged to the priests, into which class he had himself been adopted by marriage, then became the property of the crown. He then made a new division of the land, allotted out the estates to the husbandmen to cultivate, and gave them seed to plant, and required them for the future to pay one-fifth part of the crop, as a rent, to the royal treasury. Thus did that Asiatic minister, copying the customs of the east, make the king the landlord of the whole country except the estates of the priests; and the land was then held by what is now known in Asia as the ryotwar tenure. In Asia, generally, the landholders are tenant-proprietors at a changeable rack-rent of about one-half of the crop; whereas the Egyptians paid a fixed and low rent of one-fifth. The Egyptian landholder was therefore rich enough to have peasants or slaves under him, while the Indian ryot is himself the peasant-proprietor. This rent was in the place of all direct taxes.

Throughout the Bundi territory by far the greater part of the land is the absolute property of the cultivating ryot, who can sell or mortgage it. There is a curious tradition that this right was obtained by one of the ancient princes making a general sale of the crown land, reserving only the tax. In Bundi, if a ryot become unable, from pecuniary wants or otherwise, to cultivate his lands, he lets them; and custom has established four annas per bigha for irrigated land, and two annas for gorma, that dependent on the heavens, or a share of the produce in a similar proportion, as his right. If in exile, from whatever cause, he can assign his share to trustees; and the more strongly to mark his inalienable right in such a case, the trustees reserve on his account two seers on every maund of produce, which is emphatically termed 'huk bapota ka bhom,' the dues of the patrimonial soil.—*Tod's Rajasthan*, ii. p. 540; *Sharpe's History of Egypt*, i. p. 36; *Carnegy; Imp. Gaz.* iv.

RYTINIA STELLERI, the sea-cow of Behrin Straits. It lives on sea-weed. The Kolush t have nearly exterminated it.

S

S, the 19th letter of the English languag a sibilant consonant, and has a hissing so It has two uses,—one generally at the begin or end of words, to pronounce a mere hissing, Sabbath, sack, sin, etc.; the other a vocal hiss precisely like that of z, as in muse, music, wi but its sound in the middle and end of words only be learned by practice. In a few Eng words it is silent, as in isle. The simple sibil of Europe occurs in Arabic, Sanskrit, and in Indian alphabets. The palatal s of the Na alphabet, in use in words of Sanskrit origin commonly pronounced as sh somewhat softe The Arabic alphabet has two letters to which India, is given the sound of s. One of th called in India sad or swad, has, amongst Arabs, the sound of dad or dhad; the other Ar letter is called in Arabia, say or thay, but in I it has only the sibilant sound of s. The Persian l sin has the simple sound of the English lett The Persian and Nagari letter sh has the s of sh of the English alphabet. On the we districts of British India, and along the lin the Indus river, the letters h and s are intercha able, so that Sind becomes Hind, and sing lion, is changed into hing, garlic. S, t, an are interchangeable letters, also s and t in all anian, Turki, and Dravidian tongues are i changeable,—sri or shri becomes tiri, sar-t or head-dress, head-tie, becomes tarband. Cassius remarking on the term Assyria or At noticed that the barbarians change the sigma tau,—Ashur becomes Athar. Tiri or tira is the cognised Dravidian pronunciation of the Sans sri or shri, sacred or holy. Ss was pronou as th by the ancient northern races, who w Sol or Sor, the sun, as Thor. In Tamil y an are constantly interchangeable. Thus uyir or is life; uyaru and usaru is to be exalted or li up; in Canarese usar is life, power. S of Sanskrit changes into h in most of the H dialects, and also in the Greek. In the Z the Sanskrit s, as in asura, changes to h, a ahura.

SA. KOL. A grove.

SAA. ARAB. A grain measure of 7 lbs. or 8

SAAD ALLAH KHAN, vizir of the empe Shah Jahan, died about the year 1653. He the most able and upright minister that e appeared in India. He makes a conspicu figure in all the correspondence of Shah Jah and is constantly referred to as a model in correspondence of Aurangzeb, during the l reign of that monarch. Khafi Khan says that his time the descendants of Saad Allah Kha near a century after the death of their ancest were still distinguished for their virtues and telligence, and he contrasts the respectability their conduct with the frivolity and effemin of the other nobles of that era.—*Elphin.* p. 51

SAADAT, ARAB., pl. of Syud, lords, descend-

ts of Mahomed through his daughter Fatima
d his son-in-law Ali.

SABA, of Ezekiel xxvii. 22, an ancient town in
strict of Balad-ul-Jahaf in Yemen, and the
al of the ancient Sabæans, and to this day the
ict is termed Ard-es-Shaba, or 'land of
ba.' It is doubtless identical with the realm
ace the queen of the East came to visit
non. Mareb, the present capital of the dis-
, is built on the site of the ancient Saba. It
ains about three hundred small houses and
ral ruins, which are attributed to Queen
ees. A dyke or dam of masonry, famous in
history, was drawn across the valley, between
ills called Balak, six hundred paces asunder.
Sail-el-Arim or Sedd Mareb.) Haram Bal-
, the palace of the queen of Sheba, is west of
town of Mareb. About one-fourth of the
is still standing, and covered with Himyaritic
iptions. The ancient residence of the queen
heba, who formed the city, is about a mile
a half in diameter. At the time of the Peri-
of the Erythræan Sea, the Sabæans monopol-
the commerce of India, and acted as inter-
ate agents between the merchants of India
Egypt. In the reign of Ptolemy Phileter
177), the Greek sovereigns in Egypt had
traded directly to India, but imported their
n commodities through Saba, the capital of
ia Felix. The port of Berenice was not used
nat commerce, but Myos Hormos or Arsenoe
still the emporium, and the only trade down
coast of Africa was for elephants' teeth.
rade to the east had been monopolized by
erchants of Sabæa, from the patriarchal days
ob. The period at which the kingdom of
or Himyar flourished was the golden age of
ic poetry. The religion of the Himyarites,
eir devotion, was directed to a multitude of
es, of which the principal were represented
e sun, moon, and planets. Saba, surnamed
r, was the father of Kahtan (Joqtan), father
oorab, father of Yahsab, father of Abd-us-
ns. Abul Fada ascribes the construction of
Mareb-dam to Abd-us-Shams, but other his-
ns ascribe it to Loqman, king of that remnant
he Adites who renounced idolatry on the
ching of the prophet Hud, and who are
ly styled the second Adites. Saba was also
me applied to Abd-us-Shams, founder of
ba. Amongst his sons were Himyar, Amru,
an, and Ashaar.—*Playf. Aden; Early Chris.*

BA, said to signify a host, particularly the
of heaven, or the celestial bodies, in the
ation of which the Sabæan ritual is believed
ave consisted; the celestial bodies, the planets
constellations, were personified in the genii
ood and evil.

ABAB, a mountain of Siam, near which and
he frontiers of the Xong tribes, precious
es, consisting of rock-crystal, cat's-eye, topaz,
et, sapphire, and rubies, are found.

ABADILLA, fruit of Veratrum sabadilla, of
græa officinalis, and of several other of the
anthaceæ.—*Ben. Phar.*

ABÆAN or Sabean, the people of Saba in
en, the traditional descendants of Saba or
ba, the rulers of the Cushite kingdom in
thern Arabia, now known as the Himyarite.
y are quite distinct from the Sabians men-
tioned in the Koran. Sabæan is a term which has been variously applied to the ancient inhabitants of Southern Arabia; also to the philosophical sectaries of Haran; and likewise also to the pseudo-Christian remains of Babylonian astrolatry. The Arabian writers, on the other hand, apply it to the pagans of all parts of the world, to all who are neither Jew, Zoroastrian, Christian, or Muhammadan. The true Sabæans of to-day are the 'Subba' of Mesopotamia. They are descendants of the Nabathæans, the Chaldæans. They have a great reverence for the planets; they call themselves Mandæans (Mando-Yahya, disciples of John), and they have various sacred books; but though called Christians of St. John, they are Chaldees in speech and religion. They have 360 divinities, amongst whom are Yahya, also Babram Rabba and God, whom they style Alaha. In the environs of Babylon they retain a great number of Babylonian religious traditions; they designate the tree of life in their Scriptures as Setarvan. Sabæism was formerly re-introduced in Kuseem by Darim, about the year 1200, and prevailed till the Wahabee revival. In the Vedic Sabæanism only the elemental powers are invoked. Sabæan worship once extensively prevailed in South America. There is a curious passage in Tavernier concerning the aversion of the Sabæans to blue; and there exists a similar antipathy among the Kurdish sect of the Yezdi (who appear to have been once Christians) for that colour, grounded on a different, although not less absurd, reason. Tavernier makes mention of another peculiarity of the Sabæans, and calls it the ceremony of the fowl, which their priests alone have the right to kill; but he does not explain in what this ceremony consists, so that we cannot now judge whether it has any connection with a custom prevalent among the Yezdi. Arabian authors who lived with the Sabæans state unanimously that they worshipped the seven planets (Masudi, i. p. 218), and that their faith did not materially differ from that of the Chaldæans. It resembled that of the idolatrous nations around them; they addressed their devotions to numerous deities, of which the principal were represented by the sun, moon, and stars; but there were many who acknowledged one deity as the supreme Lord of the universe. They believed in the immortality of the soul, and a future state of rewards and punishments, while many held the doctrine of transmigration. The Sabæan, called Sabi by Muhammadans, who are known to Europe as the Nazarenes, also Christians of St. John, designate themselves Mandæan. They are in two small tribes of artisans, about 4000 in number, one tribe settled in Haran and one in Babylonia; those of Haran only took the name of Sabæan in A.D. 830, during the khalifat of Mamun, in order to bring themselves within the 5th Sura of the Koran, which recognised as people of the faith, Jews, Sabæans, and Christians. Those of Haran have a confused belief framed of biblical legends, Jewish ceremonial laws, Greek gods. Those of Babylonia speak an Aramaic dialect closely allied to Syriac and Chaldee. They have two Scripture books,—one the Sidra Rabba, also Ginza or Treasure, and the other the Qolasta hymns. John the Baptist is their lawgiver. They have frequent baptizings and purifications by ablutions.—*As. Res.* ii. p. 374. See Ali Ilahi; Veda; Yezdi.

SABAGRÆ, according to Orosius, a people who made their submission to Alexander the Great during his halt at the confluence of the Panjab rivers. According to Curtius, they were called Sambracæ or Sabracæ; and according to Diodorus, who placed them to the east of the river, Sambastæ. They were a powerful nation, second to none in India for courage and numbers. Their forces consisted of 60,000 foot, 6000 horse, and 500 chariots. The military reputation of the clan suggested to General Cunningham the probability that the Greek name may be descriptive of their warlike character, just as Yaudheya means warrior or soldier. He thinks therefore that the true Greek name may have been Sambagræ, for the Sanskrit Samvagri, that is, the united warriors, or Συμμαχοι, which, as they were formed of three allied tribes, would have been an appropriate appellation. In support of this surmise, he mentions that the country of which Bikanir is now the capital was originally called Bagar-des, or the land of the Bagri or warriors, whose leader was Bagri Rao. The word Bhati also means warrior or soldier, and thus at the present day the tribes calling themselves warriors form a large proportion of the population in the countries to the east of the Sutlej, namely, the Johiya or Yaudheya along the river, the Bagri in Bikanir, and the Bhati in Jeysulmir. All three are of acknowledged Lunar descent. He thinks it possible that the name Sambagri might have been applied to these three clans, and not to the three tribes of the Yaudheya, but he thinks that the Yaudheya have a superior claim, on account of their undoubted antiquity. To them he attributes the foundation of the town of Ajudhan or Ayodhanam, the battlefield, which is evidently connected with their own name of Yaudheya or Ajudheya, the warriors, and he thinks the latter form of the name is most probably preserved in the Ossadii of Arrian, a free people who tendered their allegiance to Alexander at the confluence of the Panjab rivers.—*Cunningham's Geog. of Ind.* p. 246.

SABAKHIA, a predatory race in Orissa.

SABAKTAGIN, the second ruler over the southern tribes of modern Afghanistan. In the reign of Abdul Malik, the fifth prince of the house of the Samani, Alptegin, A.D. 961, A.H. 350, rose to be governor of Khorasan. He had been a Turki slave of Abdul Malik, but, having incurred the ill-will of his successor, he retreated with 3000 disciplined slaves to Ghazni, and till his death held the strong tract between the Suliman mountains and the Indus, against all attacks. He died A.D. 976, A.H. 365, fourteen years after assuming independence. He was succeeded by Sabaktagin, a Turki slave, who had married the daughter of Alptegin. Raja Jeipal of Lahore advanced into Laghman to oppose him, but entered into agreements, which he subsequently refused to fulfil, and formed a combination with the rajas of Dehli, Ajmir, Kalinjar, and Kanouj. Sabaktagin advanced to meet their army, which he defeated and pursued with great slaughter to the Indus. He found a rich plunder in their camp, and took possession of all the country up to the Indus, and occupied Peshawur. The Afghan and Khilji of Laghman immediately tendered their allegiance. He subsequently twice carried a large force to the aid of Nuh or Noah, the seventh of the Samani kings, whom Bog Khan of the Hoie-ke Tartars had forced to across the Oxus. Sabaktagin on the seco occasion totally defeated them (A.D. 995, A.H in the neighbourhood of Tus, now Meshid. Sa tagin made Ghazni his capital. He died on way to Ghazni. The name is also written Sa taghi. He was succeeded by his son Ismail, Ismail after a few months was put aside his younger brother Mahmud. Mahmud, died A.D. 1028, enriched Afghanistan with spoils of India. In the reign of the cruel Bah one of the Tartar's descendants, the Sabakt dynasty were deprived of all but the Panjab. this too, in A.D. 1160, they lost.—*Elphin* 274–76; *Ferrier's Afghanistan*, p. 14.

SABALA, one of the two dogs of Yama.

SABALIA, in Gujerat, a low caste, empl in tending cattle; a cowherd race.

SABAL UMBRACULIFERA, the West In fan-palm, growing in Jamaica to a height o to 80 feet, bearing leaves 4 to 6 feet in diame it might be introduced into India.

SABAR, wash-leather, soft leather of the bur deer in the Kangra and Hoshiarpur distri

SABARÆ of Ptolemy are the Suari of P and both have been identified with the abori Savara or Suari, now a wild race of wood-cu who live in the mountainous parts of the n eastern districts of Peninsular India. The S or Saharia of the Gwalior territory occupy jungle on the Kotah frontier to the westwa Marwar and Guna.—*Cunn. Geog. of Ind.* p. See Chensuar; Suar.

SABAT, amongst the Dyak race, adoption brother.

SABA'TA-AHRAF. ARAB. The seven di current in Arabia in the time of Mahomed, Quraish, Tai, Hawazin, Ahl-i-yaman, Saqif, ail, and Bani Tamin.

SABATHU, in lat. 30° 51′ N., and long. 7 E., a military station a few miles N.E. of S The cantonment is 4205 feet, and the fort is feet, above the sea.—*Ger.*

SABERNARIKA, properly Suvarnarika, a that separates Bengal from Orissa, and o into the Bay of Bengal.

SABHA. SANSK. A committee, any c an assembly, a club. Sabha-mandap, HIN portico, or an erection in front of a Hindu te where people assemble; the open space temple in front of the apartment of the ido audience hall, an assembly room; a sacred or apartment in a Hindu temple. Sabhapa Chilambara, a name of Siva.

SABLE.

Zobel, . DA., GER., SW.	Sohol, ...
Zibelline, . . . FR., IT.	Cebellina, . . .
Zibelina, ... POR.	

One of the weasels, Mustela zibellina, a n of Northern Europe and Siberia, with a fine the hairs of which turn with equal ease in e direction. Its colour is generally of a deep gl brown or black, and sometimes, though rarely, yellow and white. Throughout the seve of a Siberian winter it retains its rich brown It subsists on fruits and berries in winter, an small birds. Bargouzine is famed for its sab no skins have yet been found in any part of world equal to them. The fur is of a deep jet-bl with the points of the hairs tipped with white

nd this constitutes their peculiar beauty. For a ngle skin a hunter demanded the sum of £18.— aulkner; Bingley; M'Culloch.

ABLE FISH of Europeans, the Willam-min ne Tamil, a species of Clupea.

ABZAH. ARAB., HIND. The large leaves and sules of the hemp plant; also an intoxicating rage prepared from them by washing them, after drying, reducing them to powder with k pepper, cardamoms, and sometimes poppy, ander, and melon seeds, and sugar, and then sing the mixture in milk and water, or in water alone. Another recipe for this intoxi- g liquor is Cannabis sativa or hemp leaves, black pepper, cardamoms, poppy seeds, Cu- is utilissimus, and C. sativus. It exhilarates out injurious consequences.

ABZAWAR. The town and district of Sab- r lies between that of Turbut-i-Hyderee and ; since the death of Nadir Shah it has been e possession of a chief of a Turkish tribe.— colm's Persia, ii. p. 230.

ABZ-MITTI. HIND. An earth used to wash air.

ACÆ, Gete, Aswa, and Takshak are names h have crept in amongst the thirty-six royal ut races, common with others also to early sation in Europe. Sacæ are supposed by ssor Lassen to be the Szu Tartar who were led about B.C. 150 from the Ili valley by the chi or White Huns, whom he supposes to be ochari. After occupying Tahia or Sogdiana time, they are stated by the Chinese to have driven thence, also, by the Yengar some years wards, and to have established themselves in , in which name Lassen recognises the en valley in Kohistan. The Sacæ country Turkestan, and they seem to have been one e Central Asia tribes to whom the vague Scythian was applied. Little is known of acæ and their migrations, but they seem to been widely diffused, occupying and coloniz- ountries remote from Central Asia. It is well n to geographers that the Segistan of the s, whence Seistan, is the same as the Sake- or country of the Sacæ of the Greeks. The are located by Strabo and Ptolemy on the of the Himalaya, but they were also on the . The Sacæ were known as Sakko on the of Cheban, in Assyria, and Sacæ are men- in the Behistun inscription. Tod states Sacæ in Sanskrit has the aspirate, Sac'hæ, ng literally the branches or tribes. This frequently occurs in Hindu annals, and nel Tod believes that the Saka of the Hindu ls cannot be other than the Sacæ or Sakai of ical geography. They seem to have been n on the borders of India or in its western icts in the first century preceding Christianity. amaditya, king of Ujjain, became known as Sakari or conqueror of the Sacæ; and as his dates B.C. 56, it would appear that about his some northern tribes had settled themselves g the Indus, constituting the Indo-Scythi of ian. Their attempt to penetrate farther to the by way of Malwa, was not improbably arrested Vikramaditya, whence the epithet Sakari. e tribes penetrated early into India, making way in force from the Hindu Kush into Orissa. have been supposed to give their names to the Sassani, Saxani, or Saxons. Sacæ or Buddhii took possession of Kashmir, B.C. 340; some tribes opposed Alexander; others of the Sacæ over-ran India in the reign of Asoka, who, according to the Ain Akbari, were expelled by his successor Jaloka. The following passage occurs in D'Anville's Eclaircissemens Geographiques sur la carte de l'Inde, p. 42: 'On ignore le temps auquel les Scythes sont venus occuper le Sindi. Dans le Périple de la mer Erythrée, la ville de Minnagra, le même que Monsora, est qualifiée de capitale de la Scythie. Denys Périegete dit que les Scythes meridionaux habitents sur le fleuve Indus. Eustathe les nomme Indo-Scythes; et ce que Ptolémée appele Indo-Scythie, remonte le long de l'Indus jusqu án fleuve Coos.'

A tribe bearing the name of Sacæ is still found in Jhalawan. It is supposed that they are the descendants of Sacæ from between the Paropamisan mountains and the Sea of Aral who accompanied Alexander, and, returning with Craterus through the Moolla pass, settled in their present position.

Strabo says, 'All the tribes east of the Caspian are called Scythic, — the Dahæ next the sea, the Massagetæ (Great Gete), and Sacæ more eastward; but every tribe has a particular name. All are nomades, the best known being the Asi, Pasiani, Tachari, Saccaranli, who took Bactria from the Greeks. Sacæ made in Asia irruptions similar to those of the Cimmerians; they possessed themselves of Bactria and the best district of Armenia, called after them Sacasenæ.' Of the first migrations of the Indo-Scythic Gete, Takshak and Asi, into India, that of Sehesnag (Takshak) from Sehesnagdes (Tacharisthan?) or Sehesnag country, six centuries, by calculation, B.C., is the first noticed by the Hindu Puranas. About this period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia; not long after, the Asi and Tachari overturned the Greek kingdom of Bactria, and the Romans felt the power of the Asi, the Catti, and Cimbri from the Baltic shore. The Asi and Tachari are the Aswa and Takshak, or Toorshka races of the Puranas of Saca-Dwipa. 'C'est vraisemblablement d'apres le nom de Tachari, que M. D'Anville aura cru devoir placer les tribus ainsi denommées dans le territoire qui s'appele aujourd'hui Tokarist'han, situe, dit ce grand geographe, entre les montagnes et le Gihon ou Amou.' Bryant gives the following as a passage from Chærilius in the history of the Sacæan Cuthites, of whose ancestry he speaks with great honour in describing the expedition of Alexander the Great:

> 'Next marched the Sacæ, fond of pastoral life,
> Sprung from the Cuthite nomades, who lived
> Amid the plains of Asia, rich in grain;
> They from the shepherd race derived their source,
> Those shepherds who in ancient times were deemed
> The justest of mankind.'

A branch of the Sacæ on one occasion invaded the inhabitants on the borders of the Pontic sea; whilst engaged in dividing the booty, the Persian generals surprised them at night and exterminated them. To eternize the remembrance of this event, the Persians heaped up the earth round a rock in the plain where the battle was fought, on which they erected two temples, one to the goddess Anaitis, the other to the divinities Omanus and Anandate, and then founded the annual

festival called Sacæa, long celebrated by the possessors of Zela. Such is the account by some authors of the origin of Sacæa. According to others, it dates from the reign of Cyrus only. This prince, they say, having carried the war into the country of the Sacæ (Massagetæ of Herodotus), lost a battle. Compelled to fall back on his magazines, abundantly stored with provisions, but especially wine, and having halted some time to refresh his army, he departed before the enemy, feigning a flight, and leaving his camp standing full of provisions. The Sacæ, who pursued, reaching the abandoned camp stored with provisions, gave themselves up to debauch. Cyrus returned and surprised the inebriated and senseless barbarians. Some, buried in profound sleep, were easily massacred; others, occupied in drinking and dancing, without defence, fell into the hands of armed foes; so that all perished. The conqueror, attributing his success to divine protection, consecrated this day to the goddess honoured in his country, and decreed it should be called the day of the Sacæa. This is the battle related by Herodotus, to which Strabo alludes, between the Persian monarch and Tomyris, queen of the Getæ. Amongst the Rajput Sachæ, all grand battles attended with fatal results are termed Saca. When besieged, without hope of relief, in the last effort of despair, the women and girls are immolated, and the warriors, decorated in saffron robes, rush on inevitable destruction. This is to perform saca, where every branch (sacha) is cut off. Chitore has to boast of having thrice (and a half) suffered saca. Chitore sac'ha ka pap, 'by the sin of the sack of Chitore,' is the most solemn abjuration of the Gehlot Rajput. If such is the origin of the festival from the slaughter of the Sacæ of Tomyris, it will be allowed to strengthen the analogy between the Sacæ east and west of the Indus. The Sakai who settled in Armenia were named Sacassani (lib. vi. c. 19), Saxons, the Sacosena of Strabo (lit. xi. pp. 776–788).

Sacasenæ, the ancestors of the Saxon race, dwelt in Armenia, on the confines of Albania. 'La Sacasene,' says a French author, 'etoit une contree de l'Armenie sur les confins de l'Albanie ou du Shirvan' (note 4, tome i. p. 191, Strabon).

This Scythic race adored the solar divinity under the name of Gæto-Syrus, the Surya of the Sacha Rajputs.—*Rennell's Memoir*, p. 185; *Isodore Char. in Hudson's Geog. Memoirs*, ii., *quoted in Ed. Ferrier Jour.* p. 428; *Hind. Theat.* ii. p. 179; *Tod's Rajasthan*, i. pp. 70, 164, *quoting Strabo*, lib. xi. p. 254; *Indian Infanticide*, p. 16; *Turner's Anglo-Saxons; Hallam.* See Afghan.

SACAM, or the White Island, mentioned in the Puranas, is England. It is mentioned in the Varaha Purana as in the possession of the Sacæ. —*Wilford.*

SACAMBARI or Sacambhari, a goddess, the tutelary divinity of the Chauhan tribes, whose statue is in the middle of a lake. Colonel Tod derives Sacambhari from Sacam, the plural of Sachæ, 'branch or race,' and Ambhar, 'covering, protecting.' The invocation is Om! Sacambhari Mata! Om!—*Tod's Rajasthan*, i. p. 95.

SACCHARUM, a genus of plants of the natural order Panicaceæ and section Sacchareæ. There are many species of the genus, all growing in warm countries, and those better known may be thus enumerated:—

S. canaliculatum, *Roxb.*, of Bengal.
S. cylindricum, *Roxb.*, Ajmir.
S. fuscum, *Roxb.*, Ajmir.
S. munja, *Roxb.*, Hindustan, Sind.
S. officinarum, *Linn.*, E. Indies, China, W. Ind[ies], Africa.
S. procerum, *Roxb.*, Bengal.
S. sara, *Roxb.*, Bengal.
S. semi-decumbens, *Roxb.*, Bengal.
S. Sinense, *Roxb.*, China, India.
S. spontaneum, *Linn.*, S. Asia.
S. violaceum, *Tussac*, Polynesia.

Some of the species, owing to the silex in t[heir] cuticle, are so durable that they are employe[d] India for thatching, such as S. canaliculatum, cylindricum, and S. spontaneum, which make good mats. The natives of Bengal m[ake] their pens of the narrow stems of S. s[emi]-decumbens, S. sara, and S. fuscum. The las[t] well as the culms of S. procerum, are also for screens and other economical purposes. officinarum is the sugar-cane, from which is duced a large quantity of the sugar used by It is a native of the south and west of Asia, was introduced by the Saracens into the sou[th] Europe. It has several varieties, of which o[ne] the—

Saccharum commune, or native cane of Indies,

β S. purpureum, Kajuli, of Bengal.
γ S. giganteum, Khuloa, of Bengal.
δ S. Tahitense, Otaheite cane.

Two other species yielding sugar are—

Saccharum violaceum, *Tussac*, said to be tical with the Otaheite cane.

Saccharum Sinense, *Roxb.*, cultivated in C[hina]

Saccharum cylindricum, *Roxb.*

Saguerus cylindrica, Horse's tail grass.

Oola, ... HIND. | Baroom biss, . . .

Grows on the Ajmir plains, and flowers ea[rly] the rains; also all over Bengal.—*Roxb.* i. p.

Saccharum fuscum, *Roxb.*

Khori, ... BENG. | Ishwalika, . . . S.
Pati kori, . . . ,, | Kandu rellu gaddi, .

Grows in Bengal. Natives make their pe[n]s its culms, and also use it for screens and fences. The best dark-coloured reeds with w[hich] the natives write are made from this species.

Saccharum munja, *Roxb.*

Sur-pata, . . . HIND. | Sirki, ...
Surr, ... SIND. | Ponika, Munja gaddi

This grass grows throughout India, but Panjab it covers immense tracts of inun[dated] lands, and forms the chief difficulty of the culturist, as it rapidly encroaches on the cul[ti]tion. Ropes made from its sheathing petiol[es] possessed of great tenacity, and used as rig[ging] in all the vessels above Sukkur, also as tow-r[opes] for tying up cattle, for drawing water, an[d] tying on the buckets of Persian wells. The t[ough] made from it is used for the bottoms of bedst[eads] The plant grows at Benares, all over Oudh in Northern Circars; is common at Ajmir, in valleys, and very abundant, along with S. cerum, near Jeypore. The best munj ro[pe] made from the floral leaves of this plant, an[d] best sirki rope from the culms. The pla[nt] distinguished from S. procerum by its inf[erior] height, the fineness of the culm, and narrow of the leaves. Two-inch ropes, often 50 fathoms

h length, are made of its fibres, being sufficient
r dragging the largest 1200-maund boats up the
ndus, and consequently against the full force of
stream, even round projecting points. The
e is light, bears without injury alternate
posure to wet and to subsequent drying.
nts growing beyond the range of the over-
wings of the river, or of the influence of the
s, are best. The upper leaves, about a foot or
n length, are preferred and collected. They
made up into bundles, and are kept for use.
en required for twisting into rope, they are
t moistened in water, then, two men sitting
osite to each other, take one of these moist
dles and beat it alternately with mallets, until
loose cellular are separated from the fibrous
ts. These are then ready for twisting into the
es which are so extensively employed on the
us. A continuation of the same process, or
employment of the dhenki, would afford a
y ample supply of half-stuff for paper-makers,
at a cheap rate. If the rope is not occasion-
wetted, and allowed to become too dry, it
ly breaks when used. The prepared fibre
s two rupees per maund. It was latterly
g exported from Kurachee, and brings £5
8 per ton.—*Roxb.; Voigt; Irvine*, p. 175.

ccharum officinarum, *Linn.*, Sugar-cane.

is species of the sugar-cane is supposed to
native of the East Indies, and to have spread
there to other countries, into Africa, the
h of Europe, the Canaries, N. and S. America,
the West Indies. A considerable portion of
sugar of commerce is manufactured from this
ies, but the S. violaceum is now extensively
ivated, and in the tropics the juices of the
yra and phœnix palms are also largely con-
d into sugar. In Europe, from beet-root.

The sugar-cane was introduced by the Saracens into the south of Europe, but the period is not well ascertained. Gibbon says they introduced it into Sicily soon after they got possession of the island. About the year 1420, it was much cultivated by the Portuguese in Madeira. In 1503 we read of sugar being imported from the Canaries, and in 1506 sugar-canes were carried thence to Hispaniola in the West Indies. But besides the Indian cane, another, and a much more prolific kind, that of Otaheite, was introduced into the West Indies about 1794; and about the same time, or in 1796, the China sugar-cane was introduced into India. The Chinese and Indians seem both, therefore, to have had distinct plants from which they could extract sugar; and, as history shows, they did so at very early periods. The Otaheite sugar-cane has been introduced from the Mauritius into India, and rapidly spread through the country. It is no doubt the same species that was introduced into the West Indies in 1794. It is probably the Canne de Haite of Tussac, or S. violaceum. S. officinarum, in the United States, is profitably cultivated up to lat. 32° N.; in China, to 30° N.; in Japan, up to 36° N. The yield in Japan of raw sugar is 3300 lbs. an acre.—*Roxb.; Voigt.*

Saccharum procerum, *Roxb.*

Sirkunda, . . .	HIND.	Sarkara, Sirki, .	HIND.

Grows 20 feet high in India, and is very abundant everywhere on the sandy ridges and plains. In November, when in full flower, it is highly ornamental. The leaf (sarpat) is used for thatch; the lower part of the stem (sentha, also sirkunda) is used for screens (chik) and low stools (mondha); the upper and tapering portion of the stem (sirki) is made into fans, mats, sieves, and for thatch, and to cover carts in the rainy season; the sheaths (munj) are dried and beaten, and made into twine and ropes; the flower, tied in bunches, is the house broom. The floral leaves are made into 'munj,' separating the fibres by beating the leaves; this is very much used to make string and rope.—*Roxb.* i. p. 243; *Irvine.*

Saccharum sara, *Roxb.*, Pen reed.

Shur, Sura, Sar, .	HIND.	Gundra, .	SANSK., TEL.
Sara, Gundra, .	,,	Sarut, .	SUTLEJ, RAVI.
Sar-pat, Sarar, .	,,	Kanda, . .	,, PANJ.
Sarkara, . . .	,,	Kura, Karre,	,, ,,
Jhund, ...	PANJ.	Sacha, Darga,	TR.-INDUS.

Common in the plains of India. Its culms are finer and stronger than those of S. procerum, and when obtainable are used to make arrows of in preference to the other species; it is also used for the common 'kalm' or reed pen with which in India Arabic, Persian, and other characters are written; it is said to be beaten into a rude fibre and then twisted into a rope. Mr. Henly informed Dr. Royle that the pen-reed grass is employed as a tow-line by the boatmen about Allahabad and Mirzapore, and esteemed there for strength and durability, even when exposed to the action of water.—*Roxb.; Irvine; Voigt; Royle.*

Saccharum semi-decumbens, *Roxb.*

Khori, Khuree, .	BENG.	Tat, Neja, . . .	HIND.
The Grass—Mora,	HIND.	The Culm—Kelik,	HIND.

The culms are used for screens and pens. It is a native of Bengal, where it delights in low, wet places, blossoms about the close of the rains and the beginning of the cold season.—*Roxb.*

Saccharum Sinense, *Roxb.* A plant introduced from China, named by Dr. Roxburgh. It was extensively distributed throughout India, and still is grown to some extent, as the canes are large, rich in juice, and hard enough to resist the attacks of the white ants. Its culms are from 6 to 10 feet high. Leaves flat, with margins hispid.—*Roxb.*

Saccharum spicatum is the Mau-ken of the Chinese.

Saccharum spontaneum, *Linn.*, Thatch grass.

S. biflorum, *Forsk.*		Imperata spontanea, *Trin.*	
Kash, Kashiya, .	BENG.	Kan, . .	MANIL., PANJ.
Thek-kay-gyi, . .	BURM.	Kahu, ...	SIND.
Kasa, Kus, . . .	HIND.	Relu-gaddi, . . .	TEL.
Kasha, Kagara,	,,	Kaki veduru, . . .	,,

This grass grows in every part of India; is common on islands, etc., and when in blossom in the rains has a beautiful silvery appearance. Brooms are made of the culms, string of its leaves, and the whole is used to thatch with. Elephants, horses, and horned cattle do not object to it as fodder. It grows from 3 to 15 feet high,

and it flowers in great profusion after the rains. A familiar couplet, in which the hunger and avarice of Brahmans are sportively alluded to, shows the correct pronunciation, as well as the season of its flowering—

'Aye kunagut phoole cas
Bamhan buet'he choolhe pas.'

'The time (kuar) for performing the ceremony in honour of deceased ancestors has arrived, the cas is in flower, and Brahmans surround the fire-place.'—*Stewart; Mason; Irvine; Roxb.; Elliot.*

Saccharum violaceum, *Tussac.*

The sugar-cane plant of Polynesia is grown in India, and is abundantly cultivated in the Saharunpur district; it gives a larger percentage of sugar, but it is objected to by the natives as being too hard for the pressure of the native mill; it is therefore principally cultivated for eating. In the Dehra Doon it has with much advantage been extensively cultivated for making sugar, but it is there pressed with European mills. —*M. E. J. R.; Royle, Ind. Fibres; Cal. Cat. Ex.*, 1862; *Powell; J. A. Murray; Smith; Von Mueller.*

SACCOLABIUM, a genus of Asiatic plants belonging to the natural order Orchiaceæ; found in the Indian Archipelago, the Malay Peninsula, and thence extending north along the Himalayan mountains to lat. 30° 4′ N., where S. guttatum is found on trees, as well as in more southern latitudes. The genus consists of caulescent epiphytes, with two-rowed coriaceous leaves, which are often oblique at the apex. The flowers are axillary, and either racemose or solitary. The following species are known:—

S. calceolare, *Lindl.*, N. E. India.	S. papilosum, *Lindl.*, Burma.
S. carinatum, *Wall.*, Khassya.	S. retusum, N. E. India.
S. guttatum, *W. Ic.*	S. Rheedii, *W. Ic.*
S. micranthum, *Lindl.*, N. E. India.	S. rigidulum, *Wall.*, Khassya.
S. niveum, *W. Ic.*	S. rubrum, *W. Ic.*
S. paniculatum, *W. Ic.*	S. speciosum, *W. Ic.*
	S. Wightianum, *W. Ic.*

These orchids are largely cultivated for their beauty. Their generic name has been applied to them from their lip forming a bag or spur.

Saccolabium papilosum, *Lindl.*

Cymbidium præmorsum, *Swz.*
Epidendrum præmorsum, *Roxb.*
Aerides undulatum, *Sm.*

Grows in the Circars and in Burma.

Saccolabium retusum.

Epidendrum retusum, *L.*	Aerides retusum, *Swz.*
Limodorum retusum, *Swz.*	A. guttatum, *Roxb.*
Sarcanthus guttatus, *Lind.*	Mo ma khan, . . BURM.

This, one of the noblest orchids in the Tenasserim Provinces, is profusely multiplied in the neighbourhood of Moulmein; grows in Java, Peninsula of India, Chittagong, Dacca, Khassya, Nepal, Burma, Tenasserim. The flowers are numerous, white, spotted with rose-violet, and stand on little pedicles all around the stalk, so as to form an elegant plume sometimes a foot long, which gives the trees on which they grow a most princely appearance.—*Mason; W. Ic.; Voigt.*

SACCOPETALUM TOMENTOSUM. *H. f.*

Uvaria tomentosa, *Roxb.* | Kirna, ... HIND.

A tall, handsome, good-sized tree of ver straight growth, of the order Anonaceæ, not un common about the foot of the Ghats on th western side of the Madras Presidency, and found in Chanda, Central Provinces, the Konk Behar, Orissa, and Nepal. Another species, longiflorum, *H. f. et T.*, occurs in Eastern Ben —*Beddome, Fl. Sylv.*

SACHIN, a Native State in Gujerat; about 300 square miles; pop. (1872), 18,0 gross revenue, £15,983. The nawab of Sachi of African descent, known in India as Sidi Habshi or Abyssinian. His ancestors were kn as the Sidi of Dauda, Rajapur, and Janj They were the admirals of the fleets of Ahmadnaggur and Bijapur dynasties, and sub quently of the emperors of Dehli, being appoin to that office by Aurangzeb about the year 16 with an annual assignment of £30,000 on Surat revenues. On the decline of the Mog power, the Sidis of Janjira became notor pirates, plundering the ships of all nations ex those of the English, whose flag by treaty they to have early cultivated friendship they Janjira during the wars between Sivaji and Moghuls, also during the war between the Pes and the British Government. Towards the of the 18th century, the heir, Balu, had expelled from his dominions by a younger br of the family (1784–91). He appealed for ai the Mahrattas and British, and an arrange was come to in 1791 by which Balu ceded Ja to the Peshwa in return for Sachin. Balu got possession of Sachin; but when the Pes claimed Janjira, the Sidis who held it succe in maintaining their independence. Sachin remained in the hands of Balu and his descend while Janjira is still held by the younger br of the family who had ousted Balu. Janji reckoned a maiden fortress to this day.— *Gaz.; Aitcheson's Treaties*, iv. p. 324, ed, 187

Terms synonymous with this English word are applied in Asia to individuals, animals, books, places, stones, and plants.

Sacred books of the East is a title under which, towards the latter part of the 19th century, several of the orientalists of Europe published translations of books relating to the religions of the Eastern Asiatic races,—Hindus, Buddhists, Zoroastrians, Chinese, and Muhammadans. These have been edited by Professor F. Max Muller, who translated the Hindu Upanishads and the Dhammapada.

Georg Bühler translated the Apastambha and

Gautama, also the Vasishtha Baudhayana, the sacred laws of the Aryas.

James Legge translated the texts of Confucius, Shu-king, the religious portions of the Shih-g, and the Hsiao-king.

E. W. West translated Pahlavi texts, Vendidad d Zendavesta were translated by James Dur-steter, Julius Jolly translated the Institutes of hnu, and T. W. Rhys Davids translated Buddh- Suttas from the Pali. V. Fausboli translated Sutta Nipata, Julius Eggeling the Satapatha hmana, K. T. Telang the Bhagavat Gita, atsugatiya, and Anugita.

t the same time has been appearing trans-ons of other sacred books. Of these may be ntioned the Udanavarga from the Tibetan by W. Rockhill,—it is the Northern Buddhist ion of Dhammapada; Le Pantheon Egypten, Paul Pierret, conservator of the Egyptian eum of the Louvre; the Clarendon Society lished a catalogue of the Buddhist Scriptures; ures on Buddhist literature in China were vered and published by Samuel Beal; A. P. ett wrote on Esoteric Buddhism.

r. H. Oldenberg wrote on Buddha, his life, loctrine, and his order.

. Rhys Davids issued a volume on Buddhist stories or Jataka tales. It was a translation e Jattakatt'havannana, the oldest collection lk-lore extant.

W. Rhys Davids and H. Oldenberg translated Vinaya texts, viz. Patimokha, Mahavagga, and vagga.

e Yi-king or Yh-king, the oldest book of the se, was translated by Terrien de la Couperie.

E. Gough, M.A., wrote on the philosophy of Upanishads and ancient Indian metaphysics.

. C. P. Tiele wrote a history of the Egyptian ion, which James Ballingal translated from Dutch.

muel Beal translated the Fo Sho Hing Tsan-

E. H. Palmer translated the Koran.

e Vedas and the Puranas are the sacred books he Hindu religion. The sacred books of the stian religion are designated the Old and New ament, or, collectively, the Bible. The Old ament inculcates monotheism, and gives a his-f the Hebrews for about 2000 years, to B.C. . The New Testament gives a history of John the Baptist, and of Jesus, the Christ, the Messiah or Anointed, of His teachings, His doctrines, and those of His disciples. It was written in Greek, but was early rendered into Latin. Protestant missionary bodies have translated the Old and the New Testaments into nearly all written tongues, and into many languages which previously had no scriptory character, and millions of copies have been published. In many instances these sacred books have given a form to the various spoken dialects of a language without a literature.

The *Sacred cities* of the Hindus, sacred rivers, and sacred sites are exceedingly numerous, and at most of them they have erected the temples for their religion. Sacred cities of the Brahmanical Hindus, twelve in number, are—

1. Bhimasankar, at the source of the Bhima, N.W. of Poona.
2. Ellora.
3. Kedareswar, in the Himalaya.
4. Mahakala, at Ujjain.
5. Malikarjuna, on Srisaila mountain, in the S. of India.
6. Omkara, on an island in the Nerbadda.
7. Naganath, E. of Ahmadnaggur.
8. Rameswara, on an island opposite Ceylon.
9. Trimbuk, near Nasik.
10. Somnath, in Kattyawar.
11. Vaidynath, in the Bombay Dekhan.
12. Viswanath, in Benares.

Besides these twelve, Srirangam, near Trichinopoly, Benares, Puri, where Jaganath is, Badrinath in the Himalaya, Conjeveram and Tripati in North Arcot, with Dwarka, Gaya, and Mathura, may be indicated as sacred towns; and the Ganges, Brahmaputra, Godavery, Kistna, and Cauvery among the rivers, and hundreds of thousands annually visit them. Govardhana mountain is sacred to the Hindus, and Palitana to the Jains. Mount Meru and Mount Kailasa of the Himalaya are famed in Hindu mythology.

Sir George Birdwood mentions, in particular, other sacred cities of the Hindus,—Ayodhya or Oudh, the city of Rama; Mathura or Muttra, the city of Krishna; Maya or Buddha Gaya; Kasi or Benares, the city of Siva as Visveswara; Kanchi or Conjeveram; Avanti or Avantika or Ujjaiyini and Dwaraka or Dharawati; Gao-karna or Cow's Ear, near Mangalore; Rameswaram; Somnath and Pathan.

Jerusalem is sacred to Jews, Christians, and Muhammadans, and the last-named designate it Bait-ul-Maqaddas; with them Mecca is called Bait Ullahi'l-haram, the holy house of God; and with them Karbala, Medina, and Meshid also are holy cities, which are resorted to by pilgrims from all Asia and Africa.

Sacred fires are kept up by the Agnihotra Brahmans of India, and by the Parsee or Zoroastrian religionists. The Brahmanic families who keep up the sacred fires are supposed descendants from the seven Rishi,—Bhrigu, Angoras, Visvamitra, Vasishta, Kasyapa, Atri, Agastya; but Jamadagni, Gautama, and Bharadwaja are also enumerated.

Sacred plants among the Hindus are numerous; their flowers are offered up to their idols, their seeds are used for rosaries, etc., and their gums as incense.

The Sij plant, Euphorbia, is the god of a race in Assam.

The Jews, about the 12th to the 3d century B.C., largely followed surrounding nations in their worship in the groves.

The sacred grove of oaks at Dodona, supposed to have been planted by the Pelasgi, existed till the time of Constantine. Their branches were hung with bells, sacred pigeons rustled amidst the leaves. The laurel of Apollo at Delphi was sacred like the oak at Dodona. Under the laurel's shade the python took refuge.

Modern Hindus restrict their reverence to individual plants, some of them being sacred to Siva and some to Vishnu and their avatars; and the following are those chiefly regarded:—

Achyranthes aspera.
Ægle marmelos.
Æschynomene sesban.
Afzelia bijuga.
Antenaria, *sp.*
Aplotaxys gossipina.
Artemisia astriaka.

SACRIFICE.

Fida, Sadqa,	ARAB.	Sagrifizio,	IT.
Tasaduq,	,,	Sacrificio,	IT., PORT., SP.
Libation, Oblation,	ENG.	Sacrificium,	LAT.
Opfernd,	GER.	Med'h,	SANSK.
Kurban,	HEB.	Bali,	TAM.
Sacrifizio, Sagrificio,	IT.	Gao,	TEL.

A sacrifice is an offering of any consecrated thing to a deity, whether an animal, anything of the mineral or vegetable world, a manufactured article, or in the form of a libation or an oblation. All nations seem to have had a stage in their history in which to make offerings in sacrifice formed a part of their mode of worshipping the deity whom they reverenced. The earliest extant record of sacrifices are those recorded in Genesis iv. 3, 4, in the cases of Cain and Abel, where Cain, a cultivator, brought of the fruit of the ground an offering to the Lord, and Abel, who was a nomade, a keeper of sheep, brought of the firstlings of his flock and of the fat thereof, and it is mentioned that the Lord had respect *unto* Abel and to his offering, but unto Cain and to his offering he had not respect; so even in those early days in the history of the human race, the blood sacrifice, the oblation, and immolation of animals was deemed by the offerer more worthy of the deity's acceptance than the fruits and flowers of the earth. The contest marks the jealous rivalry and strife between the powerful, over-bearing dwellers in cities who bear arms and till the ground, and the nomade shepherds. The first victim was Abel, but the struggle runs through the whole history of Asia, and continues amongst the races and sects of India at the present day. The view seems to have been that the most precious thing should be offered, with the object of propitiating a wrathful being, and there followed on this the offering up of human beings, of the children of the sacrificer, the children of kings, though criminals, captives taken in war, slaves, and even women were also sacrificed.

The duty of offering to the Lord of the first of every product has had almost a universal hold on man. Exodus xxii. 29 commands the offer of th first fruits; the same is enjoined in Deuteronom xxvi. 2; Leviticus ii. 12, and numerous othe places. Genesis iv. 4 tells us that Abel brou the first of his flock, and Exodus xiii. 12 a other places enjoin this, and to the present d in the villages around Chingleput the first-b daughters in the Hindu weaver families devoted as deva-dasa to the gods of their temp A conscientious Hindu, before he eats, offers food to his guardian deity, using some such wo as these, 'This food, O God, I present to th A Hindu shopkeeper, also, gives his god credi his daily accounts for a sum which may amo to the twentieth of a halfpenny.

Dr. Milman considers that in the Heb religion the rite of sacrifice was regulated w three distinct objects. Every morning and ev evening the smoke from the great brazen a of burnt-offerings ascended in the name of whole people. On the seventh day, two ani instead of one were slain; and the offering of poorest was acceptable. The sacrifices v partly voluntary acts of reverence in orde secure the favour of God to the devout wors per; partly expressive of gratitude for the di blessings. Of this nature were the first fr and whether reaping the harvest or gatheri the vintage, the Israelite made an oblatio thanksgiving to the gracious Being who had stowed His bounty. Lastly, the Hebrew sacri were piacular or expiatory; every sin eith the nation or the individual had its appo atonement. The tenth day of the seventh m was set apart for the solemn rite of nationa piation. First a bullock was to be slain and blood sprinkled, not only in the customary pl but within the Holy of Holies itself. Then goats were chosen, and lots cast upon them one assigned to the Lord was sacrificed; o other, by the imprecation of the high priest sins of the whole people were heaped, and it then taken beyond the camp and sent into desert to Azazel, the spirit of evil to w Hebrew belief assigned the waste and how wilderness as his earthly dwelling. But in fanatic zeal of the Jews, great excesses occur In the time of Solomon an instance (2 Chr vii. 5) is recorded of the sacrifice of 22,000 ox It was left to Isaiah (i. 10-14) openly to denounce the sacrifice of animals as an atonement for sin: 'Hear the word of the Lord, ye rulers of Sodom; give ear unto the law of our God, ye people of Gomorrah: to what purpose is the multitude of your sacrifices unto me? saith the Lord: I am full of the burnt-offerings of rams, and the fat of fed beasts; and I delight not in the blood of bullocks, or of lambs, or of he-goats. When ye come to appear before me, who hath required this at your hand, to tread my courts? Bring no more vain oblations; incense is an abomination unto me; the new moons and Sabbaths, the calling of assemblies, I cannot away with; it is iniquity, even the solemn meeting. Your new moons and your appointed feasts my soul hateth: they are a trouble unto me; I am weary to bear them.'

As might be supposed from the sacrificial rites amongst the Jews, allusions to such are to be found in the New Testament (Mark vii. 11): 'But ye say, If a man shall say unto his father or

mother, It is Corban (that is to say, a gift), by whatsoever thou mightest be profited by me; he shall be free.' This word is equivalent to Sadqa Pasaduq or Fida, and is often used by Muhammadan men or women addressing a superior, in which case it means merely, I am your Kurban. The word is Arabic, derived from the Hebrew, has allusion to an approaching to God, and means a sacrifice, a victim, an offering, an oblation, for which also we have the Greek Καρπωμα. The other words, in the Arabic, Sadqa, Fida, and Saduq, mark the continuance of the sacrificial idea. Sadqa, ARAB., properly Sadaqa, from the Hebrew, means alms, propitiatory offerings, and sacrifice. The words are continued into Hindustani, in Sadqe-jana or Sadqe-hona, to become a sacrifice for the welfare of another, and Sadqe-dena, to sacrifice for the welfare of another.

Animal sacrifices seem to have been a usual rite amongst all the Scythian races. Some branches of this great stock appear to have wandered so far from their northern seats as the Peninsula of India, in the most southern parts of which are found great numbers of cromlechs, kistvaens, and cairns. All around Hyderabad, in the Dekhan, these are to be seen, and at one place about 12 miles from that city is a vast site of these ancient tombs. In all the cairns that have been opened urns, sepulchral urns have been found, and in their neighbourhood human bones and bones of animals. Of the race who adopted that form of burial nothing is now known; but they were Troglodytes, dwelling in tents, the stone walls enclosures for each tent being perfect, and within the enclosures there are no mounds of ruined houses, but in all merely a level space.

Professor Max Müller reminds us of what we read in Herodotus (v. 5), that amongst the Thracians it was usual after the death of a man to find out who had been the most beloved of his wives, and to sacrifice her upon the tomb. Mela (ii. 2) gives the same as the general custom of the Thracæ line. Herodotus (iv. 71) asserts a similar custom of the Scythians, and Pausanias (iv. 2) of the Greeks.

Amongst the Aryan races who went to the north-west, there are no grounds for believing that the Saxons continued to offer human sacrifices after their settlement in Great Britain, but in their own land the immolation of captives in honour of their gods was by no means uncommon. The great temple at Upsal, in Sweden, appears to have been especially dedicated to Odin, Thor, and Friya. Its periodical festivals were accompanied by different degrees of conviviality and licence, in which human sacrifices were rarely wanting, varied in their number and value by the supposed exigency. On some occasions even royal blood was selected that the imagined anger of the gods might be appeased.

The Massageta, the Scythian, the Gete, the Sarmatian, all the various nations upon the Baltic, particularly the Suevi and Scandinavians, held it as a fixed principle that their happiness and security could not be obtained but at the expense of the lives of others. Their chief gods were Thor and Woden, whom they thought they could never sufficiently glut with blood. They had many very celebrated places of worship, especially in the island of Rugen, near the mouth of the Oder, and in Zeeland. Some, too, very famous among the Sumnones and Nahanvalli. But the most reverenced of all, and the most frequented, was at Upsal, where there was every year a grand celebration, which continued for nine days. During this term they sacrificed animals of all sorts, but the most acceptable victims and the most numerous were men. Of these sacrifices none were esteemed so auspicious and salutary as a sacrifice of the prince of the country. When the lot fell for the king to die, it was received with universal acclamations and every expression of joy, as it once happened in the time of a famine, when they cast lots, and it fell to the king Domalder to be the people's victim, and he was accordingly put to death. Olaus Triliger, another prince, was burnt alive to Woden. They did not spare their own children. Harold, the son of Gunild, the first of that name, slew two of his children to obtain a storm of wind. 'He did not let,' says Verstegan, 'to sacrifice two of his sons unto these idols, to the end he might obtain of them such a tempest at sea as should break and disperse the shipping of Harold, king of Denmark.' Saxo Grammaticus mentions a like fact; he calls the king Haquin, and speaks of the persons put to death as two very hopeful young princes.

Tacitus takes notice of the cruelty of the Hermunduri in a war with the Catti, wherein they had greatly the advantage, at the close of which they made one general sacrifice of all that were taken in battle. The poor remains of the legions under Varrus suffered in some degree the same fate.

Human sacrifice, Bunsen says, was abolished by the Egyptians, in the very earliest times, declaring it to be an abomination to the gods. Whereas in Palestine, in Syria, and in cultivated Phœnicia and Carthage, such sacrifices continued to be offered to Moloch as the very climax of religious worship. Even Rome, in the time of her Cæsars, buried her Gallic prisoners alive, in order to appease the wrath of their gods. Many of the kings of Judah and Israel caused their children to pass through the fire. The Greeks also were not free from these atrocities. Chap. xi. of Judges tells how Jephthah, when he invaded the country of the Ammonites, vowed a vow unto the Lord, and said, 'If thou shalt without fail deliver the children of Ammon into mine hands, then it shall be, that whatsoever cometh forth of the doors of my house to meet me, when I return in peace from the children of Ammon, shall surely be the Lord's, and I will offer it up for a burnt-offering. . . . And Jephthah came to Mizpeh unto his house, and, behold, his daughter came out to meet him with timbrels and with dances. . . . And he said, Alas my daughter! . . . I have opened my mouth unto the Lord, and I cannot go back. . . . And it came to pass, at the end of two months, that she returned unto her father, who did with her according to his vow which he had vowed: and she knew no man.' Jeremiah xix. 4, 5, shows, says Dr. Milman, that in later times human sacrifices were offered by the Jews to Moloch and to Baal. Abraham, when commanded to cut off that life on which all the splendid promises of the Almighty seemed to depend, he obeys and sets forth with his unsuspecting child to offer the fatal sacrifice on Mount Moriah. Besides the common worship of Moloch, the Book of Kings names the Sepharvites as making these human sacrifices

SACRIFICE.

(2 Kings xvii. 31), and the king of Moab (2 Kings iii. 27). It was a Babylonian and Assyrian rite. Filial sacrifices were doubtless of rare and extraordinary occurrence, either to expiate some dreadful guilt, to avert the imminent vengeance of an offended deity, or to extort his blessing on some important enterprise. But Hannibal sacrificed 3000 Grecian prisoners on the field of Himera, where his grandfather Hamilkar had been slain 70 years before.

Sale's Koran contains evidence of the practice of infanticide, but assimilating more than in any other case with the custom of the Jahreja race of Cutch and Kattyawar. This barbarity seems to have been confined to the female infants, as is the case with the Jahreja; and it is remarkable that the difficulty of providing for them in marriage, or the apprehension of their conduct disgracing their parents, is assigned in both cases as the cause of this inhuman custom. One benefit which resulted to mankind from the success of Mahomed has been the relinquishment of that inhuman practice amongst his numerous followers.

Abbe Domenech says that some branches of the Scythic stock undoubtedly crossed to America in the early centuries of our era, and they seem to have carried with them the sacrificial customs which have been a peculiarity of all their offshoots. The Comanche and the Nachez, Indian [illegible] of North America, formerly buried the wives of a deceased chief along with him. The Ottawa offered a horse in sacrifice on the tomb of the dead. With the Nachez, the victims placed themselves on mats and danced the death-dance with their executioners, who formed a circle around them. The Pawnee tribes, supposed to be descendants from the ancient Mexicans, also offered human sacrifices, though the rite latterly fell into abeyance. These sacrifices took place more particularly in the month of April, that is, at sowing time, with a view to obtaining abundant harvests from the Great Spirit. The preparation lasted four days; on the fifth the victim was bound to three stakes, placed above the funeral pile. He was painted red or black, and his breast burned and pierced with arrows, and after his heart was reached it was torn from his breast and devoured all bleeding. This barbarous ceremony was terminated either by setting the pile on fire, or by eating the victim, whose blood served to water the seeds about to be committed to the earth. Many Indian nations of the northern and western parts of North America celebrated annually solemn festivals when the leaves of the willow had attained their full size. These solemnities were in commemoration of a great event,—in propitiation of the superior powers; or were offered in expiation. Among the Mandan, these were prolonged four days, and the greatest cruelties were practised on the tortured victims.

The pouring out of water as a libation is a very ancient rite. In Genesis xxxv. 14, Jacob is mentioned as setting up a pillar, and he poured a drink-offering thereon, and he poured oil thereon; and to the present day, throughout British India, the lingam, the priapus or phallus, in its daily worship by the Saiva Hindus is washed with oil and milk. Wine was occasionally used, as in Numbers xxviii. 7, causing the strong wine to be poured unto the Lord for a drink-offering; also 1 Samuel vii. 6, Israel gathered together to Mizpeh, and drew water, and poured it out before the Lord. David, when pressed by the people of Palestine, craved for a drink from the well at the gate of Bethlehem, and afterwards would drink it when brought by three men, 'but pour it out unto the Lord.' And to the present da all Hindus offer water libations to the earth dei

The sacrifices of the Zoroastrians were new of human beings. The ordinary victims of Aryans were the horse and mare, oxen, sheep, a goats.

A little after the time of Isaiah, Buddha peared, objecting to all animal sacrifices. I from the times of the Vedas until now, the Hon an offering of ghi to the fire, from the dhenk or sacrificial ladle; also the Pasaya, sacred fo of rice and milk, cooked in sacrificial kett have been oblations of Hindus. In the Hin sacrifices, the sweet-smelling kusa grass seems have been employed, from the most ancient dat and also an alcoholic fluid which they called soma juice, and the ancient Persians called h What this fluid was is doubtful, but it had stin lating and intoxicating qualities, for the Veda (ix.) says, 'the purifying soma, like the rolling its waves, has poured forth songs hymns and thoughts.' It has been said to be fermented acid juice of the Sarcostemma acid the shom-luta of Bengal; and the fierce exultati which are noticed in the Rig Veda could have been produced by a strong alcoholic drin

The ordinary Vedic offerings were of coo food, delicious food and drink; the Janemaja was a sacrifice of snakes (qu. the Si however, Rajasaya was a royal sacrific race), and the [illegible] of sovereignty the gods in acknowledgmen[illegible] supremacy. Originally it was a great n feast.

The ancient history of India shows that it had four great religious eras. *First*, The Ve in which Agni, Indra, and other personificati invoked with feasts and with the hymns of Rig Veda, and in which maidens selected th husbands in the Swayamvara, and monar sacrificed the horse in the Aswa Medha. *Seco* The Brahmanic period, when the Kshatr feasts were converted into sacrifices for the ato ment of sins against the Brahmanical law, divine worship was reduced to a system of aust ities and meditations upon the supreme spirit as Brahma. It was in this era that the Brahmans assumed the character of a great ecclesiastical hierarchy, and established that priestly dominion which still extends over the minds and senses of the Hindus of India. *Thirdly*, The Buddhist period, in which Sakya appeared. And *fourthly*, the Brahmanical revival, during which Brahmans abandoned the worship of their god Brahma, and have clothed with new attributes some of the old national gods and heroes of the Vedic Aryans. In this era Siva is worshipped by one great portion of Hindus as supreme, and styled Iswara and Mahadeva, Lord and Great God, while by a larger part Vishnu came to be regarded as the supreme being, and Rama and Krishna as his incarnations. The Buddhist philosophies do not authorize or favour the sacrifice of animals, but Du Carne tells us that a Buddhist of his camp made an offering of one of his fingers at a Buddhist shrine in Annam. Also, Mr. Wade remarks, that at the Chinese court, in the middle

SACRIFICE.

f the 19th century, some Manchu and Mongol, in
he five banners, had the prefix tsai-sang, which
eclares them to be employed in slaying the
ims used in sacrifice. The flesh of victims is
ed in the Hwan-ning-kung, the portion of
palace appropriated to the empress, every
ning at 4 o'clock, and at the same hour in the
rnoon; at the monthly sacrifice performed on
second of the first moon, and the first day of
succeeding; and at the sacrifice of the morrow,
formed on the third of the first, and the second
all succeeding moons. The morning daily
rifice is to Buddha, Kwan-yin, and Kwan-ti
e Mars of China); the evening, to nine Tartar
inities bearing long unintelligible appellations.
e monthly sacrifices appear to be the same with
t on 'the morrow,' *i.e.* of the monthly sacrifice.
flesh of the victim is boiled and placed before
idols above enumerated, on the right and left
he shrine of heaven; when removed, it is par-
n of by the emperor or empress, if officiating
erson, or by those to whom his majesty may
ct the nobles, his proxies, to distribute it.
here are two hymns in the Rig Veda describing
rite of the Aswa Medha or sacrifice of the
and which leave no doubt that in the early
on of the race this sacrifice was had recourse
a burnt-offering to the gods. It was even
, however, falling into disuse, and was exist-
as a relic of an ante-Vedic period, imported
some foreign region, possibly from Scythia,
e animal victims, and especially horses, were
nonly sacrificed. And in still later times,
Aswa Medha consisted in certain ceremonies
g in the liberation of the horse, as through-
Southern India is still practised with a bull or
many of which are met with in every village,
or let loose in the name of the gods Siva or
nu.

the Mahavira Charita, Vasishtha, addressing
dagni, says, 'The heifer is ready for sacrifice,
he food is cooked in ghi. Thou art a learned
, come to the house of the learned, favour us
waiting and participating in the sacrifice.'
, the Uttaram Charita says (Cal. Rev. 109,
)—

'Why, know ye not
The Vedas, which enshrine our holy law,
irect the householder shall offer those
ho in the law are skilled, the horned animal,
nd with it flesh of ox, or calf, or goat;
nd the like treatment shall the householder
eceive from Brahmans learned in the Vedas.'

e Institutes of Menu contain the following
grap. ∇ 'The sacrifice of a bull, of a man, or
horse, in the kali age, must be avoided by
orn men; so must a second gift of a
young woman, whose husband has died
onsummation; the larger portion of an
other, and procreation on a brother's
vife.'

shnava sect have four kinds of sacrifices,
aiswadeva, Varuna-praghasa, Saka-
nasiriya, to be offered up in the months
Kartik, and Phalguna. The attributes
se are roasted cakes of flour, with figures
eep made of dough to Vaiswadeva and Varuna,
th vegetables to Agni and Indra.

Bloody sacrifices form no part of the ordinary worship now paid to Rama, Krishna, Hanuman, and other modern deities of the Vaishnava sectarians, nor to Vigneswara, Subrahmaniya, etc., of the Saiva sect, or of their respective goddesses.

It is usually supposed that all Vaishnava Brahmans abstain from offering living creatures in sacrifice. But in Southern India, at the present day, the Vadaghala Vaishnava sect offer living creatures in sacrifice, while the Tenaghala Vaishnava and Madhava substitute dough for animals. In the sacrifices of Saiva Brahmans the victim's head is never cut by the Sudra pujari, but it is strangled by him, so that the life is lost without spilling blood. Saiva Brahmans sacrifice living creatures in Southern India, and never use dough images as a substitute. Amongst the Smartha, and also Madhava Brahmans, each household keeps a tulsi plant in the middle of the courtyard for worshipping. Each new moon, as also on the occurrence of an eclipse, either of the sun or moon, also at the summer and winter solstices, their Utrayanam and Datchanayanam, every caste Hindu, whether Brahman, Kshatriya, Vaisya, or Sudra, offers the Tharpanam, or water-sacrifice, in the names of his deceased father, grandfathers, great-grandfathers, and their wives, seeds of the oriental sesamum being mixed with the water. It is as a means of continuing this Srad'ha ceremony that Hindus long to have a son born to them, as in their creed it is taught that the manes of ancestors are gratified by the Tharpanam. This is a particular part of the sacrifice, called yugnu, but at present it is often performed separately. The things offered are clarified butter, sesamum flowers, boiled rice, rice boiled in milk and sweetened with honey, durba grass, vilva leaves, and the tender branches, half a span long, of the ushwutthu, the doomvuru, the pulashu, the akun-du, the shumee, and the khudiru trees. Clarified butter alone is sufficient, but any or all of these things may be added.

The *Saiva* Brahmans likewise, annually in some towns, Conjeveram for instance, perform the bloody rite to the Vedic gods, Indra, Varuna, Yama; and both in 1859 and 1860, the Saiva Brahmans in Madras so sacrificed. Several Brahmans are employed in this rite. One Brahman, assisted by his wife, the couple being styled the Soma Yaji and Soma Devi, commences the rite by performing the fire sacrifice by pouring ghi into a large fire. The pujari, a Sudra, then strikes the head from the victim, and large portions of its flesh being thrown into the fire and reduced to ashes, portions are distributed to the assembly. This being a Prasad'ham, or food offered to the gods, all castes can partake of it. Many partake of it.

Throughout India generally, at the present day, in almost all the household sacrifices, in which the husband or head of the house is the priest, the oblation is used as food. In North America, the animals sacrificed were killed and eaten or buried; sometimes the horse, instead of being killed, was simply set at liberty, in the presence of the warriors of the tribe. Sonnerat relates that the Syrians at the feast of the torches or funeral pile, and the Hebrews at the feast of the Passover, made arbours before the temples, and carried their gods round them in procession, whom they afterwards burned. The people then presented their offerings, which commonly were lambs and sheep; and after the priest had made the first libation upon them, each person carried

his victim home to eat it. Some texts of Menu would seem to authorize the eating of animal food at all seasons, observing merely the preliminary ceremony of offering a portion of it to the gods or manes, like the heroes of Homer, with whom the sacrifice was only the prelude to a feast.

The grand festival to Friya was in spring; then boars were offered up to her by the Scandinavians, and boars of paste were made and eaten by the peasantry. So, at the present day, 'Vasanti,' or spring personified, is worshipped by the Rajputs, who open the season with a grand hunt, led by the prince and his vassal chiefs, when they chase, slay, and eat the boar.

Self-destruction.—The Rev. Mr. Ward, writing in the early part of the 19th century, says it was difficult to form an estimate of the number of Hindus who perish annually, the victims of superstition; but he conjectures 10,500 as the number of victims annually sacrificed,—Widows burned on the funeral pile, in Hindustan, 5000; pilgrims perishing on the roads and at sacred places, 4000; persons drowning themselves in the Ganges, or buried, or burned alive, 500; children immolated, including the daughters of the Rajputs, 500; sick persons whose death is hastened on the banks of the Ganges, 500.

A great change has been made in this respect, through steady repression by the British Government of India. Up to the year 1802, Hindus drowned their children at the mouth of the Ganges, but the rite was then prohibited. Until later times, men and women drowned themselves in the sacred river, and frequently at the junction of the Jumna and the Ganges. They fastened earthenware pots to their bodies, and walked calmly into the river beyond their depth, filled the pots by turning them to one side, and as the pots filled they sank. As the century advanced, the Government ascertained that the sacred books of the Hindus gave no sanction to widows immolating themselves, as sati, along with the bodies of their deceased partners, and it was prohibited in 1829, during Lord William Bentinck's administration, and rulers of the Feudatory States were induced to issue a similar prohibition. Akbar had endeavoured to put a stop to this practice, and on one occasion he rode about 80 miles to prevent the widow of the Jodhpur raja's son destroying herself, but was not listened to. Instances still occur from time to time, but the people generally avoid it.

Men, from time to time, bury themselves alive. The practice is known as Samad'h, and is had recourse to alike by fanatics as by persons incurably afflicted with leprosy or other severe diseases. Scarcely a year passes by without an occurrence of this kind, and, being done stealthily, the police are often baffled. Up to the early years of the 19th century, instances occurred of individuals being crushed under the wooden wheels of the huge cars in which their idols are carried in procession. It is now admitted that the statements about the frequency of self-immolations and accidents in that manner were exaggerated; but by the care taken by the constabulary, these occurrences are now unheard of.

According to former accounts, writes Malcolm, self-destruction among men, by casting themselves during public festivals from a rock at Onkar Mundattah, and from a precipice near Jawad, was once common. The sacrifices hav of late years seldom occurred. The men wh sacrificed themselves were generally of low tribes usually the Bhil, Dher, or Chamar. One of leading motives by which they were said to actuated, is a belief that they will be re-b as rajas in their next state of transmigration.

In 1883, the Indian papers reported the s sacrifice of a Banya family of twelve persons Kattyawar, to propitiate the gods.

About the year 1877, in the month of M Soomar Bhartee, a Sanyasi Gosain from Bena settled in a linga temple in the village of Mul pur, in the Vishalghur territory of the Kolha State, and along with a lingayat Wani, sacrifi Ballya, a little boy, 12 years of age, as an offer to Siva (Mahadeo), to obtain a revelation wh hidden treasure was to be found.

The British Indian authorites have been unc ing in their efforts to check infanticide. It been practised chiefly by the Rajput races, destroyed their newborn daughters to avoid great expenses of their marriages. Several the tribes acted thus, but the Jhareja of C exceeded all the others. The Indian Governn in 1871 ascertained the villages in which the children exceeded the girls in number, and p such places under strict supervision, with pulsory registration of births. In the censu 1881, in the entire population of British I there were 129,941,851 men and boys, 123,949,970 girls and women; but in Rajpu the males were 5,544,665, and the fe 4,723,727, fewer by 820,938.

It has been customary, from unknown t along the banks of the Ganges, for ailing, d men, particularly the aged, to be taken t river side to expire. They would sometime days be there awaiting death, and repe instances occurred of their death being ca by the relatives filling the mouth with water the river, or the clay of its banks. Wit Hindus it is usual at the death-agony to fill mouth of the dying person with the fluid of panchagavya, but the exposure of their sick the river banks could only hasten the fatal ev

The Charan and the Bhot (Bard), semi-relig tribes of Rajputana, until recent years employed as guarantees for the safety of indiv travellers, and also as convoys for carava merchandise. Their sacred character gave the influence which they exercised in beh those under their care, but if pushed to extr they would wound and even destroy their fam and themselves, so that their death might the robbers.

Until British supremacy, the Hindus of India, in order to extort a debt, would pile of wood, called a Koor, placing cow or an old woman, and set fire t and sacrifice the victim. The sacrific posed to involve in great sin the pe conduct forced the constructor of th adopt this mode of obtaining his money.

During the religious convulsions from the Aryan Hindus have suffered, the writing some of their sects have put forward qui opposing views as to human sacrifices.

In the Brahma Purana, every Naramedha, or man-sacrifice, is expressly forbidden; and in the fifth book of the Bhagavat, Sir William Jones

as pointed out the following emphatic words: —'Whatever men in this world sacrifice human victims, and whatever women eat the flesh of e cattle, those men and those women shall animals here slain torment in the mansions Yama; and, like slaughtering giants, having aved their limbs with axes, shall quaff their od.'—*As. Res.* iii. p. 260.

n the Acharya Brahmana, translated by Roth, s related that 'Harichandra had been married a hundred wives, and yet there was no man- d born to him. At the suggestion of Narada, age, he went to Varuna, and promised that if prayers were heard, and a son granted to , he would offer him up in sacrifice to the g. Accordingly, in due time, a son was born, o was called Rohita. Varuna wanted to keep ichandra to his promise, but the latter put h various excuses till Rohita grew up. And n Rohita objected, and fled to the woods, ere he wandered for six years, until he fell in h the rishi Agastya. The rishi had three sons, he promised to Rohita his second, Suna- a, on receipt of 100 cows. But another ulty occurred, for no one would bind the ntil Rohita gave 200 cows more. Suna- a, unwilling to be sacrificed, interceded first Prajapati, then with Agni, and was released, not before Sunasepha was bound to the ificial post, and his father whittling his sword oaching to kill him, on which Sunasepha imed, 'They will really kill me, as if I was a man.'

o religious rite can be more minutely ordered detailed than this is in the Kalika Purana, sanguinary chapter of which has been trans- l by Mr. Blaquiere, and given in the fifth me of the Asiatic Researches, Art. xxiii., and ell as the ceremonies, the implements, prayers, used on these horrid occasions, are minutely ribed and recited. In this article, premising Siva is supposed to address his sons, the irava, initiating them in these terrible mysteries, urs: 'The flesh of the antelope and the rhino- s give my beloved' (*i.e.* the goddess Kali) light for 500 years.' 'By a human sacrifice, ended by the forms laid down, Devi is pleased 0 years, and by a sacrifice of three men, 0,000 years. By human flesh, Camachya, Chandica, and Bhairava, who assume my shape, are pleased 1000 years. An oblation of blood which has been rendered pure by holy tests, is equal to ambrosia; the head and flesh also afford much delight to the goddess Chandica.' 'Blood drawn from the offerer's own body is looked upon as a proper oblation to the goddess Chandica.' 'Let the sacrificer repeat the word Kali twice, then the words Devi-Bajreswari, then Lawha Dandayai, Namah! which words may be rendered —Hail, Kali! Kali! hail, Devi! goddess of thunder! hail, iron-sceptred goddess!' 'Let him then take the axe in his hand and again make the same by the Calratriya text.' Different mantra are used in reference to the description of the victim to be immolated: females are not to be immolated, except on very particular occasions; the human female never.

The *Bali* is any offering to an idol, such as that of flowers or the presentation of food to all created beings, by throwing grains up into the air, or offering goats and other animals in sacrifice. The presentation is called bali-dan or bali-danam. The offerings to Vishnu consist of rice, milk, curds, fruits, flowers, and inanimate forms; but to the terrific forms of Siva, or his consort Durga, living creatures, sheep, goats, buffaloes, and human beings are offered up, in which case the heads are given to the sacrificial priests, and the bodies are carried away. The Ostyak, when they kill an animal, rub some of the blood on the mouths of their idols. Even this seems at length to be replaced, as Mr. Taylor has suggested, by red paint, and the sacred stones in India, as Colonel Forbes Leslie has shown, are everywhere ornamented with red lead. In many cases it seems to be a necessary portion of the ceremony that the victim should be eaten by those present. Thus in India, when the sacrifice is over, the priest comes out and distributes part of the articles which had been offered to the idols. This is received as holy, and is eaten immediately.

The terms used for the sacrifice are Bali, TAM.; Gavu, TEL.; Yagnya Magha, SANSK. When an ox, lamb, or fowl is offered up in sacrifice to a Devi or Mari female deity by the Sudras, the first two words are used. The words Yagnya Magha are used to indicate a sacrifice celebrated only by the Brahmans on occasions in which they offer goats and not any other animals. In the present day, the cow is not offered in sacrifice by any Hindu sect or race, but in the marriage ceremony of some parts of the country, where a milch cow, surābhi, is released on the intercession of a barber, sufficient remains to show that the rite was formerly practised at marriages for the sake of hospitality. The male buffalo is, however, frequently sacrificed, sometimes in considerable numbers; and only in 1859, the government of Madras ordered the magistrate of the Krishna division to forbid the cruel rite to Ammavaru, wherein buffaloes were impaled alive to appease that angry goddess, and avert cholera. On that occasion, in a small village, 12 to 24 buffaloes were sacrificed, as also several hundred sheep, and the heads of the sacrificed buffaloes were carried in procession on the heads of men.

Every hamlet of the southern parts of the Peninsula has its own object of adoration, village deities, always supposed to be a goddess. Amongst names given to it are—

Ankal Amma.	Tripura-sundari,	Karikatta.
Poni Amma, or gold mother.	or the beautiful of three cities.	Tanthoniamma.
		Dandumari.
Kani Amma.	Osuramma.	Mallamma.
Yegata, or sole mother.	Sellamma.	Chinnamma.
	Yellamma.	Ammanamma.
Mutialamma, or pearl mother.	Padavettu Amma	Choundeswari.
	Tulukan Amma.	Vadivatta.
Paleri Amma, or great goddess.	Muttumari.	Nagattamma.
	Poteramma.	

They are called Amman, Amma, Amani, and Ai, all of them meaning mother. The villagers believe that these goddesses protect them from sickness and losses, and that their worship averts such or mitigates them. A pujali or pujari, a worshipping priest, of the Sudra caste, is appointed for her daily worship. He anoints her daily, and puts ashes on her head, really on the top of the stone, for it is not an image, being entirely without shape. In a small pot he cooks rice, which he collects from the villagers in turn, presents it to the idol, and then takes it to his own home. He breaks a cocoanut in front of

the idol, to which he offers it. But the one-half he keeps for himself, and gives the other to the families from whom he collected the fruit. The villagers make vows to their goddess to offer up to her fowls and sheep in sacrifice, if she will fulfil their desires. Once a year, the villagers collect money by subscription, and celebrate a feast in honour of their goddess, during which sheep and fowls are largely sacrificed. Many of the Sudra, and the entire servile tribes in the south of India, have the fullest faith in their respective village goddesses. When they or their children are overtaken by sickness, they seek the idol, and consult the pujari, who sings songs, affects to hear the Amman's voice, and then announces to the worshipper the offering that must be presented. If cholera break out, it is not unusual for some neighbouring village deity suddenly to rise into great importance, and the sacrificial rite is then almost unceasingly performed. The Hindus, too, have even personified this pestilence into a goddess, whom they have named Maha-Kali, the Great Kali, also Mari-Ai, the Death Mother, and believe that if they neglect her worship she destroys them by the disease. Indeed, gods are still in process of establishment, and smallpox and cholera have thus been personified. Maha-Kali of Ujjain being the goddess of cholera, and Mari Amman of the Tamil people, the Sitla Amman of Western India, a smallpox deity. When a person is attacked with smallpox, they believe that the goddess has taken possession of the sick man. They entertain a great dread of this goddess. While in the house, the sexes remain apart until recovery, and until the sick has been purified by ablution. They place the leaves of the margosa tree beside the sick person, because the goddess is supposed to delight in this tree. They give cooling food, but employ neither internal nor external remedies, in reverence for the deity. The women of the household offer rice flour mixed with jagari, or coarse sugar, and black gram (Pairu, TAM., Pesalu, TEL.), before the patient, in honour of the goddess, and afterwards distribute offerings to Sudras and others. On the seventh day, *i.e.* what medical men call the 15th day, the invalid is bathed in cold water, and the whole body rubbed with a pasty mixture of leaves of the margosa (Azadirachta Indica) mixed with turmeric, and on the same day rice mixed with curds are distributed to Sudras. If in the virulence of the disease an eye be lost, it is attributed to something having been done displeasing to the goddess. The goddess indeed is supposed to appear in three forms, as Tattu-ammavaru or Chinnamavaru, *i.e.* little small goddess; Peddammavaru, or great goddess; and Pairammavaru, or goddess of green gram, the two last of which are most feared.

The Amman worshippers almost all practise and believe in the efficacy of demon or devil or evil spirit rites, amongst which sacrifices always form a part. The sacrifice of the cock to the demon Peisachi, in this respect similar to the devil-worshippers in Kurdistan, is practised by all the non-Aryan people in the south of India, whether of the Brahmanical Hindu persuasion, or of the servile non-Hindu people.

Madan is very little known, but with a class of Tamil magicians is deemed a very great and powerful demon. He is generally courted by the Pariah, Chuckler, Lubbai, and uneducate Muhammadans, who offer beef and arrack t obtain his good-will and favour.

Living sacrifices of animals are an esse part of the worship of all the tutelary vill goddesses in Southern India, as also of t goddesses of cholera, smallpox, etc. Th names are various amongst the several Ta Telugu, Canarese, and Mahratta nations. Amm Amoor Amma, Bal Amma, Poch Amma, Yellam Marri Ammun, Ai, Satwai Devi, Sitla Devi, others, amongst whom, everywhere, Bal Amma her worshippers seem dreaded the Pariahs worship other of the Ammun goddesses refus to intermarry with her devotees. The Y worshippers also are dreaded as sorcerers, their wives are distinguishable by the mode which they attire themselves with their sa which they bring from behind, and from left right. Satwai, amongst the Mahrattas, is a g goddess, to whom children's hair is devoted, front part offered to her, the back part b retained till some other goddess possess the b (ang bharave), such as the smallpox goddess cholera goddess Marri-ai.

In the bloody sacrifices of these n races, the goat is the usual victim. The ri ordinarily performed only once a year, w friends join to offer a goat, and make a f of its flesh afterwards. At all the sacrif oblations, bread and cereal grains are also offe and used in the after-feasting. Thousands sheep and fowls are annually sacrificed at Pe palayam, a village about 30 miles from Ma and multitudes of people attend from that and the neighbouring villages, to celebrate yearly festival, which takes place in the b half of the month of Adi. Large numbe buffaloes were, until the middle of the century, offered at the funeral rites of the T of Ootacamund, but the Madras Government a stop to such wholesale massacre, and restri the rite to the killing of only two animals time,—a measure which the Toda race vie with unaffected alarm and dislike, as likely decrease their children and cattle. In 1883 race at Kotagherry applied for permission sacrifice a sambur. The Irular race of the N gherries sacrifice to their deities a he-goat or co by cutting the victim's throat, and throwing to the idol. This is a winnow or fan, which they call Mahri, and is evidently the emblem of Ceres; and at a short distance in front of the rude thatched shed, which serves as a temple, are two rude stones, one called Moshani, the other Konadi Mahri, but which are subordinate to the fan occupying the interior of the temple. Human sacrifices are still, in Southern India, deemed to be requisite to mollify goddesses and demons who guard hidden treasure, and who are believed to have a partiality for the blood of a pregnant woman, especially of one who is conceived of twins, and to the firstborn of the goldsmith caste; indeed, in popular belief, in the year 1860, one of the latter was supposed to have been very recently offered. There is a shrine of Vatrappa-nachiyar, the tutelary goddess of Tiruvattur, a village to the north of Madras, on the road to Ennore; this is situate in a part of the great and much-frequented pagoda of Tiyagaraia Sami, for which the village is celebrated in ancient Hindu

ooks. The sacrifice now offered there is that
f a male buffalo, but is conducted with great
ecrecy, and people are not generally admitted
witness it. Indeed, the dread of witnessing the
rifice and its attendant ceremonies are so
at, that pregnant women are, if possible, kept
of the village for fear of abortion, which is
ieved to be the certain result should the shrieks
he men who carry the raktabali fall on their
s. This raktabali (Rakta, blood; Bali, sacrifice)
assumed to be the food for devils and the
ndant spirits of the goddess, and consists of
mixed with the sacrificial blood. It is carried
during the last day of the annual festival of
goddess, after midnight, in an earthen pot
a peculiar shape and design, by men specially
tted to the duty. They run and shriek and
l in the street to scare away the devils and
spirits, and halt at the corners and windings,
throw balls of this blood-mixed rice to the
ons, etc. It is considered to be an evil
n for any man to meet them in their rounds,
ver, madness, and disease might befall him.
ll treasure concealed underground for a
h of time is said to become the property of

he Woon district in East Berar came under
care of the British about the middle of the
century, when Berar was assigned by the
m of Hyderabad. Before the assignment,
hers for treasure used to offer human beings
crifice, but the victims there are now con-
to buffaloes, sheep, goats, and fowls. A
lo is sacrificed in every village in the
erah festival, to the goddess of kine, Gaodevi,
the buffalo is led up to the house of the
l-man of the village, who makes to it oblations
owers, etc. He then strikes it on the muzzle
a sword, and allows the blood to fall on the
nd as a libation to the goddess, to appease
anger. It is then led to the door of every
se in the village; each householder makes a
ey present to the leader; in the evening the
im is killed by its throat being cut, and at
south boundary of the village a drop of its
is applied to the foreheads of the head-man,
he potail, the deshpandi, and deshmukhs.
side of every Woon village is a shrine of the
smallpox goddess, called there Sitla Devi. It is
merely a few stones coloured with red lead; and
after recovery from this ailment, the family in
which the disease has been visit the shrine,
offer a goat as a victim, and prepare food for
this oblation.

With the Kol, one or two of the Hindu gods are reverenced, but they have many of their own non-Aryan deities, to which they mostly resort. They sacrifice fowls, and pour libations before eating. Colonel Tod describes a lofty three-peaked mountain in the Vindhya range on which is a temple dedicated to Aya-mata, also called Isani, the tutelary divinity of the Kol, and he mentions that Isani and the effigy of the horse are the only objects worshipped among this aboriginal race. He mentions that Isani means mother-earth, from Isa, goddess, and Anani, earth. The chief divinity of the Larka Kol is the sun, suraj; and next to the sun ranks the moon, chanda; and then the stars, which they believe to be the children of the moon. Besides the sun and moon, there are spirits called bhonga which inhabit the trees and groves in and around the village, and those trees are never denuded of their branches or cut down. When labour-pains come on, the women are shut up in a lonely hut, offerings are hung up near to propitiate the bhonga, and no one ventures to approach till the labour is over.

The Kandh had long been addicted to sacrifice human beings to the earth goddess. The victim was always purchased, and was destroyed with much ceremony, in the midst of assembled Kandhs, each of whom tore off a portion of the body to bury in his field as a propitiation.

The Indian Government became aware of the Kandh custom about the year 1834, and took immediate measures to induce them to discontinue it, and the year 1860 passed by without a single meriah. Captain MacViccar and Colonel Campbell exerted themselves to suppress it. Among the Kandhs, when performing this meriah sacrifice, which was quite common up to the year 1850, a stout stake was driven into the soil, and to it the victim was fastened, seated, and anointed with ghi, oil, and turmeric, decorated with flowers, and worshipped during the day by the assembly. At nightfall the licentious revelry was resumed, and on the third morning the victim got some milk to drink, when the presiding priest implored the goddess to shower her blessings on the people, that they might increase and multiply, prosperity attend their cattle and poultry, fertility their fields, and happiness to the people generally. The priest recounted the origin and advantage of the rite, and concluded by stating that the goddess had been obeyed and the people assembled. Other softening expressions were recited to excite the compassion of the multitude. After the ceremony, the victim was taken to the grove where the sacrifice was to be carried out; and to prevent resistance, the bones of the arms and legs were broken, or he was drugged with opium or datura. The Janni wounded his victim with his axe, and this act was followed up by the crowd, who pressed forward to obtain a piece of his flesh to bury in their fields, and in a moment he was stripped to the bone.

At Bombay, Kali is worshipped at Sitali, and at other places, as Devi, Mata, and Amoor Amma. At Chanda and Lanji she has temples in which human victims were offered almost up to the middle of the 19th century. The victim was taken to the temple in the evening and shut up, and in the morning he was found dead, the dread goddess having 'shown her power by coming in the night and sucking his blood.' At Dantewada, in Bastar, about 60 miles S.W. of Jagdalpur, near the junction of the Sankani and Dankani, tributaries of the Indrawati, is a shrine of Danteswari, at which, about A.D. 1830, it is said that upwards of 25 full-grown men were immolated on a single occasion by a raja of Bastar. Since then, adds Mr. Hislop, numerous complaints reached the Nagpur authorities of the continuance of the practice, up to the time of the annexation by the British. Captain Clune, writing in 1828, says

that when a rana of Mewar had occasion to pass the Mahi river, an individual from a tribe descended from a Chauhan Rajput and a Bhil mother was sacrificed, his throat being cut and his body thrown into the river. This sacrifice had been once performed in the lifetime of the rana then reigning. Dr. Mason relates that when, about A.D. 1780, the gates of the new city of Tavoy were erected, a criminal was put into each post hole, and the massive posts thrown in upon him, so that his blood gushed up at the sides. His spirit was supposed to become a Nat, that would hover about the post, inflicting evil on all who came near, thereby contributing to the defence of the town.

Human sacrifices and the ornaments of the victim are alluded to in the Toy Cart or Mrichchi-kati, and in the Malati and Madhava, two ancient Sanskrit dramas. Madhava comes on the scene when the Aghora Ghanta is preparing to offer Malati, and he exclaims:

'What luckless chance is this, that such a maid
With crimson garb and garland, like a victim
Adorned for sacrifice, should be the captive
Of impious wretches!'

In like manner, the ordinary victims of the Greeks were adorned with crowns and garlands, as thus, in the Clouds, in the scene between Socrates and Strepsiades:

'*Socr.* Now take this chaplet—wear it.
Strep. Why this chaplet?
Would'st make of me another Athamas,
And sacrifice me to a cloud?'

So also in the Heraclidæ, Macaria, when offering herself as a victim to secure the triumph of the Athenians, exclaims:

'To the scene of death
Conduct, with garlands crown me!'

The translator of Euripides also observes that human sacrifices at their first origin appear to have consisted of virgins or young men in the state of celibacy, and in this respect the selection of Malati offers another analogy. The words translated above impious wretches, Pashanda and Chandala, mean aboriginal races, heretics, and out-castes. These epithets indicate little respect for the worshippers of Durga, and their application so publicly declared would lead us to infer that the author's sentiments were those of his age. Jagaddahara states that in the rite two legal prohibitions are violated, of which he gives the text; they are, 'Let him not eat from the leaf of the asclepias, nor slay a female nor child;' also, 'Females of every description of being, it is well known, are not to be slain.'

In addition to the village deities noticed, the only goddess who requires victims is the Sakti of Siva, defined by her votaries to be the visible energy of the divine essence symbolized as a female. She is highly venerated during the nine days of the Dassera or Navaratri (the nine nights), at the close of which a sheep is generally offered in the houses of Rajputs and Mahrattas. The sacrifice of buffaloes on the occasion is very rare, and when it is offered, the ceremony takes place in temples sacred to this goddess, but sometimes in jungles and unfrequented parts. The goddesses and demons of the Sudras all accept bloody sacrifices, which are generally accompanied with the offering of spirituous liquors. As a general rule, the offering of such sacrifices among the houses of educated Hindus, and i the superior temples, is observed with grea secrecy.

Man, as a victim, is still being offered up many other parts of the world.

Human sacrifices of the most extensive charact and ancestral worship, still prevail in Dahom and in all Africa a serpent-worship prevails. many as 600 victims have been offered up Dahomey at one time.

At Quendendes village in South Africa, Livingstone found human sacrifices frequent; when a chief dies, a number of his servants slaughtered, to form his company in the o world, a custom which the Barotse also foll Also, in many of the Polynesian islands, up to present date, human beings are sacrificed commencing to build a war-canoe, a chief's ho or on the death of a chief.

In a chapter on human sacrifice in Dr. Nor Chever's book on Medical Jurisprudence, author writes of human sacrifice by decapita as an existing practice (pp. 408, 410), and there are 'strong reasons for believing that t is scarcely a district in India in which hu sacrifice is not still practised occasionally religious rite.' Doubtless, the old sangu expiatory ideas still lurk in the breasts o masses, and in face of impending famin pestilence, when men's apprehensions are deeply stirred, the offering of a human victi the power which can inflict hunger or dis instead of the usual goat or buffalo, is n violent or unnatural step. Ideas of this na formulated under the terms sacrifice and a ment, are essential axioms in comparative reli and their abandonment is only to be hoped f part and parcel of a refinement of national th and habit. To this end, general education, more particularly education in the phy sciences, and the fostering of a belief in ge laws and a benevolent God, are the great m and the increasing power of the British in I may lead to the discontinuance of such barbar

The Reverend Mr. Ward, writing regar Bengal in the early part of the 19th cent mentions that at a village called Ksheeru, the town of Bardwan, human sacrifices w offered to the goddess Yoogadya, a form Durga; at Kirectukona, near Murshidabad Kali; and at many other places. The disco of murders in the name of religion was mad finding bodies with the heads cut off nea images; and the natives well knew that t people had been offered in sacrifice. At the village of Serampur also, near Kutwa, before the temple of the goddess Tara, a human body was found without a head; and inside the temple, different offerings, as ornaments, food, flowers, spirituous liquors, etc. All who saw it knew that a human victim had been slaughtered in the night, and search was made after the murderers, but in vain.

On the N.E. frontier of British India, several Mongoloid races sacrifice human beings till now. The object of the Kuki inroads on the plains is not plunder, for which they have never been known to show any desire, but they kill and carry away the heads of as many human beings as they can seize, and have been known, in one night, to carry off fifty. These are used in certain cere-

honies performed at the funerals of their chiefs, nd it is always after the death of one of their ajas that their incursions occur.

In Manipur, Cachar, and Assam, according to Calcutta Review for 1860, the offering of man sacrifices was still continued. By the ords of the Sudder Nizamat Adalut of Chitta- ng for 1852, some men of the Toonia Joom hals were tried for murder by sacrificing. is is a forest tract in the hills, and inhabited by Mug, Chukma, Reang, Tiperah, and other races, more or less nomadic. The place of sacrifice s a cleared spot in the jungle, and staked round h bamboos about 6 feet high. The sacrificial , the Phula bans, are bamboos scraped and pped at the edges, the hanging strips giving a le notion of ornament. These sacrifices gener- occur once a year. During its celebration Agartollah, a gun is fired every evening at set, when every person hurries to his home. Kuki and all the hill tribes worship local ties, said to be 14 in number.

According to Dr. W. W. Hunter, the Hadi are elot race spread over all Bengal, who take r name from the original Santali word for Had,' and who have supplied such terms as , base, low-born; hadduk, a sweeper; hunda, blockhead, imp; hudduka, a drunken sot, ; also hadi, in low Bengali hadikath, is the e of a rude fetter or stock, by which the holder used to confine his serfs until they ed to his terms. It means literally the helot's ; it was also used for fastening the head of victim in the bloody oblations which the an religion adopted from the aboriginal races, cially in the human sacrifices to Kali, to h the low castes even now resort in times of ial need. In an account of the last human rings to Kali, during the famine of 1866, it mentioned that the bleading head was found d on the harcat, *i.e.* helot's log.

n a war between two Arab chiefs, in the time of isarius, but which was carried on without the rference of either Persia or Rome, the son of reth fell into the power of the Mondar of ah, who sacrificed him to Uzza, the deity wor- pped by his tribe. Al-Azu of the ancient abs, is the same with the lingam of the Hindus, l to this emblem human sacrifices still occur.

Human sacrifices till lately were common with the Garo as offerings to the manes of deceased chiefs. The Burmese stopped the practice amongst the Chutia. It was annual, and the victims had to be provided by a particular tribe, who were rewarded by being exempted from service and taxes. The Koo Karen are reputed to torture human victims in the same manner as they torture the Gayal, by despatching it with numberless spear wounds. The Bhuiya of Keonjhur Hills, in the Tributary Mahals of Bonai and Gangpur, and Bamra, so late as 1st May 1868, performed a human sacrifice.

So late as 1859, the July number of the Calcutta Review (p. 423) remarks that 'in Bengal, in the worship of the bloody Kali, all castes mingle together, and, after a libation of ardent spirits to the goddess, drink spirits and eat flesh, as their fathers did in the Vedic times. It is practised also to this day in the foul and secret rites of the Tantra. A festival held in honour of Kali is called also Kali-puja, as the Dasra in honour of the same deity, under the name of Durga, is called also Durga-puja and Durgotsava.'

The body of a man, named Rama, resident of the village of Narsipur, in the Shimoga district, was found in a small temple on the 18th of February 1875. He was a lingayet worshipper of Siva, aged about 22 years, of a retiring disposition, and given to reading religious books. The temple is a small, low building cut into the hill, and consisting of three rooms: first the outer one supported on pillars, then an inner square one, and inside this again the very small one or sanctum, containing the lingam. In the middle room the body was found lying on a blanket, on its right side. The arms were crossed on the chest, the last joints of the five fingers of the left hand were cut off, and were in front of the idol, between it and the door, arranged in a line; and still nearer the door, in front of the idol, blade toward it, was found a kudigol or sickle-shaped knife, besmeared with blood. Two days previous to the discovery of the body, two pujali came to the temple, and on attempting to open the door, they were warned by a voice from within to be off, that there were scenes of wonder being enacted inside which it would not be well for them to witness, and so they left.

A correspondent sent the following report to the Madras Times, of a case of human sacrifice which occurred in the Patna Feudatory State, in the Central Provinces. The chief of the Gonds of the Alardu ground of villages was sitting by the side of a road during the Dusserah festival, talking to his uncle, a chowkidar, and a liquor-seller. Presently a strolling minstrel appeared on the scene, and salaamed to the chief, who asked him if he drank liquor. The minstrel replied that he did, so the chief caused him to be served with some toddy, which the party had with them. The Gond chief and the liquor-seller then went into the jungle, the remainder of the party stayed talking by the side of the road. When the chief and the liquor-seller returned, the latter went up to the minstrel, and, seizing him by his hair, pulled him down. The Gond chief said to his uncle, 'Take your axe and cut the minstrel's throat.' Accordingly the chief's uncle sat astride the minstrel's chest, and cut his throat with an axe, the Gond chief in the meantime holding a lota belonging to one of the party to catch the blood which gushed out. The minstrel died at once, and the chowkidar and the liquor-seller chopped up the body, and, taking it a little way into the jungle, buried it there. The whole party then proceeded to the temple of the goddess Duarini, which they reached about 10 P.M. The chief, leaving the others outside, went in and woke up the pujali, saying, I have brought an offering of liquor for the goddess, do you pour it over her image. The pujali at first refused, but afterwards, yielding to the earnest solicitations of the chief, took the lota and poured its contents over the stone image of the goddess. Seeing the contents were blood, he inquired from whence it came. The chief said it was the blood of a buffalo bull. He then went outside, and joining his party, they all returned home. About ten days after the murder, the minstrel's relatives, finding that he did not return, gave information to the police, and on an investigation being held, the chowkidar confessed fully, and on his confession,

the chief, his uncle, and the liquor-seller were brought to trial before the commissioner of the Ch'hattisgarh division, and were sentenced by him to be hanged.

Captain Postans, writing on Western India, tells us that Brahmans of the Dekhan long preserved the custom of yearly sacrificing an aged woman, on the occasion of the raja of Sattara's visit to the fort of Partabghur. There is, toward the close of the 19th century, a numerous tribe of Brahmans who are still accused of the practice. They are the Kurrada, and are inhabitants of the Konkan. They were noticed in 1808 by Colonel Walker, Resident of Baroda, and subsequently by Sir John Malcolm in his History of India, and the latest reports from that neighbourhood show the belief that the practice of sacrificing human beings still continues amongst them. The goddess of their worship is Maha Lakshmi, to whom they believe human sacrifices are acceptable, and the more so if the victim is a Brahman learned in the shastras. Kurrada Brahmans are accused of effecting, by the secret operation of poison, that object. Colonel Walker knew several Kurrada Brahmans who, admitting the former prevalence, most strongly denied its present practice, but many people would decline to eat of food prepared by a Brahman of this tribe, of which he himself should not at the same time partake. Sir John Malcolm also states of the Kurrada Brahmans that they had a custom at Poona of annually sacrificing to the Sakti a young Brahman; and as, according to the sacred books, if the victim is unwilling, the sacrifice is forbidden, to prevent the possibility of such an occurrence, the unsuspecting but devoted one is frequently the stranger, who for months, or perhaps years, had shared the hospitality of his murderer. On one such case occurring, orders were issued for the apprehension of a Kurrada Brahman and his family, who themselves were put to death, whilst every priest of the sect was expelled from the city of Poona, and their return forbidden by the heaviest penalties.—*Milman's Hist. of Jews*, 4th edit., i. pp. 24, 154; *William Howit, The Supernatural; Bunsen, Egypt; Georgic*, lib. iii. p. 5; *Sharpe's Egypt*, i. p. 163; *Early Christianity in Arabia; Colonel Forbes Leslie; Lubbock, Origin of Civil.; Kenrick's Phœnicia; J. SACRIFICE ROCK, on the W. coast of the Peninsula of India, lies 4½ miles off the neares shore, 15½ miles from Tellicherry. It is whitish i appearance, 40 feet high, and has edible birds nests on it. Dr. Fryer, who visited India 1673, says that at Mangalore the Dutch ha fort, and, 6 miles to the north, the French had flag flying; within a league of which a grey ro extols its hoary head eight fathoms above wat navigable on all sides, justly called by us Sacrifi Island, in remembrance of a bloody butchery some English by the pirate Malabars, who are worst pickeroons on this coast, going in fle and are set out by the great men ashore, the ch of whom lives at Durmapatan.—*A New Acco of East India and Persia, etc.* p. 55, Lond. 16 *Ouseley's Travels*, i. p. 68.

SADA, Hindu Unitarians, which their na Sada or Sad'ha, HIND., pure or puritan, impli They originated in A.D. 1658 with a person nam Birbhan. They have no temples.

SADACHARAS. SANSK. Fixed religi observances of the Hindus.

SA-DANG, also Saundang. BURM. A meas of length in Pegu=0·601 yards.

SADARO, a shirt assumed and worn by Parsee race as a token of admission to faith.

SADASHEGHUR, a small seaport town the west coast of India in the N. Canara dist of the Bombay Presidency, in lat. 14° 51′ 25″ and long. 76° 10′ 55″ E. The prevalence of h breakers outside and across the mouth of bay, from Carwarhead to Deoghur Island, and throughout its interior (except close under Head), during the height of the S.W. mons render it dangerous at such times for inw bound vessels to make the anchorage, and in sible for those outward-bound to put to sea.

SADASHYA. SANSK. Bystanders at a cou whose business it is to notice and correct takes. The Sadashya regulates the ceremonie worship, but is not employed on all occasion *Ward's Hindoos*, ii. p. 17.

SADAT, ARAB., plural of Syud. This wor the northern Hejaz and in British India is app indifferently to the posterity of Hasan and Hus sons of Ali and Fatima, and grandsons of Ma med. The descendants of Ali by other wives styled Alavi Sadat.—*Burton's Mecca*, ii. p. 26

SADA-VART or Sada-bart, a poorhous distributing alms to the poor, in the form of od or money, and daily or periodically.

SADDAIMUNI is said to have been a Saiva devotee, who lived at the same time as Agastya. A Vedantic treatise, Gnana Nuru, a work on medicine, Kalappa Nuru, and one on alchemy, Vata Nikandu, are attributed to him; but they are forgeries.

Kakapa, Palana, MALAY.	

The saddles of Europe are made with a wooden framework covered with leather of different kinds, and with intervening padding. Those in use in Asia are made of cloth or felt (namdah), with or without a wooden framework, and the different races in Sind, in Kattyawar, Tibet, and Hindustan

have each their own peculiar forms. Their saddle-cloths are often embroidered. At the Exhibition of 1851, the saddle-cloths and matchlock accoutrements from the raja of Kotah had a pattern produced with gold-headed nails fixed into green velvet. The effect of this was so good as to be greatly admired by some of the best judges.—*Royle's Arts, etc., of India*, p. 508.

SADDLE ISLAND, in the Red Sea, has active volcanoes.

SAD-GOP, a cowherd race of the N.W. Provinces. They have no connection with the other Gowalla of Bengal, and neither intermarry with them, nor follow the same pursuits.—*Cal. Rev.*, No. 110.

SAD'H or Sad'hu. SANSK. Pure, pious, virtuous, good; a person leading a pious or religious life, an ascetic, a mendicant, a monotheist sect of Hindus, whose chief seats are Dehli, Agra, Jeypore, Farrakhabad, but there are several of the sect scattered over other parts of the country. The Sad'h utterly reject and abhor all kinds of idolatry. They say Sad'h, the appellation of the sect, means 'servant of God;' its real meaning is pure, from Sad'ha, pure. They are [illegible]s, and their form of worship is most [illegible]. Sad'hs resemble the Quakers, or Society of Friends in England, in their customs in a remarkable degree. Ornaments and gay apparel of every kind are strictly prohibited. Their dress always white. They never make any obeisance or salutation. They will not take an oath, and are exempted in the courts of justice, their affirmation, like that of the Quakers, being considered equivalent. The Sad'hs profess to abstain from all luxuries, such as tobacco, betle, opium, and wine. They never have exhibitions of dancing. All violence to man or beast is forbidden; even self-defence resistance is allowable. Charity is strongly enjoined. Their nuptial rite is simple, all unnecessary expenses being scrupulously avoided. Polygamy is never allowed, and widows are forbidden to unite with a second husband.—*Cole. Myth. Hind.*

[illegible]AN, a devout Hindu butcher of Benares who lived in the 17th century, and was fervent in the observances of his religion. He is fabled to have miraculously weighed all his meat with a stone, and without dying to have ascended to heaven.—*Sherring*, p. 266.

[illegible]HI RAM DAS was the first Sikh guru of the Sad'hi tribe, and hence was named Ram Das, Sad'hi. The Sad'hi were numerous about Muckawal about the middle of the 19th century.—*MacGregor's Sikhs*, i. p. 29.

SADHUA PANTHI, a Vaishnava sect of Hindus in the N.W. Provinces of India; originated by Sadhua, a butcher.

SAD'HWIA, a Hindu female saint. Sad'hya, SANSK., is from Sad'h, to perfect.

SADI, a Persian poet, a beautiful writer in his own peculiar way. Though inferior to Hafiz in lyric poetry, his works are much more voluminous and diversified, embracing all kinds of composition in prose and verse. Sadi was his literary takhallus or title, given, it is said, because he lived in the reign of Sad-bin-Zangi, king of Persia. His name was Shaikh Masalah-u-Din. He was born at Shiraz A.D. 1194, and died there A.D. 1292, at the age of 98 solar years. He was a man of much learning and great piety, real or pretended. He travelled as a darvesh during the greater part of his life, and made the pilgrimage to Mecca no less than 14 times.

SADID-ud-DIN GAZERUNI, author of Ul-Moghni-fi-Sharh-ul-Mujiz, a commentary on the Commentary of Ala-ud-Din Ali on Avicenna's Qanun fi't Tibb.

SADIYA, village in Lakhimpur district, Assam, in lat. 27° 49′ 45″ N., and long. 95° 41′ 35″ E., on the right bank of the Brahmaputra, about 100 miles above Dibrogarh, and 210 feet above the sea. Sadiya is the extreme N.E. frontier outpost of British India. The river is navigable thus far in the rains. In 1839, the Khamti tribe rose in rebellion. They cut off the outpost at Sadiya, and killed Major White, the commandant and political agent, together with the detachment of sepoys. In order to promote friendly relations with the neighbouring hill tribes of Khamti, Mishmi, and Singpho, a fair is held in February. The hillmen bring down caoutchouc, wax, musk, cloth, mats, daos or hill-knives, and ivory.—*Imp. Gaz.*; *A. Schlagentweit.*

SADOZAI, a title of the Daurani Afghans. They ruled in Kābul from A.D. 1747 until they were put aside by Dost Muhammad Khan, a chief of the Barakzai.

SADQA. ARAB. Sacrifice. Sadqe-hona or Sadqe-jana, to become a sacrifice for another. Sadqe-karna, to sacrifice for the welfare of another.

SADR. ARAB. Chief, principal. Sadr adalat, the chief court of justice; Sadr Diwani adalat, the chief civil court; Sadr foujdari adalat; Sadr Nizamat adalat, the chief criminal court. Sadr-amin, a judicial functionary; Sadr mal guzar, in the revenue system, the head-man of a village who collects and pays the land-tax. The Sadr-amin of the British is a subordinate judge with limited civil and criminal jurisdiction.

SADRAS, correctly Satranja-patana, a small seaport town on the Coromandel coast, in lat. 12° 31′ 15″ N., and long. 80° 12′ E. Population, about 1144. Sadras first became a trading settlement of the Dutch in 1647, and was long famous for the fineness of the muslin produced by its looms. The British captured it in 1795. It was temporarily restored to the Dutch, but has been an English possession since 1824.—*Imp. Gaz.*

SADRPUR, a pargana in the Sitapur district of Oudh; Muhammadans form the principal proprietary body, owning 119 villages; Raikwars hold 11; Seths, 5; Janwar Kshatriyas, 4; Panwars, 4; Kashmiri Brahmans, 4. The remaining 23 are chiefly held by Kayasths.—*Imp. Gaz.*

SADULLAPUR, a village in Maldah district, Bengal. The chief descent or ghat to the holy stream of the Bhagirathi is at this place, to which the dead bodies of Hindus are brought from great distances to be burned.—*Imp. Gaz.* viii.

SADWAR. HIND. Pikemen in the Northern Circars.

SAFA. HIND. A small, close-fitting, coloured turband, worn under the dastar.

SAFDAR ALI, a Muhammadan chief who was engaged in the contest for supremacy, and was for a short time a nawab in Arcot, but was murdered there by Pathans and Abyssinian slaves. He left a posthumous and only son.

SAFED KOH, a range of mountains in Afghanistan, which commences from a few miles west of the Shutargardan pass, between Kuram and

Logar. Its highest point is the Sita Ram mountain, 15,622 feet above the sea, whence the range is perhaps nowhere less than 12,500 feet, until it again culminates in a double-peak mountain, whose summits average 14,800 feet. It throws out to the north a spur which forms the east watershed of the Logar river, and, dividing it from the Khurd Kābul river, ends at Bhutkhak. Another spur separates the Khurd Kābul and the Tezin rivers, and over it run the Haft Kotal and Lata-band passes. Another spur, after running north for about 30 miles to the north of Jagdalak, turns to the east, parallel with the Kābul river, and ends at the junction of the Surkhab with that river. Other north spurs run between the streams which flow down from it into the Surkhab or the Kābul river. Of these the principal are, commencing from the west, the Gandamak, Karasu, Chiprial, Kisarak, Kote, and Mohmand. On the south of the range is a spur which runs out from the Shutargardan pass, and drains on the north and east into the Hazardarakht and Hariab streams, and on the south into another source of the Kuram; and a second south spur is the Peiwar Kotal, which comes out from the Sita Ram peak, 15,622 feet, and ends at the Kuram, draining into the Keria and Hariab rivers on the west and the Peiwar on the east.—*Walker; Moorcroft*, ii. p. 355; *Mohun Lal's Tr.* p. 339; *MacGregor's Afghanistan*, p. 686; *Imp. Gaz.; Bellew.*

Two species yield the safflower of commerce, viz. Carthamus tinctorius, which has small leaves and an orange flower; and C. oxyacantha, with larger leaves and a yellow flower, a native of Caucasus. The former is cultivated in every part of the E. Indies, in China, America, Spain, some of the warmer parts of Europe; is indigenous to the whole of the Indian Archipelago, and a large quantity is grown in and exported from Bali.

It has been noticed under its Latin name Carthamus tinctorius, also under Dyes, but it may be mentioned here, that though still largely used throughout the East Indies, and exported from British India, the aniline dyes are being preferred to it even in the places of its growth. The safflower exported from India was—

Safflower oil, Poliyan of the Panjab, and Karirma safir of the Persians, is a light-yellow, clear oil, obtained from the seeds when properly prepared. It is used in India for culinary and other purposes. This oil deserves more attention than it has hitherto received. It is used in some of the Government workshops as a 'drying oil.' It is believed to constitute the bulk of the celebrated Macassar oil.

Crocus sativus, the saffron plant, has been noticed under that head. It is a native of Asia Minor, naturalized in many parts of Europe, and cultivated in Persia and Kashmir. The Chinese obtain it from Tibet. It is brought to India from Great Britain, the seaports of the Red Sea, Persia and Kashmir. The dried stigmata of the flower are picked out, dried on paper either in a kiln or by the sun. If compressed into cakes, it is called cake saffron. Hay saffron, that usually met with, consists of the stigmas, each about an inch and a half long. One grain of good saffron contains the stigmata and styles of nine flowers, so that one ounce of saffron is equal to 4000 flowers. The dried pistils, compressed into firm cakes or masses, are termed in India rootla saffron. Saffron, as now met with, is prepared from the florets of the safflower. Saffron is used in medicine, and as a dye, and in India also by women to tinge the skin of the body of a light-yellow colour, but the aniline dyes are everywhere displacing it. To put on the saffron robe is the sign of 'no quarter' with the Rajput warrior. It is employed as a seasoning in cookery, also to colour confectionery, liquors, varnishes, and it is used to a small extent by painters and dyers. The colouring ingredient is a peculiar principle, to which the name of polychroite has been given. It possesses the properties of being totally destroyed by the action of the solar rays, colouring in small quantity a large body of water, and of forming red or green tints when treated with sulphuric acid or with sulphate of iron. In the Arabian and Hindu schools of medicine saffron continues to be used. The Arabians class it among their Mosébetat (Hypnotica), Mokewyat (Cordials), and Mufettchat (Deobstruentia).

SAFI are a widely-spread people occupying Nur, Dara Mazar, Dara Pech, and the valley ing on the Khonar river, also in a district Surkh Khambar, south of Bajur, and they inhabit Taghow. They speak the Afghan dialect, but also Pashai. In the emperor Baber's time, they were styled Kafir, and they were subsequently expelled by the Ghilzai from the lands to the south of Taghow, and between Kābul and Jalalabad. Nadir Shah cultivated a friendship with them. South of the Safi, at Bahi, the first march from Goshter, on the Jalalabad river, towards Bajur, are a people called Yeghani, who consider themselves Afghans, but are probably converted Kafir, for they speak a dialect which no Afghan can understand.—*Masson's Journeys.*

In the beginning of the year A.D. 1818, by a treaty concluded between the Peshwa Baji Rao and the British Government, Sagar, with the greater part of the present Sagar district Damoh, Jubbulpur, and Mandla, were made over to the British.—*Imp. Gaz.*

SAGAR or Saugor Island is at the mouth of the Hoogly river, Bengal, in lat. 21° 35′ 30″ to 21° 56′ 30″ N., and long. 88° 4′ 30″ to 88° 14′ E. Its lighthouse is in lat. 21° 38′ N., and 88° 1′ E. long. It is 21 miles in length and 6 in breadth, and is low, but as it lies upon the extreme edge of the deltaic basin, it is consequently higher than the centre of the delta. The remains of tanks, temples, and roads are still to be seen, showing that it was once more densely populated than it is now, and native history informs us that Saugor Island has been inhabited for centuries. During the operation of clearing Saugor Island in 1822 to 1833, and later when clearing away the jungle for the electric telegraph in 1855-56, remains of buildings, tanks, roads, and other signs of man's former presence were brought to light. Again, upon the eastern portions of the Sunderbuns, where the country has been cleared of forest, mud forts are found in good numbers. Mug, Malay, Arab, Portuguese, and other pirates, about A.D. 1581, depopulated the country so far to the westward between the river Horinghatta and the Rabnabad channel. The delta is intersected from north to south by many broad rivers, and by endless creeks running one into the other, filled for the most part with salt water when near the sea. This tract of land occupies approximately 28,080 square miles of superficial area, or double the area of the delta of the Nile; measuring from west to east, or from the right bank of the Hoogly river opposite to the Saugor tripod on the south-west point of Saugor Island, to Chittagong, it is 270 miles in width, presenting to the Bay of Bengal a series of low, flat mud banks covered at high water and dry at low water; a few miles from low-water mark commence mangrove swamps; a little farther inland trees appear, and lastly cultivation, the nearest cultivation in the central portion of the delta being 47 miles from the sea. In the sea front of the delta there are nine principal openings having a head-stream, that is, having water flowing direct from the Ganges, or from the Megna or Brahmaputra. They are—1. the Ganges; 2. the Megna or Brahmaputra; 3. Horinghatta; 4. Pussur; 5. Murjatta or Kagga; 6. Barapunga; 7. Mollinchew; 8. Roymungul or Juboona; 9. Hoogly. Besides these large rivers, there are numerous openings having no head-stream, being mere salt-water tidal estuaries; these openings or headless rivers are the deepest, as no silt or deposit is poured into them from the higher lands. The tides in the Hoogly run with a rapidity in the springs of 7 miles an hour between Saugor and Calcutta. At Calcutta it is high water about 2h. 30m. on full and change of the moon. The bore is of not unfrequent occurrence in this branch of the river.

A fair is held on the island in the beginning of January, to which pilgrims from all parts of India, but especially from Bengal, resort to wash away their sins in the waters of the holy stream. A writer in the Calcutta Review states that, in 1688, two years before the foundation of Calcutta, contained a population of 200,000 persons, who

in one night were swept away by an inundation. A cyclone of 1864 caused enormous destruction and loss of life. The storm-wave, 11 feet above the level of the land, swept over the island with resistless force; 1488 persons survived out of a population of 5625. The island, when surveyed in 1812, was found to contain 143,265 acres of dry land. The island is now covered with dense jungle, and infested by tigers and other wild beasts. Many attempts have been made to cultivate it, but with small success.

SAGARA, in Hindu legend reputed son of Bahu or Bahuka. He is said to have warred with and conquered the Saka, the Yavana, the Kamboja, the Parada, and Pahlava. Sagara had two wives, Sumati, daughter of Kasyapa, and Kesini, daughter of Raja Viderbha, both of whom had children, all bad men, who were destroyed.—*Garrett; Dowson.*

The Sageretia genus of plants, belonging to the natural order Rhamneæ, is found in S. and N. America, Java, China, and in India along the foot of the Himalaya. S. Brandrethiana is a large shrub of Kaghan; abounds in places, Trans-Indus, from 2000 to 3500 feet, and in the Salt Range, and occurs low in the Jhelum basin. The fruit is well known in the bazars of Peshawur and Afghanistan; it is small and black, and is very pleasant eating when fresh and in sufficient quantity, the flavour being not unlike that of the bilberry. In the Salt Range, a chatni is made of the fruit; wood very hard and close-grained.

SAGO.

[illegible] a kind of sago is produced both in the [illegible]est Indies.

[illegible]on filare, *Mart.*, a native of China, [illegible]nferior sago of commerce.

[illegible], a sago is obtained from the Phœnix [illegible] *Roxb.*

In China, sago is obtained from Rhapis flabelformis, [illegible] which, also, it is made for native [illegible] in Tr[illegible]ncore, Mysore, and Wynad, in the [illegible]nsula of India.

Mergu[illegible]o is manufactured from the Tacca [illegible]atifida, and may be seen in every bazar in the [illegible]sserin[illegible]rovinces, the plant abounding along [illegible]sea-sh[illegible] The same plant is common in the [illegible]th Sea [illegible]nds, and its tubers there supply to [illegible] inhabi[illegible]s the place of bread. A spurious [illegible]d of [illegible]rroot has long been made at Mergui [illegible]m the [illegible]ne plant as that which yields the [illegible]go; but [illegible]lical men have decided that it con[illegible]ns pro[illegible]es which render it unsuitable for the [illegible]k, and [illegible]emical analysis has developed that [illegible]contai[illegible]nly half the nutritious qualities of [illegible]uine arrowroot.

Sago occurs in commerce in two states,—pulverulent and granulated. (1) The meal or flour, [illegible]he fo[illegible]n of a fine amylaceous powder, whitish, [illegible]h a buffy or reddish tint; odour faint, but [illegible]ewha[illegible] unpleasant and musty. (2) Granulated [illegible]o of [illegible]wo kinds,—pearl and common brown. [illegible] former occurs in small hard grains, not [illegible]eding in size that of a pin's head, inodorous, having little taste. They have a brownish or [illegible]ish-yellow tint, and are somewhat translucent. [illegible]the [illegible]id of a solution of chloride of lime they [illegible]be bleached, and rendered perfectly white. [illegible]dealers it is said, pay £7 per ton for bleaching it. Common brown sago occurs in larger [illegible]wnish-white grains about the size of pearl [illegible]ey.

Sago in its granulated form is that usually [illegible]orted. The best sago is the produce of Siak, [illegible]the north coast of Sumatra. This is of a light-[illegible]wn co[illegible]our, the grains large, and not easily [illegible]oken. [illegible] sago of Borneo is the next in [illegible]ue; it i[illegible]iter, but more friable. The pro[illegible]ce of th[illegible]luccas, though greatest in quan[illegible] is of [illegible] smallest estimation. The cost of [illegible]anufactured sago, from the hands of the grower or [illegible]producer, [illegible]as, according to Mr. Crawfurd, only a [illegible]dollar a pikul of 133⅓ lbs. It fetches in the London market—common pearl, 20s. to 26s. the cwt.; sago flour, 20s. the cwt. The Chinese of Malacca and Singapore invented a process by which they refine sago so as to give it a fine pearly [illegible]ture.

In [illegible]ner parts of the Archipelago, two kinds of [illegible]alluvial soil are found in greater or less abundance, [illegible]one consisting chiefly of sand, often thrown up in [illegible]ridges, and the other principally of decomposed vegetable matter. The latter is often a consequence of the production of the former, which serves to keep out the waves of the sea, and allow a rank vegetation to flourish. In process of time, by the elevation of the surface and the extension of a similar formation seaward, the [illegible]low marshes are no longer subject to tidal [illegible]influence, and become gradually filled up by the [illegible]decay of fresh-water plants. For these two [illegible]descriptions of soil, nature has provided two kinds [illegible]of vegetable arranged in a wonderful manner to the [illegible]benefit of man. On the barren sand she has planted the cocoanut, and in the morass the sago tree.

Along the immense alluvial tract of the Sumatra coast, from Siak to the Lampongs, and in the large plains of the rivers of the Peninsula, such as those of Rio, Formosa, and the Muar, are hundreds of miles of sago land unoccupied and unproductive, every acre of which is capable of yielding at the rate of about twenty thousand pounds of meal yearly.

One or other of the kinds of the sago tree is found throughout the whole length of the Archipelago, from the islands off the west coast of Sumatra to New Guinea. It is probably capable of flourishing with complete vigour across nearly its entire breadth wherever its natural soil occurs, and certainly within ten degrees north and south of the equator, a band which includes all the Archipelago save the Philippines. The only countries, however, where it is found growing in large forests are New Guinea, the Moluccas, Celebes, Mindanao, Borneo, and Sumatra, being widely spread over the Moluccas, but confined to particular parts of the others.

In the eastern parts of the Archipelago, it forms in many places the chief portion of the inhabitants' food. The sago palms do not appear to be indigenous in Sumatra and the Malay Peninsula.

It is from palm trees of the Archipelago that the sago of commerce is [illegible] most of the islands of th[illegible] palms a[illegible]ate property [illegible] shillings a tree. In making [illegible] cut down close to the ground, the [illegible] stalks cleared away, and a broad strip [illegible] taken off the upper side of the trunk. [illegible] exposes the pithy matter, which is of a rus[illegible] colour near the bottom of the tree, but higher up pure white, about as hard as a dry apple, but with wooden fibres running through it about a quarter of an inch apart. This pith is cut or broken down into a coarse powder by means of a club of hard and heavy wood, having a piece of sharp quartz rock firmly imbedded into its upper end. By successive blows, narrow strips of the pith are cut away till it falls down into the cylinder formed by the bark, leaving only a skin not more than half an inch in thickness. These pith strips are then put into a washing-trough made of the large sheathing vases of the leaves, and the strainer is the fibrous covering from the leaf-stalks of the young cocoanut. Water is poured on the mass of pith, which is pressed against the strainer, and kneaded until all the starch is dissolved, and passes through into a trough with a depression in its centre, into which it is deposited, the surplus water trickling away. When the trough is nearly full, the mass of starch, which has a slightly reddish tinge, is made up into cylinders, neatly wrapped in sago leaves, and in this state is sold as raw sago or sago meal. When this is boiled with water, it forms a thick glutinous mass, with a rather astringent taste, and is eaten with salt, limes, and chillies. When sago bread is to be made, raw sago is broken up, dried in the sun, powdered, and finely sifted. A small clay oven with 6 or 8 slits, ¾ of an inch wide and 6 or 8 inches square, is heated over a clear fire of embers, the powder is finely sifted, the openings are covered with a flat

piece of sago bark, and in about five minutes the cakes are turned out sufficiently baked. They are pleasant to eat. When not wanted for immediate use, they are dried for several days in the sun, and tied up in bundles of twenty. They will then keep for years, can be eaten in that state, or soaked in water and toasted or boiled. A tree 20 feet long, and 4 or 5 feet in circumference, will produce 900 pounds, and a pound weight will produce three cakes, and two of these cakes are sufficient for a man for a meal. Two men will finish a tree in five days, and two women will bake it all in five days more, so that for about 12 shillings, one man's food for a year will be had.

In the Moluccas, the pith of the sago palm is prepared for use and exportation. It constitutes the principal food of the natives of the Moluccas, especially during their sea voyages. It is cooked by simply dipping the cakes into warm water, which softens them and renders them easily masticated. It is also made into a sort of soap.

The sago palm of the Spice Islands is the most plentiful but least esteemed, that of Siak, on the north coast of Sumatra, being the best, and that of Borneo second in estimation. Sago meal furnishes the principal food of the Javanese, being baked into cakes.

The process of extraction differs among many of the islands, as that of Mindoro from that of the [illegible] the size of the cake, those [illegible] inches broad and six long, [illegible] much larger [illegible] people [illegible] ive habitually on this sub- [illegible] of medulla extracted is immense; [illegible] is not unusually afforded by a single [illegible] refuse, after the bread is made, is thrown [illegible] heaps, from which a delicate edible mushroom springs up, and in the heaps, as well as in the decaying wood, are generated worms of a white colour, held in great estimation among the epicureans of the Moluccas Islands. Certain wood-worms were in the same manner prized by the ancient Romans; and the taste of the Amboynese has been shared by Europeans, after a struggle with prejudices, which are indeed mere matters of custom.

The sago tree of Sumatra, according to Sir Stamford Raffles, is found in Java only in a few low marshy situations, all of them being deep bogs next to impassable. From seven to ten years is the time it takes for the tree to bear fruit, when planted from the seed in the first instance; the pith commences generally at about the age of six or seven years; after this period, it gradually loses its moisture, and is no longer fit for sago when the tree comes into bearing. One person is sufficient to clear the underwood away, as it grows up, in every lot of 100 fathoms square. The whole family are, however, fully occupied when they cut down the trees for manufacture, which is always done on the spot where the tree is felled. They prepare the number of tampin or measures required for the reception of the sago in the first instance, and put them out to dry; they then fell the tree, and split it in halves by means of wedges, build a temporary house over it, and dig out the pith with hoes made from the rind of the tree. They then carry the pith up into the house, the floor of which is latticed so close as just to allow the finer parts of the medulla to pass through on being wetted with water and trodden by the feet. Into this hous[illegible] the produce of two or three trees is brought at [illegible] time, and all the finer parts are carried down b[illegible] the water into the trunks of the trees, troughs thr[illegible] or four feet in diameter, which are cleanly hollow[illegible] out, and left below to receive it. In order that [illegible] wastage may take place, they lead a mat, mad[illegible] also of the leaves of the palm, fro[illegible]he floor [illegible] the workshop down into the shells [illegible]f the tre[illegible] and this carries the water without[illegible]pilling an[illegible] They trample it until the water p[illegible]es throug[illegible] clear of the farina, and then throw aw[illegible] the refu[illegible] merely keeping sufficient to stuff t[illegible]nds of [illegible] tampin. By the next day, the medu[illegible] has set[illegible] in the trunks of the trees, leaving t[illegible]ater at [illegible] top; this is drawn off, and the sago[illegible]ur thro[illegible] in its wet state into the tampin alre[illegible] prepar[illegible] and left to strain itself; some refus[illegible]th is th[illegible] put on the end, before left open, of t[illegible]ase of t[illegible] cone, and the work is done. The she[illegible]f the tr[illegible] is cut up for firewood, or in slips, an[illegible]rown in[illegible] the marsh, to facilitate its carriage [illegible]wn to [illegible] boats waiting for it. This is always the sell[illegible] duty. Sago once made is obliged to be k[illegible] or it would spoil in a few days; again, k[illegible] stantly wet, the tampin leaves soon rot: cultiva[illegible] cannot therefore keep a stock nearly, but at gr[illegible] risk. They have a method of frying this [illegible] over the fire, called there sago randang, wi[illegible] sells for a real, or 82 cents of a Spanish dollar, [illegible] 16 of their gantong are equal to 20 of Singapo[illegible] or one pikul. This, however, will not keep fo[illegible] as damp throws it all into a glutinous mass, and [illegible] a short time spoils it.

The natives of the Moluccas prepare [illegible] in different ways, chiefly, however, [illegible] bread, which, if kept dry, may be preserved [illegible] long as ships' biscuits, and is called sago lempi[illegible] The meal, after having been dried for two or th[illegible] days, is sifted until it becomes tolerably fine, [illegible] remains somewhat adhesive. It is then form[illegible] into small flat cakes, which, to the number of so[illegible] or eight, are placed in a mould of red earth, [illegible] baked to the proper degree.

The sago *bornek* or *borne*, the g[illegible]lar sago[illegible] dried for a shorter period, then si[illegible]nd shak[illegible] by two men in a piece of cloth until granulat[illegible] It is then smeared with fresh cocoanut oil, a[illegible] heated in an iron pan (tatyu) until it attains a certain degree of hardness, after which it is placed in the sun to dry.

For sago *tetu-pala*, the meal is aired until it becomes red, when it is sifted and stuffed into an entire fresh bamboo, which is placed in different rows above a fire until it bursts and the sago is roasted. Sago thus prepared may be preserved a long time if kept dry.

For the sago *buksona*, the meal is mixed with grated santang kalapa, sagar, and a little pepper and salt, enveloped in young sago leaves, and boiled in water.

To make the sago *bagea* or *kwee bagea*, the meal, after being dried in the air to redness, is sifted, mixed with fresh kanari kernels, and then baked in young sago leaves. Sago baruwa are small sago cakes of different forms. The sago sinale is the meal baked to a cake in a pot. The sago uha is the meal enveloped in fresh sago leaves and baked on the fire. Sago kalapa, like the lemping, is baked in moulds and mingled with much grated santang kalapa; the outside is smeared

with gula areng, and it is eaten warm. Sago kalapa is even preferred by Europeans to bread at breakfast, and ranked as a dainty. Papeda, sago bubur or pap, is prepared in the same way as arrowroot.

In Amboyna, the native mode of preparing sago was taught to the Amboynese by Rumphius. Before his time, the Amboynese, like the natives at this day at various places on Ceram and Buru, and also elsewhere, as on the west coast of Sumatra, ate the sago mixed with the ela. The recollection of Rumphius amongst the Amboynese was long continued, accompanied by a true recognition of the value of this most necessary mode of preparing an article of food which nature has so bountifully bestowed.

The Papua oven for sago flour is made of earthenware. It is generally nine inches square, and about four deep; it is divided into two equal parts by a partition parallel to its sides. Each of these parts is subdivided into eight or nine, about an inch broad; so the whole contains two rows of cells, about eight or nine in a row. When the cell is broad, the sago cake is not likely to be well baked; the best sized cell is such as would contain an ordinary octavo volume upon its edge. When they are of such a size, the cakes will be properly baked, in the following manner:—The oven is supposed to have at its bottom a round handle, by which the baker turns the cells downward upon the fire. When sufficiently heated, it is turned with the mouths of the cells up, and then rests on the handle (which is now become the bottom) as a stand. While the oven is heating, the baker is supposed to have prepared his flour, by beating the lumps small, moistening it with water to dough, and passing it once or twice through a sieve, at the same time rejecting any parts that look black or smell sour. This done, he fills the cells with the flour, lays a bit of clean leaf over, and with his finger presses the flour down into the cells, then covers all up with leaves, and puts a stone or piece of wood at top, to keep in the heat. In about ten or twelve minutes this will be sufficiently baked, according to their thickness; and cakes thus baked will keep several years; kept for twelve months, vermin did not affect it. It may be amiss to mix a little salt with the flour. Sago bread, fresh from the oven, eats just like hot rolls. If the baker hit his time, the cakes will be lightly browned on each side. If the heat be greater, the corners of the cakes will melt into a jelly, which, when kept, becomes hard and horny, and when eaten fresh, proves insipid. When properly baked, it is in a kind of middle state, between raw and jellied. A sago cake, when hard, requires to be soaked in water before it can be eaten; it then softens and swells into a curd, like biscuit soaked; but if eaten without soaking (unless fresh from the oven), it feels like sand in the mouth.

Sago is not an article which can ever displace the cereals, or which should be anywhere substituted for them, but it ought to be produced in an exportable state at such a price as to be within reach of the poorer classes whenever a diminution in the supplies of rice or corn deprives them of a sufficient quantity of their ordinary food.

According as we allow 7 or 15 years for the growth of a tree, an acre of sago is equal in annual produce to 23 or 10 acres of wheat.

The sago palm of Ceram, probably S. farinifera, has a midrib 12 to 15 feet long, which is used in lieu of bamboo. The lower part is as thick as a man's leg; entire houses are built of them; they form admirable roofing poles for thatch; when split and well supported, they do for flooring; and when selected of equal size, and pegged together side by side to fill up the panels of framed wood houses, they have a very neat appearance, and make better walls and partitions than boards, as they do not shrink, require no paint or varnish, and are not a quarter of the expense. When carefully split and shaved smooth, they are formed into light boards, with pegs of the bark itself, and are the foundation of the leaf-covered boxes of Goram. The leaflets, when folded and tied side by side on the smaller midribs, form the atap or thatch in universal use; while the product of the trunk is the staple food of some hundreds of thousands of men.

Pearl Sago.—Raw sago having been made ready for the manufactory, the first process to which it is subjected is that of a thorough washing. The moist sago being poured into a strainer of coarse thin cloth, and there broken and bruised by the hand, is agitated until all its fine particles pass through the cloth and descend to the bottom of the tub. The sago is then stirred about with an oar for about an hour, after which it is left to stand for about twelve hours, when the water is ladled out, and the sago is removed to undergo the last purifying process which precedes the granulation. This is performed in a mode at once simple and ingenious. Two tubs are placed at a distance of ten or twelve feet from each other, and connected by two troughs raised by a framework above them. A man now stirs up a portion of the sago with an oar till the water obtains a milky appearance, when he pours it into the troughs. When the milk in the upper tub begins to grow shallow, it is again filled up with water and more sago stirred up and mixed with it. The water in the troughs has occasionally time to deposit all its contents, the last being a fine fibrous matter, which, if not removed, would leave a thin yellow layer. The surface is washed with the hand until this layer is effaced and held in suspension. When the troughs have been gradually filled up in the manner described, the sago is left to consolidate for twelve or fourteen hours. In order to give it the degree of dryness required, it is removed from the troughs and exposed for one day to the sun in lumps about a cubic foot in size, which are placed on tables standing in the open air. Large kajang mats, made of the leaf of the mang-kwang, are kept in readiness to cover it when a shower of rain falls. It is next carried to the large shed, where it is thrown in a heap on a long table, and broken down into a pulverulent state. It then passes through an oblong sieve, 30 inches by 20 inches, of which the bottom is formed of parallel fibres from the stem of the cocoanut leaf, kept in their positions by strings which cross them at distances of about two inches. The lumps which do not pass through the long interstices between the fibres, are thrown back into the heap. The granulation or pearling now takes place. The sifted sago is placed in a cloth, of which the ends are tied to a long stick, and which is kept expanded in a bag shape by a short cross stick. A horizontal vibratory motion is given to this, the whole mass being kept in constant agitation, and

every part successively driven along the sides of the bag. If under-dried or over-dried, it will not granulate. This lasts for about a minute, when the new granular sago is again passed through a sieve similar to the last, but the smaller grains which pass through are those which are now rejected. Those that remain are transferred to a circular sieve, of which the bottom is formed of fine stripes of bamboo crossing each other. The grains that pass through the square holes thus produced, form the pearl sago of commerce in the unroasted state. Those that are larger than the holes are thrown back into the heap, to run through the same course again. To assist the men, the oblong sieves and granulating bag are sometimes suspended by rattans from the rafters of the shed.

The roasting takes place in a row of iron pans, each about 2½ feet in diameter, which are built into a platform of masonry about 15 feet long and 4 feet in breadth, covered with flat tiles. The pans rest in an inclined position, partly against the back of the platform, which rises about a foot above its level, and partly on a small prop of brick-work on the right side, an offshoot from the wall. Into the top of this prop a plate is sunk, in which a cloth saturated with wood oil or miniak-krueng is kept. Behind each pan is an open furnace mouth, and a man constantly attends to the fires, keeping them supplied with a few billets of bakau wood, and regulating them with a long two-pronged iron fork, so as to maintain a moderate heat. The pan being gently rubbed with the cloth, a man who sits in front of it on a low stool placed on the platform, pours into it a quantity of granular sago. This he slowly stirs for a short time with a wooden implement called weah, having a sharp curved edge. More sago is poured in, until it amounts to about two chupa, when, as it hardens, he uses the weah more freely. After about three minutes' roasting, it is removed to a table and passed through a round sieve similar to that before described. The grains that adhere to each other are thrown aside, and those that pass through form a smoking heap, which is allowed to lie undisturbed for about twelve hours. The grains are about the same size as they were before roasting, and some retain wholly or partially their white and mealy appearance, but the greater part have become translucent and glutinous, and all have acquired a certain degree of toughness, although still soft. This change appears to be brought about in this way: The water contained in the granules being heated, first converts the mealy starch into a jelly, and then escapes by evaporation, leaving the jelly tough. The second tumefaction drives out the remainder of the water. The final process is another roasting, which renders them hard and tough, and greatly reduces their size. The pearl sago thus prepared and fit for exportation, is put away in large open bins ready to be transferred to boxes or bags when sold.

This method of making pearl sago was introduced into Singapore in 1819. It was taught to the first Chinese who tried it there, by a woman who came from Bukit Batu, a place on the coast of Siak, facing the large island of Bencoolen, and famous for its great fishery of the trubu, the roe of which is so extensively used. In Malacca, however, manufactories had existed for many years before the establishment of Singapore. It is certain, however, that Malacca derived the art from Bukit Batu. In Singapore it appears almost from the first to have been conducted without any attempt at concealment.

Sixteen men would suffice for a manufactory such as described above, and they would produce about 450 pikuls per month. The original outlay is probably from 300 to 400 dollars. There were, about the year 1840, fifteen Chinese manufactories in Singapore.—*Jour. Ind. Arch.*; *Bennett's Ceylon*; *Low's Sarawak*; *Forrest's Voyage to New Guinea*; *Crawfurd, Hist. Ind. SAGUEIR, palm wine of the Arenga saccharif It is as intoxicating as ordinary beer or cider.

SAGUN. HIND. First payment of the y first ploughings, first sowings, are all called s by Hindus, and are followed by festivities.

SAGUS FARINIFERA. *Gærtn.*

Sagus Rumphii, *Willde.* | Metroxylon sagus, *Ko*
S. spinosus, *Roxb.* |

This sago palm is a native of the peninsula Malacca and of the Eastern Archipelago. T seeds are generally abortive, and it propaga itself by suckers from the roots of the old tr This palm is one of the smallest of its tribe, seld reaching to more than 30 feet in height, and gr ing chiefly in a region extending west to Ce and Borneo, north to Mindanao, south to T and east to Papua. Ceram is its chief sea and there large forests of it are found.

It is grown in great perfection in some parts of Borneo, and its sago meal is exported in large quantities from the west coast to Singapore, and also by the Bugis boats from the eastern and southern sides of the island.

The stem, before maturity, and previous to the formation of the fruit, consists of a thin hard wall, about two inches thick, and of an enormous volume of tissue (commonly termed the medulla or pith), from which the farina or sago is obtained. As the fruit forms, the farinaceous medulla disappears, and when the tree attains full maturity, the stem is no more than a hollow shell. The edible farina is the central pith, which varies considerably in different trees, and as to the time required for its attaining proper maturity. It is eaten by the natives in the form of pottage.

In Borneo, the natives prefer rice, and the Milanowe, who live on the rivers Egan, Hoya, Mocha, and Bintulu, and who are the principal cultivators of the sago tree, always import considerable quantities of grain for their own consumption.

The pith producing the sago is seldom of use the tree is fourteen or fifteen years old; and tree does not live longer than thirty years. The farinaceous matter afforded by each tree is considerable, 500 lbs. being a frequent antity, while 300 lbs. may be taken as the com- on average produce of each tree. Supposing plants set at a distance of ten feet apart, an would contain 435 trees, which, on coming maturity in fifteen years, would yield, at the ore-mentioned rate, 120,500 lbs. annually of naceous matter. Sago meal, in its raw state, keep good about a month. The Malays and ives of the Eastern Islands, with whom it forms chief article of sustenance, partially bake it in henware moulds into small hard cakes, which keep for a considerable time.

ossus saguarius, a large lamelliform beetle, d in the pith of this sago palm, is considered the natives a great delicacy.—*Roxb.; Voigt; twig.*

AGUS LÆVIS. ' *Rumph.* True sago palm.

Dr. Hunter gives the following as the relations of these three Indian dynasties, the Sah, Gupta, and Valabhi, to the successive hordes of Scythians. He says two Vikramaditya Sakari, or vanquishers of the Scythians, are required for the purposes of chronology, and the great battle of Korur near Multan, in which the Scythian hosts perished, has been shifted backwards and forwards from A.D. 78 to 544. The truth seems to be that, during the first six centuries of the Christian era, the fortunes of the Scythian or Tartar races rose and fell from time to time in Northern India. They more than once sustained great defeats; and they more than once overthrew the native dynasties. Their presence is abundantly attested during the century before Christ, represented by Vikramaditya (B.C. 57); during the first century after Christ, represented by the Kanishka family (B.C. 2 to A.D. 87); and thence to the time of Cosmas Indicopleustes, about A.D. 535. The latest writer on the subject believes that it was the White Huns who overthrew the Guptas between A.D. 465 and 470. He places the great battles of Korur and Manshari, which 'freed India from the Saka and Huna,' between A.D. 524 and 544. Cosmas Indicopleustes, who traded in the Red Sea about A.D. 535, speaks of the Huns as a powerful nation in Northern India in his days. The Nandas, whom Chandragupta succeeded in Behar, were a Sudra or non-Aryan dynasty, and according to one account, Chandragupta and his grandson Asoka came of the same stock. In almost every district throughout Oudh and the N.W. Provinces, ruined towns and forts are ascribed to aboriginal races who ruled at different periods, according to the local legends, between the 5th and 11th centuries.—*Mr. Newton in Jo. Bombay As. Soc.*, 1867-68, p. 18; *Fergusson*, p. 719; *J. Bo. As. Soc.* viii. pp. 27, 119, 238; *Imp. Gaz.*

SAH. HIND., SANSK. Saha and Sahukar, commonly Saucar, a banker.

SAHAI or Sahi is added to the name of a Brahman tribe of Oudh.

SAHAJ RAM, a celebrated Nanakshahi fakir. His sangat or shrine is tended by a mahant, who has a large establishment of disciples living upon the revenue drawn from one or two endowed villages for Sahaj Ram. Hasanpur, town in the Sultanpur district of Oudh, is four miles west of Sultanpur town, lat. 26° 16′ N., long. 32° 3′ E. Bandhua, a small village immediately adjoining Hasanpur, is notable as containing the tomb and having been the residence of Baba Sahaj Ram.—*Imp. Gaz.*

SAHA-MARANA. HIND. Burning of a widow at the same time and place as her husband's body.

SAHAN, a cotton cloth manufactured at Santipur, Chandrakona, and Kopamow, in sizes of 1 to 16 yards.

SAHAN. HIND. Hematite, used as a drug.

SAHAR or Suhurgahee. HIND. Dawn of day; breakfast during Lent, so called.

SAHARAWAN, a district of Baluchistan of about 10,000 square miles. The population does not exceed 50,000. The borders of this elevated plateau, the more northern of the Baluch confederate provinces, runs with the Afghan districts of Peshing and Toba, dependent on Kandahar, and is separated on the east by a range of hills, from Dadar and Cutch Gandava. It has only the Bolan river and a few rivulets, but the climate is cool, and the rains ensure good grain harvests. The Raisani, the most respectable of the Saharawan tribes (from Rais, ARAB., a ruler), are able to raise 500 fighting men. The Brahui tribes in Saharawan and Jhalawan, whose great chief is the Khan of Kalat, ethnologists consider to be of the same Scythic stock as the Dravidian races in the south, and infer from this that the passage of some of the Dravidian tribes from Turan was along the valley of the Indus.

The Bolan pass, on the border of Saharawan, leads from the Dasht-i-be-Daulat to Dadar, and is the great route of communication between the western Afghan provinces and the countries opening on the Indus. It is a continuous succession of ravines and gorges. The air in the lower part of the pass is in summer oppressively hot and unhealthy. It extends from lat. 29° 30′ to 29° 52′ N., and long. 67° 4′ to 67° 40′ E.—55 miles; or half a mile wide at entrance. The entrance is 800 feet;

Ab-i-gum, 2540; crest, 5793 feet. Average ascent, 90 feet per mile. The Bolan pass with the Moolla pass, far to the south, are the only level routes intersecting the great chain of mountains, defining, on the east, the low countries of Cutch Gandava and the valley of the Indus; while westward it supports the elevated regions of Kalat and Saharawan. There are many other passes over the chain, but all of them from the east have a steep and difficult ascent, and conduct to the brink of the plateau or table-land. Such are the passes of Takari and Nagow, between the Bolan and Moolla routes, and there are others to the north of the Bolan. This pass is no less important, as occurring in the direct line of communication between Sind and the neighbouring countries with Kandahar and Khorasan. It also constitutes, in this direction, the boundary between the Sard-sehl and Garm-sehl, or the cold and hot journeys (sard sair, garm sair). The natives here affirm that all below the pass is Hind, and that all above it is Khorasan. This distinction is in a great measure warranted, not only because the pass separates very different races from each other, speaking various dialects, but that it marks the line of a complete change of climate, and natural productions.

The Bolan river is about 70 miles long; the Sir-i-Bolan pass, in lat. 29° 51′ N., and long. 67° 8′ E., is 4494 feet above the sea. It is remarkably sinuous, but runs generally south-easterly, from a junction with the Nari river. It is liable to inundation; and as its bed in some parts occupies the whole breadth of the ravine, travellers are frequently overtaken by its torrents. It falls 3751 feet in 54 miles from its source to Dadar.—*Masson's Journeys*, i. p. 338.

SAHARUNPUR, a town and district in the Meerut division of the N.W. Provinces of British India. The town is situated in lat. 29° 58′ 15″ N., and long. 77° 35′ 15″ E., on a low site on both sides of the Damaula Nadi. Population (1872), 43,844. Elevation above the sea-level, 902 feet. The district lies between lat. 29° 34′ 45″ and 30° 21′ 20″ N., and between long. 77° 9′ and 78° 14′ 45″ E. Area, 2219 square miles; population in 1872, 884,617 souls. Saharunpur forms the most northerly portion of the Doab or alluvial table-land which stretches between the valleys of the Ganges and the Jumna. The Siwalik Hills rise above it on the northern frontier. The Rajputs are reckoned at 27,420, of whom only 10,564 are females. They are suspected of infanticide, and in many villages the provisions of the Infanticide Act are strictly enforced. The Chamars number 158,859, and the Gujars 53,576.

SAHASARAM has one of Asoka's edicts on a rock. It is at the extreme N.E. end of the Kaimur range of hills, 70 miles to the S.E. of Benares, and 90 miles S.W. of Patna.

SAHASRARJUNA, a Hindu ruler, famous in Hindu legendary traditions.

SAHAWEL. Arab. Plural of Sahil, the maritime region on the N.E. of Africa, about 600 miles long, between the river Jub and Cape Delgado, with the Somali on the north and the Kafir to the south.

SAHET MAHET (or Sravasti), a vast collection of ruins in Gonda district, Oudh; situated in lat. 27° 31′ N., and long. 82° 5′ E., on the south bank of the Rapti river, 10 miles from Balrampur, and 6 from Ikauna. These ruins have been identified by General Cunningham as the remains of the ancient city of Sravasti. Its ruler, Vikramaditya, in the middle of the 2d century A.D. overthrew the Ghavahana of Kashmir, and as his dominion stretched from Peshawur to Malwa, and from Malwa to Bengal, he assumed the title of emperor of Jambudwipa, or the Indian continent.

SAHH-DHARI, one mile N.E. of Kisarai, the modern city of Taxila.—*Dowson.*

SAHIB. Arab. The respectful term employed by natives of India, and by Europeans themselves to designate a European of rank. Sahibah, a lady. In Mewar, the title of the rani is simply Mahi at Jeypore, where they have long used the language and manners of Dehli, they affix the Persian word Sahibah, or lady-mother. Sahib-i-Qiran, a Muhammadan titular term for a sovereign ruler, meaning Lord of the Grand Conjunctions, was a title of Timur. Sahib-i-Tasarruf, in speculative Muhammadan theology, [illegible] in the world holding supremacy over souls of men. Sahib-kran, a Persian coin, rather less than a shilling.

SAHL. Arab. A plain, level country. Sahl-al-Antakia, the plain of Antioch. Sahl-al-Baqa, a plain situated between Lebanon and Anti-Lebanon, called by the ancients Cœle-Syria. Sahl-al-Kabir, also called Sahl Jabal-ur-Tur, the great plain, the Plain of Mount Tabor, commonly called the Plain of Jezreel or of Esdraelon, the Armageddon of the Apocalypse. Here Barak discomfited Sisera; here Josiah fell in battle with Necho, king of Egypt; here Nebuchadnezzar fought with Arphaxad. Here Jews, Gentiles, Saracens, Crusaders, French, Egyptians, Persians, Druse, Turk and Arab have fought.

SAHO, also Sahocar. Hind. In India, a Hindu who deals in money as a banker, or in exchange. See Sah; Sahu.

SAHO, son of Sumbaji, ruler of the Mahrattas, in early youth was taken prisoner, and was a captive in the camp of Aurangzeb for about 17 years. He was released by prince Azim about February 1708, and in March he got possession of Satara and proclaimed himself king. During his captivity, the Mahrattas had placed his uncle Ram on the throne, and on the death of Raja Ram, his widow, Tara Bai, carried on the government in the name of her infant son. When Bahadur Shah returned to Dehli (1708), Dhanu Khan Paimi concluded an agreement with Saho, consenting that the chouth or fourth part of the revenues should be paid, and this arrangement kept the Dekhan quiet during the brief reign of Bahadur Shah. But in the time of Ferokhsir, bands of Mahrattas ravaged the Moghul territories as before, and individuals seized on villages within its limits, and turned them into forts, from which they plundered the adjoining districts. Dabari, a chief who occupied a line of fortified villages on Kandesh, defeated a very strong detachment sent against him, and, influenced by Balaji Wiswanath, Husan Ali Khan, A.D. 1717, made peace with Saho, agreed to pay the chouth or fourth over the whole of the Dekhan, and to make a further payment of one-tenth on the remaining revenue under the name of Sir Desmukhi, and to acknowledge Saho's claim to the whole of the territory formerly possessed by Sivaji, with the addition of the later conquests. In return, Saho was to pay a tribute of ten lakhs of rupees, to furnish 15,000 horse, to

reserve the tranquillity of the country, and to be nswerable for any loss occasioned by depredations om whatever quarter. Saho would never, how-ver, have recovered his superiority, but for the ilities of his minister Balaji Wiswanath, the under of the Brahman dynasty of Peshwa. He s joint commander of the Mahratta troops that nt to Dehli along with Husan Ali Khan, and mately obtained a ratification of the treaty by ammad Shah, A.D. 1720. This established the endency of Saho over his rival; and Balaji ore his death, in October 1720, had the satis-tion of seeing him placed above the assaults of nies either foreign or domestic. Balaji Wis-ath was succeeded by his son Baji Rao, the st of all the Brahman dynasty, and of all the ratta nation, except Sivaji. He pointed out tottering state of the Moghul empire, and d Saho to permit him to carry his standard the territories beyond the Nerbadda. Saho ht up his enthusiasm, and exclaimed, 'You l plant it on Himalaya!' Saho died in 1748, a long reign of 50 years. By the road-side Satara is a cenotaph with a dog carved on a sitting posture, said to be the burial-place favourite dog of raja Saho which had once d him from a tiger. He was eccentric, and called the Veda Raja. He kept a palanquin blishment for the dog, and on one occasion sed it in gold brocade and placed it in full ar.

AHRA. ARAB. A desert, a sandy plain, the y desert of Africa and Central Asia. The se heat and cold of deserts is owing to the mstance that among crystalline bodies, rock-al, or silica, is the best conductor of heat. fact accounts for the steadiness of tempera-in one set district, and the extremes of heat cold presented by day and night on such y wastes as the Sahra. The sand, which is he most part silica, drinks in the noonday and loses it by night just as speedily. The ence of the hot winds from the Sahra has been rved in vessels traversing the Atlantic at a nce of upwards of 1100 geographical miles the African shores, by the coating of im-able dust falling upon the sails.

AHRAI, a numerous Muhammadan tribe of the an desert, of which he was the terror. The rai is a Muhammadan family from Sind, who erned at Kalat, until expelled by the Hindus, who subsequently were expelled by the Brahui. Sahrai is from Sahara, a desert, hence also Sarrazin or Saracen, from Sahara, desert, and Zaddan, to strike, contracted. The Khossa is a branch of the Sahrai, whom in habits he resembles, plundering on camels, but they are cowardly and faithless. —*Curiosities of Science.*

SAHREE. SIND. An earth found near Sehwan, in Sind, and sold at Hyderabad for a rupee a maund of 80 lbs. It is dissolved and soaked for 12 hours in water, and the paste formed is used for pottery.

SAHYADRI, the mountain range usually known as the Western Ghats. Throughout the Konkan the Sahyadri form a continuous chain of hills, interrupted, however, by deep depressions. In the latitude of Daman, 20½° N., the chain begins to sink abruptly in the Tapti valley, and changes its course, or sends off a spur of considerable elevation in an easterly direction, as the Chandor Hills. The range thus runs from the Tapti river to Cape Comorin. The highest summits, such as the Mahabaleshwar, 4717 feet, are flat topped; the Neilgherry and the Pulney, also, which rise over 8000 feet, are plateaux. The southernmost portion is entirely separated by the broad Gap of Palghat. At Mahabaleshwar the rainfall amounts to 248 inches annually. In the Southern Konkan, especially in the Sawantwari district, the rains are as heavy as in Canara. At Bombay, the rains last from June till the end of September, and the fall is only 80 inches, which is considerably less than any point farther south on the coast. At Tanna, however, the average fall is more than 100 inches.

SAIFALI, a section of the Kābul Khel Waziri, inhabiting the independent hills to the westward of the Bunnu t'hul. They entered into an agreement or treaty with the British to do all in their power, as far as their own tribe is concerned, to check and prevent the robbery or murder of British subjects, and to cause stolen property from British territory to be returned. This section of the Waziri is said to have been long unfavourably distinguished as receivers of stolen cattle and other property from the Bunnu district.—*Lahore Courant.*

SAIGA TARTARICA is the Antilope colus, *Smith.* It inhabits the open steppes and deserts from the Danube to the Irtish eastward, and as far north as 54° of north lat., found in Poland, Moldavia, about the Caucasus and the Caspian Sea, in Siberia, and in Northern Persia. Their eyesight is said to be defective from the reflection of the dry arid plains upon which they mostly reside.—*Eng. Cyc.* p. 235.

SAIGON, called Luknoi by the Cochin-Chinese, is in lat. 10° 15′ N., and long. 106° 43′ E. The surrounding country abounds with timber and other necessary articles for ship-building. See Kobo.

SAIL. HIND. Slate or schist; a slate; a slab of stone.

SAIL. ARAB. A flood. Sailab or Sailaba, a flood of the great rivers, or overflow of waters from other sources. Sailabi, land watered by flood. Sail-al-Aram, also called Sail-ul-Mareb, the flood of Aram, a great calamity which befel the Arabs of Yemen, soon after the time of Alexander the Great. Abid-Shams, surnamed Saba, built the city of Saba, afterwards called Mareb, and made a great dam to form a reservoir. The water was 20 feet deep, and was utilized for irrigation; but one night it burst and carried away the whole city with the neighbouring towns and people. Mahomed mentions it in the Koran. See Arim; Balak; Mareb; Saba; Yemen.

SAILOR FISH, or Fan Fish of the Archipelago, is a species of Histiophorus. It is the Ikan layer of the Malay, the Zeyl fish of the Dutch.

SAIN, in Sind, is the Sahib of India, the Sir of England.—*Burton's Scinde*, i. p. 143.

SAINGRI or Sangri. HIND. The seed-pods of jhand, the Prosopis spicigera, one of the common shrubs of the rakh or preserves.

SAINHIKEYA. In Hindu mythology, an asura or giant, who stole amrita or nectar when the gods churned the sea of milk, for which Vishnu cut him into two pieces, called Rahu and Ketu, which are said to cause the eclipses.

SAINT HELENA, a volcanic island 2700 feet high in the S. Atlantic, with an ancient crater.

It has a peculiar, though limited flora. It belongs to Great Britain, and is in the tract of sailing ships from the Cape of Good Hope to Europe and America. The emperor Napoleon I. was detained here after the battle of Waterloo. It was formerly clothed with trees, but these have been destroyed; the soil being washed off, the island is now a bare barren rock.

SAINT HILAIRE, M. BARTHELEMY, a French author of great fame, the first historian of Buddhism; author of a Life of Buddha.

ST. JOHN'S ISLAND or Seberget, in lat. 23° 36′ 20″ N., and long. 36° 10′ 15″ E., is a small, circular, barren island on the African side of the Red Sea, with remarkably sharp peak of volcanic origin. It is said to have been once famous for its emeralds.—*Findlay.*

ST. JOSAPHAT. See Jataka.

ST. MARUTHA was a grandson of Oda, a pagan priest of Mesopotamia. He obtained from Yezdejird, to whom he was accredited by Theodosius as an ambassador, the alleviation of the Christian persecution, and persuaded him to make an alliance with Theodosius the younger.

ST. SIMON STYLITES, a Christian ascetic, who lived for many years on a pillar, the remains of which are still shown to pilgrims. The monastery of St. Simon is about 18 miles N.W. of Aleppo, and in the 6th and 7th centuries was famous from the sanctity of this saint. Mount St. Simon is called by the people Jabal Sheikh Barakat, the mount of the blessed, holy man.

ST. THOMAS. Gibbon says, 'According to the legend of antiquity, the gospel was preached in India by St. Thomas. At the end of the ninth century, his shrine, perhaps in the neighbourhood of Madras, was devoutly visited by the ambassadors of Alfred, and their return with a cargo of pearls and spices rewarded the zeal of the English monarch, who entertained the largest projects of trade and discovery. When the Portuguese first opened the navigation to India, the Christians of St. Thomas had been seated for centuries on the coast of Malabar, and the difference of their character and colour attested the mixture of a foreign race. In arms, in arts, and possibly in virtue, they excelled the natives of Hindustan; the husbandmen cultivated the palm tree, the merchants were enriched by the pepper trade, the soldiers preceded the Nairs or nobles of Malabar, and their hereditary privileges were respected by the gratitude or the fear of the king of Cochin and the Zamorin himself. They acknowledged a Gentoo sovereign; but they were governed even in temporal concerns by the Bishop of Angamala. He still asserted his ancient title of metropolitan of India, but his real jurisdiction was exercised in fourteen hundred churches, and he was entrusted with the care of two hundred thousand souls. Their religion would have rendered them the firmest and most cordial allies of the Portuguese; but the inquisitors soon discerned in the Christians of St. Thomas the unpardonable guilt of heresy and schism. Instead of owning themselves the subjects of the Roman Pontiff, the spiritual and temporal monarch of the globe, they adhered, like their ancestors, to the communion of the Nestorian Patriarch; and the bishops whom he ordained at Mosul traversed the sea and land to reach their diocese on the coast of Malabar. In their Syriac liturgy, the names of Theodore and Nestorius were piously commemorated; the[y] united their adoration of the two persons of Chris[t] the title of Mother of God was offensive to the[m] ear, and they measured with scrupulous avari[ce] the honours of the Virgin Mary, whom the sup[er]stition of the Latins had almost exalted to [the] rank of a goddess. When her image was fi[rst] presented to the disciples of St. Thomas, th[ey] indignantly exclaimed, "We are Christians, [not] idolators!" and their simple devotion was con[tent] with the veneration of the cross. Their sepa[ra]tion from the western world had left them [in] ignorance of the improvements or corruptions [of] a thousand years; and their conformity with [the] faith and practice of the fifth century w[ould] equally disappoint the prejudices of a papist [or a] protestant. It was the first care of the minis[ters] of Rome to intercept all correspondence with [the] Nestorian Patriarch, and several of his bis[hops] expired in the prisons of the holy office. [The] flock, without a shepherd, was assaulted by [the] power of the Portuguese, the arts of the Jes[uits] and the zeal of Alexis de Menezes, Archbish[op] Goa, in his personal visitation of the coast [of] Malabar. The synod of Diamper, at which [he] presided, consummated the pious work of [the] reunion, and rigorously imposed the doctrine, [the] discipline of the Roman Church, without for[bid]ding auricular confession, the strongest engl[ish] ecclesiastical torture. The memory of Theo[dore] and Nestorius was condemned, and Malabar [was] reduced under the dominion of the Pope, [the] Primate, and of the Jesuits who invaded th[e] of Angamala and Cranganore. Sixty years [of] servitude and hypocrisy were patiently endu[red] but as soon as the Portuguese empire was sh[aken] by the courage and industry of the Du[tch] Nestorians asserted with vigour and ef[fect] religion of their fathers. The Jesuits w[ere] capable of defending the power which th[ey] abused; the arms of forty thousand Chri[stians] were pointed against their falling tyrants; [and] the Indian archdeacon assumed the charact[er of] a bishop, till a fresh supply of episcopal gifts [from] Syriac missionaries could be obtained from [the] Patriarch of Babylon.'—*Gibbon, Ch.* 47; *La C[roze] Christianisme des Indes; Geddes' Church His[tory] of Malabar.*

SAINT THOMAS' MOUNT, a military sta[tion] of the British, ten miles south-west of Mad[ras]. It is famed amongst eastern Christians as the [scene] of the martyrdom of St. Thomas, and the church on the summit of the hill is visited by pilgrims even from Syria. It is the Romanist Portuguese Church of the Expectation of the Blessed Virgin, and is built over the spot where the Portuguese in 1547 discovered a cross. According to Dr. Burnell, the date of the cross tablet and its Pehlavi inscription is probably about the 8th century. Population in 1874 was 15,480, Europeans, East Indians, Muhammadans, Pariahs, Vallalar, and Idagai (Idagen). It was plundered in 1752 by the troops of Chunda Sahib, under his son Raja Sahib, and the advanced force of Hyder Ali later in the century again plundered it. The Little Mount is on the right bank of the Adyar river, three miles nearer Madras.

ST. THOME, or Mylapore, in lat. 13° 1′ N., a southern suburb of Madras, in the district of Chingleput, and about three miles from Madras to the south. St. Thome was one of the most

mportant stations of the Portuguese on the oromandel coast. It subsequently belonged ccessively to the French, the Dutch, the king of olconda, the nawab of Arcot, and has been in tish possession since the wars in the Carnatic. native name is Mailapur, often in travellers' ounts written Meliapore.—*Calcutta Rev.*, 18th . 1871.

AIR. ARAB., HIND. Transit duties; a due tax levied on certain wild products, other cultivated lands; such as on date trees, ries, and grass, etc. In revenue accounts, eceipts other than land revenue is sair.

AIR-ul-MUTAKHIRIN, by Gholam Husain, a k of surprising industry. A translation in e quarto volumes was published in India in 9 by Mustafa, a renegade Frenchman, but a large ion of the impression was lost on the voyage ngland. General Briggs translated a sixth of it. Sir Charles Trevelyan while Governor adras reproduced part of the original in Roman acter.

AIVA, a sectarian Hindu, follower of Siva. y Saiva Hindus believe in the three Hindu Brahma, Vishnu, and Siva, as triune, and Saiva are essentially polytheists; but Vaish- Hindus are rarely in accord in this, and the of the Hindu religionists regard Siva, Vishnu, Brahma as distinct deities. The Saiva sect otnumber the Vaishnava. The essential e t in the Saiva faith is a reverence for, or ation of, the reproductive power with the ens of the lingam and the yoni, and their so ly seems to be a simple physiological idea eation, made to assume a religious form. It als however, been supposed to represent Bud hist doctrine of gradual perfectability ing man almost to the rank of a god). The nava creed is one of a separate creation of a an his occasional incarnation in the form of an animals.

e Saiva are worshippers of Siva, in one of his forms.

Ganapatya worship Ganesa.

Sakta exclusively worship the sakti or e energy.

Ganapatya and the Sakta are subdivisions ations of the Saiva, of which may be d these distinctions,—1. Saiva proper, mean- th worshippers of Siva and Parvati con- ly; 2. Lingi or Langaet, the adorers of Siva, his phallic type, separately, and these are a very strict and rigid sect; 3. Sakta, the adorers of the yoni of Bhavani, or her symbol, separately; 4. the Ganapatya, the exclusive worshippers of Ganesa, the first-born of Mahadeva and Parvati. The Ganapatya adore Ganesa as uniting in his person all the attributes of the deity. The Vira Saiva are very numerous in all the Canarese-speaking countries, and are distinguishable by their wearing the lingam in a silver or gold casket fastened round their arm or suspended from the neck.

The Avadhuta or Abd'hut of the south of India, is a religious mendicant of the Saiva Hindus, who, similarly to the Virakta Vairagi, has subdued the passions and estranged himself from the interests and emotions of mankind, abandoning religious observances and worldly restraints. The Sakta have two classes of these,—one the Vyakta-vadhuta, or professedly free; the other, Gupta-vadhuta, who privately throw off the usual restrictions of caste.

The Akas-mukhi is a Saiva devotee, who retains his head so long in the position of looking to the sky, that he cannot restore the neck to its proper position.

Saiva sectarians of S. India worship 63 deified heroes, designated Adiyars.

SAJADA. ARAB. In the ritual of Muhammadan prayer, a single prostration with the forehead touching the ground. It is performed from a sitting position, after the Dua or supplication that concludes the two prostration prayers. Some of the Ulema, especially those of the Shafei school, permit this 'Sajada of thanks' to be performed before the prostration prayer, if the visitor have any notable reason to be grateful.—*Burton's Mecca*, ii. p. 67.

SAJJI. HIND. Impure carbonate of soda, prepared from the alkaline soil called Dhobi's earth, and also by burning the Caroxylon Griffithii and other plants growing on the shores of the salt lakes which are scattered through the Indian deserts. In the Panjab, the castes principally employed in the manufacture of sajji are the Chura, Dhobi, Nafiri, and a few Arura. Sajji matti, or soda earth, is found in many parts of India. Sajji is made in considerable quantities in the districts of Multan, Jung, Jhelum, and Thanessur, by burning plants of the genus Salsola, a few of the Chenopodiaceæ, species of the genera Caroxylon and Salicornia, also Sueda fruticosa. It is extensively used in soap-making and calico-dyeing.—*J. A. Murray.*

SAK. HIND. Bark of the kikar and other barks, put into the fermenting mass in spirit distilling.

SAK or Thoek or Thak, called Chatu or Chat by the Bengali, a small tribe who inhabit the eastern branch of the Naf river in Arakan, in lat. 21° 20′ N., and long. 21° 30′ E., about 25 miles east from Elephant Point near the Koladyn river.

SAKA. ARAB. A water-carrier.

SAKA or Sak'ha. SANSK. A branch, the branch of a tree; a tribe, a clan.

SAKA. SANSK. Any era; the era of prince Salivahana, commencing in the 77–78th year of the Christian era, and to be identified with that by adding 78¼; thus the Saka year 1800 began towards the end of March (A.D.) 1878. It is said to have been called after Sakaditya, brother of Vikramaditya. Dr. Bhau Daji supposed the Saka king to be the Kshaparata Nahapana. The oldest Sanskrit works and the copperplate grants extant are dated in this era. The Vikrama Samvat is coeval with the defeat of the Saka by Vikramaditya. The Saka Nripa Kala, identical with the Salivahan era, is coeval with the conquest of Malwa by the Saka.

Saka Kala, or the era of the Saka, has been confounded even by native writers, sometimes with the first and sometimes with the second event, leading to a mistake of 135 years in their calculations.—*Dr. Bhau Daji.*

SAKA, a race mentioned in the Mahabharata, Puranas, and other religious works, also in the rock inscriptions and on copperplate grants, and generally recognised to be Scythians; other Scythian tribes in India being the Hun and the Naga. The races whom the Greeks call Scythæ, called themselves Scoloti according to Herodotus,

and the Persian equivalent of Scythæ was Sakæ. The Scythians east of the Caspian were called by the Greeks Saka and Massagetæ, the last probably the Maha-Jat or Great Jat of the Panjab. The Saka overthrew the Græco-Bactrian kingdom in Afghanistan, and other branches extended their possessions towards the south, occupied Sind and the countries of the lower Indus under Mayes and his successors Azes and Azilaus. Once their progress was checked by Vikramaditya, the Hindu king of Malwa, who, B.C. 56, signally defeated them, assumed the title of Sakari, and established an era which still bears his name. In Prakrit works Saka is written Saga. From between the parallels of lat. 30° and 50° N., and from long. 75° to 95° E., the highlands of Central Asia, migrated the Sacæ or Scythic races, which passed into Europe and within the Indus. The Takshak, the Gete, the Kamari, the Katthi, and the Hun came from Sakitai or Sakadwipa, and from the Dasht-i-Kapchak, crossed the Jaxartes or Jihun, and crossed the Paropamisan range into the plains of Hindustan.

SAKADWIPI, a tribe of Brahmans, chiefly remarkable for their great numbers, and for the fact that they will drink from a vessel from which another person has already drank.—*Cal. Rev.*, No. 110.

SAKAI, a pagan population in the Malay Peninsula divided into the Sakai Jina and Sakai Bukit, the latter being hill-men and mountaineers, the former more settled and civilised. They are worshippers of the elements. Sakai is the Pahang word for an aboriginal. The Halas is a branch of the Sakai population of the Malay Peninsula, They tattoo their face and breast, pierce their ears and nose, and insert porcupine quills. The Orang Sakai, of Siak, manufacture sago meal. The sago plantations belong to Malays, who employ the Sakai, allowing them one-half of the produce. On this and wild animals the Sakai subsist, and the sago which they do not require they dispose of to Malays in barter for cloth, tobacco, etc.

SAKALA or Sangala, an ancient town in the Panjab, the She-kie-lo of Hiwen Thsang. It was the capital of Raja Milinda, was subject to Raja Mihirkul, is the Sangala of Alexander, and has long ago been recognised in the Sakala of the Brahmans and the Sagal of the Buddhist. It was visited by the Chinese pilgrim Hiwen Thsang in A.D. 630. Both Arrian and Curtius place Sangala to the east of the Hydraotes or Ravi; but the itinerary of Hiwen Thsang shows that it was to the west of the Ravi, and as nearly as possible in the position of the present Sanglawala-Tiba or Sangala Hill. Wilford three times described its position in the Asiatic Researches. When Hiwen Thsang visited the city there was a monastery of 100 monks who studied the Hinayana, or exoteric doctrines of Buddhism, and beside it there was a stupa, 200 feet in height, where the four previous Buddha had left their footprints. The Brahmanical accounts of Sakala have been collected from the Mahabharata by Professor Lassen in his Pentapotamia Indica. According to that poem, Sakala, the capital of the Madra race, who are also called Jartika and Bahika, was situated on the Assaga rivulet to the west of the Iravati or Ravi river. The country is still well known as Madr-des, or the district of the Madra, which is said by some to extend from the Beas to the Jhelum, but b[illegible] others only to the Chenab. The Buddhist notice[s] of Sakala refer chiefly to its history in connectio[n] with Buddhism. There is the legend of t[he] seven kings who went towards Sagal to carry [off] Prabhavati, the wife of king Kusa. But the ki[ng] mounting an elephant, met them outside the ci[ty] and cried out with so loud a voice, 'I am Ku[sa]' that the exclamation was heard over the wh[ole] world, and the seven kings fled away in terr[or]. This legend may have some reference to the s[ix] brothers and sisters of Amba-Kapa, which is [a] 40 miles to the east of Sangala. Before the [be]ginning of the Christian era, Sagal was [the] capital of Raja Milinda, whose name is [also] famous in all Buddhist countries as the ski[lful] opponent of the holy Naga-Sena. The territ[ory] was then called Yona or Yavana, which mi[ght] refer either to the Greek conquerors or to t[heir] Indo-Scythian successors; but as Naga-Sen[a] said to have lived either 400 or 500 years a[fter] Buddha, the date of Milinda is uncertain.—*C[unn]ingham's Ancient India*, p. 179.

SAKALELI, dancing parties of birds at t[he] pairing season, practised by the turkey of N[orth] America, the seven brothers of India, and [the] paradise birds of the Aru Islands.

SAKALI or Sakaliga, a homeless tribe in [the] Ceded Districts, and in Mysore itinerant [tra]dealers.

SAKAR. SIND. An embankment. This [gives] the name to Sakar or Sukker, a town on the I[ndus] opposite Rori, where is a natural limestone m[ound] about 100 feet high.

SAKAR, of Shahpur, a huge clay vessel [of] strong grain.

SAKARI, a title of Vikramaditya, king [of] Ujjain, given to him because of his succe[ss] opposition of the Sacæ, an Indo-Scythic [race] who settled along the Lower Indus.

SAKATAI or Chaghtai, the Sakadwipa o[f] Purana, corrupted by the Greeks to Scythia, w[hose] inhabitants worshipped the sun.

SAKHA, in Hindu music, a notation. [The] three Sakha are now known to Hindus in Indi[a] the Rānāyanīya, Kauthuma, and Jaiminiya. [The] first two are common, and only differ a litt[le] the way of chanting; the Jaimini text appear[s] agree with the others except in a few details; [the] notation of the chant is totally different.—*[Sir] Burnell.*

SAKHALIN is the Aino name, Isoka of the aborigines, Oku Yesso of the Japanese, Schalién of the Russians, the Karapto of old writers; also Ula-hata; also Augo-hata, or Island of the Black River; also Amur. Siebold and Keith Johnston call it Tarakai, but the usual name is Sakhalin, from Sugaun, one of the names of the river Amur. The lips of the women are tattooed of a pale-black colour; they part their hair down the middle. They have metal ear-rings, and those on the coast wear silver-grey or spotted sealskins, with long boots of the same materials. They have a leather waist-belt as a cestus veneris.—*Arthur Adams' Travels.*

SAKHI BHAVA, a sect of Vaishnava Hindus in Northern India, who adopt Krishna and his mistress Radha for their special worship. They assume the female garb, and the dress, ornaments, manners, and occupations of women. See Hindu.

SAKHI SARWAR, a famous Muhammadan ine in Dehra Ghazi Khan district, Panjab; . 30° N., long. 70° 10′ 30″ E. The shrine owns the high bank of a hill stream at the foot e Suliman range, in the midst of arid desert ery. Founded in honour of Saidi Ahmad, rwards known as Sakhi Sarwar, the son of -ul-Abidin, an immigrant from Baghdad, who d at Sialkot, 12 miles east of Multan, in the r 1220. Zain-ul-Abidin was a descendant of and dreamt that Mahomed stood by his side, anding him to proceed to India to convert doistors. Accordingly he reached Sialkot, e he married a daughter of Rahan Khan, an, and had two sons, Syed Dhoda and Syed ad. Ahmad became a devotee, and, having rmed a very remarkable series of miracles, presented by the Dehli emperor with four londs of money, with which the Sakhi r shrine was erected. A handsome flight ps leads from the bed of the stream to the ng, constructed at the expense of two Hindu hants of Lahore. The buildings include—the eum of Sakhi Sarwar himself; a monument Nanak; the tomb of Massamat Bibi Bai, f Sakhi Sarwar; and a thakurdwara. They comprise a curious mixture of Hindu and hmadan architecture, and are frequented by ees of all religions. The guardians of are the descendants of Sakhi Sarwar's three ts, always miraculously limited to the er of 1650, among whom the revenues ng from the offerings are equally divided. ghout the year, the shrine forms the resort merous mendicants, Hindu and Muham- ns.—*Imp. Gaz.* viii.; *MacGregor*, iii. p. 61.

KI or Saki is the general name given in to the alcoholic liquid prepared by the ntation of rice. There are many kinds of it, receiving a specific name. Saki beer has 11 per cent. of alcohol. At an entertainment a pair of chop-sticks was placed at each of every table, in the centre was an earthen lled with saki, surrounded with four acorn four large coarse china cups, with clumsy s of the same material, and four tea-cups of Cups of tea were first handed round, these followed by very small cups of saki, which he taste of French liqueur.—*American Exped.*

-KING of Siam. Sir R. Schomburg saw, at ilding sheds of the first king, a log of this which was being prepared for the construc- a war canoe, measuring 135 feet, and per- ound and without a flaw. It possesses the rty of being easily bent by artificial means.

SAKLA PAKSHAM. Sansk. The light half of the month.

SAKLAWIA, a canal which leaves the Euphrates 5¾ miles N.W. of Felujia. It crosses Mesopotamia by a tortuous eastern course on the N. side of Akar Kouf, and enters the Tigris at a point 5 miles below Baghdad, after a course of 45 miles. It is the ancient I'sa canal.—*MacGregor.*

SAKRANT, also Sankrant, also Makar-Sankrant, a Hindu festival, held on the day that the sun enters the sign of Makar at the winter solstice. On this night, in ancient India, a horse was sacrificed to the sun or Bal-nath, the god Bal. Hindus now bathe in the sea, rub their bodies with sesamum seeds, and entertain friends. The festival of the sun, with the Getæ and Aswa nations of the Jaxartes, as with those of Scandinavia, seems to have been the winter solstice, the Sakrant of the Rajput and Hindu in general. The ceremonial of the horse's return after a year evidently indicates an astronomical revolution, or the sun's return to the same point in the ecliptic. The return from his southern declination must have been always a day of rejoicing to the Scythic and Scandinavian nations, who could not, says Gibbon, fancy a worse hell than a large abode open to the cold wind of the north. To the south they looked for the deity; and hence, with the Rajputs, a religious law forbids their doors being to the north. —*Tod's Rajasthan*, i. p. 676. See Astronomy.

SAKTA, a sect of Hindus who worship the female principle according to the ritual of the Tantra. Of these there are two divisions,—the Dakshina Chari or right-hand ritualists, and the Vama Chari or left-hand ritualists. The worship of the right-hand division is public, and is addressed to the goddesses, in the forms of Durga, Bhavani, Parvati, Lakshmi, Maha Lakshmi, and others. The left-hand ritualists worship, in preference, the Tantrica impersonations of Durga, as Devi, Kali, Syama, etc., or a woman representing the Sakti. Their worship is private and unavowed, and is much talked about as the oriental form of the Eleusinian mysteries. Wilson thus describes the left-hand sect (i. p. 257): 'All the principal ceremonies comprehend the worship of Sakti, and require for that purpose the presence of a female as the living representative and the type of the goddess. This worship is mostly celebrated in a mixed society, the men of which represent Bhairavas or Viras, and the women Bhairavis and Nayikas. The Sakti is personated by a naked female, to whom meat and wine are offered and then distributed amongst the assistants, the recitation of various Mantras and texts, and the performance of the Mudra, or gesticulations with the fingers, accompanying the different stages of the ceremony, and it is terminated with the most scandalous orgies amongst its votaries.' The Rev. J. Burgess, writing in 1874, mentions that at Jamnagar, in Kattyawar, there was a Nanak-panthi ascetic who dressed in silks and satins, physically a magnificent man, and that Saktaism was secretly practised there. Mr. C. P. Brown, whose means for information were very great, and who lived through a great part of the 19th century, said that Sakta puja had never extended into the Madras Presidency. The Editor also never heard there of any of the alleged impurities. In the district of Tinnevelly the Saktas will not admit that they do more than eat flesh and drink toddy together. The theory of the Saktas is said to be the following: The extinction of desire is the great aim of Hinduism. The other sects seek it by the mortification of the passions; the Saktas by their gratification.

The Hindu worshippers of the Sakti, the power or energy of the divine nature in action, are numerous amongst all classes of the Hindus. In their mythology, this active energy is impersonated in the forms of the three female deities, —Lakshmi, Parvati, and Saraswati, the consorts respectively of Vishnu, Siva, and Brahma. The worship of the female principle, as distinct from the divinity, appears to have originated in the literal interpretation of the metaphorical language

of the Vedas, in which the will or purpose to create the universe is represented as originating from the Creator, and co-existent with him as his bride and part of himself. Thus, in the Rig Veda, it is said 'that divine spirit breathed without affiation single, with (Swadha) her who is sustained within him, other than him nothing existed. First, desire was formed in his mind, and that became the original productive seed.' Also, the Sama Veda, speaking of the divine cause of creation, says, 'He felt not delight, being alone, he wished another, and instantly became such. He caused his own self to fall in twain, and thus became husband and wife. He approached her, and thus were human beings produced.' It is probable that these legends may relate to the primitive tradition as to the origin of mankind, but there is in them also a figurative representation of the first indication of wish or will in the Supreme Being. Another set of notions of some antiquity, which contributed to form the character of the Sakti, whether general or particular, were derived from the Sankhya philosophy. In this system, nature, Prakriti, or Mula Prakriti, is defined to be of eternal existence and independent origin, distinct from the Supreme Spirit, productive though no production, and the plastic origin of all things, including even the gods. In the Puranas, especially in the Brahma Vaivartta Purana, Prakriti or Maya bears a prominent part, for from the Sankhya philosophy, Prakriti has come to be regarded as the mother of gods and men; whilst as one with matter, the source of error, it is again identified with Maya or delusion, and as co-existent with the Supreme as his Sakti, his personified energy or his bride. According to the Prakriti Khanda section of the Brahma Vaivartta Purana, Brahma, or the Supreme Being, having determined to create the universe, became two-fold, the right half becoming a male, the left half a female, which was Prakriti. She was of one nature with Brahma. She was illusion, eternal and without end; as is the soul, so its active energy,—as the faculty of burning is in fire. It is from the Tantras that the rites and formulæ of the worship of Prakriti or Sakta are obtained. They are numerous, of great extent, and in the form of a dialogue between Siva and his bride. The earliest record of Sakti is in the Periplus.

It is related that the energy of each god, exactly like him, with the same form, the same decorations, and the same vahan (vehicle), the Sakti of Brahma, girt with a white cord and bearing a hollow gourd, arrived on a car yoked with swans; her title is Brahmani. Maheswari came riding on a bull, and bearing a trident with a vast serpent for a ring and a crescent for a gem. Kumara, bearing a lance in her hand, and riding on a peacock, being Ambica in the form of Kartikeya, came to make war on the children of Diti, the giants, or Asura. The Sakti named Vishnaivi also arrived sitting on an eagle, and bearing a conch, a discus, a club, a bow, and a sword in her several hands. The energy of Hari, who assumed the form of the boar, likewise came there, assuming the body of Varahi. Narasinhi, too, arrived there embodied in a form precisely similar to that of Narasinha, with an erect mane reaching to the host of stars. Aindri (Indrani) came bearing the thunderbolt in her hand, and riding on the king of elephants, and in every respect like Indra, with a hundred eyes. Last came the dreadful energy named Chandica, who sprang from the body of Devi, horrible, howling like a hundred jackals. She, surnamed Aparajita, unconquered goddess, addressed Isana, whose head is encircled by his dusky braided locks.

Eight of these Sakti are more particularly recorded, their names are the following:—

Maheswari, Sakti of Mahesa, or Siva.
Brahmi, or Brahmani, Sakti of Brahma.
Narayani, Sakti of Narayana.
Aindri, Sakti of Indra.
Kumara, Sakti of Kartikeya.
Varahi, Sakti of Vishnu of the Vahar avatara.
Narasinhi, Sakti of Vishnu in the Narasing avat
Aparajita, a form of Bhavani, Sakti of Siva.

Mr. Paterson (As. Res. viii. p. 68) rem that Aparajita may be the Aphrodite of Greeks, and Maheswari, or the female Siva, ri on a white bull, may have given rise to the of Europa's rape; while Brahmi, or the fe Brahma, with the swan, may in like manner been the origin of the fable of Jupiter and Bhavani is, however, oftener seen on a tiger than on Nandi, the vahan bull of he In some places they are thus enumerated,—Br Maheswari, Aindri, Varahi, Vaishnavi, Ku Chamunda, and Kartika. Some reduce number to seven; omitting the two latter, adding Cauveri. The worshippers of these are called Sakta. The emblem of worship yoni. One branch of the Sakti worshippe been said to be so grossly licentious that th held in detestation by other sects, and even large portion of their own; but this stat cannot be verified.

The Hindu goddesses are uniformly repres as the subordinate powers of their resp lords; thus Lakshmi, the consort of Vishn preserver, is the goddess of abundance and sperity; Bhavani, the wife of Siva or Maha is the general power of fecundity; Uma Gauri, also, are gentle forms of the Sakti of while Durga and Vali are the severe forms.

Chamunda and Chandika are hideous godde who attend upon Siva as Bhairava, the ter destructive deity, who is propitiated by offe of wine and flesh.

Saraswati, whose husband was the cr Brahma, possesses the powers of imagination invention, which may justly be termed cre She is therefore adored as the patroness fine arts, especially of music and rhetoric; inventress of the Sanskrit language, of the nagri writing characters, and of the sciences writing perpetuates; so that her attributes spond with those of Minerva Musica of Greec Italy, who invented the flute, and presided ove literature.

Lakshmi or Maha Lakshmi is the Sakti or consort of Vishnu.

Dr. Hunter says (Imp. Gaz. iv. p. 304) left-hand worship is an organized five-fold ritual of incantation, lust, gluttony, drunkenness, and blood. The Vami or Vama Chari worship comprises the five-fold Mukara, which takes away all sin, viz. Mansa, flesh; matsya, fish; madya, alcoholic fluids; maithuna, sexual intercourse; and mudra, mystical gesticulations. There is nothing of this kind in the south of India.—*C. P. Brown; Wilson's Hindu Sects; Wilson's Gloss.;*

SAKUNTALA, or the Lost Ring, an ancient ...krit drama by Kalidasa; translated by Sir ...am Jones and by Professor H. H. Wilson, ... In the drama Sakuntala is described as the ...hter of the rishi Visvamitra by the apsara ...ka, who was sent from heaven by Indra to ...e the sage. Sakuntala was the offspring, and ...brought up by the rishi Kanwa in a forest ...itage south of Hastinapura. King Dushyanta, ...roaming in search, beheld her on one occasion ...hunting in the forest, and persuaded her to ...y him, giving her his ring as a token. ...yanta then returned to his own city, and ...ntala continued in her father's cottage. ...rvasa, a sage, visited her home, but he did not ...ve sufficient attention from her, her thoughts ...g with her husband. This irritated the sage, ...o prayed she might be forgotten by the man ...loved; but relenting somewhat afterwards, ...said her husband on seeing the ring should ...ognise her. Finding herself enceinte, she set ...for her husband's palace, but while bathing ...the way, the ring fell from her finger and was ..., and the king failed to recognise her. Her ...ther took her back to the forest, where she ...a son, whom they called Bharata. But it so ...pened that a large fish was caught, and ...hyanta's ring was found in its belly, and ...taken to him. When he saw it all his recollection ...of the lovely Sakuntala returned, and he hastened ...to the forest, where he saw Bharata playing with ...young sucking lions, and putting aside their ...mother. Presently Sakuntala appeared, and he ...recognised her, and knew that the boy was his ...son. He took them to his city, made Sakuntala ...his chief queen, and declared Bharata his successor. The poet Kalidasa dramatized the story ...in Sanskrit under the title of Sakuntala, or the Lost ...Ring. Buddhism still exists among the characters ...of the piece, but had lost its ascendency, and Siva is the chief object of worship.—*Garrett; Dowson.*

SAKYA, the tribal name of Buddha. Hairs of his head are said to be in the Shoay-dagon at Rangoon; his thorax bone (breast bone?) in the dagoba at Bentenne near Kandy in Ceylon; a canine tooth, after several changes, was taken to Ceylon, A.D. 311; another tooth was placed in a tope on the island of Salsette in Bombay harbour, —it was opened by Dr. Bird, but tooth not found; another at Nagrak in N. India.—*Fergusson*, pp. 59, 60.

SAL. HIND. A year. Sal-girah or Barasganth is the anniversary of a person's birth, on which a knot is added on a string kept for the purpose. A girl's years are numbered by a silver loop or ring being added yearly to the gardani or silver neck-ring.—*Herkl.*

SALABAT JUNG, son of Nizam-ul-Mulk. His brother Nasir Jung in 1750 brought him into the Carnatic a prisoner, but in February 1751, on the death, at Cuddapah, of Muzaffar Jung, he was released and proclaimed Subah. He took Kurnool, and advanced to Hyderabad, where he pacified the French troops, and then in May advanced to Aurangabad, which he reached on the 18th June. In July he purchased a peace with the Mahrattas, and proceeded against the Nirmul raja, whom he defeated, and after this he sent to the Marquis Dupleix a sunnud of nawab of the Carnatic. In 1755, he proceeded to Seringapatam, and exacted 52 lakhs of rupees as tribute. In 1756, he came to a rupture with the French under M. Bussy, dismissed and pursued them, and sought the aid of the British from Madras.—*Orme.*

SALAB MISRI. HIND. Salep, the root of Orchis mascula, Eulophia, and other plants.

SALAGRAMA, fossil ammonites, reverenced and worshipped by the Hindus; supposed by some to be the ætiles or eagle stones of the ancients. The principal sorts are the Lakshmi Narayani, the Vamuna, the Demodura, the Narasingha, etc. Their abundance in the beds of mountain torrents, especially the Gandak, has been long known. They form an indispensable article in the sacra of the Hindus, and are used in propitiatory oblations to Vishnu, as well as in funeral and other ceremonies. They are black, mostly rounded, and are commonly perforated in one or more places by worms, or, as the Hindus believe, by Vishnu, in the shape of a reptile. According to the number of perforations and of spiral curves in each, the stone is supposed to contain Vishnu in various characters. For example, such a stone perforated in one place only, with four spiral curves in the perforation, and with marks resembling a cow's foot and a wreath of flowers, contains Lakshmi Narayani. The salagrama is fossilized with iron, clay, and pyrites, strikes fire with steel, but scarcely at all effervesces with acids; some very heavy, commonly black, but sometimes violet, oval or round, a little flat, nearly resembling a touchstone, and hollow, with only one small aperture; within it has spiral lines terminating towards the middle. Some are supposed to represent the gracious incarnations of Vishnu, and are then highly prized; but when they border a little on the violet, they denote a vindictive avatara, such

as Narasingha, when no man of ordinary nerve dares keep them in his house. The possessor of a salagrama preserves it wrapped in clean cloth. It is frequently perfumed and bathed; and the water thereby acquiring virtue, is drunk, and prized for its sin-expelling property. It is always placed near persons when they are about to die. A garden or plantation is consecrated by the Hindus by marrying the salagrama stone carried by one man to represent the groom, to a branch of the tulsi tree carried by another to represent the bride. It is the usual marriage ceremony, somewhat modified; and after this consecration, the fruit can be eaten. Mr. Dunlop found two extensive lias beds at Takuli Shem, in Hundes, with numerous salagram, which are thence taken to Badrinath and Kailas. Hindus are averse to show them. The Grihadeva or household deity is sometimes represented by a water-pot, a rude figure, a salagrama, or a tulsi plant. The stones, called Ban-ling, found in the Nermada, are similarly considered as types of Siva, but they are not fossils, merely stones rounded by attrition.—*Sonnerat; Gerard*, October 1830; *As. Res.* iii. p. 24; *Cole. Myth. Hind.; Moor's Pantheon; Wilson's Gloss.*

SALAH-ud-DIN, the Saladin of English writers, a distinguished Kurd soldier of the twelfth century, who opposed the Crusaders led by Richard Cœur de Lion. Salah-ud-Din, the son of Ayyub, a Kurdish chief, early became attached to the service of his uncle Asad, usually called Shirkuh, who commanded the army of Nur-ud-Din, king of Aleppo, a strong upholder of the Abbasside khalifs. Salah-ud-Din Yussuf was still very young, when two vizirs of Egypt, the ministers of the Fatimite khalif, residing at Cairo, quarrelled, and one of them succeeded in banishing the other. The exile Shawer betook himself to Aleppo, and Nur-ud-Din offered him the help of Shirkuh and his Kurds to reinstate him. But Shawer soon quarrelled with the wild mercenaries, and made an alliance against them with Amaury or Amalrich, the crusader king of Jerusalem. Shirkuh, with the help of his nephew, defeated them both; and, taking Cairo, put Shawer to death, and annexed Egypt to the possessions of his master, Nur-ud-Din. The Fatimite khalif, a mere puppet, conferred on him a robe of honour, and gave him the title of Malik-al-Mansur, or Victorious King. He was thus serving Nur-ud-Din of Aleppo and both the rival khalifs. His servitude did not hinder him, however, and his nephew from establishing their power in Egypt. Shirkuh lived long enough to secure his nephew a firm hold upon Egypt, and the title of Malik-al-Nasr—which means nearly the same as Malik-al-Mansur—from the Fatimite khalif in his palace or state prison. Nur-ud-Din sent word to Saladin from Aleppo that he must not receive these favours from a heretic, and ordered him to proclaim the Sunni khalif. Saladin desired the preachers in the Cairene mosques to omit the name of the Fatimite khalif from their prayers, and to replace it with that of the Sunni Commander of the Faithful, and Al Aadad, buried in the recesses of his palace, knew nothing about it. Saladin's life after this was one of uninterrupted prosperity. Nur-ud-Din died just when he might have become troublesome; so did Nur-ud-Din's little boy. As king of Egypt, and of Syria all but Palestine, Saladin turned his attention next to the Crusaders and their little kingdom. After the fatal field of Hattin, Jerusalem itself fell into his hands. This was the culminating point in his life, and he died himself in 1193, having exercised undisputed power for five years. His family quarrelled among themselves; his own descendants were dethroned, and those of his brother formed the Eyubite dynasty of Egyptian sovereigns, who reigned with varying fortunes for eighty years, one of the last being another Salah-ud-Din, who, army, when he himself was dying or dead, took Louis prisoner at Damietta.

Salah-ud-Din built a fortress on the mod town of Ajlun, and near the Wady Yabees; a Es Salt, where is the tomb of the prophet Hos 30 feet long and 3 feet wide. The Christ women of Ajlun are of the purest Grecian type eyes large and lustrous; nose, mouth, and c classical, and complexion pure olive.—*Osbo Islam.*

SALAI. TAM. An idol.

SALAJIT. HIND. A mixture of sulphure aluminium, sulphate of alumina, and sulphat iron. Its composition is very uncertain.

SALAM. ARAB. Peace, a Muhamma salutation, of which there are several ki viz.—

Salam Bandugee.
Salam Kurnish.
Salam Tasleem or Tasleemat.
Salam Qadambosee or Zameenbosee.
Salam Sashtung (prop. Hashtang).
Salam Gallay-milna, or embracing.

Us-salam-oon-alei-kum-Rahmat-Oolahe, The peace and mercy of God be with you all.

It is incumbent upon all Muhammadan return the words Alaik-us-salam to the sa tion 'Salam-alaikum' of a true believer, w ever be his rank.

Salam-alaikum, peace be unto you; O al salam, and unto you be peace! Salam say unto him peace, touching the b and forehead or lips and forehead; kis of the lips is not known with men, only cheeks and shoulders. The right cheek first, the left, and sometimes the cheeks alone kissed, but generally the shoulders, also as Ge xxxiii. 4, xlv. 15, Luke xv. 20. Kissing of hands is common, as in Matthew xxiii. 7, M xii. 38; and rising to receive, as in Job xxix.

One of Lane's useful allies was, he says, a bo seller. Ahmad, a descendant of the prop brought him a mushaf (a copy of the Kora which he wished him to purchase; but he thoug necessary to offer an excuse for his doing so. remarked that 'by my following or conforming w many of the ceremonies of Muslims, I tacitly o fessed myself to be one of them; and it is incu bent on him to regard me in the most favourable light.' 'You give me,' says he, 'the salutation of "Peace be on you!" and it would be impious in me, and directly forbidden in my religion, to pronounce you an unbeliever; for he, whose name be exalted, hath said in the excellent Book, "Say not unto him who greeteth thee with peace, Thou art not a believer" (chap. iv. v. 96).'

The not returning Salam is a sign on the part of the Bedouins that they are out to fight, and not to make friends. In India, after the

irst salutation of peace, in conversation you say, Is your illustrious disposition well?' and the eply is, 'Al hamd ul illah,' Thanks be to God, or 'Ap ki mihrbani se,' By your favour, and if enting to a proposition, 'Insha ul illah,' If it ease God. Salam-alaikum is the Hebrew alom Alechem, Peace be to you, of Luke x. 5. ve my peace to So-and-So, on parting, where e says good-bye, or God be with you. With ace, go in peace, Exodus iv. 18.—*Fraser's orasan*, p. 81; *Burton's Mecca*, i. p. 340.

SALAMANDER, the water-salamander of pan (Sieboldia maxima), the largest of existing ies of the order of Batrachians. These are , sluggish animals, said to be endued with an ordinary amount of vitality, and to live to eat age. They feed principally on fishes. r native home is in the clear mountain ams of the Japanese empire, in the valleys of hon, between lat. 34° and 46° N. They reside rivulets and lakes formed by the rains at a ht of from 4000 to 5000 feet above the level he sea; they grow to about 3 feet in length. A extraordinary aquatic salamander is found in lakes of Central Mexico,—the Siredon Mexi- m or Axolotl,—which in its ordinary state esses naked external gills.

ALAMI, HIND. Tribute, quit rent; Act vii. 863 imposed a quit rent in Bombay Presidency wo annas per rupee on all unadjudicated ated lands.

ALAMLIK, also Salamji. TURK. The place sembly in a house where the Muhammadan ting Salam-alaikum is pronounced.

AL-AMMONIAC.

ma, ...	ARAB.	Sadar, ...	MALAY.
-sha, Nou-sha.	CHIN.	Nowsadur, . .	SANSK.

ing-sha,* . .	,,	Navacharum, . .	TAM.

l-ammoniac is a hydro-chlorate of ammonia. substance from which this salt was first ined was the soot of camels' dung, by sub- tion, in Egypt, near the temple of Jupiter mon, whence its name. Since the establish- t of gas-works, it has been chiefly derived the liquor obtained during the preparation oal-gas. It is found native at Etna and uvius, in some of the Tuscan lakes, in Persia, hara, in Mongolia and Ile, from lakes and the nity of extinct volcanoes. That in use in ia was formerly obtained from Lan-chau-fu Ning-hia, in Kan-su; but the country of the or Sifing and Turfan formerly yielded it, also tures in the volcanic mountain of Peh-ting Turfan. It is met with in commerce as large s of a semicircular form, translucent, and uriess, with a sharp, saline, cool taste, but no ll. It forms a considerable article of trade in nal, where the manufacture has been known ages. It is important as a source of most of compounds of ammonia, and is used at Lahore for the manufacture of solution of ammonia, for snake-bites,* to a considerable extent. It is extensively employed in the arts, in the prepara- tion of aqua regia, in soldering some of the metals, in tinning iron and copper, in the preparation of dyes, liquid ammonia, and in various chemical manufactures.—*O'Sh.; Smith's China; Powell.*

SALANGORE, in lat. 3° 20′ N., and long. 101° 12′ E., lies on the south side of the entrance of the river of the same name. This place was formerly frequented for tin and other articles of trade. Salangore is separated from Perak by a small river called the Runkup, a little north of the Birnam stream. The Bugi occupy the coast. —*Newbold*, ii. p. 27.

SALARIAS ALTICUS. Near the rocks of the Ceylon coast are multitudes of this curious little fish, which possesses the faculty of darting along the surface of the water and running up the wet stones and across the sand with the utmost ease and rapidity. Mr. Gosse had seen a species of Antennarium similarly running quickly to and fro on the surface of the great beds of floating sea- weed in the Gulf-stream, progressing with the utmost facility by means of its pectorals and ventral fins, quite out of water. By aid of the pectoral and ventral fins and gill-cases, they move across the damp sand, ascend the roots of the mangroves, and climb up the smooth face of the rocks in search of flies, adhering so securely as not to be detached by repeated assaults of the waves. These little creatures are so nimble that it is almost impossible to lay hold of them, as they scramble to the edge and plunge into the sea on the slightest attempt to molest them. They are from three to four inches in length, and of a dark- brown colour, almost undistinguishable from the rocks they frequent.—*Gosse*, p. 122; *Tennent's Ceylon*, i. p. 332, ii. p. 493.

SALAR JUNG, a successful financier, for many years minister of Hyd[redacted] in the Dekhan. He was grandson of Mir Alam, who also had been the minister of that State. His titles from the Nizam were Mukhtār-ul-Mulk, and the Queen-Empress of India made him a Knight Grand Cross of the Star of India. He died A.D. 1883.

SALATAH. ARAB. A favourite Arab dish made as follows:—Take a cucumber, pare, slice, and place it on a plate, sprinkling it over with salt. After a few minutes, season it abundantly with pepper, and put it in a bowl containing some peppercorns, and about a pint of curds. When the dish is properly mixed, a live coal is placed upon the top of the compound to make it bind, as the Arabs say. It is considered a cooling dish, and is esteemed by the abstemious as well as by the toper.—*Burton's Mecca*, i. p. 198.

SALATHI. HIND. A kind of cotton floor- cloth.

SALATURA, the So-lo-tu-lo of the Chinese pilgrim Hiwen Thsang, the birthplace of Panini, the grammarian. Hiwen Thsang says it was 20 li or 3⅓ miles to the north-west of Ohind. At the village of Lahore, which is exactly four miles to the N.E. of Ohind, General Cunningham in January 1848 procured several Greek and Indo- Scythian coins, from which it may be inferred, with some certainty, that the place is at least as old as the time of Panini himself, or about B.C. 350. He therefore identifies Salatura with Lahore. The loss of the first syllable of the name is accounted for by the change of the palatal sibilant to the aspirate, according to the usage of the people of Western India, by whom the Sindhu river was called Hendhu, and the people on its banks Hindus. Salatura would therefore have become Halatura and Alatur, which might easily have been corrupted to Lahore; or, as General Court writes the name, to Lavor.—*Cunningham's Ancient India*, pp. 5–8.

SALEM, a town of Southern India, in lat.

11° 39′ 10″ N., and long. 78° 11′ 47″ E., which gives its name to a revenue district of the Madras Presidency, extending between lat. 11° 2′ and 12° 4′ N., and long. 77° 33′ and 79° 6′ E. The town is prettily situated on the Terumani mattar, 900 feet above sea-level, in a long valley, with the Shevaroy Hills towering above, six miles distant. The area of the district is 7483 square miles, and population 1,966,995. The district is hilly, and is largely cultivated by the Maleali race in villages at heights of 2230 to 4150 feet above the sea. The chief ranges are the Shevaroys (highest point 5410), the Kalrayan (about 4000), the Melagiri (4580), the Kollimalai (4663), the Pachamalai (about 4000), the Yelagiri (4441), the Jevadi (3840), the Vatthalamalai (about 4000), the Erivani and Valasaimalai (about 3800), the Bodamalai (4019), the Thopur Hills, the Thalaimalai. Dharmapuri is about 1500 feet, and Krishnagiri from 1500 to 2000 feet above sea-level.

The chief river is the Kaveri (Cauvery), from the left bank of which a large area in Tiruchengod and Namakal is irrigated. The Palar, Pennar, and minor streams fertilize the district. The district contains three palaiyams or zamindaris,—Sulagiri, Bagalur, and Berikai, all in the Osur taluk. A large portion of the Shevaroys is clothed with middling-sized jungle. Sandalwood is found, and the Jevadi and Yelagiri Hills contain some valuable timber. Magnesite veins occur chiefly at the chalk hills (so miscalled) near the foot of the Shevaroys. Potstone is found in several places. Magnetic iron-ore occurs in practically inexhaustible quantities. Corundum and chrome iron-ore are also obtainable. The Pennar and some other rivers yield gold. Hindu pilgrims crowd to the sacred springs on the Tirthamalai, to Hanumatirtham on the Pennar, to the pagoda at Osur, to the Adipadinettu at the falls of the Kaveri (Cauvery), and to the festivals at Dharmapuri, Mecheri, and other places. The chief shrines where the Malayalis worship are on the Shevaroys and the Chitterimalai Hills near Harur.—*Imp. Gaz.*

SALEMOTE, a silk scarf of Singapore, sometimes embroidered with gold thread. The Salendong and Salemote, with and without gold thread and silk, are in use throughout the Archipelago from Sumatra to Timor. Timor is the most remote of the eastern islands in which textile fabrics are manufactured, the countries beyond producing no other cloths than those of bark beaten out. The texture of the cotton cloths manufactured in Timor and the adjacent islands closely corresponds with those of the Batta of Sumatra and the Dyak of Borneo. The manufacture is evidently of great antiquity, and must have been introduced before that of Java of the present time, which is of Hindu origin. Cotton and dyes are grown in Timor. The silk threads introduced are made from raw silk imported from China and the continent of Asia.—*Cat. Ex.*, 1862.

SALENDONG, a silk scarf of Singapore. It is a woman's head-dress thrown over the head and shoulders.

SALEP. Salep misri, Arab., Hind., Pers. Oriental salep is probably obtained from Eulophia vera and E. campestris. European salep is obtained from Orchis mascula, *W.*; O. latifolia, O. morio, *W.*; O. militaris, *W.*; O. papilionacea, *W.*; O. coriophoira, *Pers.*; and O. undulatifolia; and Tacca salep from Tacca pinnatifida. The tubers of the orchis are compressed, ovoid, rather transparent, and composed chiefly of bassorine, soluble gum, and a large proportion of amylaceous matter or starch. One drachm of the powdered r requires 60 drachms of boiling water to effect it solution; two drachms afford a sufficient meal f an invalid. Good salep carefully prepared is o of the best articles of diet a convalescent can u In India the salep of Kashmir from E. vera reckoned the best. It is also imported from Persian Gulf. From the peculiar shape of tubers, it has gained immense, but most unmerit celebrity as an aphrodisiac. The same circ stance has given the orchis plant its name bot the Greek and Arabic language. Native pra tioners prescribe it in conjunction with m and some other ingredients, in such case require tonics. In England it is supposed chocolate-makers grind it up with cocoa; Europeans it is frequently used for child as an easily digestible form of farinaceous fo consisting mostly of bassorine. Residents Simla and Ootacamund (in the Neilgherries) ar the habit of collecting the tubers of sev orchids for family consumption. Tacca p abounds in certain parts of Arakan, and Mug race prepare the farina for export to China market. After removing the peel, root is grated on a fish-skin, and the pulp ha been strained through a coarse cloth, is wa three or four times in water, and then drie the sun. Mr. Nuttall (American Journal Pharmacy, ix. p. 305) says the Otaheite sal obtained from a new species of Tacca, whic names the T. oceanica.

SALEP-i-SHAITAN. Pers. Conium m latum; Cicuta virosa.

SALI, in Berar, silk-weavers of saree choli.

SALIBAH, an Arab race in the northern pa the Peninsula and southern parts of Mesopota who take their name from Salib, a cross. Anne Blunt describes them (ii. p. 110) as s of stature, well made, engaged in hunting, clothed in gazelle skins. They have donk and goats, but no camels or horses; they from the Arabs; they eat hedgehogs. T women are beautiful, but no Bedouin, howe poor, would marry one of them. She suppo them to be of Indian origin. Lieut.-Col. Pelly some men of this tribe at Koweit and elewh They are said to worship the cross (Salib), perform many ceremonies, more nearly allied the corruptions of Asian Christianity than Islamism. Men and women dance round a sor May-pole. They wear a carter's smock, com down to the feet, and which, like a boy's pinaf ties behind. They possess a beautiful breed donkeys, which they ride, without girths, up saddle made like a cottage wooden chair bot They squat on this seat, and twist their legs over a pummel peak, crossing them over the donkey's neck. They seem to prize their saddles as an Arab does his mare, and would not sell them. They appear a merry, quick-witted, disreputable lot, with retrousse noses and Irish features. They stood, with eyes twinkling (legs and hands always on the fidget), and pelted him with the peelings of their fun. This strange people live on the flesh of the gazelle, which they shoot, and dress

themselves in its skin. They wander about amongst, and are friends with, all the Arab tribes, d yet remain entirely distinct. They adopt me of the forms of the Muhammadan faith, but t feasts and marriages they raise the cross as a gn of rejoicing. They are the best guides for e desert, knowing where water is to be found, nd the position of the various tribes. Those om he saw seemed much more intelligent than Arabs, and they have more of a European an Asiatic cast of countenance.

SALICACEÆ. *Lindl.* The willow tribe of ants, comprising species of the genus Salix. licine is a crystallizable bitter principle, tained from the leaves and young bark of the plar, willow, aspen, etc.; used in rheumatism. forms small white silky needles, and in some pects resembles the vegeta-alkalies, cinchona g febrifuge properties; but it in containing no nitrogen, and with acids.—*Tomlinson.*

n plant on such salt grounds as by the spring tides on the Malabar ed for barilla. The value of barilla depreciated by the progress of in Europe, where the purest ctured by decomposing common by sulphuric acid, and at the low rate of £10 maunds. Salicornia, Salsola, and over every patch of saline land in —*Eng. Cyc.; Roxb.; W. Ic.; Voigt.*

B. A traveller, a class of devotees, the Tarikat or path of salvation of ns.

SOILS occur in many parts of British stan, in the Dekhan, and in the In Northern India they are own as reh (*q.v.*), and salts of soda are largely ctured from them.

carbonates of soda, known as rasi and sajji, are manufactured from reh soil. Rasi is ained by lixiviating the reh and concentrating brine by solar heat. Sajji is the fused solid ained by mixing reh with water, and exposing n a furnace to artificial heat. The products m both processes are crude carbonate of soda, these are largely used in the manufacture of p and tobacco.

Reh soil tracts have intermixed patches of salt soil and saltpetre soils, and if these soils are intermixed with the reh in the manufacture of sajji or rasi there will be no formation of salt. Reh soil, however, where genuine or pure, differs from the other soils containing sulphate of soda and saltpetre, as it contains no common salt.

An ordinary factory worked by five or six men will, in one season, produce over 250 British man or maund of crude carbonate of soda.

Glauber's salt is known in N. India as Khari, also Khari-nun. Its manufacture is by filtration and solar heat. The machinery requisite consists of a filter (channa), reservoirs (hauz or hauda), a shallow masonry pan (patta) 14 yards by 12 yards and from 5 to 6 inches deep, made of consolidated kankar, with a thick surface coating of lime-plaster. The patta or masonry pan is subdivided into four or five compartments (kyari) on different levels to facilitate transfer of the fluid. These are constructed on a tract of khari soil, where water is conveniently at hand, and in the early part of March work is commenced. The soil is gathered and taken to the factory, passed through the filter, and the compartments filled with the brine, and exposed to the action of the sun. On the second or third day, the contents of one compartment are run off into the others; one after another is thus emptied, until all the concentrated brine is collected in one compartment for the Glauber's salt to precipitate. The empty compartments are filled with fresh brine.

In the soil there is always a percentage of common salt, and during the evaporation the sulphate of soda first precipitates; secondly, the chloride of sodium. It is thus an easy matter to remove the upper layer of salt from the glauber beneath, and this is usually done.—*Carnegy.*

SALINE SPRINGS are found in Sind and in the higher portion of the Punjab; they contain common salt with some sulphate of soda and small quantities of other salts, when they are not simply brine. Traces of iodine are found near Kangra. Throughout Rajputana and in some parts of the Panjab, the wells are abundantly impregnated with soda. Some of the springs in Kamaon contain mineral impregnations, but scarcely to an extent to be considered saline. Scarcely any strong saline springs are thermal. The few thermal salines are chiefly calcareous, and one or two silicious. There are many saline springs in Turkish Arabia and in Persia; also springs in Salt Range, Peshawur; a hot fountain in Kattyawar, with saline and sulphur springs within high-water mark; sulphurous well near Somnath; saline springs in the Konkan; saline and sulphurous springs in Lukee pass; sulphuretted hot springs at Badrachellum on the Godavery; hot springs at Nair and Urjunah, and at Byorah in the Dekhan.—*Jour. B. A. S.* iii., 1856. See Reh; Salt; Saltpetre.

SALISBURIA ADIANTIFOLIA. *Sm.*

Gingko biloba, *Linn.*		Pa-hwo, ...	Chin.
Yin-kwo (fruit), .	Chin.	Gingko, Jinko, . .	Jap.

A tree of Japan, much cultivated in China, and found in many gardens in Europe. In congenial climates it attains the size of the walnut. Its leaves are wedge or fan shaped, deeply bilobed, and finely striated with veins, having some resemblance to the leaves of some species of Adiantum, whence it is commonly called maiden-hair tree in England. The pulp of the fruit is austere tasted, but the large kernel is sweet, with some degree of bitterness when raw, but agreeable as a dessert when roasted like chesnuts. They are much eaten in China. The Chinese are fond of dwarfing it, and it is often seen in that state in their gardens. Its fruit is sold in the markets in all Chinese towns by the name of Pa-hwo, and is not unlike dried almonds, only whiter, fuller, and more round. It is rarely eaten by Europeans.

—*Eng. Cyc.; Fortune's Wanderings; Roxburyh; Smith.*

SALITAH. HIND. A canvas sheet used to contain the articles composing a camel's load. In cold weather it is converted into a blanket.—*Burton's Scinde*, ii. p. 43.

SALIVAHANA was the son of a potter. He headed a successful popular movement, and became the chief of a powerful monarchy in Maharashtra. He ruled at Munji-Paithan. The ruler whom he overthrew is said to have been Vikramaditya, king of Malwa, but there are 135 years between the era of the historical Vikramaditya and that of Salivahana. He gave origin to a new era, which is still current in India. The era reckons from A.D. 78, the supposed date of his death. It numbers the solar years, as the era of Vikramaditya numbers the luni-solar years. Tod describes Salivahana as of the Takshak race, and states that the Salivahana era set aside that of the Tuar in the Dekhan. Salivahana had 300 wives, from whom the Beis Rajputs are descended.—*As. Res.* p. 121; *Elphinstone*, p. 224.

SALIX, the willow genus of plants. There are about 50 species in Eastern and Southern Asia. The earliest mention of the willow tree is in the Pentateuch, where the Israelites were directed at the institution of the feast of tabernacles to 'take the boughs of goodly trees, branches of palm [redacted] of thick trees, and willows of the brook, and to rejoice before the Lord their God seven days.' At a later period, the Psalmist describes the captives as lamenting—'By the rivers of Babylon, there we sat down; yea, we wept, when we remembered Zion. We hanged our harps upon the willows in the midst thereof. For there they that carried us away captive required of us a song; and they that wasted us required of us mirth.' Willows are valuable for economic purposes. S. Babylonica and S. Ægyptiaca occur in gardens in Upper India. S. Lindleyana, or dwarf willow, occurs at 12,000 to 13,000 feet on the Himalaya; S. chita and S. rotundifolia in Kanawar. In Tibet, the whole plough except the point, which is iron, is generally made of willow. In Afghanistan willow wood is generally used for building, as insects do not attack it. On the Chenab, pails, etc., are rudely cut from single blocks of the willow; and, according to Moorcroft, combs to remove the [redacted] goat's hair from the animal's back are made of this in Ladakh. The wood in Tibet and Spiti is employed for boarding. The small twigs are used for basket-work, and the leaves are highly valued in winter as food for sheep. One of the substances known as manna, the bed-khisht, used as a laxative, is said to be a product on a species of willow of Khorasan and Turkestan. S. flabellaris, *Ands.*, S. hastata, *L.*, and S. oxycarpa, *Ands.*, are found at various elevations in the Panjab Himalaya and Ladakh from 6000 to 15,000 feet; and the leaves, etc., of several are used as fodder. In Kashmir the willow is used largely for basket-making; in Tibet many of the houses are made of willow wattle and daub. Twig bridges of willow are mentioned in Spiti, Zanskar, and Ladakh, where Parrotia is not found. In Kashmir, willow twigs are employed as tooth-sticks. There also, and still more on the Chenab and in Ladakh, the trees are severely and systematically lopped, the young shoots and bark of the larger removed by hand, being used as fodder.—*Cleghorn; Royle; O'Sh. Hooker, Him. Jour.; Stewart; Honig.*

Salix acmophylla, *Boiss.*

Bisu, . . HIND., PANJ.	Budha, . . . SIN
Bedh, ... PUSHTU.	

A moderate-sized tree of Persia, Afghanista N.W. Himalaya, and Upper Sind. Wood tou and elastic, used in small carpentry; weight, lbs. to the cubic foot. Leaves as fodder.—*J. Murray.*

Salix Ægyptiaca, *Linn.*

Bed-i-musk, . . . PERS.	Khagawla, . . PUSI

Cultivated at Lahore for the distillation, fr the palm, of an aromatic water, which is m used in the hot season.

chs, . . . DUT., GER.	Salmao, ... POR.
aumon, . FR., SCOTCH.	Semgha, ... RUS.
Sermone, ... IT.	

No trout or salmon inhabits any of the rivers that debouche into the Indian Ocean (the so-called Himalayan trout is a species of carp). Salmonidæ are, however, found in the Oxus, and in all the rivers of Central Asia that flow north and west; and the Salmo orientalis, *M'Clelland* (Calcutta Jour. Nat. Hist. iii. p. 283), was caught by Griffith (Journals, p. 403) in the Bamian river, which flows into the Oxus, and whose waters are separated by one narrow mountain ridge from those of the feeders of the Indus.

S. orientalis, *Pallas*, according to Adams, p. 187, occurs in the Gulf of Pe-chi-li. The nature of the tropical ocean into which all the Himalaya rivers debouche is no doubt the proximate cause of the absence of Salmoninæ. Sir John Richardson (Fishes of China Seas, etc., in Brit. Ass. Rep., etc.) says that no species of the order has been found in the Chinese and Eastern Asiatic seas.

SALON, Manchu tribes on the Upper Saghalin.

SALONES are a tribe of sea-gypsies, living in the dry weather in their boats, and during the monsoon seeking a temporary shelter in huts built on the lee side of the islands of the Mergui Archipelago. They are said to be divided into several clans, which have each a recognised right to fishing-grounds within certain limits. Formerly they were much exposed to the predatory attacks of Malay pirates, but these troubles have almost ceased, and during the fine weather Salones may be seen in their peculiar wicker-work boats at Mergui, whither they come to dispose of their fish and beche-de-mer. In personal appearance they are between the Malays and the Burmese. Their language has affinities with the tongue of the former, and belongs to the Malay-Polynesian group of agglutinating languages. 894 were counted in the Mergui district living in various islands of the Archipelago.

SALOO, a cloth of Banda; it is dyed with alkanet root, with a mixture of castor-oil, in the proportion of one pâo to every piece of cloth, each piece of cloth being eight yards. Besides castor-oil, Russee, a kind of earth, is also mixed, and goats' dung and alum. The cloth is first rubbed for ten days in the castor-oil, Russee, and goat's dung, and then dried in the sun. After ten days it is well washed and dried, and then steeped in the oil for five days; afterwards washed and dried in the sun; and after a third application of soap and water, the cloth is ready for sale. The cost of dyeing different kinds of cloth is as follows:—Nynsook cloth sells at 1 anna per yard; mul-mul at ¾ anna per yard; and that used for the pagri or turband at ½ anna per yard.

It is not easy to ascertain the extent and value of the quantity of saloo cloth annually manufactured. It is exported to other parts of India, and its use is general, and not limited to particular castes. The wholesale market value is about 1 rupee 6 annas 6 pice per piece, according to the quality of the cloth dyed.—*Cal. Cat. Ex.*, 1862.

SALOTAR. A work is extant on veterinary medicine; it is said to be by Salotar, who is stated to have been the tutor of Susruta. It was translated from Sanskrit in the year 1831. But Professor Max Müller mentions that Salotar is not known as the author of such a work, and he adds that Salotariya is a name of Panini, and that the teacher of Susruta is said to have been Devodasa. Salotar, also Salastri and Salotri, HIND., is a veterinary surgeon.—*Müller's Lectures*, p. 142.

SALSETTE is supposed to be derived from She-aste, meaning, in Mahratta, eighty-six, it having formerly contained, it is said, that number of villages. Mr. Burgess says (p. 349) it is called Shatshashthi. It is 150 square miles, and much

the largest of the many islands near the island of Bombay, and the islets of Dravee and Versova are just off the shore of Salsette. Salsette and Bassein were taken by the British on the 28th December 1774, and Salsette, Bassein, and the revenues of Broach were ceded by Raghoba on the 6th March 1775. Its northern point is in lat. 19° 7′ 40″ N., and long. 72° 47′ E. It is connected with Bombay by a causeway and bridge at Sion, 2 miles E. of Mahim. Between Mahim and Bandora are a fine causeway and bridge, constructed at the joint expense of Sir Jamsetjee Jejeebhoy and Government. It is beautifully diversified and well peopled. It has many ancient rock-temples at Kanheri, Marol, Magathana, Mandapeswar, and Jogee, and at Kanheri, about one hundred, mostly small, excavated in a large, solitary, bare hill, some of them covered with sculpture of the Mahayana type. The chaitya at Kanheri has been pronounced by Dr. Fergusson to be merely a copy of the Karli cave. It belongs to the beginning of the 5th century, but nine of its viharas seem to be of earlier date.—*Burgess*, p. 349.

SALSOLA, Kontee-lanee and Kharu lanee, SIND. A genus of plants belonging to the natural order Chenopodiaceæ, named from Salsus, salt, in consequence of many of the species, S. kali, S. sativa, S. soda, and others, yielding kelp and barilla. The species are chiefly found on the sea-shore in temperate climates, but also in hot parts of the world where the soil is saline, or where there is salt water in the vicinity. Various species of Salsolaceæ abound in the more saline dry parts of the doabs of the Western Panjab. The Salsola kali of Europe and the colder parts of Asia is mostly found on sandy shores or arid deserts; an annual bushy plant, with stiff, thorny, channelled leaves. The dried plant, when reduced to ashes, yields 25 to 30 per cent. of carbonate of soda; used in India in soap-making, calico-dyeing, washing, etc.

SALSOLA INDICA. *Willde.* Oomari-keeray, TAM.; Ella-kura, TEL. This, with species of Salicorneæ, and other of the Chenopodiaceæ, are natives of the salt marshes and grounds near the sea, flowering the greater part of the year. The [illegible] universally eaten by all classes green leaves are univers[illegible] and are reckoned of natives who live near the sea, [illegible] very wholesome. The leaves of this [illegible] saved many thousand lives during the famine in India of 1791–92–93. It is a small procumbent weed, with linear-shaped leaves, is used as greens, and is a very pleasant vegetable. This, being naturally salt, has given rise to the Teling saying, 'The carping husband (finding fault without cause) says to his wife, There is no salt in the Ilakura.' In Malabar, barilla is made from it.

SALSOLA NUDIFLORA. *Willde.* Ravakada, Reyyi-kada, TEL., is a native of salt barren lands near the sea, and flowers during the greater part of the year. The stems are perennial, many spreading close upon the ground, and often striking root, ramous extremities of the branches ascending. The plant is only used for fuel, but Roxburgh believed it would yield excellent soda. —*Roxb.; O'Sh.; Voigt; Jaffrey.*

Four kinds are distinguished,—rock-salt, s[illegible] salt, lake-salt, and earth-salt. When found n[illegible] in immense masses, which only require to [illegible] dug and reduced to powder, it is termed r[illegible] salt; when obtained by the evaporation of [illegible] water, common salt or sea-salt; and when ma[illegible] factured from the saline soil, it is known [illegible] earth-salt. Sea-salt is extensively manufactu[illegible] on account of the Indian Government at m[illegible] places along the coast. The process is not eve[illegible] where exactly the same, but generally, the [illegible] water being raised by means of levers, ca[illegible] pakottas, is run into shallow beds or pans, [illegible] evaporated, additional water being added as [illegible] evaporation goes on. The salt is raked to [illegible] side, and conveyed to platforms or raised pla[illegible] where it is heaped in quantities of 10 or n[illegible] garce. In some places a proportion of the [illegible] water is obtained from wells dug near salt cre[illegible] in others the salt water is dammed up in [illegible] mouths of rivers, where it is partially evapor[illegible] for some time before being run into the cry[illegible] lizing pans. In some parts of Ceylon, of [illegible] adjoining coast of the Peninsula of India, w[illegible] the beach is long and shelving, also on the s[illegible] of the Runn of Cutch, salt is formed naturall[illegible] the sea-shore, by the sun's rays evaporating [illegible] tidal waves.

All round the coasts of Ceyl[illegible] and the Peni[illegible] of India, but chiefly on the east coast, s[illegible] locally made in great quantities, and at a [illegible] defying all foreign competition. For this re[illegible] in British India, Ceylon, and Netherland I[illegible] salt manufacture is a monopoly of the respe[illegible] governments in India, and yields a large [illegible] of the revenue.

In Bengal, the monopoly of salt in one [illegible] or other dates at least from the establishmen[illegible] the Board of Trade there in 1765. The s[illegible] monopoly of salt commenced in 1780 [illegible] system of agencies. The system [illegible] 1780 continued in force with c[illegible] and cations till 1862, when the se[illegible] introduce[illegible] occasional mo[illegible] were gradually abolished, leaving the suppl[illegible] salt, whether by importation or excise ma[illegible] facture, to private enterprise. Since then, Bengal proper, the supply of the condiment [illegible] been obtained chiefly by importation, but in [illegible] by private manufacture under a system of exc[illegible]

The Indian Salt Act xij. of 1882 was pa[illegible] by the Governor-General on the 10th March, repealed the Inland Customs Act viii. of 1[illegible] and the Salt Act xviii. of 1877; also sectio[illegible] of the Bengal Salt Act vii. of 1864, clauses *b* [illegible] *c* of section 39 of the Burma Land Act i[illegible] 1876, and sections 36 and 37 of the Ajmir L[illegible] Regulation iii. of 1877.

Act xii. of 1882 embraced the N.W. Provinces, Panjab, Oudh, Ajmir, Mairwara, Sind, the Patna Division, and Central India, and fixed Rs. 50 as the fee for a licence to manufacture and refine saltpetre and to separate and purify salt; also Rs. 10 for a licence to manufacture sulphate of soda (Khari-nun) by solar heat in evaporating

howers of sand fell in China on the 26th ch 1850, and lasted several days; about ten ns to the square foot collected in one day, or t eighteen tons per square mile. Such wers are frequent,—three occurred in 1850; natives believe that the dust comes from the ert of Gobi. Mr. J. Alexander mentions t on the 29th March 1821, when in lat. 11° 3′ and long. 22° 5′ W., 300 miles from the ic coast, sand was blown on to the rigging the ship.—*Jam. Ed. Journ.* vii. p. 494.

SA . HIND. A bull liberated by Hindus on em occasions, and allowed t wander at ll.

SA a sort of lizard in Java. It is l ed, the product applie Muhammadans the is; the reptile is also eaten as an phrod —*Gen. Med. Top.* p. 151.

SANDACRES, districts in Ceylon which differ om those called Patuna in being studded with roups of timber trees of majestic dimensions.—*ennent.*

Many of the synonyms for this wood have been derived from the Sanskrit, the letters ch of that tongue being converted into s and ts. One kind is the produce of a small tree, Santalum album, growing in India and Ceylon, which gives its title to the natural order of plants called Santalaceæ or sandal-worts. The sandal-wood of the Sandwich Islands is from two other species of the same family, S. Freycinetianum and S. paniculatum; but S. Freycinetianum has been so recklessly cut down in the islands of the South Seas that it has almost disappeared. The Myoporum tenuifolium, or spurious sandal-wood tree, grows in elevated situations, attains to 15 or 20 feet in height and 3 or 4 feet in circumference. Its scented wood varies from yellow to red, according to the age of the tree, and is used for planes. A white sandal-wood, termed lava or lawa, is imported into Bombay from Zanzibar, and is applied to the same purposes as Mysore sandal-wood.

Another spurious kind is from the Exocarpus latifolia of the Percy Islands, Cape Upstart, the Palm Islands, Repulse Bay, etc., and in India the wood of the Plumieria alba is fraudulently mixed with the billets of the true sandal-wood. In the year 1881-82, the value of the exported sandal-wood from India was Rs. 3,98,284, and in 1882-83, Rs. 4,02,031.

Coorg sandal-wood sells at Rs. 180 to Rs. 425 the ton. That of Mysore is of excellent quality, and there the tree has been strictly conserved since the middle of the 19th century. Up to 1875-76, five sandal-wood plantations had been formed in Mysore. The Mysore revenue from sandal-wood (1055 tons) in that year was Rs. 2,87,132. [illegible] wood was [illegible] inferior [illegible] down w[illegible] root; i[illegible] logs, whi[illegible] in order [illegible] outer woo[illegible] out touchi[illegible] only valu[illegible] however, [illegible] yellow; [illegible] layers of t[illegible]od.

The odour of sandal-wood is very strong, rose-like, and enduring; its taste slightly bitter. The odour is due to the presence of an essential oil, heavier than water, readily congealed, and having a peculiar sweet smell. The deeper the colour, which is of a yellow-brown, and the nearer the root, the better is the perfume. The Chinese imported an amount of sandal-wood in 1838 worth about 150,000 dollars. From Timor and the Fiji islands China derives her chief supply. The natives of Yap, the Isle of Pines, and Maree traffic with ships for the sandal-wood. Timor is the only country in the Eastern Archipelago which produces it in any quantity. That of Bonin Island is of excellent quality.

The oil is employed by the European perfumers, and in India is very extensively used for the adulteration of attar of roses. The wood in powder is given by the native physicians in ardent remitting fevers, and is supposed to be sedative and cooling; with milk it is also prescribed in gonorrhœa. The Chinese consume it largely as a fancy wood, and by them it is often elegantly carved. By the Chinese it is ground into powder and used as a cosmetic. The powder is rubbed on the skin to allay the irritation of mosquito bites, of prickly heat, and other cutaneous disorders. The wood is a preservative against insects, and is much used in making work-boxes, walking-sticks, pen-holders, and other small articles of fine ornament. It is much used in

India and China for burning in temples, is extensively employed as a fuel in the funeral ceremonies of the Hindus. Its bark gives a most beautiful red or light claret-coloured dye, but it fades almost immediately when used as a simple infusion. In the hands of the experienced dyer, it might, it is supposed, be very useful. — *G. Bennett*, p. 419; *Tomlinson; Tredgold; Ainslie; Crawfurd; M. E. J. R.; Macgillivray's Voyage*, i. p. 97; *Bombay Forest Reports; Report of Madras Forests; Poole, St. of Comm.*

SANDARACH, Sandrac, Sandarac.
Sundroos, Zoos, . ARAB. | Yun-hiang, . . . CHIN.

A resinous substance met with in round or elongated tears, of a whitish or pale-citron yellow; brilliant, transparent, and limpid, brittle under the teeth, burns with a clear flame, and emits a pleasant odour; taste resinous, and slightly balsamic. It is used as an ingredient in varnishes and incense; when reduced to a powder, it forms the article term pounce. Sandarach is obtained from Morocco, according to Brongniart and Schousboe from the Callitris quadrivalvis, a coniferous tree, which in Barbary is called the arar tree, and attains a height of from 15 to 20 feet. It was discovered by Desfontaines on Mount Atlas in 1796. Dr. Lindley had seen a plank two feet wide of this sandarach tree. The wood is con- s indestructib nd they use mosques. vagantly een the ed arbor s striped, led, apiatæ. able. The —*Faulk- Smith.* ng natur- and

SAND-B ally all along the shores of Bri and in the tracts on the margin of the Indian desert; but more could be done to prevent the sands being blown from the deserts and from the gulf between Ceylon and Peninsular India, and from the shallow beds of its many rivers. Bremontier, by planting the Landes of Gascony with the cluster or pouch pine (Pinus pinaster or P. maritima of botanists), recovered 100,000 acres from the blown sand.

This class of plants has been largely utilized in Australia, and Baron von Mueller enumerates sixty genera, which he recommends to be so employed; among them species of aloe, carex, casuarina, cynodon, opuntia, spartina, spinifex, stipa, tamarix, and yucca.

Spinifex squarrosus, *Linn.*, known to Europeans by the designation of ground rattan and sea pink. The Tamil name, Ravan mise or Maha Rawana and Ræwula, *i.e.* whiskers of Ravana, is a descriptive epithet. It comes near to the sand carex of England in its habit of growth, creeping along horizontally, sometimes above, sometimes below the surface of the earth, emitting roots and shoots at intervals of a few inches. It is extremely tenacious of life, the shoot at every node being capable of renewing the existence of the individual as fast as destroyed, and the whole plant offers a resistance to the effects of a storm, which is rarely overcome. This species would be nearly as indestructible from natural causes as couch grass, and would speedily colonize the sand tracts spontaneously, if it wer unmolested for a year or two.

Ipomœa pes-capræ, *Sweet.* Mosul t Goat's-foot-leaved ipomœa, or rabb perennial, creeping to a very great ext rooting at distant intervals. Leav long-petioled, two-lobed, like those o tipped with a neacro. Flowers larg purple, very handsome. This fine equally abundant in both Peninsulas also a native of Mauritius, Macao, etc., the place of C. soldanella of the Br and a more striking and beautiful sp tropical bindweeds is rarely seen. Rab and horses eat it, so do cows, but th tainted. Great difficulty occurs in plant in the vicinity of houses, as the tread it down, and cattle nibble the te It naturally takes a higher position o band than the spinifex, and suffers during a storm; but they often gro and conjointly effect much benefit. T arrests the drifting sand, and the ipon what the former collects. Mr. Cadde extensively along the canal banks near

Canavalia obtusifolia, *D. C.* Koyli a Common on the sea-shore, frequentl with the Ipomœa pes-capræ. It is a plant, very abundant at the Adyar, mouth of the Godavery, and between Anjengo.

Hydrophylax maritima, *Linn.*, the kola of the Singhalese, literally jointe plant, a straggling herbaceous plant, shore of Coromandel, where it shows its lilac blossoms great part of the year. The run over the sand, sometimes under and strike root at the joints. It when the sand is moist.

sarmentosus, *Wigh* ble plant, commo

Microrhy widely-diffused hum sea-beach, with long

Pupalia orbiculata, *Wight.*
Achyranthes orbiculata, *Heyne.* | Adai yo
Cyathula orbiculata, *Moquin.*

Grows on sandy soils near the sea-b ant at St. Thome and near the m Adyar river. It is an extensively-sp cumbent plant, the branches being feet long; bristles attaching thems clothes of passengers, cling to them

Pandanus odoratissimus, *Linn.*, bush, Taylie maram, TAM., is a larg ramous shrub, often planted in belts, much room, forms dense thickets, a venomous reptiles. The lands in wh is cultivated are often protected fro by means of this shrub. It is a binder, but is objectionable from its hills.

Ehretia arenaria, *Griffith*, is found lat. 12° and 28° N., binds together in a minor degree. It may be the same as cuneata? *W. Icon.* iv. t. 1385, which grows sandbanks in the beds of all the rivers of the Western Peninsula of India.

Pedalium murex, Ipomœa pes-tigridis, and Sesamum prostratum, etc., co-operate in the work of conservation to a minor extent, but are less widely diffused along the coast; also Fagræa Coromandellia. Trees such as the casuri

(Anacardium occidentale), the Alexandrian laurel (Calophyllum inophyllum), and the wild date (Phœnix sylvestris) grow well, and render a double service by preventing a further encroachment of sand, and rendering the land useful. In Ceylon, the grass-worts, Salicornia Indica, and salt-worts, Salsola Indica, are the first to appear among the newly-raised banks. Ipomœa pescaprœ abounds on the shores, also Canavalia obtusifolia, Dolichos luteus, and the Hydrophylax maritima. A little above high-water mark is, likewise, the Aristolochia bracteata, the Hedyotis umbellata, Sayan; also Choya, SINGH.; Gloriosa superba, Vishnu karandi, TAM., or Lippia nodiflora.—*Dr. Clephorn; Sir J. E. Tennent; Von Mueller; Prof. Rolleston*, p. 16.

SAND-BOX TREE, Hura crepitans. Chiefly remarkable for the violence with which the ripe fruit opens to discharge its seeds, often with a report like that of a pistol.

SANDERS-WOOD. Red Sanders-wood.

Sandal-holz,	GER.		

The sanders-wood or red sanders-wood of commerce is the product of a large useful timber tree, the Pterocarpus Santalinus, found in Malabar, Mysore, Ceylon, near Madras, in the Pulicat and Tripaty Hills, Malay Peninsula, and Timor. The wood is extremely hard, of a fine grain, and a bright garnet-red colour, which brightens on exposure to the air. It is employed to dye lasting reddish-brown colours. The concentric circles are finely divided by lines which indicates a deep-red to [illegible] cold water. It is principally imported from Calcutta in logs [illegible] diameter, generally without the roots and light pieces; it is very hard, and it is very much used as a red dye-wood, [illegible] often for turning. The logs are often notched at both ends, or cut with a hole as for a rope, and much worn externally from being dragged along the ground; other woods, as also indeed ivory tusks, are sometimes thus perforated for the like purpose. With different mordants, it yields various shades of red; these are said to be little permanent. This wood is largely exported from, but little used in, Madras. The Madras exports for 1854 amounted to 47,431 cwt., value 5[illegible]570 rupees.—*M. E. J. R.; Tredgold.*

SAND-GEMS, or Ava gem sand, comes from the neighbourhood of Ava, and is sometimes one of the Shan articles of merchandise. It consists of small fragments of nearly all the precious stones found in the country; but garnet, beryl, and spinel are its principal constituents, more especially the last, which seems to constitute nearly three-fourths of the whole mass. A single handful will contain specimens of every shade,—black, blue, violet, scarlet, rose, orange, amber-yellow, wine-yellow, and white.—*Mason.*

SAND GROUSE, the Syrrhaptidæ, *Blyth*, and Pteroclidæ, *Jerdon*, are also known as the rock grouse and rock pigeon. They are birds of rapid and powerful flight. The Indian species are Pterocles arenarius, *Pallas*, Pt. fasciatus, *Scopoli*, Pt. alchata, *Linn.*, Pt. exustus, *Temm.*, and Pt. Senegallus, *Linn.*, the last being of Africa and Arabia, and it is said also of Sind. The Tibetan sand grouse, Syrrhaptes Tibetanus, *Gould*, repairs in large flocks to drink at the fresh-water springs. The plumage of both sexes is much alike, but the long tail of the male is distinctive.—*Adams.*

SANDHARA. HIND. Cutlers in Hindustan, who profess to have come originally from Marwar, and to be related to the Rajputs. Muhammadans who pursue the same avocation are called Saikalgar.

SANDHEADS, a maritime term applied to the seaward islets of the delta of the Hoogly, nearest the Bay of Bengal.

SANDHI, a form of conjunction of words in Sanskrit, and in those words of the Telugu language derived from Sanskrit, and is a systematic element in grammar.

SANDHI or Sandhya. SANSK. The twilight or crepuscle. The Sandhya of Brahma consists of 1,728,000 solar sidereal years, the same duration as the Krita or Satya-yug, which quantity is used in its double capacity for constructing the Kalpa. Pratas sandhya, the morning twilight; Sayam sandhya, the evening twilight. The twilight of each yug is equal to 1-6th part of the same.

SANDHYAVANDANUM, three prayers by Brahmans at sunrise, noon, and sunset.

This el[illegible]rge size in Burm[illegible] enang, the Molucc[illegible] Philippin[illegible] is scarce in the forests of British Burma, but is large and plentiful near all villages both in the Rangoon and Tounghoo districts, where it is cultivated by the Burmese for its fruit, which is of the size of an orange, and has a fleshy acid pulp. The wood is white-coloured, and adapted to every purpose of house-building. The pulp of its fruit is eaten raw by the natives of Tenasserim, who esteem it as excellent. It is watery and cooling, and makes a good jelly, but this has a peculiar odour. Its root is bitter, and used in medicine in bowel complaints.—*Roxb.* ii.

SANDOWAY (Than-dwai), a British district in the Arakan division, British Burma. Area, 3667 square miles; population (1872), 54,725 souls. The town is situated in lat. 18° 27′ 35″ N., and long. 94° 24′ 36″ E., on the Sandoway river, about 15 miles from its mouth.

SANDRACOTTUS of the Greeks, king of Magadha, was a contemporary of the early successors of Alexander. He was the Chandragupta of the Indians, who founded a new dynasty, and he was grandfather of the Asoka who reigned B.C. 250, the Constantine of Buddhism, the first who gave that religion supremacy in India.

SANDSTONE ROCK occurs in most countries, an aggregation of sand by a sort of semifusion, as in quartz rock and in common gritstone, adjoining trap dykes or great faults. In many of the white sandstones the grains merely cohere together. Some sandstones are in the laminæ, plane, waved, or slightly concentric; these admit

of being readily split. The freestones are not distinctly laminated, the grains being so arranged as to present equal resistance in every direction. They work freely under the stone saw and the ordinary picks and chisels. They can also be turned into balustrades, pedestals, and vases. In the East Indies, sandstones occur of different qualities, from the coarsest soft grit to the hardest freestone, the most compact snakestone, and the toughest chert.

The sandstones of the Kymore range in the Vindhya have a high commercial value at Partabpur, Chunar, and Mirzapore, being used as flagstones and for ornamental purposes. The proximity of the Ganges affords an easy river carriage. They are in general fine-grained, and of reddish-yellow or greyish-white colours.

In the upper Bhanrer series are two varieties of excellent building stone,—one dark-red, sometimes quite unspotted, sometimes streaked and dashed with yellowish-white spots; the other is a yellowish-white, very fine-grained rock, perfectly homogeneous both in texture and colour.

Flexible sandstone is found in Ulwar, at Dadri, in Jheend, and at Jubbulpur. It is called Sang-i-larzan, *i.e.* shaking stone, and is obtained from the Kalyana Hill in the pargana Dadri; it is used for roofing and for ornamental pillars. Sandstones also occur at Sahi Balabgarh, in the hills [redacted] eeana at [redacted] mosque [redacted] earliest [redacted] stones of [redacted], and the [redacted] n erected [redacted] The [redacted] ram, and Tilowlhoo[redacted] famous. The Sone ca[redacted] d the [redacted] nway bridge are built of the dense sandstone of Sasseram, and little quantities of it are found in the higher portions of the range towards Rohtas. The best stone, while easily workable, is almost as hard as granite, and may be had of any colour, viz. white, crystalline, blue, grey, and all shades to a dark red.

The ghats of Benares, its palaces, walls, minarets, and many temples, are built of sandstone, and St. John's Church, Calcutta, is built of Chunar stone. The Vindhyan sandstones near Gwalior have been used to construct forts, temples, etc.; and on the cliffs are some figures of Titanic dimensions.

The upper Bhanrer formation has quarries to the south of Bhartpur, Futtehpur Sikri, and Rupas. Portions of the Taj at Agra, Akbar's palace at Futtehpur Sikri, the Jaina Masjid at Dehli, and buildings generally in Agra, Dehli, and Mutra (Mathura), and the palace of the raja of Bhartpur, have drawn on these quarries for the materials used. The Jain temples and railway bridges at Barakar are built of sandstones of the Gondwana series. The caves of Sirguja and Chang Bakhar are in the Gondwana sandstone. They have inscriptions in the old Pali character.

The Tawa viaduct is built of sandstones of the Bagra group of the upper Gondwana series. In the Jubbulpur station is a very dense sandstone which has been largely used locally, and the viaduct over the Nerbadda below Jubbulpur has been built with it. The sandstones and flag-beds of the Rajmahal series are occasionally employed for local building purposes. The jurassic rocks of Cutch, the cretaceous sandstones of the Bagh beds, those of the eocene series at Dagshai, Kasaoli, Subathu, and Dharmsala, afford good building material, at the latter place of a grey colour. The quartzite of the Satuma Hill in Manbhum, has been used in Calcutta for paving and coping.

The compact sandstones at Conjeveram are easily dressed. The whole of the valley of the Kistna and great parts of the valleys of its affluents, the Gutpurba, Malpurba, Bhima, Tungabudra, and Tumbudra, and much of the valley of the Godavery and of the valleys of its northern affluents, have limestone, clayslate, and sandstone rocks, and the houses and more extensive buildings are all built of these. The limestone of Kurnool, west to the Bhima, is an excellent building material. Soft sandstones resembling bathstone and tripoli abound near Nellore, Bellary, Cuddapah, and Hurryhur. Sandstones suited for grinding purposes are obtained in Cuddapah; at Chellamacoor, a greyish-brown schistose granular sandstone; near Cuddapah there is bluish-grey compact magnesian limestone, suited for fine sharpening stones; from Woontimitta, fine-grained schistose sandstone, suited for a ragstone. In Guntur, at Palnaud, are purple and lilac-slaty sandstones fine in grain, honestones, black limestones, and lithographic marbles. From Gootemookoola and Dyda, hones from Koopokoonda, 8 miles west of Vinacondah, below the signal pond; rough sandstone glistening with mica. From Matoor Hill, schistose ragstone.—*Powell's Handbook*, pp. 35-56; *Mad. Ex. Jur. Report; Reports and Ca[redacted]alogues of Govt. Cent. M[redacted] Madras; Tomlin[redacted]on.*

SANDUR, an i[redacted] ive State in the Ceded D[redacted] of India; a[redacted]ea, [redacted] the family was 140 [redacted] in the arm[redacted] of Malaj[redacted] um of Rar[redacted]an-malai is [redacted] On the plat[redacted]ux there is [redacted] ars, and the [redacted]mple of Kumaraswa[redacted]an adjoining hill. The [redacted]ills are about 1[redacted]miles long, running from south-east to north-west, ending abruptly near Hospet. This range forms the greater part of the western boundary of the native state.

SANDWIP ISLAND, in the Bay of Bengal, is situated off the coast of Chittagong and Noakhali, in lat. 22° 24′ to 22° 37′ N., and long. 91° 22′ to 91° 35′ E. It is the largest of many chars or islets formed by the Megna as it enters the sea. From its low-lying position, Sandwip is peculiarly exposed to inundation from storm-waves, and suffered severely in loss of life and property by the cyclones of 1864 and 1876. On the latter occasion, the number of deaths was officially estimated at 40,000, out of a total population of 87,016, and cholera set in soon after the cyclone had passed over.

Cæsar Frederick, the Venetian traveller, in 1565 described the inhabitants as 'Moors,' and stated that the island was one of the most fer[redacted] places in the country, densely populated, and well cultivated. Purchas (circ. 1620) states that most of the inhabitants near the shore were Muhammadans. Sir Thomas Herbert (circ. 1625) describes it as one of the fairest and most fruitful spots in all India.

iople have been known to the British
since the latter part of the 18th century. In 1832 two Government officials were deputed to demarcate with solid masonry pillars the present area of the Daman-i-Koh or skirt of the hills. The permission to Santals to settle in the valleys and on the lower slopes of the Daman stimulated Santal immigration to an enormous extent. Since the beginning of the 19th century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. And, in 1855–56, in attempting to revenge themselves on the Hindu money-lenders, who had taken advantage of their simplicity and improvidence, the Santals rose in arms. The insurrection was not repressed without bloodshed,—indeed, half their numbers perished; but it led to the establishment of a form of administration congenial to the Santal immigrants; and a land settlement has recently been carried out on conditions favourable to the occupants of the soil.

The Goalas, cowherds and milkmen (of whom there are 74,529), form by far the most numerous caste in the Santal Parganas; the artisan castes number altogether 83,722 persons, of whom 27,954 are Telis (oilmen). The total number of persons belonging to aboriginal tribes is 557,277, of whom the great majority (455,513) consist of San[redacted] oth[redacted] th[redacted]

[redacted] Hazaribagh, 35,306. The Santals form 3 per cent., or more than one-third of the total number of the aboriginal races under the Lieutenant-Governor of Bengal, and are the best known to Europeans.

The Santal, Mundah, Bhumij, and Ho races speak languages nearly identical. The Santal are a simple, industrious people, honest and truthful, tractable, free from caste prejudices, and are much sought after and prized as labourers by the Bengal indigo planters, and on the railways and other works of Western Bengal, and in the Assam tea plantations. The Santal are a branch of the Mundah Kol. They seem to have separated when the Mundah fell back on Chutia Nagpur from the Damuda river, which the Santal call their sea, and they preserve the ashes of their dead until an opportunity occurs of throwing them into that stream or burying them on its banks. Lieutenant-Colonel Dalton thinks that they left their chief settlements on the Damuda river from having been pressed by the Kurmi. The Santal, Bhumij, and Mundah tribes have long been known to be intimately connected, and they have affinities with the wild clan of the Korewah of Sirguja and Jushpur, the Kheriah tribe of Chutia Nagpur, and the Juanga of the Cuttack tributary mahals.

The Santal and Bhumij races have suffered in esteem in consequence of the human sacrifices offered, up to 1835, at the shrine of Kali, as Runkini; but these races personally do not much care for this goddess, at whose shrine the establishment and ritual are essentially Brahmanical. The

Santal and Paharia or Rajmahali are markedly different in habits, appearance, manners, and national characteristics, and on the Chutia Nagpur plateau these differences are very marked. The Santal are a very ugly race, with flat, broad-nosed features. They are a more simple, mild, and industrious race than the Rajmahali, Gond, or Khond, are truthful and kind-hearted.

In 1881 they again became uneasy, the cause having a religious mixed with a political element. The movement is said to have been started in 1875 by one Bhagrit Mangi, who gave out that he was commissioned by heaven to deliver the Santals from British rule. He acquired great influence, his orders were implicitly obeyed, and he himself received both royal and divine honours, being crowned as king of the Santals, and having a shrine set up for his worship. Eventually he was convicted and imprisoned, and his shrine demolished, but his religion continued to spread, being preached throughout the country by his disciples, the Kherwar. The most influential of these, Dhubia Gosain Babagi, was arrested, and sent to Lucknow as a state prisoner about 1881. The Kherwar stirred up an agitation against the 1881 census, using it for their own purposes, and spreading wild tales as to the intentions of the Government, which were readily believed by the credulous Santal. The Santal believes in [redacted] five [redacted] they [redacted] buried [redacted] shed called Buddhathan, [redacted] is also called Buddah Manji, a Manji and Santal being synonymous. The panchayets of the Santal assemble here. In the months of April and May, when the leaves are bare, 2000 to 4000 Santals assemble with bows and arrows, for their great Seudra or hunting expedition, during which they make wide circles to enclose and kill all the smaller game. They eat the flesh of every animal. Their most solemn oath is taken when touching a tiger's skin. They dance in bodies of one or two hundred to the monotonous music of flutes and drums. The men go round one way, while the women circle the other. The men step in time without much action, but the women drop their heels and toes in a double shuffle, and bend their bodies forward to a half-kneeling position, as though paying homage to the men. The houses of the Santal are in enclosures made with the green boughs of the Sakua, planted in the ground and tied together; they keep each family distinct from its neighbours.—*Dalton*, p. 154; *Campbell*, p. 33; *Travels of a Hindoo; Lubbock, Or. of Civil.*

SANTALUM ALBUM. *Linn.* A small evergreen tree rising to 30 feet in height and 4 feet in girth. It grows in a wavy tract from S. Canara southwards into Mysore and Coimbatore; is most abundant almost throughout the dry Denkenacotta taluk of Salem, less abundant on other hill tracts in the Salem, Trichinopoly, and N. Arcot districts, such as the Shevaroys, Kollay Mallays, Putche Mallays, Javadies, etc., and on the Pulneys in Madura. In these places it is found up to about 4000 feet elevation. It also thrives well in North Canara; freely without any cultivation in all parts of the Bombay Dekhan; may be seen there in quantities in waste gardens, even in some of the grass preserves, and in numbers of the hedges along the water-courses in Western Kandesh. But the Northern Bombay sandal-wood has not the high qualities of that found in the more southern provinces.

The Madras Forest Department have now large plantations of this valuable tree. It grows readily from seed if slightly shaded. Two or three seeds are sown in the pit where the tree is to stand, and at the same time a few chili seeds round them; the latter grow up before the sandal seedlings, and give them the necessary amount of shade whilst young; eventually the strongest of the two or three seedlings only is left in the pit, the others being removed.

It is only the heart-wood that is scented and of any value, and trees grown slowly on rocky and dry poor soil produce the maximum of this; where the tree is found in rich alluvial soil on the banks of rivers, etc., it is of very fine growth, but produces no heart-wood, and is consequently valueless. The heart-wood is yellow, and deliciously fragrant; when unseasoned it weighs 72·75 lbs., and when seasoned 58 lbs., and its specific gravity is ·924. It finds an immediate sale at Rs. 4 or 4.8 per maund of 28 lbs., and it is chiefly employed for making all sorts of ornamental articles, such as small tables, work-boxes, glove-boxes, card-cases, etc. A valuable oil, used as a perfume, is distilled from the roots and chips or pieces of the heart-wood. The heart-wood of the tree yields the oil, and one pound of the wood will yield about two drachms. In North Canara there are many stills for making sandal-wood oil. The wood is burned as a perfume in houses and temples, both in India and China; is used in the funeral ceremonies of the Hindus; is employed for trunks, almirahs, etc., as a preservative against insects; is much used in making work-boxes, walking-sticks, pen-holders, and other small articles of fine ornament. Its powder is a favourite cosmetic with Hindu, Chinese, and Burmese ladies, and Hindus use it to form the sectarian marks on their foreheads. It is much used among the Chinese in cabinet-work, and in the manufacture of fans and other ornamental articles.

In Mysore, foresters are employed to destroy the strong creepers which tend to choke the young plants, springing from seed dropped in hedgerows by birds. It is their duty also to cut, annually, all the ripe trees, 20 years old, and to take care that the billets are properly prepared and sorted, and brought into the sandal godown.

Sandal-wood is very liable to the heart-shake, which decreases its value 20 to 30 per cent. It bears a small black berry, which, if planted, grows without any trouble. The seeds of the sandal-wood tree yield by expression a thick and viscid oil, which is burned by the poorer classes in lamps. The attractive nature of the sandal tree is described in the Sanskrit sloka, 'Round the stem of the Chandana dwell serpents; on its top birds; on its branches monkeys; on its flowers bees,—so the riches of a good man are beneficial to all.'—*Roxb.; Bennett, Gatherings; Gibson; Cleghorn;*

M'Gillivray; Wight; Mason; M. E. J. R.; Wilson, Hindu Theatre; Beddome.

SANTALUM CYGNORUM, *Miquel*, of S.W. Australia, yields scented sandal-wood. S. Preissianum, *Miquel*, of the desert country in extra-tropical Australia, yields the Quandong or edible native peach. S. yasi, *Simmonds*, of Fiji, yields scented sandal-wood.

SANTALUM FREYCENETIANUM, *Gaudi.*, grows up to 3000 feet elevation in the Sandwich Islands. The sandal-wood of the Sandwich Islands is from S. Freycenetianum and S. paniculatum, and the name of sandal-wood is also given to the wood of the Exocarpus latifolia, which grows in the Percy Islands, Repulse Bay, Cape Upstart, Palm Islands, etc. etc.; but it is useless as a substitute. These grow in the South Sea Islands, at Hawai, Fiji, and New Hebrides, but have been nearly extirpated by the avidity of traders.—*Bennett's Gatherings*, p. 419.

SANTALUM MYRTIFOLIUM, *Roxb.*, is a strongly-marked variety of S. album, found by Dr. Roxburgh in [illegible] district. [illegible] of the Rajamundry Circar. [illegible] tree is indigenous, kusoom[illegible] opposite lanceolate le[illegible] and where, as in the Doon in April, according t[illegible]ily recognised at a distance by the it is 'cert[illegible] of its young leaves. All its parts of

SANT[illegible]ion are liable to considerable variation. descent[illegible]y sub-acid aril forms a grateful fruit; Kajrava [illegible] hard, and used as timber. Mnemon, a Persian king, B.C. 426, at whose court Ctesias resided for some years. After Scylax, Ctesias was the next historian in India, and in his Indica, cap. iv. p. 190, he mentions that Artaxerxes Mnemon and his mother Parasatys presented him with two iron swords, which when planted in the earth averted clouds, hail, and strokes of lightning. This is the first notice of the lightning conductor.—*Prinsep by Thomas:*

SAPOTACEÆ. *Endl.* The Sappodilla tribe of plants comprise genera which may be thus shown:—

Achras sapota, *Linn.*, East and West Indies.
A. sessiliflora, *Poir.*, Mauritius.
Lucuma mammosa, *Juss.*, America, China, E. and W. Indies.
Chrysophyllum cainito, *L.*, E. and W. Indies, S. America.
C. Roxburghii, *G. Don*, Assam, Khassya.
Imbricaria Commersonii, *G. Don*, Bourbon, Mauritius, Java.
Payena lucida, *D.C.*; Cachar, Tenasserim.
Isonandra Wightiana, *D.C.*, W. Ghats, Ceylon.
I. obovata, *Griff.*, Tenasserim, Tavoy.
Sarcosperma Griffithii, *Hooker f.*, E. Himalaya.
S. arborea, *Hook. f.*, E. Himalaya.
Dichopsis polyantha, *Benth.*, Cachar, Chittagong, Assam.
Mimusops Indica, *D.C.*, S. India.
M. littoralis, *Kurz*, Andamans.
M. elengi, *Linn.*, Moluccas, Ceylon, both Pen. of India, Bengal, Sylhet.
M. obtusifolius, *Lam.*, Mauritius.
M. kauki, *L.*, Malabar, Gour, Malay Islands, New Holland, Moluccas.
M. hexandrus, *Roxb.*, Circar mountains, Bombay.
M. erythroxylon, *Bojer*, Bourbon, Mauritius.
Bassia longifolia, *L.*, Ceylon, Malabar, Coromandel.
B. sericea, *Bl.*, Java.
B. latifolia, *Roxb.*, Peninsula of India, Malwa.
B. cuneata, *Bl.*, Java.
B. butyraceæ, *Roxb.*, Nepal, Almora.
B. Parkii, *G. Don*, West Africa.
Sideroxylon inerme, *L.*, —?
S. elengioides, *D.C.*, W. Ghats.
S. regium, *Wall.*, Pegu.
S. cinerium, *Lam.*, Mauritius.
S. tomentosum, *Roxb.*, Ghats.
S. Wallichianum, *Wall.*, Penang.
Isonandra lanceolata, *Wight*, Peninsula of India.
I. villosa, *Wight Ic.*, Peninsula of India.
I. gutta, *Wight Ic.*, Malay Peninsula, Java, Borneo.

The Indian Sapoteæ spread from the islands of the Indian Archipelago along the Malayan Peninsula to Sylhet, and from that to Nepal. The Achras sapota has delicious fruit with very bitter seeds, believed in Martinique to be powerfully diuretic; the bark is deemed a substitute for cinchona. The barks of other species are astringent, the fruits pulpy, acidulous, and edible. The seeds contain an oil rich in stearine. Bassia butyracea is found in the neighbourhood of Almora and Nepal Hills. The butter is of a delicate white colour, and of the consistence of fine lard, but without any disagreeable smell. It is highly esteemed as a liniment in rheumatism, contraction of the limbs, etc., and when used by natives of rank is frequently impregnated with some fragrant attar. The tree very much resembles B. latifolia, but may be distinguished by its much less fleshy corols and more numerous stamens; flowering in January, and ripening its fruit in August. The kernels are about the size and shape of almonds, are easily extracted from the smooth chesnut-coloured pericarps, when they are bruised and rubbed up to the consistency of cream, and subjected to a moderate pressure in a cloth bag. The oil concretes immediately it is expressed, and retains its consistency at a temperature of 95°.—*Lindley, Fl. Med.* p. 388; *O'Sh.* p. 427; *Royle, Ill. Him. Bot.* pp. 262, 263; *Roxb.*

SAPOTA ELENGIOIDES. *A. D. C.* A large tree of the hot, drier parts of the island of Ceylon, common on the Neilgherries. Bark rough and cracked; fruit edible, used in curries; wood strong and elastic like the hawthorn, burns well when green.—*Thw.; M'Ivor.*

Zaffiro, . . . IT., SP.	

Corundum, if translucent, when red is the oriental ruby, when blue a sapphire, when green it is the oriental emerald, and when yellow a topaz. Sapphire is usually dark-blue, but also occasionally colourless, and the green variety of corundum is the rarest of all gems. But Sapphirus with the ancients was a generic term for all blue gems. It was on sapphirus tablets that the Ten Commandments were engraved. In the arts, other minerals are also styled sapphire, the names being dependent on their colours. Chemically, sapphire is 92 per cent. of a pure alumina; it occurs in six-sided prisms, often with uneven surfaces; it

ranular. When the surface is polished, x rays corresponding with the hexa- is in some specimens seen within the

n, sapphire, ruby, emerald, and topaz great abundance in the Peninsula of not with sufficient translucence to be precious stones. At the Madras ome small fragments of sapphire and th the matrix in which it occurs, were m Masulipatam. Sapphires, in colour, deepest blue and black, and stones varied hues. If held in water with se coloured and uncoloured stones A very good blue sapphire of one would bring £20.

lly very valuable stones are met with, eat bulk are of comparatively little larger among them being generally Sapphires of good quality are also e same beds in the proportion, it is sapphire to about 500 or 600 rubies. dix to Yule's Ava (published 1857), , superintendent of the Geological ndia, estimated the value of the gems se mines, rubies and sapphires, about annum. The mines are considered opetty of the king, who maintains a t monopoly of them, and employs his own aries to polish and prepare the best of the es.

pphires have been discovered in the territory e maharaja of Kashmir.

pphire occurs in Ceylon in dolomite. A dug out of the alluvium near Ratnapura, 853, was valued at £4000. In Burma, hires are found in the same earth with rubies, are much more rare, and are generally of a r size. Sapphires of 10 or 15 rati without w are common, whereas a perfect ruby of size is hardly ever seen. The value of the , rubies and sapphires obtained in a year be from 1¼ to 1½ lakhs. A Karen informed Helfer that precious blue stones are to be had, h the Shan people collect and carry to kok. He described the place as eight days' nt. Some valuable sapphire mines were dis- ed in 1878 in the Siam provinces of Chantaboon Battambong, and throughout 1879, thousands British subjects went from Burma to the mines. e sapphire was offered for sale at Chantaboon Rs. 1000. The owner finally sold it in Cal- ta for Rs. 3000. The largest which the Govern- t has yet heard of weighed 370 carats in the h, and 111 carats when cut. The mines are to be very unhealthy. In Mr. Hope's collec- is a blue sapphire which cost £3000. A able sapphire of 133 carats, now in the eum of Natural History at Paris, is said to come from Bengal. It was sold for £6800. Burdett Coutts had two of them, valued at 000.—*Emmanuel; Tomlinson; Mason.* See ious Stones.

APRIA GRIFFITHII, a plant closely allied to esia, which was discovered in the Assam tains by Griffith, is the most remarkable known to occur there.

SAPTA. SANSK. Seven. Saptag, the octave in music. Sapta Matri, a name of Brahmi or Chamunda. Saptaswa, the seven-headed horse that draws the chariot of Surya, the sun. Sapt-Gandak, the feeders of the Gandak, and Sapt-Kausika, the Nepalese term for the seven alpine feeders of the river Cosi. Sapta Sindhava, the seven rivers, applied to the Panjab, but also to other rivers and seas of India. Virgil says (Æneid, ix. p. 30), 'Ceu septem surgens sedatis amnibus altus per tacitum Ganges.'

SAPU TANGANG. MALAY. A kerchief for the head. Sapu-Tangan Siri, a handkerchief.

SAR. HIND., PERS. The head, chief, principal; often employed to form compound words. Sardar, a chief; Sar-kar, a government, a head servant; Sarhad, a boundary; Sarrashtadar, the head of a department; Sar-band, head-binder, is the source of the turband, the s being changed into t.

SAR. BALUCH. The Northern Indus, from the junction of the Panjab rivers to the town of Sihwan. It is also a Slavonic word. Gatterer and Niebuhr mention that Sauromatæ means Northern Medes, and north of the Caucasus were the province and tribe of Siracene.—*Elliot, Hist.*

The Jonesia asoka, *Roxb.*, the asok tree, is a small tree cultivated throughout India and Burma for its handsome flowers. Its wood is light and of a reddish-brown colour. S. lobbiana, *Baker*, is a tree of Martaban, and S. triandra, *Baker*, [redacted]

SAI[redacted]GEN, a name given by [redacted] tian w[redacted]ers to the Arabs. It is from Sahra, the des[redacted]nd Zadan, to traverse.

SARAF. HIND. A money-changer or banker.

SARAI. HIND. A caravansary, a building for the shelter and accommodation of travellers. Sarai, as in Ak-sarai, means a palace, a large edifice. It is a purely Persian word, and has been adopted into the English language under the word Caravansary (Karawan sarai). There are many Sarai throughout British India, but few of them have gathered towns about them. The Tamil term Chattram corresponds with the Sarai in Anglo-Tamil Choultry.

SARAKHS, an ancient city of Khorasan, situated about midway, or six days' journey, between Merv and Naishapur.

SARAN, a district in Bengal, lying between lat. 25° 40′ and 26° 38′ N., and between long. 83° 58′ and 85° 14′ E. The chief aborigines, Bhar, number 7647; the Chamar, 94,844; the Dasadh, 73,046; and the Bind, 18,429. The most numerous caste is the Goala, herdsmen. They bear a bad character for turbulence and dishonesty. The Koeri (141,209) are the best cultivators in the district, holding most of the opium lands, from which they raise first-rate crops; and the Kurmi (100,790) are also an agricultural caste.

SARANGI, a stringed musical instrument of Hindus and Muhammadans; a violin.

SARANJAM. PERS. Utensils, furniture; remuneration for services.

SARANYU of the Vedas, Varuna of the Hindus, is the Greek Erinys and Ouranos.

SAR-a-PA. PERS. A suit of garments presented by Muhammadan princes to those whom they intend to honour; literally, from head to foot.

SARAS, HIND., also Surhuns, Grus antigone, occurs all over British India. They may be seen in pairs, now plunging their bills into the shallow waters, now scattering pearly drops from their

throats. The natives of India strongly object to shooting these birds, about which they have a multitude of curious stories. There is a prevalent idea that if one of a pair be killed, the survivor will return again and again to the spot to hover over it. It is perhaps less exclusively a grain feeder than some other species, and is generally met with not far from water. Its fine trumpet-like call, uttered when alarmed or when on the wing, can be heard a couple of miles off. In many parts of the country it is so confiding and fearless in its habits, as to prevent the sportsman from shooting it, and in the territories of Holkar it is said to be esteemed so highly as to be held sacred from the shikaris. In Australia the place of the Saras is occupied by the Australian crane, the Grus Australis.—*Burton's Falconry*, p. 58; *Jerdon.*

SARASWATA, a tribe of Brahmans who originally dwelt on the banks of the river Saraswati, and are now met with in the Panjab and other parts of Northern India. They are usually fair complexioned, tall, and handsome men. They seem to take their appellation from a rishi named Saraswata, and the Hindu tradition is that during a famine the Vedas became forgotten by all but Saraswata, to whom, at the close of the scarcity, Brahmans repaired, and 60,000 disciples again acquired a knowledge of the Vedas. This legend seems to indicate the introduction or a revival of

[redacted] rivers of this name.

Saraswati or Sarsuti, a sacred river [redacted] the Panjab, frequently mentioned in the Vedas. It rises in lat. 30° 23′ N., long. 77° 19′ E., in the low hills of Sirmore State; emerges upon the plain at Zadh Budri in Ambala, a place esteemed sacred by all Hindus; passes by the holy town of Thanesar and the numerous shrines of the Kurukshetra, a tract celebrated as a centre of pilgrimages; enters Karnāl district and Patiala State, and finally joins the Ghaggar in Sirsa district (lat. 29° 51′ N., long. 76° 5′ E.). In ancient times the united stream below the point of junction appears to have borne the name of Sarsuti, and, undiminished by irrigation near the hills, to have flowed across the Rajputana plains, debouching into the Indus below its confluence with the Panjab rivers. The Hindus identify the river with Saraswati, the Sanskrit goddess of speech.

On the banks of the Caggar Saraswati the Aryan race came into contact with others, caste became recognised, but their descendants on the banks of that river have never adopted the high Hinduism of the Brahmans of the Gangetic valley, and continue agricultural.

Saraswati of the Sanskrit writers, in Zend became Haraquaiti, and in Greek Ἀραχωτος, all of which agree in the last two syllables with the Chinese Tsaukuta.

Another Saraswati river, rising in Mount Abu, Rajputana, flows through the Palanpur and Radhanpur States of the Mahi Kanta Agency.

Saraswati river of the Hoogly district, Bengal, was formerly the main stream of the Ganges, and navigable by large vessels as far as Satgaon. It has silted up and become a foul shallow creek.—*Imp. Gaz.* viii.

SARASWATI, a Hindu goddess, the wife, or sakti, or female energy of Brahma, is analogous in western mythology to Minerva, the patroness of learning, etc. Saraswati is the [redacted] dess of learning, music, and poetry, [redacted] called Brahmi or Brahmini, the god[dess] sciences; and Bharadi, the goddess [redacted] She is sometimes represented as a w[oman] standing on a lotus or water-lily, hol[ding] (or vina) in her hand, to show that [she] the goddess of music; at others, [with] peacock, with the same emblem in [her] Although the worship of Brahma has [fallen] disuse, the annual festival of Saraswat[i] day of the month Magha, is highly hon[oured] day is called Sri-panjami, and Saras[wati] the goddess of arts and eloquence, is [worshipped] with offerings of perfumes, flowers, [fruit] rice; even implements of writing and [books] treated with respect, are not used on t[his] and are presented to the image of t[he] Saraswati is, among other deities [to be] propitiated in the marriage ceremo[ny] Brahmans. The following hymn is [addressed] her honour:—'Charming Saraswa[ti] a mare, whom I celebrate in the [sacrifice] universe, protect this solemn rite. [Goddess] whom the elements were produced, i[n the] universe was framed, I will now sing [the] (the nuptial text), 'which constitute[s] glory of women.'—*Colebrooke, As. Res.* [vii.] *Moor, Hindu Pantheon*, p. 128; *Cole[brooke]* *Hind.* p. 10; *Menu*, ch. iii. v. 121.

SARATH, Buddhist ruins in the Benares [district] trict of the N.W. Provinces, distant 3½ [miles] north of Benares city; Sakya Muni first preached his doctrines here.—*Imp. Gaz.*

SARAWAK, in Borneo, is situated in a [bay] to the eastward of Point Api, at the foot of a range of mountains from 1500 to 3000 feet high, extending towards the interior of the island. The Sarawak government acquired the [whole] territory from Cape Datu to the river Bantam. The banks of the river of Sarawak are everywhere covered with fruit trees; the mangosteen, lansat, rambutan, jambou, and blimbing are abundant, but the durian is most [delicious] and esteemed. A beautifully resplendent sand, particles of which resemble amethysts and topazes, is found at Lingah, a branch of the great Batang Lupar river, not far from its mouth. Sago is manufactured at Muka, and antimony is found at Bassein in Borneo.—*Low's Sarawak.*

SARAWAN, a province in Baluchistan. The great central mountain range or table-land, running north and south comprises the provinces of Sarawan, Jhalawan, and Lus. See Baluchistan.

SARAWI, a sect of the fakirs of India.

SARCOCEPHALUS CORDATUS. *Roxb.*

Nauclea cordata, *Roxb.* | N. coadunata, *Sm.*

This tree, the Bakmee of the Singhalese, is very common in the southern parts of Ceylon on the banks of streams; it flowers in May and June. The wood is light and tough, and in use for sandals, common furniture, doors, etc. The Australian tree is described under this name in Bentham's Fl. Aust. iii. p. 402, but it must be a different species. The size of the larger coadunate leaves of S. cordatus are often about one foot long and upwards of 8 inches broad.—*Beddome, Fl.*

their ligious festivals, and was used by the
rishi intoxicant. The rishi continued it
at their meals with beef. The Rig Veda, ix., says, the purifying Soma, like the sea rolling its waves, has poured forth songs, and hymns, and thoughts.—*Roxb.; W. Ic.; Voigt; Birdwood.*

Sarcostemma viminale, *R. Brown*, the Soma or Soma luta, is a plant of all British India, Sind, and Baluchistan. It is a leafless plant, resembling the Euphorbia tirucalli; flowers white in the rains. The natives tie the stems up in a bundle, and place them in the water-course of their wells for the purpose of preventing the attack of white ants.—*Riddell; Voigt.*

SARCOSTIGMA KLEINII, its oil, long known under the name of Poovana and Poovengah, is used largely on the western coast of the Peninsula of India as an external applicant in rheumatism. —*M. E. J. R.*

SARDAB. PERS. An underground room which the people of Baghdad occupy in the hot weather. Except in British India, most houses in the hot countries of the east are provided with subterranean chambers, called sardab (literally cold water), to which the family retire during the heat of the day. They are often furnished with the greatest luxury, and their refreshing coolness is increased by the play of fountains, and punkahs or large fans hung from the ceiling. This is the favourite place for the ladies' afternoon siesta.—*Ed. Ferrier, Journal*, p. 292.

SARDANAPALUS, of the Roman historians, was Assur-bani-pal, the son of Esarhaddon, and the greatest of the Assyrian monarchs, who reigned B.C. 67[illegible] to about 626.

SARDHANA, a town in the Meerut (Mirath) district of the N.W. Provinces of British India, in lat. 29° 9′ 6″ N., and long. 77° 39′ 26″ E.; pop. (1872), 12,466. Walter Reinhard, a soldier of fortune, better known by the name of Samru or Sombre, was a butcher by his trade, and a native of Luxemburg. He came to India as a soldier in the French army, and deserting that service, took employment with the British, where he attained to the rank of sergeant. Deserting again, he rejoined the French service at Chandernuggur, and on the surrender of that settlement accompanied M. Law in his wanderings throughout India, from 1757 to 1760. For the latter year, Law's party joined the army of Shah Alam in Bengal, and remained with the emperor until his defeat in 1760 at Gaya, by Colonel Carnac, in his attempt to reconquer Bengal from the nawab. Samru took refuge with a succession of new masters, and was ultimately presented with Sardhana, where he died in 1778, leaving the Begum Samru as his widow and heir. This lady, in 1834, devoted £15,000 to the foundation of a clergy fund and poor fund; and her name now stands first in Archdeacon Pratts' Endowments of the Diocese of Calcutta. The litigation connected with her property was not finally settled till more than a third of a century after her death.—*Imp. Gaz.*

SARDINE. ENG., FR., IT.
Sardellen, . . . GER. | Sardinas, ... SP.

The sardine fish of commerce is found in the Mediterranean, where its fishery employs a great number of people. In the Asiatic seas there are fishes of the same or allied genera. Engraulis meletta? is a small fish of the herring family at Tavoy and Mergui, which is nearly related to the common sardine.

The sardine of Penang is the Dussumieria

acuta, *Cuv. and Val.*, the Tambat Bulat of the Malays, also the Clupeonia perforata, the Ikan tamban of the Malays.

Sir J. E. Tennent mentions that Sardinella Neohowii, *Val.*, frequents the southern and eastern coast of Ceylon in such profusion, that in one instance, in 1839, 400,000 were taken in a haul of the nets in the little bay of Goyapanna, east of Point de Galle. As this vast shoal approached the shore, the broken water became as smooth as if a sheet of ice had been floating below the surface. S. lineolata, *Cuv. and Val.*, and the S. leiogaster, *Cuv. and Val.*, are found at Trincomalee, also off the coast of Java. Another Ceylon fish of the same group, a Clupea, is known as the poisonous sprat. The sardine has the reputation of being poisonous at certain seasons, and accidents ascribed to eating it are recorded in all parts of Ceylon. Whole families of fishermen who have partaken of it have died. Twelve persons in the jail of Chilau were thus poisoned about the year 1829; and the deaths of soldiers have repeatedly been ascribed to the same cause. An order passed by the Governor in Council in February 1824, after reciting that, 'Whereas it appears by information conveyed to the Government that at three several periods at Trincomalee, death has been the consequence to several persons from eating the fish called Sardinia during the months of January and [illegible]er, enacts that 'it shall not be lawful in that district to catch sardines during these months, under pain of fine and imprisonment.' This order is still in force, but the fishing continues notwithstanding. The poisonous fish of this family which occurs in the Asiatic seas, is, however, the Meletta venenosa.—*Tennent's Ceylon*; *Mason*; *Jour. Ind. Arch.*

SARD-SAIR. PERS. A term in use amongst the nomade races of Persia to indicate the locality to which they drive their herds in summer; the garm-sair is their winter quarters. In the south of Persia, a huge wall of mountains separates the garm-sair, or low region, from the sard-sair. Sard-sair signifies the cold region, but it is also termed the Sarhada, a word literally signifying boundary or frontier, but generally applied to any high land where the climate is cold, as on the high table-land of Persia. One of the most conspicuous of these is an abrupt lofty hill, named Hormooj, where coal occurs.

SAREE. HIND.

Shiali, ...	CAN.	Pudawi, ...	TAM.
Lugra, ...	MAHR.	Chira, ...	TEL.

The saree is the lower garment worn by most of the Hindu and non-Aryan women in India. It is, in fact, the national costume of almost all Hindu women. The Muhammadan women of Hyderabad in the Dekhan, Oudh, Rajputana, the N.W. Provinces, and the Panjab, and many Hindu women, whether secluded or otherwise, wear the voluminous petticoat, or gown, introduced by the Muhammadans; but from Rajputana southwards to Cape Comorin, Bengal, and Orissa, all adhere to the ancient national costume of the saree, and this article of woman's dress only varies with local taste as to colour, length, and breadth, and fineness or closeness of texture. It is an entire cloth, in many cases 18 yards long and about a yard broad; and the texture varies from the finest and most open character of muslin in Bengal and the south of India, to the still fine but closer texture of the Dekhan, Central India, and Gujerat. Sarees are of all qualities, to suit the very poorest as well as the very richest classes of society, the ordinary labourer and the princess, and are obtainable for 2s. each up to £100 of value. In the manner of tying and wearing this garment there is little difference anywhere. The cloth, which has one plain end, is passed around the loins, and the upper border tied in a strong knot; the cloth is then passed two, three, or even four times round the waist, to form a petticoat. A portion is then plaited neatly into folds, and tucked in before, so as to hang down in front to the instep, or even lower. The remainder of the cloth is passed across the bosom over the left shoulder and head, on which it rests, the ornamented ends falling partly over the right arm below the waist. In the south of India, however, the end does not pass over the head; it is drawn tightly over the left shoulder and bosom, and tucked in to the waist behind, or on the right hip. The ancient female costume of Egypt, a saree or single robe, appears to have been put on and worn in precisely the same manner without a bodice. Well-to-do women of the Dekhan and the south frequently wear a gold or silver zone, according to their circumstances, which, passing over all, confines the drapery to the waist in graceful folds. This zone appears unknown to the northward, but in many cases it is beautifully wrought, and extremely ornamental. The sarees are largely made of silk in Benares; but the multitude have them of cotton, some of [illegible] and silk, with borders of gold or silk. Each woman of a household usually gets a new saree once a year. The saree, with a small sleeved bodice, completes a lady's attire; the higher the class of the lady, the lower the saree will hang. Women of the labouring caste seldom wear the saree below their knees. In the Nagpur country every modest Hindu woman drapes one fold of her saree over her head, whereas, in the Konkan, respectable ladies have their heads uncovered. Gond women always keep the head uncovered; some of them wear chignons, and all wear jungle flowers in their hair on festivals.

The Mahratta women, and women engaged in labour, often make the saree take a very ungraceful form, by passing it between the legs, in which it assumes the appearance of tight trousers. Viscountess Faulkland (Chow-Chow, p. 7) describes a group of Bombay women, with their heavy anklets making a tinkling with their feet (Isaiah iii. 16), each with their saree folded over their heads and persons, and carrying little chubby children on their shoulders, or astride on their hips; and now these are lost to sight, and a fresh group appears, consisting of Hindu women of various castes, clothed in jackets and the sarees of divers colours, and wearing the chains and the bracelets, the ear-rings, the rings, and the nose-jewels (Isaiah iii. 19–21); one end of the saree forming a very voluminous kind of skirt or petticoat, the other end being drawn over the head and shoulders, somewhat in the style or form of a Maltese faldetta.

SARGASSUM BACCIFERUM, *Agh.*, or gulf-weed, covers all the Gulf Stream from lat. 22° to 36° N., and long. 35° to 65° W. It is in enormous quantity, floating in an eddy of the

nen and Persian slaves. In Khiva 0,000 families, all engaged in trade, uits, and rearing silk-worms. They rds, but are unwarlike, unacquainted agement of horses or the use of —*Cotton, Khiva; Cent. Asia; Vambery.*

SARUN, district in the Patna division of between lat. 27° 29′ and 35° 40′ N., 55′ and 85° 30′ E., bounded on the by Nepal, on the E. by Tirhut, on S.W. by the Ganges, and on the W. by Hts area, 6394 square miles; popula- about 1,000,000. Its chief civil station is a town built on the left bank of the ges, in lat. 25° 45′ N., and long. 84° 48′ E., 370 miles from Calcutta.

SASA. Tel. Pl. Sasalu. Grains of rice mixed turmeric or other colouring ingredients, is cast over the heads on auspicious occa-

ASALA TALA. Singh. Literally the shak- leaf; one of the names of the Bo Tree, the us religion. Its leaves are almost constantly purious.—*Forbes.*

ASANA. Sansk. Shasana, Tam. A stone or or copper plate on which memorial inscrip- s, grants to religious bodies, temples, etc., are raved; title-deeds, a royal grant.

ASARKUND is a pool in the Mahur jungle, re the Pain Ganga is said to be engulfed. Naikude Gond repair there in pilgrimage, in Chaitra, to a huge stone that rises in a e, and goes by the name of Bhim Sen, before h the Naikude Gond mingle with Raj Gond Kolam in worship. Towards evening the hippers cook a little rice, and place it before god, adding sugar. Then they smear the e with vermilion, and burn resin as incense, which all offer their victims, sheep, hogs, fowls, with the usual libations of arrack. The ari appears to be inspired, rolls his head, leaps dly about, and finally falls down in a trance, en he declares whether the god has accepted services or not. At night, drinking, dancing, beating tomtoms goes on, and in the morning return home after an early meal. Those ble to leave home perform similar rites beneath lahwa tree.

SASSAFRAS PARTHENOXYLON is a lofty ber tree growing in the forests of Sumatra. bark is rough and brown. The fruit has a g balsamic smell, and yields an oil, considered ful in rheumatic affections. An infusion of root is used in medicine. Sassafras bark of Lasiania (Atherosperma moschata; *Lab.*), used emote parts of the colony as tea, also affords essential oil.—*Eng. Cyc.*

SASSANIAN KINGS of Persia. The following the dates given in Dr. Smith's Dictionary, Dr. Mordtman's latest determinations of the alogical history of this race, who ruled in A.D. 226 to 632.

Smith. A.D.	Mordt. A.D.	
	226	Ardashir Babegan bin Sassan, or Artaxerxes.
	238	Shappuhr, Shahpur, or Sapor, captured Valerian.
	270	Hormuzd or Hormisdas.
	271	Bahram or Varanes I.
	274	,, ,, II.
	293	,, ,, III., Segan Shah.
294	291	Narse or Narses, conquered Armenia and Galerius.
303	300	Hormuzd or Hormisdas II.
310	308	Shahpur or Sapor II.
381	380	Ardashir or Artaxerxes II.
385	383	Shahpur or Sapor III.
390	389	Bahram or Varanus IV., Kerman Shah.
404	399	Yezdejird or Izdejerd I.
420	420	Bahram Gor or Varanes V., visited India.
448	440	Yezdejird or Izdejerd II.
458	457	Hormuzd or Hormisdas III.
458	458	Firoz or Perose, allied with Khakan of Huns.
484	485	Balas, Palash, or Balasces.
488	491	Kobad or Caodes.
498	498	Jamasp (Kobad recovers kingdom 502).
531	531	Khosru, Kesri (Nushirvan), or Chosroes.
579	571	Hormuzd or Hormisdas IV.; deposed by his general, Varanus VI. A.D. 590; M., A.D. 591.
591	591	Khosru Parvez, Kesri, or Chosroes II., put to death by
628	623	Kobad Shiruyieh or Siroes.
	629	Ardashir III., anarchy.
	629	Shariar or Sarbazas.
	629	Puran Dukht.
	631	Azermi Dukht.
	631	Ferokhzad Bukhtyar.
	632	Yezdejird or Izdejerd III., overthrown by Muhammadans 641.

This monarchy commenced in Persia in the year A.D. 226, when Artaxerxes overthrew the [illegible] of Parthian dynasty, and it continued until itself overturned by the Muhammadan khalifs in the year A.D. 632. The founder of the Sassanian dynasty died in 240. In his latter days a certain Arpog was king of China, one of whose sons, Mamkon by name, fled from home on account of a charge brought against him, and took refuge in Persia.—*Prin. Ind. Ant.* p. 13; *Thomas' Prinsep*, i. p. 302; *Yule, Cathay*, i. p. 84.

SASSETTI. Philip Sassetti, an Italian, visited India at the end of the 16th century. He studied Sanskrit, and noticed the resemblances between Sanskrit and Italian.—*Sayce*, i. p. 43.

SASTRA. Hind. An order, a command, a Hindu scripture, a religious work; Dharma Sastra, the code of Menu, or any book on law or science, religious books of the Hindus in general, and more especially certain philosophical systems, six in number. Also, as Sastri, a Hindu skilled in the Sastras, the literary title of a learned Hindu, as Ranganadam Sastri. It is written and pronounced Shastri, and in the south of India is the equivalent of pandit.

SATA, a clan of bards of Central India who are genealogists.

SATADRU or Sutudri, the river Sutlej.

SATAN, an evil spirit of the Jews, Christians, and Muhammadans. Shaitan, the Sathanos or Satan of Europe, was recognised by the Chaldees.

SATANI, 714,000 in number, are a sect of Hindus who to a great extent ignore caste distinctions. They are followers of Chaitanya, a religious teacher of the 15th century, and of his disciple Sanatana. They have views similar to those of the Baisnab reformers of Bengal. Many of them in Southern India worship Permalu, an incarnation of Vishnu, perambulate the street morning and evening, and accept alms from all but the lowest castes, often exacting the same by threats of burning themselves with a lamp. The temple servants are generally taken from the Satani. They are skilled in weaving flowers into

beautiful garlands. They are generally attached to the Vishnu temples; while the Pandarums are attached to the Siva temples. One of the Satani sects burn their dead; the other bury their dead in a sitting posture up to the head, then burst the head by throwing cocoanuts on it, and heap it over with earth.

SATARA, a town of the Bombay Presidency, in lat. 17° 41′ 25″ N., and long. 74° 2′ 10″ E., which gives its name to a revenue district, with an area of 5378 square miles. Early in the Christian era, Satara formed part of the dominions of the great Salivahana, whose capital was at Paitan, on the Godavery river. The Chalukya Rajputs next ruled the country, rising to their greatest power in the 10th century, and becoming extinct at the end of the 12th. The Jadhav rajas of Dowlatabad succeeded them for about a hundred years. The first Muhammadan invasion took place in 1294, and the Jadhav dynasty was overthrown in 1312. Two-thirds of the population consist of Mahrattas and Kumbi, who during the period of Mahratta ascendency (1674–1817) furnished the bulk of the armies. The Mawala, Sivaji's best soldiers, were drawn from the Ghatmatha (hill top) portion of the district. Brahmans, employed as priests or Government servants, are found in large numbers in the towns of Satara and Wai. Besides these, Vani, Dhangar, Ramusi, [illegible], and Mang are among the principal castes met with throughout the district. Satara was taken by the Indian army on 11th February 1818.

SATARUPA. SANSK. In Hindu mythology, the female half portion of the androgyne form of Brahma, framed out of one-half of Brahma's body; the type of all female creatures. The consort of Swayam-Bhuva.

SAT-DHARA, said to mean literally the hundred streams, is a group of Buddhist topes on the left bank of the Besali river, just below the junction of the Ghora-pachar river. The topes are two miles W.S.W. of the small village of Ferozpur.

SATHWARA, a humble tribe of the Bombay Presidency, similar in their habits and pursuits to the Kacheea.

SATI. SANSK. Good, pure; hence suttee, a good woman who immolates herself with the body of her deceased husband. The term is applied to a true and chaste wife.

SATI, a Hindu goddess, Siva's first wife, a daughter of Daksha. The gods whom Sati contained in her womb burst out; her limbs were scattered all over the world, and the places where they fell are become sacred. Her breasts fell near Jalandar in the Panjab, the yoni into Assam, and the guhya (podex) into Nepal, where they are worshipped to this day. The last is a small cleft in a rock, with an intermitting spring; it is called Guhyast'han.—*Wilford; As. Res.* vi. p. 477; *Moor*, p. 108.

[illegible]ATIN.

[illegible] . . . . GER. | Atalas, Intalas, . MALAY.
[illegible] . . . IT. | Setim, ... PORT.

fabric manufactured in Europe. A [illegible]oven, twilled silken fabric, with a [illegible]Satins are either plain or figured, [illegible]colours.—*Faulkner.*

[illegible]he Swietenia chloroxylon [illegible]od. It is hard, and when [illegible]ful, with a satiny lustre. It is much used for picture-frames, rivalling bird's-eye maple of America. It is occasionally used by cabinet-makers for general furniture, but it is liable to split. Satin-wood grows chiefly in mountainous districts of Southern India and Ceylon. It is abundant in the hills of the Vizagapatam and Ganjam Circars, though logs seldom exceed eight inches diameter. Very fine satin-wood occurs at Kutapatti, in the Tengrikottah taluk of Salem. It is used for mallets, also for the naves of gun carriage wheels, and is the best suited of all the Indian woods for fuses. The price is nearly the same as that of teak and black-wood. Colonel Frith mentions a satin-wood of Penang, of a straw colour, and a beautiful wood for ornamental furniture, etc.; but it is not known what satin-wood tree grows there. The best variety is the West Indian, imported from St. Domingo in square logs and planks from 9 to 20 inches wide; the next in quality is the East Indian, shipped from Singapore and Bombay in round logs from 9 to 30 inches diameter; and the most inferior is from New Providence, in sticks from 3½ to 10 inches square. The wood is close, not so hard as boxwood, but somewhat like it in colour, or rather more orange; some pieces are very beautifully mottled and curled. It was much in fashion a few years back for internal decoration and furniture; it is now principally used for brushes, and somewhat for turning; the finest kinds are cut into veneers, which are then expensive. The Nassau wood is generally used for brushes. The wood has an agreeable scent, and is sometimes called yellow sanders-wood. —*M.E.J.R.; Mr. Rohde, MSS.; Cleghorn; [illegible] J. Frith; Tredgold.*

SATNAMI, a monotheistic sect in the Central Provinces, who worship the Creator under the designation of Satnam, the pure name. The sect arose among the Chamars of the Ch'hattisgarh, Bilaspur districts, by the influence of Ghasi Das, one of their own number, who disappeared for six months, and on returning he explained to them how he had been miraculously sustained in the wilderness, how he had held communion with a higher power, and how he had been empowered to deliver a special message to the members of his own community. This message absolutely prohibited the adoration of idols, and enjoined the worship of the Maker of the universe without any visible sign or representation, at the same time proclaiming a code of social equality.

The movement occurred between the years 1820 and 1830, and nearly the whole Chamar community of Ch'hattisgarh now call themselves Satnami.

He died in the year 1850, at the age of eighty, and he was succeeded in the office of high-priest by his eldest son, Balak Das. They ignore Hindu festivals. As a rule, they are monogamists, though polygamy is not specially prohibited. Some forms of prayer collated from Hindu authors are said to exist among the teachers, but these are quite unknown to the people, and the only act of devotion which a Satnami practises is to fall prostrate before the sun at morn and eve, and exclaim, 'Satnam, Satnam, Satnam!' They will not even drink water except from one of their own caste, and liquor is prohibited. They are divided into two grand sections, the 'smokers' and 'non-smokers.' There is no class more loyal and

satisfied with British rule than this community. This movement had its origin at Girod, a small hamlet in the Bilaspur district, on the south bank of the Mahanadi, and on the borders of the Sonakhan estate. This class of deistical Chamars now numbers at least a quarter of a million. They are a thriving and industrious people, occupying a very important position as cultivators and village headmen in the Bilaspur district.

SATNARAMI, a religious sect of Hindus who settled near the town of Narnol, and about A.D. 1676, A.H. 1087, rose in insurrection in the time of Aurangzeb. They were principally engaged in trade and agriculture, and though generally peaceable they carried arms, and were always ready to use them in their own defence. In a quarrel with the police, one of their sect was beaten by a police soldier; his comrades retaliated, the affray spread till several thousands assembled, who defeated a body of troops sent against them, and took possession of Narnol. Two other bodies sent against them from Dehli were also worsted, and the belief arose that they were possessed of magical powers and bullet proof, while their enchanted weapons dealt death at every blow. Many of the neighbouring zamindars joined them, and the whole provinces of Ajmir and Agra were thrown into such confusion, that Aurangzeb, to restore order, thought it requisite to take the field against them, ordered his tents to be pitched, wrote verses of the Koran to be fastened to the standards as a protection against enchantment. The exertions of some chiefs at last induced the royal troops to make a stand, when the insurgents were defeated, and dispersed with great loss.—*Elphinstone*, 561.

SATPURA. This name is now generally applied to the mountain range or table-land which, commencing eastward at Amarkantak, runs nearly 600 miles up to the western coast of India, though the appellation seems to have been formerly restricted to that portion of the range which divides the Nerbadda and Tapti valleys. The Satpura range is known to Hindus as three portions, the most easterly being the Mykal, the centre is the Mahadeo, and only their western portion as the Injadri or Satpura. Chouragarh, 4200 feet above the sea, is the highest peak of the Mahadeo range. The Mahadeo portion culminates in the Pachmarri peaks, sacred to Mahadeo. From Rajpipla to Asirgarh consists of a belt of mountainous country, 40 or 50 miles in breadth, and of an average height at the crest of the chain, but little under 2000 feet above the sea, while many peaks rise above 3000, and some (and even some table-lands, as Turan Mal) are as high as 4000 feet. Nearly the whole of this range, both hills and valleys, consist of trap; but towards the west, along the northern boundary of Kandesh, a series of craggy peaks are met with, such as are but rarely seen in the trap region. Elsewhere the summit of the range is more or less a table-land. Just east of Asirgarh there is a break, through which the railway from Bombay and Kandesh to Jubbulpur passes, the highest part of which is only 1240 feet. This break leads from close to the junction of the two alluvial plains in the Tapti and Purna to a flat tract lying between the two Nerbadda plains. East of this break the trap hills continue till south of Hoshangabad, where sandstone and metamorphic rocks emerge and form a great portion of the hills of the Pachmarri and Betul country. There is a table-land of considerable extent round Betul, which extends far to the eastward beyond Chindwara and Seoni, and joins the high plateau of Amarkantak. Upon this plateau trap still predominates, and a great spur from it extends between the Tapti and the Purna, forming the northern boundary of Berar as far as the confluence of those rivers. This range is also of considerable height, in places nearly 4000 feet. Like most other ranges, it has no definite name, and is generally looked upon as a portion of the Satpura. The Satpura Hills divide the valleys of, and form the watershed between, the Tapti and Nerbadda, and the Satpura plateau is the true barrier between Northern and Southern India, and is the line on which the settlers from Hindustan met the emigrants from the Dekhan and Maharashtra, each of them pressing the prior non-Aryan races into the great natural fastnesses of Central India. In Hoshangabad are Bharia, Chamar, Gond, Gujar, Kunbi, Kurku, Lodhi, and Maria. In Maudla, Ahir, Baiga, Dher or Mhar, Dhimar, Gaoli, Gond, Kol, Kurmi, Lodhi, and Teli. In Nimar are Bhil, Bhilal, Dher, Gond, Kunbi, and Kurku; and in Seoni, Ahir, Bharia, Dher, Gaoli, Gond, Kurku, Mali, and Ponwar.

SATRAP. This term is familiar to the reader of the Grecian history of ancient Persia, with merely a softening of the initial letter, as Satrapa, the prefect of a province under the Persian system of government. It is an obsolete Persian title for the governor of a province. In Sanskrit it is a term obtained from one of the insignia of royalty, the royal umbrella, the Eka-ch'hatrya, the possessor of it being the Ch'hatra-pati, lord of the umbrella, a vaulted, horizontal umbrella, the exclusive privilege of royalty. It was under this title that the Persians, at a very early period, were in the habit of governing their numerous tributary provinces. The same system and the same denomination of satrap was adopted and retained by the Macedonian conquerors, alike when Greek or native officers were employed. And instances are frequent enough of the satraps assuming to themselves independence and a regal title. The satraps of the ancient Persian monarchy are not supposed to have extended across the Indus. It was in Alexander's time this limit was first transgressed; it was not long prior to the time when the Bactrian Greeks or the Parthians made themselves masters of Sind, Cutch, and Gujerat.—*Prin. Ind. Ant.* ii. p. 64.

SATR-SOWA, Myrtus communis, the myrtle; its leaves are eaten with black pepper to cure emissions that occur from debility.—*Genl. Med. Top.* p. 152.

SATRUNJAYA, or Palitana, a sacred mountain of the Jains in Kattyawar, about 30 miles from Gogo. Its name means victorious over the foe. From the earliest period of the Jain religion, spreading in Kattyawar, Satrunjaya has been one of the places held most holy by the followers of the Tirthankara. Rising in the midst of a vast plain, near the independent city of Palitana, in the S.E. corner of Kattyawar, this city of temples is reached by a difficult narrow road, and many stairs, on the side of which are built several small resting-stations and tanks. It is surrounded by fortifications, on which a few old guns are still mounted, and has ever been kept in such a state of constant repair, that it is now almost impossible

to trace remains which can safely be considered of the original structures. From the earliest mention of the place, embellishing and restoring seems to have been the work of its proprietors and projectors, and at the present date the same spirit animates Jains from all parts of India, and great care and labour are bestowed upon its numerous temples. One of the curious features of these restorations, is the application of a brilliantly white polished chunam to the outer side, and over every part of the stone-sculptured edifices, giving them the appearance of marble. Many of these temples are beautifully painted inside. Satrunjaya illustrates the Jaina custom of grouping their temples. They are in hundreds there, covering over the summits of two extensive hills. The smaller shrines line the streets; the larger temples are enclosed in 'tuks' or separate enclosures, surrounded by high fortified walls. A few yati or priests and a few servants are there to perform the daily services and keep the place clean, but there are no other residents there. The pilgrim goes up and returns. It is a city of the gods. The shrines are almost all the gifts of single wealthy individuals. Some are as old as the 11th century, but the largest number have been constructed since the early part of the 19th century. See Architecture.

SATTAN, a name of the Hindu god Ayenar, and not identical with Satan of the Bible.

SATTATHAVAN, a Vaishnava sect [redacted] south of India, who are to the Vaishnav[redacted] the Vira Saiva are to the Saiva. They are [redacted] sellers, minstrels. See Satuni.

SATTU or Saktu. HIND. The flour or farina of parched grain of roasted barley or of pulse.

SATURN, in the sidereal theology, was represented by Bel.

SATURNIA. *Schrank.* A genus of insects belonging to the order Lepidoptera and the family Bombycidæ. The antennæ are fringed in the male; the head is small; the wings are very broad and entire; the palpi and trunk are wanting. The genus Saturnia includes now the Pavonia of Hubner, the Phalæna attacus, *Linnæus*, and part of the genus Bombyx of Fabricius. To this genus, also, some of the largest of the Lepidoptera belong; but S. atlas, the giant atlas moth, which has wings measuring 7 or 8 inches across, is now named the Attacus atlas. This species also, with S. cercropia and A. lunula, have their wings produced into a tail. The cocoons of A. cynthia and S. mylitta are used in India for the production of silk. Latreille states that these are the wild species of silk-worm of China. A. cynthia is the Arrindi silk-worm of India. S. promethia, a North American species, forms its cocoon within the leaf of a sassafras tree, having previously fastened the stalk of the leaf to the stem by a strong silken web, whereby it is prevented from falling with the other leaves.—*Westwood; Linn. Trans.* vii. See Silk-worm.

SATYA-GUNA. SANSK. The quality of truth, purity, and wisdom. Satya-loka, the region of truth, or Brahma. See Guna; Loka.

SATYASI, Chourasi, groups of 87 and 84 villages, resembles the English 'hundreds.' Satyasi, or 87, is a very frequent group; 84 is supposed to be the number of solar months in the year by the number of days in the week, $12 \times 7 = 84$.

SATYAVAMA and Lakshmi, wives of Balaji, an incarnation of Vishnu. These two [redacted] are generally seen with him as w[redacted] avatara of Krishna.

SATYAVATI, mother of Krish[redacted] Dwaipayana, and wife of king Santana. Bhishma [redacted] the son of king Santana by the holy river goddess Ganga, and hence called Santanava-Gangaya, and Nadi-ja or river born. Also Tala Ketu or palm banner. His life was one of self-denial, devotion, and fidelity. He adopted a bachelor life, and abandoned his right of succession to the throne, in order to allow of his father's marriage with Satyavati. She bore two sons to his father, each of whom succeeded to power.

Bhishma obtained for the younger, Vichitra Virya, two daughters of the king of Kasi, but he died young and childless, on which Bhishma arranged that Krishna Dwaipayana, who had been born of Satyavati prior to her marriage with king Santana, should raise up seed to his half-brother. Two children were born, Pandu and Dhritarashtra, whom Bhishma brought up, and acted for them as regent of Hastinapura, and he also directed the education of their respective children, the Pandava and the Kaurava. In the war of succession which followed, he took a part, and on the tenth day of the fight he was unfairly wounded by Sikhandin, and pierced with many arrows from the bow of Arjuna, and died 58 days afterwards.—*Dowson.*

[redacted]VRATA or Satyvrata is the Noah[redacted]uft of [redacted] He is mentioned in the [redacted]iliar [redacted]ived a warning of [redacted]ions coming deluge, [redacted]rm of an injunction [redacted] take with him into [redacted]seven rishi or sa[redacted]ward all medicinal herbs, every variety of seeds, [redacted]ing pairs of all brute animals. Satyavrata acted [redacted], this, and when the flood abated, Vishnu descended with to the earth in the form of a tortoise, and [redacted] of Mount Mandara on its back, the gods churned [redacted] scalp ocean, and obtained the fourteen precious [redacted]pping ducts, and amongst them medicines and [redacted] henceforth bestowing Dhanwantari.—*As. Res.* iii., [redacted]., viii., and

SATYAYOGA, or Golden Age of the Hindu [redacted]tory is thus described: [redacted]own,

> 'O lovely age, by Brahmans fam'd, [redacted]s of
> Pure Setye yug in Sanskrit nam'd! [redacted]; for
> Delightful! Not for cups of gold, [redacted]to a
> Or wines a thousand centuries old; [redacted]her-
> Or men, degenerate now and small, [redacted]in-
> Then one and twenty cubits tall. [redacted]the
> Not that plump cows full udders bore, [redacted]the
> And bowls with holy curd ran o'er: [redacted]his
> Nature then reigned, and Nature's law [redacted]kes
> When females of the softest kind [redacted]dle
> Were unaffected, unconfined; [redacted]his,
> And this grand rule from none was hidden,
> What pleaseth hath no law forbidden.'

SATYRIUM CUCULLATUM. *Thunb.* [redacted]pkins S. bicorne, *Thunb.* | Orchis bicornis, *Linn.* [redacted] the

A plant of the Cape of Good Hope introduced into Bengal. S. Nepalense is the Phung of Resi-Bhot race. [redacted]rica,

SAUDA, a celebrated poet who wrote in Hin[redacted]er-He was born at Dehli about the end of the [redacted]code century. His name was Mirza Rafai. He [redacted]which at Lucknow in the times of nawabs Saadat [redacted] still and Asof-u-Dowlah, and had the literary title [redacted]es a Malik-us-Shura. [redacted]chief

SAUR. HIND. A bull liberated. See [redacted]which [redacted]hotsarg. the

SAURA, a drink in use in the N[redacted]ob[redacted]unity obtained from one of the palms. [redacted]and

or Saora, a forest race on the moun- Eastern Ghats. Saura is supposed to from Surya, identical with Sol, the worshipper.

ATA or Saura, Hindu worshippers of he sun-god. A sect of limited extent significance.

SHTRA, an ancient name of the f Gujerat, which is supposed by nningham to have been lost in A.D. the successors of the Sah kings were by the Vallabhas, and the capital m Junagarh to Vallabhi. In ancient owever, the peninsula of Gujerat was n as Saurashtra, and under this name ned in the Mahabharata and in the It is called Surashtrene by Ptolemy thor of the Periplus, and its people are bly intended by Pliny under the cor- of Suarataratæ or Varetatæ, properly

dil is a sterile jungly tract in the rth-west of the Saurashtra peninsula, s about 13,000 inhabitants. These are Their only important places are the u site of Dwaraka on the west coast, a small island a few miles to the north, boasting of scarcely inferior holiness. , as also Umreyli in Kattyawar proper, r in South Kattyawar, are under the of the Gaekwar. In 1803, 1858, and in 1859, they repulsed British troops, but they seemed entirely dispersed or surren- Kattyawar is rich in jungle fastnesses. occasion, the rapidity and severity of the ance, in the escalade of the stronghold of pirates of Dwaraka by the British force the Hon. Colonel Lincoln Stanhope, induced ano, the chief of the Badhail of Beyt, to sue ms, and he agreed to surrender Beyt and to at Aramra on a stipend furnished by his ain, the Gaekwar.

e Wagher of Dwaraka, who, with the ail of Aramra, were so long the terror of seas, are a spurious branch of the Jhareja y of Bhooj, one of whom, called Abra, with gnomen of Muchwal or the whiskered, from mendous pair of these adjuncts to the face, from Cutch in the time of Rinna Sowa, in se family he intermarried, and from whom he in charge the tha'na or garrison of the castle onti or Dwaraka. His son had offspring by mas of impure caste, and they assumed the of Wagher, with the distinctive office of or gem. The last four chieftains of this were Mahap-Manik, Sadul-Manik, Sameah- , and Mulu-Manik, who, with all his kin and y company of Wagher, Badhail, Arab, etc., a desperate defence, was slain in the storm empted retreat. Throughout the sea-coast rashtra, at Gogo and Mandavie, are seamen ail themselves Hindus, but who keep entirely ot from all other classes. Some of them a descent from the mariners of the Arabian , but still as Hindus. The Badhail fixed selves in the district of Oka (Okamandala) e migration of Seoji from Kanouj.—*Tod's* ls, pp. 220, 440, 441; *Rajasthan*, ii. p. 14.

USSUREA, a genus of plants of the order posite; 13 species occur in the Himalaya and of India.

S. gossypina. In East Nepal, at the summit of the Wallan Choon pass, at an elevation of 16,748 feet above the sea, the plants gathered by Dr. Hooker near the top of the pass were species of Compositæ, grass, and Arenaria; the most curious was S. gossypina, which forms great clubs of the softest white wool, six inches to a foot high, its flowers and leaves seeming uniformly clothed with the warmest fur that nature can devise. Generally speaking, the alpine plants of the Himalâya are quite unprovided with any special protection of this kind; it is the prevalence and conspicuous nature of the exceptions that mislead, for the prevailing alpine genera of the Himalaya, Arenarius, primroses, saxifrages, fumitories, ranunculi, gentians, grasses, sedges, etc., have almost uniformly naked foliage.—*Hooker*, *Journ.* i. p. 225.

S. lappa, *Bentham*, is the Haplotaxis lappa, *Decaisne*. It is a perennial plant of Kashmir, and its aromatic root has been supposed to have formed part of the costus of the ancients.

SAVA or Saveh, a town in Persia lying between the towns of Kazvin and Isfahan. This is supposed to be the ancient Saba, whence the three magi took their departure when they proceeded to adore the infant Jesus at Bethlehem.

SAVA, eldest son of Rama, the ancestor of the Balla, a Suryavansa race of Rajputs.

SAVANDRUG, a hill fort in the Bangalore district of Mysore, locally known as the Magadi Hill, 4024 feet above sea-level; lat. 12° 55′ N., and long. 77° 21′ E. It consists of an enormous mass of granite, standing in a base 8 miles in circumference.—*Imp. Gaz.*

SAVANORE or Sanore. Its chief is a Pathan, whose ancestor, in 1750, was one of the three Pathan Muhammadans who conspired against Nasir Jung.

SAVINGS BANKS. The Indian Government sanctioned a scheme for the transfer of savings banks from local treasuries to the post-offices. Thus, 3800 savings banks will be established throughout India.

SAVU ISLAND. Its S.E. point is in lat. 10° 37′ S., and long. 122° E., and is 18 miles long. Savu and Rotti are small islands to the west of Timor, and very remarkable as possessing a handsome race, with good features, resembling in many characteristics the race produced by mixture of the Hindu or Arab with the Malay. They are certainly distinct from the Timorese or Papuan race, and must be classed in the western rather than the eastern division of the Archipelago.—*Wallace*, ii. p. 277.

SAWUNTWARI, a Native State about 200 miles south of Bombay city. Area, about 900 square miles, and population 190,814 in 1872, and 174,433 in 1881, mostly Hindus. A dialect of Mahrati, known as Kurauli, is spoken. The Mahrattas and Mhars are favourite recruits for the Bombay native infantry regiments. This state is ruled by the Sawants, hereditary deshmukhs of Wari, near Goa; they are of the Bhonsla family. In 1709, the British opened relations with Phond Sawant, nephew of Khem Sawant, who in 1707 received from Sahoji a deed confirming him in full sovereignty. In 1730 the British and Phond concluded a treaty against Kanoji Angria, the piratical chief of Kolaba. In 1738 Phond was succeeded by his grandson, Ramchandra; in 1755 Ramchandra's

son Khem succeeded, and his 48 years' rule, till his death in 1803, was one long war with various Mahratta chiefs, and with the Portuguese. In 1765 the British sent a force against him, and he ceded Vingorla and Fort Reree. Being childless, his widow adopted Ramchandra Bhao, who was murdered in 1807. He was succeeded by Phond, who died in 1812, and the regent, Durga Bai, forcibly seized districts belonging to Kolhapur, and during the war with the Peshwa, she supported his cause; but a British force was sent to reduce the country, and in 1819 a treaty was agreed upon, ceding the whole line of the sea-coast. In 1830, and again in 1832, the British had to aid Khem Sawant to suppress rebellions.

SAWUR. MALAY. A very beautiful and useful wood of Java; the colour resembles that of mahogany, but the grain is closer, and it is more ponderous; its chief use is for handles of tools for carpenters and other artificers, for machinery, especially for the teeth of the wheels of mills, and other purposes where a hard and durable wood is required. On account of its scarcity, it is uniformly cut down in Java before it arrives at the necessary size for cabinet-work. Forests of it grow on the hills of Bali, opposite the Javan shore, whence it is brought over by boat-loads for sale.

SAXIFRAGACEÆ. *D. C.* The saxifrage [illegible] Hydrangia, [illegible] splenium, Ciamitis, Adamia, Saxifraga, Chrysos[illegible]age, the Tiarella, Astilbe, and Vahlia. A saxif[illegible] of the Shih-hu-wei and Ngo-puh-shih-ts'ao Chinese, an acrid plant, grows near water; it has small yellow flowers, and is recommended in all diseases of the senses and great orifices of the body; it acts as an emetic and diaphoretic.

Saxifraga ligulata, *Wall.*

Makhan, . . . BEAS.	Bat pia, . . . JHELUM.
Shap rochi, . . CHENAB.	Popal wat phula, KANGRA.
Kurgotar dharposh, ,,	Saprotri, . . . RAVI.
Banpatrak, . . . ,,	Til kachalu, Shiblack, ,,

Cultivated in the Himalaya. Root given in honey to teething children; leaves used by Hindus as food platters.—*J. A. Murray.*

Saxifraga stenophylla, *Royle.*

Fairy-hair, . . . ENG. | Mu-i-pari, . . . PERS.

So named from its numerous thread-like stolons, in which and its general appearance it closely resembles the Saxifraga flagellaris of Melville Island.

SAYANA, the headman of a hill village in the N.W. Himalaya.

SAYANACHARYA, a man of high station and a deservedly celebrated scholar, who wrote a commentary of the Vedas. He was brought up at the court of Vira Bukka Raya, raja of Vijayanagar, in the 14th century A.D.

SAYANI CHANDRA SEKHARA, author of the Madhurani Ruddha, a drama in eight acts; the style has considerable merit.—*Wilson.*

SAYER. ARAB. Literally travelling; but in the fiscal system of India applied to the transit duties levied on goods passing from one district or one territory to another. It was finally abolished in 1834, 1837, and 1844, in the three presidencies of Bengal, Bombay, and Madras. The transit duties in Madras amounted to £310,000 sterling a year.

SA-y-NORONHA. Constantine de Sa-y-Noronha and all his army of 1500 Portuguese and 20,000 natives were destroyed by the king of Kandy in the early part of the year 1632.

SBANGJA. HIND., TIB. Moss tea, a substitute for real tea.

SCABBARD. For these, the people of the East Indies set a great value upon the skin of a fish which is rougher than a seal-skin. Upon the back of the fish there are six little holes, and sometimes eight, somewhat elevated, with another in the middle, in the form of a rose; and the more those holes grow in the form of a rose, the higher value they put upon them. Tavernier had seen ten thousand crowns given for a skin.—*Tavernier's Tr.* p. 151.

SCÆVOLA TACCADO. *Roxb.* Grows on the Coromandel coast and deltas of Indus and Ganges. It is eaten as a pot-herb. Artificial flowers from the pith of its stem and branches are made by the Malays.

SCALIE, of Cuttack, the fibre of a gigantic twining plant, common throughout the forest jungles of the district. It is used for cordage, and is made into twine for mat-making and roofing purposes.

SCALLOP. Jula, HIND., Kashkul, PERS. The fakir's dish, made of a half sea-cocoanut shell. Speaking of a child of unknown parentage, the phrase is, Fakir-ke-jhulay men tukra kon dala Who threw the portion into the fakir's sca who can tell?

SCALPING. All Hindus retain only the t hair on the crown of their heads, which is fan to Europeans from the pictures and descrip of North America, as the scalp of the Indians y, if not the *sole* re the most glorious tropl practice of we of their victor. The Hin this scalping tuft, Shik'ha, SANS Kudi mai, TAM., was doubtless brought them from Scythia; for, like the India North America, the Scythians cleaned the and hung it to their horses' bridles. Sca is generally supposed to be a peculiarly N American practice that originated in High North-Eastern Asia. But the father of hi says, 'Of the first enemy a Scythian sends he quaffs the blood; he carries the hea all that he has slain in battle to the king when he has brought a head, he is entitled share of the booty that may be taken,—not o wise; to skin the head, he makes a circular cision from ear to ear, and then, laying hold o crown, shakes out the skull; after scraping of flesh with an ox's rib, he rumples it betwee hands, and, having thus softened the skin, n use of it as a napkin; he appends it to the b of the horse he rides, and prides himself on for the Scythian that has most of these skin na is adjudged the best man, etc. They also us skulls for drinking-cups.'

The Abbe Em. Domenech (Seven Years' dence in the Great Deserts of North Am xxxix.) quotes the decalvare of the ancient mans, the capillos et cutem detrahere of the of the Visigoths, and the annals of Flude, prove that the Anglo-Saxons and the Frank scalped about A.D. 879. Abbe Domenech rel conversation between two warriors. Is it a who speaks to Mahto-totia? See the scalp w hangs from the bit of my horse, answered Scheyenne. The scalp fastened to the extre of a pole was placed in the conqueror's cabin;

on days of parade or battle, in front of the cabin. The chiefs suspend it to their horses' bridles.

SCAMMONY.

Sukmoonia, . . ARAB.	Purgirwinde, . . GER.
Scammonium, DA. DU. SW.	Scammonea, ... IT.
Scammonee, ... FR.	Pessya smert, . . . RUS.
Skammonien, . . . GER.	Escamonea, ... SP.

Scammony, the Sukmoonia of the Arabs, is found in the bazars of India; it is the product of Convolvulus scammonia, a native of Syria, the Levant, and Gujerat. The most abundant harvest of scammony is in Smyrna and Aleppo. There are several modes of collection, which give rise to corresponding commercial varieties.

SCARFS of fine muslin form part of the dress of most of the Hindu castes, and are worn suspended from the neck to about the middle of the thigh. They are largely manufactured in many parts of India. Dehli scarfs are of Kashmir cloth or net, embroidered with silks of various colours. Those of black cloth, black net, embroidered with white or gold-coloured floss silk, are the most chaste and beautiful. The art was introduced into Lahore and Dehli by Kashmir artisans, and Muhammadans are employed on it.

SCARLET MITE, or Red Spider, is the Acarus telarius or Gamasus telarius, an insect which envelopes the leaves of the coffee plant in a delicate, closely-woven web, which so checks the respiration that the plant becomes dry and withered.

SCEPTRE, the Ch'hari of the Hindu rulers, a long rod with an iron spike on it, often placed before the gadi or throne. Ch'hari mazbut t'ha, 's rod was strong, is a familar phrase, which might be rendered, his sceptre is firm.—*Tod's Rajasthan*, i. p. 410.

SCHIEFNER. F. A. von Schiefner was an authority on Finnish, edited Castren's grammars of Samoyedan and similar languages, and translated the northern epic, the Kalewala. He worked with great results among the mysterious languages of the Caucasus, and helped General von Uslar in his discoveries in the ethnology and philology of that region. But his speciality was Tibetan. The Russian Government became possessed of copies of two editions of the Kah-gyur, one of the two collections of sacred books of Tibet, which run to 100 or 108 volumes folio; the companion encyclopædia, the Tan-gyur, consisting of 225. From the first of the seven divisions of the former group, Professor Schiefner extracted all the legends and stories. They correspond to the stories of the Panchatantra, of the Russian collections of folk-lore, of Æsop, and of the Brothers Grimm. Thus the opening tale of King Mandhatar and his immoderate wishes is the same as Grimm's Fisherman and his Wife; that of Kusa is much like Beauty and the Beast; the Clever Thief is a variation of the well-known story told by Herodotus of the treasure of Rhampsinitus. One of the best stories is that of Visakha, a clever and virtuous girl, whose ways of helping people out of difficulties are innumerable. Among her decisions is one between two wives who are claiming possession of a son, an exact counterpart of the Judgment of Solomon. The story of Susroni and her magic lute is akin to those of Orpheus, Amphion, and the Pied Piper of Hamelin; and the humiliations of Madri, the wife of the princely Visvantara, are an anticipation of those of patient Griselda. The similarity of the short animal stories to Æsop and other western collections, is apparent, the chief differences being purely local, the jackal taking the place of the fox, the lion of the wolf, and so forth. Most of them, however, deal with monkeys, who live in bands of five hundreds under a chief, wise or foolish.

SCHIMA WALLICHII. *Choisy.* A valuable timber tree of Darjiling, India, growing up to 5000 feet. It attains to 100 feet in height.

SCHIZODACTYLA MONSTROSA. *Westwood.* The great cricket or carpenter insect, the Jheengoor, HIND., is about 1½ inches long and the thickness of a man's little finger; bores cylindrical passages in garden grounds, and issues at night, filling the air with a whizzing kind of chirp. It nips off the stems of the plants near its hole. It is destroyed by pouring water in, and killing it as it is escaping.

SCHIZOSTACHYIUM BLUMEI. *Nees.* A lofty bamboo growing in Java at 3000 feet. Other species occur in Madagascar, China, the Philippine Islands, and in the S. Sea Islands. S. brachycladum, *Kurz*, of the Sunda Islands and Moluccas, has stems 40 feet high and very hollow. S. elegantissimum, *Kurz*, of Java, from 3000 to 6000 feet, grows to 25 feet, and flowers in the third year. S. Hasskarlianum, *Kurz*, of Java, and S. serpentinum, Gigantochloa aspera, alter, maxima, and robusta, afford the best kinds of bamboo vegetables, in the young shoots as they burst out of the ground.

SCHLAGENTWEIT, three brothers, Herman, Robert, and Adolphe, who were employed from the year 1855, to report on the physical geography of India and High Asia. They collected and published a vast amount of information. Adolphe, the youngest, was murdered at Kashgar by its fanatic ruler, Wali-Khan. At the time of his journey, Yarkand was occupied in force by a Syud chieftain of one of those predatory bands with whom the Chinese are continually at war, named Dilla Khan or Zullat Khan. Soon after reaching the city, Dilla Khan met with a severe defeat from the Chinese forces, and was obliged to retire. A. Schlagentweit finding himself disappointed in this direction, took the resolution of going to Kashgar, at that time occupied by another Syud chieftain, named Wali-Khan. This man was possessed of considerable power on the borders, and was honoured by the title of Pir. On arrival near the camp of this chief, Adolphe pitched his tents at the distance of a cos, and sent forward Muhammad Amin to notify his advent. In a little time a person came over, who forthwith proceeded to take an inventory of the traveller's property. His arms were also demanded, and surrendered. He was then compelled to go to Wali-Khan's camp, and on remonstrating appears to have been summarily beheaded with a sword. This was about the 26th August 1857.

SCHLEGEL, A. W. VON, a Sanskrit scholar, who in 1823 published an edition and Latin version of the Bhagavat Gita, and in 1829-38 two volumes of the Ramayana, with a translation of the first volume.

SCHLEGEL, FRIEDRICH, a poet and learned Sanskrit scholar, in 1808 published The Language and Wisdom of the Indians. He laid down that the languages of India, Persia, Greece, Italy, Germany, and Slavonia form one family.—*Sayce*, i. p. 49.

This tree grows in the warmer parts of Ceylon, also in Coimbatore; common in Canara and Sunda, is not uncommon in the Dundele forest and in the forests of the South Konkan, is common in those of the North Konkan, is said to be very abundant in the Govavery forests, and abundant in Burma. It is found in greatest perfection on the banks of the Sitang in the Karen forests above Tounghoo; but is also found throughout the Pegu and Tounghoo forests in abundance, more particularly the latter. It is also found along with teak in Tharawaddy and Prome forests. A cubic foot there weighs 70 lbs.; grows in all the valleys and outer ranges of Kamaon. It occurs rarely, wild, in the Siwalik tract up to the Beas, and on the eastern verge of the Panjab. It produces a red, strong, hard, and heavy wood, which is used to make pestles, spokes for cart-wheels, and other purposes where much strength in small space is required, and as crushers for sugar, rice, and oil mills, screw rollers for sugar mills, cotton presses, etc., and the axle-trees of carts and ploughs. The seeds yield an oil which is used for burning, and from the young branches a considerable quantity of lac is gathered. The fruit is sometimes quite smooth, but occasionally armed with prickles. It ripens in May, and its pulpy aril is of a very agreeable acid taste. The bark is astringent, and is used rubbed up with oil by the natives to cure the itch. —*Roxb.; Voigt; Wight; Gibson; Brandis; Thw.; Thomson; Cat. Ex.*, 1862; *Mr. Rohde; Beddome.*

SCHMIDELIA, a genus of plants of the order Sapindaceæ; several species occur in the E. Indies. Sch. acuminata, *Thw.*, a small tree of Galagama, in Ceylon, on the banks of streams, at an elevation of 2000 to 3000 feet. Sch. allophylla, *D. C.*, a small tree, a variety of which grows at Ambagamowa and Hinidoon districts of Ceylon, up to an elevation of 3000 feet; another variety grows in the Central Province, at an elevation of 2000 to 5000 feet. Sch. hispida, *Thw.*, a small tree, grows in the Ambagamowa district of Ceylon at an elevation of 1000 to 2000. Sch. dentata, *Wall.*, occurs in Assám and in Chittagong, and Sch. glabra, *Roxb.*, and Sch. villosa, *Wight.—Roxb.; Voigt; Thw.*

A large timber tree, a native of the valleys of the mountainous parts of the Rajamundry Circars, the Nullamallay range, the Balaghat mountains, the Thull Ghat near Bhewndy, Jowar, the Central Provinces, and the Hala mountains, west of the Indus. Its wood is of a grey or yellowish colour, very close grain, heavy, and durable. It is much employed by weavers for beams and for many other purposes of their looms. It is said not to be liable to warp or bend; and was recommended by Roxburgh as a substitute for box, in the manufacture of mathematical instruments.—*Roxb.; Beddome; Major Pearson.*

SCIÆNA, a genus of fishes. S. aquila (Maigre of the French, and Umbrina of the Romans, Corvina, is found in the Mediterranean. S. pama or Pharnal pana of Buchanan resembles the maigres, but having a singular natatory bladder. When twelve inches long, fifteen inches long, it is called whiting at Calcutta, and furnishes a light diet. It is caught in great abundance at the mouths of the Ganges, but never ascends higher than the tide.

SCLAVE nations comprise the old Sclavonic, Russian, Servian, Croatic, Wendic, Slovak, and Pole. They were the Sauromatæ of the Greeks, and the Sarmatæ of the Romans; a nation living on the Don and near the Caspian Sea. They spoke a faulty Scythian dialect.

The Scythic warrior of Central Asia, the intrepid Getæ, admitted no meaner representative of the god of battle than his own scimitar. He worshipped it, he swore by it; it was buried with him, in order that he might appear before the martial divinity in the other world as became his worshipper on earth. And to the present day the sword of the Rajput continues to be worshipped.

SCLERIEÆ. *Nees.* A section of the Cyperaceæ or sedges. Two species of Scleria occur in British India. One, a very long sedge, grows by the water in the river Surma near Sylhet, and is used for thatching. Boat-loads of it are collected for the Calcutta market, also immense rafts of bamboo 100 feet long.

Scleria lithosperma, *Willd.*
S. tenuis, *Retz.* | Scirpus lithospermus, *Linn.*
A sedge of Ceylon, the Peninsula of India, and Bengal.

Scleria tesselata, *Willd.*; S. biflora, *Roxb*, a sedge of Ceylon, Peninsula of India, Bengal, and Nepal.—*Hooker's Him. Jour.* ii. p. 327.

SCLEROSTYLIS ATALANTIOIDES. *W.*
Limonia bilocularis, *Roxb.* | Arawi-nim, . . . TEL.
This small tree or shrub, one of the Citraceæ, is found in the Circars. Its wood is yellow, and is always very small, but is very hard, and might be used as a substitute for box.—*Roxb.*; *Beddome.*

Sclerostylis rotundifolia, *Thw.*, a small and not common tree, growing in Ceylon at an elevation of 4000 feet and upwards.—*Thw.*

SCLEROTIUM STIPITATUM. *Berk. et Curr.* The Puttu kai or Puttu manga of the Tamils, from Puttu, a white ant-hill, and Manga, a mango, and Kai, fruit. Mail manga, TAM., from Mail, dry, like sticks, leaves, etc., and Manga, a mango. On the western coast, where it rains for at least six months in the year, this fungus is occasionally to be met with in dark crevices, and in the recesses of rocks and caves; also in old and deserted ant-hills, and frequently after the insects have become winged. They are found only in the peripheral and more superficial caverns, springing from their roof, occasionally from the floor, never from the cells occupied by the ants. Some grow with long stalks, others are sessile; in those having stalks they can in a few be traced beneath the soil, while the sessile ones seem simply to lie over the soil. They attain the greatest perfection during, or immediately after, the rains. They take on a variety of forms, being oval, oblong, pyriform, irregularly round, etc. The external rind is black and slightly wrinkled; on cutting into it, the interior is found to be white and pithy, and is compared by the natives to the kernel of a tender cocoanut. It is tasteless and inodorous. The Malayalam Vythians believe it to be manufactured by the insects themselves, by a kind of accretive process, and that snakes are very fond of it, and devour it greedily. Snake-charmers collect the Puttu manga, and take it round for sale, and they give out that they keep a supply always on hand with which to feed their snakes. The Vythians eagerly seek it, and use it as a remedy in cholera, syphilis, and a variety of other diseases. In cholera it is prescribed as a specific by rubbing it up with a little water and ginger juice or country arrack; and the dose repeated after every motion or act of vomiting.—*Dr. John Shortt.*

SCOLOPACIDÆ, a family of birds of the order Grallatores or waders, comprising 16 genera and 33 species, as under:—

1 Ibidorhyncus, curlew.	1 Calidris, sanderling.
4 Totanus, greenshank.	1 Philomachus, ruff.
3 Actitis, sandpiper.	1 Phalaropus, stint.
6 Tringa, stints, knot.	1 Scolopax, woodcock.
1 Terekia, sandpiper.	1 Macrohamphus, godwit.
2 Limosa, godwit.	6 Gallinago, snipes.
2 Numenius, curlew.	1 Rhynchæa, painted snipe.
1 Eurinorhyncus, stint.	

This family of birds is interesting to the Indian sportsman. The woodcock is everywhere rather scarce on the plains of India. It is found on the Neilgherries, occasionally on the plains of the Peninsula, and has now and then been met with near Calcutta. Some incline to the opinion that woodcocks may not be so rare, being commonly overlooked in their jungle haunts. The birds called woodcock seen at the dinner-table are

rally greenshanks (Totanus glottis), and sionally the black-tailed godwit (Limosa cephala). Two distinct species in the Hima- are commonly confounded under the name litary snipe,' and both are very different from Gallinago major of Europe and Northern Asia, ich has not been observed in the East Indies. the other Indian kinds, one, Gallinago solitaria Hodgson, is peculiar to the Himalaya, and to s species the designation 'solitary snipe' ould be restricted. It is readily known by its hite belly and yellowish legs, wings longer, raighter, and more acuminated than in the ther, and the upper plumage more minutely peckled, with the pale linear markings on the ack narrower, and the tail also longer. Average easurement, 12½ inches by 20 in expanse of ngs; closed wing, 6½ inches; and tail, 3 inches. eight, 5 to 6 oz., or even more. The other, G. moricola, of Hodgson, should be distinguished the wood-snipe, and is more of a woodcock in earance and habits, though keeping to the skirts of the jungle. Though principally a alayan species, it is not rare in the Neilgherries, it has been met with in various parts of the ntry, and in the Calcutta provision bazar. s species has blue legs, and the under parts uniformly barred throughout; the general uring dark, and the markings bold; the gs more bowed and rounded than in the other, the tail shorter. It is only found, remarks Hodgson, in the haunts of the woodcock, with difference in its manners, that it is averse to interior of woods. Length, 12½ inches by 18 xpanse of wings; closed wing, 5½ inches; and 2½ inches. Weight, 5¼ to 6½ oz. and upwards. he 'grass snipe,' also known as the pin-tailed e (G. stenura), is distinguished by a duller nage than the common British snipe, and cially by the curious series of pin-feathers on er side of its tail; whereas the other has an-shaped tail, altogether different in form. pin-tailed is the common snipe of the Malay ntries, but not of Australia, the Australian Australis) being a much larger bird, with rmediate form of tail, as in the solitary and d snipes of British India. In Bengal G. ura is the more abundant species, early and e in the season, as the common or British snipe luring the height of the cold weather; but so ly as on the 30th August, one was bought from bazar in a bundle of pin-tailed snipes, and sequently the pin-tailed only, in considerable ndance. Nothing is more easy than to dis- uish the two species by the shape of the tail, a practised eye will generally tell them at the glance; yet very few sportsmen in India are re of the difference.

he little jack-snipe (G. gallinula) is much in its arrival, though numerous species of ll waders arrive from their breeding haunts re the end of August. The jack-snipe has a quite different from that of any of the others; rilliancy of plumage it excels all the rest.

here is a small and distinct species of wood- in the Malay Archipelago, the Scolopax rata of Horsfield.

he woodcock, identical with the British, has n obtained in the Tenasserim Provinces; it unds in the Himalaya, is less common in the lgherries, and is considered a rare bird in the mountains of Ceylon. On the Bombay side it is said to be far from common in the Mahabaleshwar.

Of the sub-family Scolopacincæ or snipes, the East Indian genera and species are as under:—

Gallinago gallinula, *Linn.*, *Sykes*, *Jerdon*, *Blyth*, *Gould*, is the jack-snipe. It breeds in the northern regions; it is found in most parts of India, in the cold weather coming later and departing earlier than the common snipe. It prefers thicker coverts, lying very close, and is difficult to flush.

The common snipe breeds in the northern regions, but is a winter visitant to India, arriving in small numbers in the N. of India early in August, and in numbers by the end of September and through October. They are occasionally seen in the Calcutta market early in August, and in that of Madras by the 25th of that month. In Upper Burma, Dr. Jerdon noticed them towards the middle or end of July. Dr. Adams says it breeds there, which Dr. Jerdon doubts. They frequent marshes, rise with a hissing call, fly against the wind, and occasionally alight in a ploughed field.

Gallinago solitaria, *Hodgson*, *Blyth*, the Himalaya solitary snipe, found as yet only in the Himalaya, in winter, up to 3000 to 6000 feet, but probably belongs to Tibet.

Gallinago stenura, *Temm.*

Rhynchæa Bengalensis, *Linn.*, *Sykes*, *Jerdon.*

R. Capensis, *Linn.*	R. picta, *Gray.*
R. orientalis, *Horsf.*, *Hardw.*	

The painted snipe is a permanent resident in some parts of India, breeding in June and July in thick marshy ground, but is found through-

out Africa, British India, Ceylon, Burma, and Southern China.—*Jerdon, Birds of India; Horsfield and Moore, Cat.; Indian Field.*

SCOLOPENDRIUM, one of the filices or ferns used in medicine in India. Its rhizomes or dried leaves are sold under the altered name, Iskoolikundrioon. Those of Polypodium are called Bulookunboon. The Asplenium radiatum, mohrpunkhee, or peacock's fan, is employed by the natives probably as an anthelmintic.—*O'Sh.*

SCOLOPIA CRENATA. *Wight, W. A. Prod.*

Phoberos crenatus, *W. A.* | Flacourtia crenata, *Wall.*
P. lanceolatus, *Wight, W.* | Hillerloo of the Badaga.

This tree is very common on the Shevaroys, Neilgherries, etc. It is a first-rate wood, and, although white, is very hard and dense. It resists the saw, and injures tools; planks are said to twist. Phoberos lanceolatus, *W.*, has the leaves narrower and more shining, but does not differ otherwise.—*Beddome, Fl. Sylv.*

SCOMBRIDÆ, a family of fishes of the section Acanthopterygii, of which the common mackerel may be regarded as a type. The tunny, sword-fish, dory, boar-fish, pilot-fishes, and the king-fish also belong to this group. The body is generally covered with small scales; the tail is usually very powerful and deeply cleft. In most of the species the pectoral fins are long, narrow, and pointed; the dorsal fins are two in number, the foremost of them being composed of bony rays; the hinder dorsal is chiefly supported by soft rays, and is often divided into numerous small false fins. They are provided with numerous cœca, and these are often united in clusters. The sword-fish, Xiphias gladius, *Linnæus*, is an inhabitant of the Mediterranean and Atlantic, occasionally visiting the British coast. It measures from 10 to 15 feet in length. Its body is lengthy and covered with minute scales, the sword forming three-tenths of its length. On its back it bears a single long elevated dorsal fin; there are no ventral fins. The tail is keeled. The lower jaw is sharp; the mouth without teeth. The upper part of the fish is bluish-black, merging into silver below. The sword-fish is said to attack the whale, wounding it with its beak. There are many well-authenticated instances of the planks of ships being perforated by the upper jaw of this powerful creature, which, it has been supposed, occasionally attacks the hulls of ships by mistake for the whale. Specimens of ships' timber penetrated by its sword are preserved in many museums. The Xiphias is mentioned by Aristotle (Hist. Anim. viii. p. 19), who notices the fact of its striking vessels. The young fish is said to be good eating. When very young, the body is covered with small tubercles, which disappear before it attains the length of three feet. Naturalists arrange the family Scombridæ as under:—

First Group.—Scombrina.

12 Scomber.	13 Thynnus.	5 Pelamys.
12 Auxis.	9 Cybium.	1 Naucrates.
1 Elacate.	10 Echeneis.	1 Hypsiptera.

Second Group.—Nomeina.

1 Gasterochisma.	2 Nomeus.	2 Cubiceps.
1 Neptomenus.	1 Platystethus.	1 Ditrema.

Third Group.—Cyttina.

6 Zeus.	2 Cyttus.	? Oroeosma.

Fourth Group.—Stromateina.

9 Stromateus.	3 Centrolophus.

Fifth Group.—Coryphænina.

6 Coryphæna.	4 Brama.	1 Ta
4 Pteraclis.	3 Schedophilus.	1 Di
1 Ausonia.	1 Mene.	1 La

Scomber pelamys, *Linn.*, the bonito, [illegible] mackerel tribe, inhabits the southern [illegible] is often caught by hook and line. It [illegible] sembles that of raw beef, and when [illegible] inviting.

Scomber thynnus, *Linn.*, the alb[illegible] length from 3 to 6 feet, is an inhab[illegible] southern seas; the back is bright p[illegible] golden tint; eyes large and silvery, [illegible] with a play of iridescent colours.—*Be[illegible] Eng. Cyc.*

SCOPARIA DULCIS. *Linn.* Nat[illegible] part of the world within the tropics; [illegible] India, particularly near the sea. Used [illegible] in ague.—*Voigt*, p. 507.

SCOPOLIA PREALTA. *Dun.*

Belenia prealta, *Dne.*

Sholar bajar bang, CHEN.	Lang, Tang,
Nandru, Dandarwa, ,,	Khardag,

Common in waste ground in parts of [illegible] basin from 6800 to 9500 feet in [illegible] Spiti, and to 16,000 feet in Tibet, and [illegible] found sparingly in Trans-Indus, in th[illegible] perhaps the same plant in one place [illegible] In the hills the leaves are applied to [illegible] also said to be poison, the mouth s[illegible] their touch, and the head and [illegible] affected when they are eaten. A man [illegible] poisonously affected by eating the plant gath[illegible] in the Lahore habitat; and the Negi of La[illegible] when at Leh in 1867, suffered from its nar[illegible] effects for two or three days, some of its le[illegible] having been gathered by mistake with his sa[illegible] greens. At the same time they can hardly [illegible] very poisonous to all animals, for in [illegible] are browsed by cattle. Dr. Christison st[illegible] that this has the same property of dilating [illegible] pupils as belladonna.—*Stewart; Powell; Cleg[illegible]*

SCORODOPRASUM BORNCENSE. Bawa[illegible] utan, the wild onion fruit of Borneo. It is li[illegible] walnut.—*Burbidge.*

SCORPÆNA RUBER, or great fire-fish[illegible] eaten by the native fishermen. Its fl[illegible]sh is wh[illegible] solid, and nutritive.

SCORPION. Eng., Fr.

Aqraba, Am-aryat,	ARAB.	Scorpio,	It.,
T'siuen-hieh,	CHIN.	Escorpion,	
Okrab,	HEB.	Teru, Telu,	
Bichu,	HIND.		

The scorpion is one of the Arac[illegible]ida, or Pedi Palpi and family Scorpionidæ, eight-legg[illegible] air-breathing, articulate animals, comprising ne[illegible] spiders, scorpions. In some parts of the Dek[illegible] scorpions are very numerous in open plains, liv[illegible] in holes about nine lines in diameter. On occasion the plain at the Gor-Nuddi, used parade ground for the Poona Horse, was fo[illegible] pierced in every direction with scorpion ho[illegible] perhaps not a foot of ground but had one of th[illegible] and in every one was a scorpion. It was a [illegible] curious sight, perhaps not rare in India, tho[illegible] unseen or unnoticed. The boys tapped [illegible] ground near, to cause a few particles of san[illegible] fall down on the scorpion, on which it w[illegible] appear at its opening, and the sharp end of a de[illegible] horn was thrust below to prevent its re[illegible] They were then tied together and made to fi[illegible] The scorpion has a curved sting at the end of

gene[illegible]e sharp point of the sting be cut off, occa[illegible] cannot wound or hurt. Scorpions ægea[illegible] hot countries of both hemispheres, live lay[illegible] ground, conceal themselves under stones [illegible] other substances, most commonly in ruins, thick[illegible] cool places, and often in houses. They who with considerable swiftness, curving the tail Over the back; this they can turn in every direc- of[illegible], and use for the purposes of attack and defence. When irritated, they draw back the shawed palpi for the purpose of defending the head, and at the same time curve the tail on the back, prepared to strike at any moment. Most Asiatics have a quite unnecessary dread of their sting. May you be stung by a scorpion of Cashan, is a common malediction in Persia. With their forceps they seize various small insects, on which they feed after having pierced them with their sting, and they are particularly fond of the eggs of spiders. The pain suffered from the scorpion's sting seems to depend more upon the temperament of the sufferer than any other cause; some suffering much agony, occasionally terminating in death, while others become only slightly agitated. The remedies employed are the volatile alkali, chloroform used externally and internally, and, Internally, ipecacuan in form of a paste. The favourite remedy now in the United States is the celebrated 'Usky care,' which, under the form of arrack, with the addition of the case of a scorpion sting with a small piece of chewed tobacco, was known for the cure of Mr. fifty years to the British soldier in India. The Linn., the great black scorpion of the Deccan, is as large as a little cray-fish; its sting in general causes a little inflammation. Small birds struck by a scorpion tremble, stagger, soon fall down, become convulsed, and die. It is said that a scorpion, if surrounded by fire so as to be prevented escaping, stings itself to death. Infested districts seem to have been common in Palestine and Mesopotamia, as in Numbers xxxiv. 4; Joshua xv. 3; Judges i. 36; 1 Maccabees v. 3. The males are smaller than the females; the penis is double, and placed near the combs; the females have two vulvæ; during copulation they are placed upon their backs. They are ovoviviparous, bringing forth 40 or 60 in number, and gestation lasts for a year.—*Eng. Cyc.*; *Burton, The City of the Saints*, p. 493; *Wallace.*

SCORPION FISH, Saccobranchus fossilis.

SCORPION SPIDER. Species of the genus Galeodes, or scorpion spiders, occur in Central Asia, Tartary, and in the Himalaya. The scorpion spiders common on the steppes, are the Galeodes araneoides (Phalangium araneoides of Pallas). The Galeodes (or Solpuga) are dreaded for their bites, reputed to be envenomed; but this is now denied by naturalists. This very formidable and most pernicious spider is a terrible pest on the Astracan steppe, where its bite is much dreaded by the Kalmuks, who call it the 'black widow (bel-befsan charra). They harbour chiefly under the tails of wormwood, and about the bones which in halways to be found near a Kalmuk habitation, T also at the mouth of the deserted nests of the coelmophilus citillus, where they collect a sort of satu of leaves. Camels seem to suffer most from The spiders, because they are most addicted to being on the ground.

abo Galeodes vorax, *Hutton*, of Northern India, Ne[illegible] at night on beetles, flies, and even large lizards, sometimes gorging itself to such a degree as to become almost unable to move, and remaining torpid and motionless for about a fortnight. A sparrow, as also a musk-rat (Sorex Indicus), put along with it, were killed by it. It was seen to attack a young sparrow half-grown, and seize it by the thigh, which it sawed through, then caught the bird by the throat, and put an end to its sufferings by cutting off its head. Dr. Baddeley confined one under a glass wall-shade with two young musk-rats (Sorex Indicus), both of which it destroyed. In neither instance did the galeodes devour its prey after killing it. Capt. T. Hutton, in the eleventh volume of the Asiatic Society's Journal, p. 860, makes mention of a lizard bitten by one being allowed to escape with only a severe wound on the side, and as it lived for some days before being permitted to run off, the bite of the galeodes would not appear to be poisonous.—*Gosse*, pp. 237, 238; *Tenn. Ceylon*, p. 470; *Capt. Hutton, in Jour. As. Soc. of Ben.* xi. part ii. p. 860.

SCORPION, TAILLESS. Three species of the tailless scorpions have been noticed in Ceylon, all with the common characteristics of being nocturnal, very active, very minute, of a pale-chesnut colour, and each armed with a crab-like claw. They are Chelifer librorum, *Temp.*, Ch. oblongus, *Temp.*, and Ch. acaroides, *Herm.* The latter species has certainly been introduced from Europe, in Dutch or Portuguese books.—*Tennent's Ceylon.*

SCORZONERA HISPANICA, *Linn.*, is an annual from the south of Europe, sown in India either in beds, broadcast, or planted out in rows at a distance of a foot apart; has a long milky-juiced root; grows without any difficulty after the rains. The root when boiled and dressed is rather a delicate vegetable. It comes to perfection in three or four months. Salsafy, the black scorzonera, requires the same treatment. Two species occur in the Himalaya. In China, the Meh-mentung is a species of scorzonera, called viper's-grass; its root is eaten as a vegetable.—*Jaffrey; Smith.*

SCOTLAND is supposed to be mentioned in the Puranas. On the east coast of Scotland are many megalithic monuments, several of which bear sculptures of serpents, while others, apparently of almost equal antiquity, bear the cross.—*Darwinism in Morals*, p. 189.

SCOTOPHILUS, a genus of bats, of which the species are Sc. Coromandelianus, falcatus, fuliginosus, fulvidus, Hodgsoni, leisleri, lobatus, pachyomus, pumiloides, serotinus. They are of the family Noctilionidæ.

Sc. Coromandelianus, *Fr. Cuv.*, is a very small bat, not much larger than the humble bee, and of a glossy black colour.

SCOURING-LEAVES, of the Actæa aspera and A. spicata of China, are used for cleaning pewter vessels.

SCREENS, the tatti of Europeans in India, are made of fragrant or other grasses, and are suspended over the house doors and windows, and wetted with water, to cool the interiors. In China, glazed and varnished papers are largely used for screens. In Japan, the Ama-do is an outside sliding shutter. Fu su-ma are sliding paper screens. The shoji is a sliding screen with translucent paper.

SCREW PINE, Kaldera bush, Umbrella tree.

Vacoa of Mauritius,	Fr.	Thaium, Thalay, .	Tam.
Keora, ...	Hind.	Thalay mazali, . .	,,
Sithay nar, . .	Tam.		

The screw pine, the Pandanus odoratissimus of botanists, grows in Africa, Madagascar, Bourbon, the Mauritius, Ceylon, in the Peninsula of India, Burma, and Malayana, being very common along the sea-coast. The leaves are used for making mats, baskets, and hats; there are extensive manufactories of these articles at Pulicat, Cuddalore, and several other localities. The leaves, as soon as gathered, have the spines stripped off their edges, the dorsal nerve is stripped off, and the leaf divided into slips of the breadth proper for the use for which they are required. The fibre of the leaf is white, soft, and pulpy, but possessed of little strength. It appears to be a good material for the preparation of paper, but ill suited for cordage. The aerial roots are much used as coarse brushes for whitewashing houses; when beaten with a mallet they open out like a soft brush. The tender white leaves of the flower yield a delightful fragrance.—*M. E. J. R.*

SCROPHULARIACEÆ. *Lind.* The fig-worts, a natural order of plants, very widely diffused over the surface of the earth, being found in the whole range of climate between the poles and tropics. 36 E. Indian genera and 166 species are known:—

1 Vebascum.	Scoparia.	5 Lindenbergia.
1 Celcia.	12 Linaria.	12 Stemodia.
8 Scrophularia.	1 Antirrhinum.	7 Limnophila.
3 Mazus.	5 Pterostigma.	3 Buchnera.
3 Mimulus.	3 Bonnaya.	1 Sutera.
5 Herpestis.	9 Vandellia.	7 Buddlea.
Curanga.	6 Torenia.	1 Hemiphragma.
3 Dopatrium.	2 Artanema.	Gerardia.
2 Peplidium.	8 Striga.	

SCULPTURES. Monuments, decorated buildings, and sculptured texts have been the principal modes which the various rulers and their wealthy subjects have adopted to perpetuate their edicts, their names, and fame. The history of the ancient races in all the south of Asia is to be read in their sculptures, and that of Egypt, Assyria, Babylonia, and British India is being daily added to by means of relics which are being exhumed after an interval of 2000 or 3000 years. The Jews were forbidden to make the likeness of anything in the heavens above, or on the earth beneath, in order to bow down and worship it. But with the Egyptians of old, and with the Hindu and Buddhist religionists now, the art of sculpture is the very pillar of their religion; the priests in every temple first made (and still make) their god, and then worshipped it; as in Exodus xx. 4, the Egyptians worshipped figures of the sun as Ra, and of the stars as the other gods, as also images of men, beasts, birds, and fishes; but the earliest examples of Indian sculpture are to be seen in the rails of Budh Gaya and Bharhut of the age B.C. 250 to 200. Elephants, deer, and monkeys are better represented there than in any sculptures known in any part of the world; so too are some trees, and the architectural details are cut with an elegance and precision which are very admirable. The human figures, too, are truthful to nature, though differing from the European standard of beauty and grace, and where grouped together combine to express the action intended with singular felicity.

In the first century of the Christian era, there arose in the extreme N.W. of India, in the Panjab, and to the W. of the Indus, a school of sculpture strongly impregnated with the traditions of Greek art, and which continued to flourish there for the first five centuries of the Christian era. What the Buddhists were to the architecture of Northern India, that the Greeks were to its sculpture. Greek faces and profiles constantly occur in ancient Buddhist statuary, and particularly pure in the Panjab. Proceeding southwards from the Panjab, the Greek type begins to fade. Purity of outline gives place to lusciousness of form. In the female figures the artists trust more to swelling breasts and towering chignons, and load the neck with constantly accumulating jewels. Nevertheless the Grecian type long survived in Indian art. It is perfectly unlike the coarse conventional ideal of beauty in modern Hindu sculptures, and may perhaps be traced as late as the delicate profiles on the Sun Temple at Kanarak, built in the 12th century A.D. on the Orissa shore. Borrowing an impulse from Greek models, the Buddhist sculptors, at the commencement of the Christian era, freed themselves from the oriental tradition, which demands only the gigantic and the grotesque, and imitated nature with some success. But with the revival of Brahmanism, Hindu sculpture again degenerated, and it possesses a religious rather than an æsthetic interest.

In the 4th and 5th centuries, at Amraoti, a school of sculpture was developed partaking of the characteristics both of those of Central India and of the west, and the degree of art displayed by sculpture there may be regarded as the culminating point attained by that art in India. In the subsequent sculpture of the early Hindu temples and later Buddhist caves, it has lost much of its higher æsthetic and phonetic qualities, and frequently resorts to expedients of doubling the size of principal personages, and of distinguishing gods from men by giving them more heads and hands than ordinary beings. This is done with considerable vigour and richness of effect in the temples of Orissa and Mysore; and in the south of India some of the most remarkable groups and statues continued to be executed down to the middle of the 18th century. But though the technic art of architecture continues to be practised with considerable success, their paintings and sculptured decorations excite only feelings of dismay, the result of the deterioration of moral and intellectual power.

Many of the Vaishnava temples all over India are disfigured by obscenities, and those in the temples of the Lingaet sect, between the Tumbudra and the Godavery, are unexampled; but the Saiva shrines are generally free from all such, though at Khajuraho in Bundelkhand is one with gross obscenities.

General A. Cunningham believes that the Buddhist sculptures of the Indo-Scythic period, found in the Eastern Panjab at Shahbazgarhi, show traces of Grecian art. In all Indo-Greek sculptures, whenever a face is partly turned to one side, that side is invariably cut away to nearly flatness, so as to give a deeper shadow to it and a greater prominence to the unaverted side. There are also fine specimens of Indo-Corinthian pillars. He thinks the great mass

of them belong to the most flourishing period of Indo-Scythic rule under Kanishka and his immediate successors, or from B.C. 40 to A.D. 100. The beauty of some specimens is great. Athene with spear and helmet, now in the Lahore museum, may date as early as B.C. 80.

The Indo-Persian style prevailed over the whole of Northern India, both before and after the Christian era. Its prototype is to be found in the famous pillars of the Achæmenian palaces at Persepolis and Susa. In the N.W. of India, it was supplanted by the three different styles of Greek architecture, by the Indo-Corinthian in the Kābul valley, by the Indo-Ionic in Taxila, and by the Indo-Doric in Kashmir. But no specimens of these styles have been found to the east of the Sutlej, whereas the Indo-Persian style was spread over the whole of Northern India, from Kābul to Orissa, and from the banks of the Ganges to the source of the Godavery. Numerous specimens of it may be seen in the [illegible]lptures of Bharhut, Gaya, and Sanchi, and in the [illegible]ual pillars of Mathura, Nasik, Bedsa, and Orissa. [illegible]he Hoisala Bellala temple at Somnathpur is [illegible]ple, the cells with their sikras being attached [illegible] a square pillared hall; elegance of outline [illegible]l marvellous elaboration of detail characterize [illegible]se shrines. The great temple at Baillur has [illegible]ery solid vimana, with an anterala or porch, [illegible]l stands on a terrace about 3 feet high and [illegible] to 15 feet wide. It was erected by Vishnu [illegible]rddhana, to commemorate his conversion by [illegible]manuja from the Jain to the Hindu faith. [illegible]t Hullabid is the small shrine of Kait Eswara, [illegible]ered with sculptures of the very best class of [illegible]ian art. The great double temple there rises [illegible]feet from the terrace, but was left uncompleted. [illegible]is built of indurated potstone, erected in a [illegible]ck, and sculptured afterwards. On the terrace [illegible]nds a frieze of elephants, above it a frieze of [illegible] Sherdala conventional elephants, the emblems [illegible]the Hoisala Bellala; then comes a scroll of [illegible]nite beauty, and over it a frieze of horsemen [illegible]l another scroll, over which is a bas-relief [illegible]ut 700 feet in length, of scenes from the [illegible]nayana, representing the conquest of Ceylon, [illegible]l all the varied incidents of that epic. At [illegible]ther part are figures of all the Hindu Pantheon; [illegible]ahma occurs three or four times, Siva with [illegible]rvati on his knee is repeated fourteen times, [illegible]shnu and his avatars still oftener. All that [illegible]wild in human fancy, or warm in human feeling, [illegible]found portrayed on these walls.

[illegible]n the architecture of Southern India, a sculp[illegible] of frequent occurrence are groups of the [illegible]; a monster of the lion type is represented [illegible]pling on an elephant, or a warrior sitting on [illegible]aring horse, his feet on the shields of foot [illegible]iers, sometimes slaying men, sometime tigers, [illegible]th of them barbarous monstrosities.

[illegible]liya stones over the graves of those who [illegible] fallen in battle, and Sati stones, are common [illegible]ujerat and Cutch, and the Paduka or foot [illegible]ptures on the monuments of Sadhus, are [illegible] numerous. The older Paliya are sculptures [illegible]wing the style of dress and warlike accoutrements of olden times,—chain armour, horses in mail, bows and arrows, swords of various shapes, shields, javelins, etc. etc., and not unfrequently the names of the reigning princes with dates, as that of Lakha Phulani at Adkot.

The sculptures in Kashmir, at Sanchi, Benares, Amraoti, Madura, Trichinopoly, Tanjore, and Mahaballipuram have attracted much notice, as also have those in the cave temples at Ellora, Ajunta, Elephanta, and the edicts of Asoka at Girnar and other places.

The Amraoti sculptures belong to a period of 300 years later than those of Sanchi, and the topes illustrate the faith at their date. In the Amraoti sculptures are numerous priests and other signs of a clerical order segregated from the laity and of an established ritual. Sanchi is illustrative of the Hinayana Buddhist philosophy, 500 years before the oldest Buddhist book; and Amraoti illustrates the Mahayana philosophy, 800 years after its promulgation.

The sculptures on every ancient temple in India throw some light on the subject of old costume. These are probably considerably within the Christian era, and they furnish specimens of the local costumes of 1000 years ago; but many temples in the south and west of India, as also in Gujerat and Orissa, etc., are known to belong to periods as early as A.D. 500. But although groups of figures are numerous beyond description, their attire seems to be entirely conventional. Men for the most part wear head-dresses in the form of conical crowns richly covered with ornaments; their bodies are naked, and their breasts and arms show necklaces and armlets of very ornate patterns. From the loins to the knee or middle of the thigh, they have in most instances kilts, as it were, also composed of ornaments; and many are altogether nude, both male and female, with a girdle of ornamental pattern round the loins. These figures abound among the sculptures of Ellora and to the 13th century; also upon the Cholla temples at Conjeveram and elsewhere, probably of the same era. In the Jain sculpture the male and female figures are invariably naked, but ornamented in general with necklaces, bracelets, armlets, and zones of exceedingly intricate and beautiful patterns, in imitation, probably, of the chased gold work of the period.

Some of the men's figures on the temples of the south of India are clothed with defensive armour, and there is no trace of a sewn garment. The men's figures have short waist-cloths or dhotis, like kilts, with an end in some cases cast over the shoulder; the women are in the same costume; but both in the earlier memorial stones and on some of the profuse sculpture on the temple at Hullabid in Mysore (Dhara Samudra, 10th to 12th century A.D.), they wear bodices, tied in front, as Hindu women wear them at present.

The best representations of ancient costume in India are the celebrated fresco paintings in the caves of Ajunta. In the Buddhist caves of Ellora some paintings in a similar style had been executed; but they were destroyed by the Muhammadans when they invaded the Dekhan early in the 14th century, and it is extraordinary that those of Ajunta escaped their iconoclastic and fanatic zeal. They did escape, however, and for several years Major Gill, of the Madras army, was engaged by Government in copying them on their original scale. It is difficult to decide the date of the Ajunta paintings, which represent scenes in Buddhist history; and the series may extend from

the first or second century before Christ to the fourth and sixth century of our era. In either case they are upwards of 1000 years old. One very large picture, covered with figures, represents the coronation of Sinhala, a Buddhist king. He is seated on a stool or chair, crowned with a tiara of the usual conventional form; corn, as an emblem of plenty and fertility, is being poured over his shoulder by girls. He is naked from the throat to the waist. All the women are naked to the waist; some of them have the end of the cloth, or saree, thrown across the bosom, and passing over the left shoulder. Spearmen on foot and on horseback have short waist-cloths only. In another large picture, full of figures, representing the introduction of Buddhism into Ceylon and its establishment there, all the figures, male and female, are naked to the waist. Some have waist-cloths or kilts only, others have scarfs, or probably the ends of the dhotis thrown over the shoulders. Female figures in different attitudes around, are all naked, but have necklaces, ear-rings, and bracelets; and one, a girdle of jewels round.

Later structures have been raised by Muhammadans. In Northern India the best buildings date from the 12th to the 16th century (A.D. 1193–1554). They were erected during the Pathan domination, and are contemporaneous with the best period of European art, that is of the Christian era. The epoch which witnessed the architectural glories of Rouen and Chartres, of Paris under Philip Augustus, of Rheims, Loan, and Noyon, of Troyes and Dijon, participated in the triumphs—only tempered by a low degree of civilisation—of Pathan warriors, who, justly ambitious to perpetuate the conquest of the Hindus, employed their subjects to erect for them a series of buildings in the capital of Dehli, which are among the most remarkable in India. No isolated monument, at least of the 13th century, exists anywhere to equal in beauty, strength, or dimensions the celebrated Kūtub Minar; and the magnificent range of arches which form part of the ruins of the Great Mosque, as the Kūtub, are only less beautiful, from certain defects of construction, than the pointed openings of Christian cathedrals, which, however, they rival in colossal proportions. The 14th century—in France almost barren of art reminiscences, owing to foreign invasion and intestine wars—is remarkable as the epoch when English art first acquired its individuality. At the same period, a like individuality was growing out of the many buildings erected by the Hindus for their Muhammadan masters. In striking contrast with the delicate ornament of Netley, Tintern, and Melrose, with the fortifications of many an English city, and the spires of many an English church, are the mausoleum of Taghalaq Shah, the city he erected and called after his name, the villages of Kirkhee and Begampur, the Jumaat Khana mosque, and the tombs around it, all of which display a stern simplicity, more characteristic of the Anglo-Saxon than the native mind, as well as knowledge of construction and power of execution, combined with mathematical precision in the application of building materials to their logical uses. The arrangements introduced to supply the wants of the ruling race, and the skilful adaptation of an indigenous method of building to the manners and customs of the Muhammadan, are as astonishing as they are successful. In the 14th century neither European nor Asiatic sacrificed utility to beauty; they sought to adorn the parts of their construction, never to construct their ornament. To them a dome was the outward and visible expression of its internal shape; if a kiosk was introduced, it was to crown a staircase, add weight to an angle, or to serve some other useful purpose. Marble was legitimately employed to cover a dome or a kiosk, to form a border to an archway inscribed with sentences from the Koran, or in perforated screens exquisitely carved. It is possible to 'read' such buildings; they are sermons in stones, they are works of art. The plains of Dehli disclose little to mark the 15th century. A mosque full of details of marvellous originality, and other buildings created by Humayun, the gateways of Arab ki serai, and many a nameless sepulchre, fairly represent the 16th; though Humayun's tomb discloses a falling off in knowledge of constructive principle. The works of Akbar, in the 17th century, present a host of ideas to inquiring men astonished to find so many proofs of bodily vigour and masculine intelligence such as it seems difficult to ascribe to an Indian population.

But the era of the European renaissance exhibits in the north-west of India a still more remarkable spectacle. There rose in the city of Agra a building of white marble, which [illegible] at sunrise or sunset, in the heat of the day, or by chill moonlight, conveys to the eye harmonies of grace and beauty such as no painter or architect of skill can seize, no painter or architect define. Forgetting that the dome is as false as it is evil, that a so-called symmetry is obtained at the expense of propriety and sense, and that a style of mosaic which should serve to decorate the boudoir is unfitted for the exterior of a colossal mausoleum,—the Taj Mahal remains the most magnificent architectural effect to be found in the whole world. The men of the 17th century who created it were artists in the highest sense of the word, but they were content to please the eye, while their predecessors of the 14th aimed at satisfying the mind also.

A raised platform, 313 feet square and [illegible] feet high, faced with white marble, has at each corner a minaret 133 feet in height. In the centre stands the mausoleum, a square of 186 feet with 33 feet 9 inches of its corners cut off. The centre of this is occupied by the principal dome 58 feet in diameter and 80 feet in height, under which is an enclosure formed by a screen of fretwork of white marble. Within this, in its centre, is the over tomb of Mumtaz Mahal, and on the side that of Shah Jahan, the tombs being in vaults immediately below. In every angle of the building is a small domical apartment, [illegible] storeys in height, 26 feet 8 inches in diameter. All the spandrels, all the angles and more important architectural details, of pure white marble, and the tombs and screens are inlaid with agates, jaspers, bloodstones, combined in wreaths, scrolls, and frets, exquisite in design and beautiful in colour.

Aurangzeb ordered a structure over his daughter Rabia at Aurangabad, and in the beginning of the 19th century an imitation was erected at Lucknow.

The black-ground mosaics at Dehli are similar

to the Florentine mosaics, and are thought to have been introduced by Austin of Bordeaux, a jeweller who was much employed by Shah Jahan. The mosaics on a white ground are to be seen in the buildings of Lahore, Dehli, Agra; the Taj Mahal and the palace of Shah Jahan, at Agra, contain the most numerous and finest examples. They resemble the white ground mosaics of Europe, as seen in trays, tables, and fancy-work.

Austin or Augustin de Bordeaux executed a mosaic of Orpheus or Apollo playing to the beasts, after Raphael's picture, which was in the throne-room there. It was brought to London to the India museum.

The Indians owe their knowledge of the pietro-duro art of inlaying in precious stones to Florentine artists. Up to the erection of Akbar's tomb at Sikandra, in the first ten years of Jahangir's reign, A.D. 1605–1615, there are numerous mosaics in coloured marble, but no sample of inlay. In the tomb of Itimad-ud-Dowlah, A.D. 1615 to 1628, both systems are in perfection. In the Taj and the palaces at Agra and Dehli, built by Shah Jahan, A.D. 1628–1668, the mosaic has disappeared, being entirely supplanted by the inlay.—*Fergusson*, pp. 33, 362, 388, 405, 588, 596; *Cunningham*, v. viii; *Burgess; Mor. and Mat.*, [illegible].

SCUTELLARIA, a genus of plants of the order Labiaceæ, section Scutellarieæ. Handsome plants when in flower, adapted for the front of borders; the colours are purple, yellow, red, or blue. S. viscidula is the Hwang-k'in of China; the roots and seed are used medicinally.

S. Colebrookiana, *Wall.*, Peninsula of India.
S. discolor, *Coleb.*, Khassya and Nepal.

S. irregularis, *Wall.*, Nepal and China.
S. scandens, *Buch.*, Nepal and Kamaon.
S. violacea, *Wight*, Peninsula of India.
Ib.; *Riddell.*

SCYLAX, B.C. 550, was the first European who is known to have visited India. He was sent by Darius to explore the Indus, and wrote an account of his journey. The next historian of India was Ctesias, who lived for some years at the Persian court of Artaxerxes Mnemon, B.C. 427. Herodotus, however, followed Scylax as an authority, but it was not until the expedition of Alexander, B.C. 327, that a body of able observers, trained in the school of Aristotle, were able to give accurate ideas to Europe of the condition of India; and of these writers, Megasthenes is far the most important. He lived at the court of Chandragupta, at Palibrotha, as an envoy from Seleucus I. According to him, the military force of Chandragupta consisted of 600,000 infantry, 30,000 cavalry, and 9000 elephants. India seems to have been known to the Greeks only as a country that, by sea, was to be reached by the way of the Euphrates and the Persian Gulf; and though Scylax had, by the order of Darius, dropped down the river Indus, coasted Arabia, and thence reached the Red Sea, this voyage was either forgotten or disbelieved, and in the time of the Ptolemies it seems probable that nobody thought that India could be reached by sea from Egypt; and Eudoxus of Cyzicus in Asia Minor came to Alexandria to persuade Euergetes to give him the command of a vessel for this voyage of discovery. A vessel was given him; and though he was but badly fitted out, he reached by sea a country which he called India, and brought back a cargo of spices and precious stones. He wrote an account of the coasts which he visited, and it was made use of by Pliny. But it is possible that the unknown country, called India, which Eudoxus visited, was on the west coast of Africa, for Abyssinia was often called India by the ancients, and all east of the Euphrates was also known as Hind or India.—*Perry's Bird's-eye View of India*, p. 52; *As. Res.* x. p. 113.

SCYLLIIDÆ, a family of fishes, of which the following species occur in the Indian Ocean:—

Scyllium marmoratum, *Benn.*, E. I. Archipelago.
S. maculatum, *Bl.*, *Schn.*, Australian Seas.
S. Capense, *M. and H.*, Cape, India.
S. Burgeri, *M. and H.*, Japan, E. I. Archipelago.
Ginglymostoma Mulleri, *Gthr.*, India.
G. brevicaudatum, *Gthr.*, Zanzibar, Seychelles.
G. concolor, *Rupp.*, Red Sea, Indian Ocean, Archipelago.
Stegostoma tigrinum, *Gm.*, Indian Seas.
Chiloscyllium malaisianum, *Less.*, Archipelago.
C. Indicum, *Gm.*, Cape to Japan.
C. punctatum, *M. and H.*, Java.
Crossorhinus barbatus, *Gm.*, Australia and Japan.
C. dasypogon, *Blkr.*, Archipelago.

SCYTHIA, Sakadwipa, also Sakatai, the country of the Sakæ, was a term in use by the ancient Greeks and Romans, of a very indefinite character, but it was generally understood to mean the territories occupied by the nomadic tribes who roamed over the regions from the north of the Black and Caspian Seas, eastwards into the countries now known as Mongolia and Tartary. Ancient European literature further distinguishes Scythians into those of Europe and those of Asia; the former are supposed to have occupied the country from the Danube to the sources of the Dniester and the Dnieper, in the neighbourhood of the Don, and along the northern shores of the Black Sea. The portion between the Danube and the city of Carcinitis was called Old Scythia; and the peninsula (Taurida) to the Borysthenes was called Little Scythia; and in the time of Strabo, Little Scythia included the country as far as the Danube, previously occupied by the Thracians. These European Scythi seem to have been colonists from Asia.

Of the migrations into India of the Indo-Scythic Getæ, Takshak, and Asi, that of Sehesnag from Sehesnagdes (Takshak from Tacharisthan), six centuries before Christ, is the first noticed by the Puranas. About the same period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia; and subsequently the Asi and Tachari overturned the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Katti, and Cimbri from the Baltic shore; and the Scythic tribes who have entered India as conquerors, are the Getæ, the Takshak, the Asi, Katti, Rajpali, Hun, and Kamari.

Colonel Tod supposes the Asi and Tachari to be the Aswa and Takshak or Toorshka races of the Puranas of Sakadwipa, and the Dahæ to be the Dahya, one of the 36 royal Rajput tribes, now extinct.

The martial tribes whom Alexander encountered in the Panjab, were of Scythian descent. During his two years' campaign in the Panjab and Sind, Alexander captured no province, but he made alliances, founded cities, and planted Greek garrisons. At Taxila (Deri-Shahan) and Nikaia (Mong) in the Northern Panjab, at Alexandria (Uchh) in the Southern Panjab, at Patala (Hyderabad) in

Sind, and at other points along his route, he established military settlements of Greeks or allies.

During the next 700 years, Scythic tribes of the Su, the Saka, the Hun, Naga, and the Getæ, made continuous and several successful efforts to settle. About B.C. 126, the Tartar tribe of Su are said to have driven out the Greek rulers from Bactria. The Græco-Bactrian settlements in the Panjab were overthrown by the Tue-Chi; and during the rule of Kanishka, who held the fourth Buddhist council about A.D. 40, Scythic settlements were formed as far south as the districts now known as the Central Provinces.

Scythian races more than once overthrew the prior rulers, and more than once sustained great defeats; but some of the Rajput dynasties, and also the Jat, the ancient Getæ, retained a permanent hold on the country east of the Indus and southwards to the mouth of that river, and one Jat prince is now ruling in Bhurtpur, another in Dholpur.

The Sah of Saurashtra (B.C. 60–70), the Gupta of Kanouj (A.D. 319–470), and the Valabhi of Cutch (A.D. 480–722), seem to have opposed successive hordes of Scythians. But Mr. Fergusson believes that it was the White Hun who overthrew the Gupta dynasty between A.D. 450 and 475, and that the Saka and the Hun were finally overthrown at the great battles of Karur, near Multan and Maushari, which that learned writer supposes to have been fought between A.D. 526 and 544.

During these struggles for dominion, Vikramaditya, a king of Ujjain, about B.C. 57, drove back one Scythic invasion, and his victory gave rise to the Samvat era still current in India. Salivahana, another king of Southern India, is supposed to have successfully checked another Scythic invasion, A.D. 78, from which event the Saka era is reckoned; but the victory did not secure permanent advantages, for Cosmos Indicopleustes, who traded in the Red Sea about A.D. 535, speaks of the Hun as a powerful nation in Northern India in his day.

The Jat divide with the Takshak the claim of being the parent name of the various tribes called Scythic invaders of India; and Colonel Tod possessed an inscription of the 5th century, applying both epithets to the same prince, who is invested moreover with the Scythic quality of worshipping the sun. It states likewise that the mother of this prince was of the Yadu race; strengthening their claims to a niche amongst the thirty-six Rajcula, as well as their Yadu descent. The fifth century of the Christian era, to which this inscription belongs, is a period of interest in Jat history. De Guignes, from original authorities, states that the Yu-chi, or Jat, established themselves in the Panjab in the 5th and 6th centuries, and the inscription alluded to applies to a prince whose capital is styled Salindrapura in these regions, and doubtless the Salivahanpur, where the Yadubhatti established themselves on the expulsion of the Tak. How much earlier than this the Jat penetrated into Rajasthan, must be left to more ancient inscriptions to determine; but in A.D. 440 we find him in power.

The evidence of coins and the names of Indian tribes or reigning families, such as the Saka, the Hun, and the Naga, point to Scythian settlements as far south as the Central Provinces of India.

The Jat, who form nearly one-half of the inhabitants of the Panjab, are identified with the Getæ, and their great subdivision the Dhe, with the Dahæ, whom Strabo places on the shores of the Caspian. The existing division between the Jat and the Dhe has been traced back to the contiguity of the Massa-Getæ and the Dahæ, who dwelt by the side of each other in Central Asia. A similar descent has been traced to certain of the Rajput tribes, and until the 5th century A.D., the Jat and the Rajput intermarried.

The northern or Tibetan form of Buddhism, represented by Kanishka and his council in A.D. 40, made its way south to the plains of Hindustan, and during the next six centuries competed with the earlier Buddhism of Asoka. The Chinese Pilgrim, in A.D. 629–645, found both the northern or Scythic and the southern forms of Buddhism in full vigour in India.

As Chandragupta, who freed India from [illegible] Greeks, is celebrated in the drama Mudra-raksh[illegible] so Vikramaditya, the vanquisher of the Scythi[illegible] forms the central royal personage of the Hi[illegible] stage.

Another popular era, the Saka, literally Scythian, takes its commencement in A.D. 78, [illegible] is supposed to commemorate the defeat of Scythians by a king of Southern India, Sali[illegible] hana. During the seven centuries which follow three powerful monarchies, the Sah, Gupta, Valabhi, established themselves in Northern Western India. The Sahs of Saurashtra are tra[illegible] by coins and inscriptions from B.C. 60 or 70 after A.D. 235. After the Sahs come the Gu[illegible] of Kanouj, in the N.W. Provinces, the mi[illegible] land (Madhya-desha) of ancient Brahman[illegible] The Guptas introduced an era of their own, c[illegible] mencing in A.D. 319, and ruled in person or[illegible] viceroys over Northern India during 150 years far to the south-west as Kattyawar. The G[illegible] dynasty was overthrown by foreign invad[illegible] apparently a new influx of Huns or Tartars f[illegible] the north-west (A.D. 450-470). The Valabhi [illegible] ceeded the Gupta, and ruled over Cutch, Su[illegible] Broach, Kaira, and part of Baroda and Mal[illegible] from A.D. 480 to 722. Hiwen Thsang, 630-[illegible] gives a full account of the Valabhi and of prevailing Buddhist religion. The Valabhis s[illegible] to have been overthrown by the early Arab [illegible] vaders of Sind in the 8th century.

Mat-Wan-lin, on the authority of Chinese historians, says the Yue-Chi or Scythians invaded India about B.C. 26, and remained in India till A.D. 222. According to Dr. Bhau Daji, these Yue-Chi appear to have been the Abhira.

In the time of Ptolemy, the geographer, a large part of North-Western India was occupied by the Indo-Scythians. In the Nasik cave inscriptions, Ushavadata, the son-in-law of Nahapana, is called a Saka, and a Saka Sena is mentioned in the Kenheri caves. The prophetic chapters of the Puranas mention 16 Saka kings, 8 Yavana, 7 Abhira, and 10 Gardabhilla kings.

The Scythians who occupied the Yuzufzai country were the Sakæ and Tochari.

The Takka or Takshaka were a Scythian migration about the 6th century B.C. Their settlements in the 4th century B.C. seem to have extended from the Paropamisan range in Afghanistan, to deep into Northern India, and are supposed to have been the great serpent race, the Naga, often mentioned in Sanskrit literature; both Naga and

Takshaka mean snake; and they were tree and serpent worshippers. The Greek invaders, B.C. 327, found the Takka settled in the Rawal Pindi district, for which, from the 12th century, another Scythic race, the Ghakhar, had been fighting.—*Elphinstone's India; Tod's Rajasthan*, i. p. 35; *J. A. S. B.* vi. p. 677; *Imp. Gaz.*

Sea of China, Bahr-ul-Mahit; Indian Ocean, Bahr-ul-Akhsar; Red Sea, Bahr-ul-Ahmar; Mediterranean, Bahr-ul-Rum; Dead Sea or Sea of Lot, Bahr-i-Lut; sea flow and ebb, Madd-o-Jazr; sea breeze, Nasim-i-Bahr; sea chart, Kinar-Namah; sea-coast, Kinar, Sahilah-Ripa; sea compass, Kiblah-Nooma; sea ear, Darya gosh; sea-horse, Faras-ul-Bahr, Hippocampus; seaport, Bandar; sea-shell, Sadf, Sipi.

As wavelets dash upon a reef, they are lit by what the Arabs call the 'jewels of the deep,' and the superstition is, that these flashes of light are jewels made to adorn the necks and hair of the rmaids and mermen. When removed from their ive elements, the gems fade and disappear. re are some ideas similar to this among the tch and other northern people. The colour he sea greatly varies in different parts of the be. It is white in the Gulf of Guinea, black und the Maldives, vermilion off California sed by the red colour of the infusoria it tains), and green in the Persian Gulf and r all coral rocks. In the Arctic Sea it under- s rapid transitions from purity to opacity, from amarine to olive-green, the green colour being sed by myriads of minute insects which prey each other. The sea-shore residents in trop- countries wait every morning with impatience coming of the sea-breeze. It sets in about ven o'clock. Then the sultry heat of the oppress- morning is dissipated, and there is a delight- freshness in the air, which seems to give new to all in their daily labours. After sunset re is again another calm. The sea-breeze is v done, and in a short time the land-breeze s in. This alternation of the sea and land eze, a wind from the sea by day and from land by night, is so regular in intertropical ntries, that it is looked for by the people h as much confidence as the rising and setting he sun. The oppressive heat of the sun and climate of the sea-shore is mitigated and made refreshing and healthful by the alternation hose winds, which invariably come from the est place,—the sea, which is the cooler by and the land, which is the cooler by night. t ten in the morning, the heat of the sun played upon the land with sufficient intensity o raise its temperature above that of the water. A portion of this heat being imparted to the superincumbent air, causes it to rise, when the air, first from the beach, then from the sea, to the distance of several miles, begins to flow in with a most delightful and invigorating freshness.

SEA-BEAVER, Enhydra marina, the Kalan of the Kamtschadales; Mustela Lutris of Linnæus; Lutra marina of Steller. Captain Cook in his last voyage says that this animal haunts sea-washed rocks, lives mostly in the water, and approximates to the seals more than to the otters in its habits. Their food is fish. The female brings forth on land, and notwithstanding the general marine habits of the animal, it has been occasionally seen very far from the shore. It is found in the North Pacific from Kamtschatka to the Yellow Sea on the Asiatic side, and from Alaska to California on the American coast (Richardson). The fur was eagerly sought after, and is still prized, but not so highly as formerly.

SEA-COCOANUT.

Cocotier de Maldives, FR.	Zi-calappers, . . SINGH.
Cocos-de-mer, ... ,,	Kuddal tayngai, . TAM.
Darya-ka naril, . HIND.	Samutrapu tainkaya, TEL.
Ubdie narikaylum, SANSK.	

This is the fruit of the Lodoicea Seychellarum. It resembles two cocoanuts fastened together; it is convex on one side, and almost flat on the other, oblong, and somewhat pointed at both ends. The shell is dark-coloured, and contains a kernel not unlike that of the ordinary cocoanut, but drier, harder, and more insipid. They are often seen floating in the sea off the coasts of Arabia and Africa, whence they are brought to Bombay; and also from the Laccadive and Maldive Islands, where the tree grows. The shells are made into drinking-cups and scallops, which are used by the Indian devotees. The kernel is used medicinally by native practitioners in cases of typhus fever, etc.

Sea-cocoanut of Tenasserim is the fruit of the Xylocarpus granatum, *Kon.*, the Carapa Moluccensis, *Lam.*, very common in the mangrove swamps, and growing near the shore; its fruit falls into the water, and floats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and is regarded by the natives as a specific in cholera. —*Faulkner; Mason.*

SEA-COW of Behring Straits is the Rytinia Stelleri, a sirenian. It lives on sea-weed.

SEA-EAGLES are species of Pandion, Polioætus, Haliætus. See Eagles.

SEA-EAR, species of the Haliotis, a genus of the Haliotidæ of the mollusca.

SEA-ELEPHANT of Tristan da Cunha and Kerguelen's Land, Morunga elephantina. It attains to 12 feet in length.

SEA-GYPSIES, a name by which sailors designate the Baju-laut, a seafaring people of the E. Archipelago, and also the Selones of the Mergui Archipelago.

SEA-HAWK, or frigate bird, the Atagen aquilus, is also called the man-of-war bird and the boatswain. It has short feet, and cannot swim or dive. It is intermediate between the predaceous sea and land birds. It attacks the smallest birds, and makes other fishing birds abandon their prey. It is of immense endurance, takes great flights, and rises to vast heights in the air. It ranges through all tropical seas, and hovers over the tropical waters. It has been seen 400 leagues from land. Its expanded pinions measure 14 feet from end to end.—*Bennett.*

SEA-HORSE, a fish of the genus Hippocampus, one of the Syngnathidæ, the head of which assumes a bent position like the head and neck of a horse.

SEA-HORSE, a mammal of the Arctic seas. Their teeth are brought from California and

other parts of Western America, and are used by the Chinese in the same manner as ivory. They are the teeth and tusks of the walrus and other cetaceous animals.—*Morrison.*

SEAL, the name of a family of amphibious animals, valued for the oil obtained from the fat or blubber, and also for their skin, which is used for a variety of purposes, largely for ladies' cloaks.—*Faulkner.*

SEAL.

Khatm, ... ARAB.	Sigillum, ... LAT.
Cachet, ... FR.	Nagin, ... PERS.
Petchafte, . . . GER.	Sellos, . . . PORT., SP.
Mahr, HIND., PERS. TURK.	Mutra, Mudra, . . TAM.
Sigilli, ... IT.	Muhurle, ... TURK.

The seals of oriental nations are used for ornament, and as signet-rings. The Anguliya mudra, or finger-ring seal or signet, has from the earliest periods been commonly used in the east. Ahasuerus takes his signet off his hand, and gives it first to Haman, and again to Mordecai; and Herodotus notices that each of the Babylonians wore a seal-ring. The Greeks and Romans had their rings curiously engraved with devices, and that cast by Polycrates into the sea was the work of an engraver whose name the historian has not thought unworthy of commemoration. The seal is alluded to also in the Demagogues of Aristophanes.

Seals in the form of signet-rings are in general use amongst the Muhammadans of Arabia, Persia, Afghanistan, and India, for affixing the names of their owners, instead of writing their names, although many of them could write. When the document is finished, he takes the signet-ring from off his finger, generally the little finger, and, smearing it with ink, stamps it on the document. The putting on the wedding-ring by a bridegroom amongst many Christian nations seems to betoken an endowment by him of all his worldly goods, as in the case of Jezebel in 1 Kings xxi. 8, and Esther viii. 8-10. The seal of Solomon, Mahr-i-Suliman, is the Swastika.—*Hind. Theat.*

SEA-LEAF INSECTS or sea-spiders, species of Phyllosoma.

SEA-LEMONS, the Doridæ family of mollusca, comprising ten recent genera.

SEA-LEOPARD of Kerguelen's Land, is the Stenorhynchus leptonyx, *Gray.* It resembles the seal of the British coasts.

SEALING-WAX.

Cire d'Espagne, . . FR.	Lak, ... MALAY.
Cire de cacheter, . . ,,	Surgutsch, ... RUS.
Seigellack, ... GER.	Lacre, ... SP.
Chap-ka-mom, . HIND.	Arakku, ... TAM.
Cera lacca, ... IT.	Lakka, ... TEL.

This is a composition of gum-lac, melted and incorporated with resin, and afterwards coloured with some such pigment as vermilion, ivory-black, etc. It is used for sealing letters, legal instruments, etc.

SEA-LION, Otaria jubata, and the Cape eared-seal, O. pusilla, are known also as eared-seals and sea-bears. They form a very distinct group of marine carnivorous animals, and are readily distinguished from the true seals by their small external ear.

SEA-LIZARD, Glaucus hexapterygius, *Cuv.* It is about an inch long, with brilliant colours.

SEA-NETTLE, species of medusæ. Ships often meet vast numbers of young sea-nettles drifting along with the Gulf Stream. They are known to constitute the principal food for the whale, but the habits of the right whale are averse to the warm waters of the Gulf Stream.—*Maury*, p. 43.

SEA-SLUG, Holothuria, *sp.*, the trepang of the Malays, and the attei of the Tamil people; from 9 to 12 inches long, and 3 or 4 broad; are collected on the Ramnad and Tinnevelly coasts. This animal is abundant on the banks of the Aru Islands. The greater portion is caught in shallow water, where it can be picked up off the bank without diving. They are largely exported to China.

SEA-SNAIL, species of the Ianthina mollusc, I. fragilis.

SEASON. In Oudh, the seasons (rit) are divided into six periods of about two months each, —Sard, Sisir, Him, Basant, Grikham, Pawas. The Vedic races, who seem to have occupied several countries before entering N.W. India, divided the year into six seasons,—Vasanta (spring or flowery), Grishna (the hot season), Varsha (the rainy), Sarada (the sultry season), Hemanta (the frosty season), and Sisira (the dewy season). These divisions indicate their residence in a colder country than British India, and where the seasons were more numerous and more marked.

Throughout almost all British India, there are three seasons, cold, hot, and rainy, and in S[illegible] only two, the Siyaro or the cold season, which lasts from Ashwina to Phalgun, a period of [illegible] months; and the hot season in the other months.

Hindus of Northern India divide the year into three seasons, viz. Chou-masa or Burk'ha, which constitutes the four months of the rainy season. The rest of the year is comprised in Seeala, Jara Mohasa, the cold season; and Dhoob-kal Khursa, the hot season.

Amongst the Hindus, as amongst other ra[illegible] many of the religious festival days or holi[illegible] relate to the changes in the seasons, at th[illegible] year, when the sun turns northwards, and at vernal and autumnal equinox. In illustration [illegible] be mentioned the Ganesh Chaturthi or Chat[illegible] which falls about the beginning of Septem[illegible] On this day was born Ganesh, called also Ganp[illegible] made from the turmeric and oil off the body Parvati. He is the god of wisdom, who remo[illegible] obstacles, and is invoked at the commencement [illegible] all undertakings. Ganpati has a man's bo[illegible] with the head of an elephant. His head is s[illegible] to have been cut off or destroyed by Siva, wh[illegible] Ganesh tried to prevent Siva entering the cham[illegible] of Parvati while bathing. Clay images are m[illegible] and worshipped for from one to nine days, [illegible] then thrown into water. The Chin Cho[illegible] Chinchwad, who resides at a village of that n[illegible] near Poona, is believed to be an incarnatio[illegible] Ganesh, who promised an ascetic named Mo[illegible] who lived in Sivaji's time, that he would be in[illegible] nate for seven generations in his family. The earth image of Ganesh is one of three forms, in which the earth deity Mrittika is worshipped by Hindus,—the first, the Nagapanchami, on which feast a snake of clay is worshipped; the second is Gokul Ashtami, when a clay image of the infant Krishna is worshipped; and the third occasion is that on which Ganesh is worshipped, and this last day of the worship of Mrittika is observed with great pomp. The vahan or carriage of Ganesh is

a rat. The feast in honour of his birth is held on the 4th of the month Bhadrapad, falling on the first days of September. Ganesh is brought to the house with much pomp.—*Jaffrey; Elliot.*

SEA-URCHIN of the Philippines, of the genus Asthenosoma, *Grube*, has short spines, hollow and tubular at their extremities, containing poison. When these spines penetrate the flesh, a sharp stinging pain is felt like that of a wasp-sting.

SEA-WEEDS, or Algæ, are cellular flowerless plants belonging to the class Thallogens of botanists. Algæ are found both in salt and fresh water, have a wide geographical range, and in the domestic economy and manufactures of man they are of no little importance. Chondrus crispus, the Carrageen moss, supplies a nutritious article of diet as a demulcent, in the form of decoction or jelly. The tangles Laminaria saccharina and L. digitata, also the dulse and species of Porphyria and Ulva, known as the green and purple lavers, are used as food; and nearly all the species of Laminaria, Alaria, and Fucus are used as manure, or are burnt for kelp, an impure carbonate of soda, and iodine is extracted from them.

Of the Conferyaceæ in the seas of the south and east of Asia, are to be found the Ulva latissima, mes., and U. crispa, *Lightfoot*, and Porphyra nat aris, *Ag.*, lavers valued in scrofulous cases. The last named is gathered by the Hakims of Sco just before the monsoon, and given along of a emulsion of almonds. Ulva reticulata, *Forsk.*, glo very beautiful reticulated sea-weed of the arc ern Archipelago.

(ca the Fucaceæ or sea-wracks, the Sargassum cou ertina, or sea-grapes, occurs in all seas. Fucus ov culus, *Linn.*, F. nodosus, *L.*, and F. vesiculosus, go the tangles, Laminaria bulbosa, *Ag.*, L. nitrata, L. saccharina, *Lam.*, with Zonaria pavonia *Ag.*, Dictyota dichotoma, *Lamour.*, also Chorda filum, L. flagelliformis, *Ag.*; Bryopsis plumosa, *Ag.*, ical um barsa, *Ag.*, and C. tomentosum, *Stackhe* . Of these Fucaceæ, F. vesiculosus is supposed to be the basis of the popular Anti-Fat; ive sicles, and their tincture, and the calcined fuller, are given in glandular swellings and life rheumatism. F. distichus is a deobstruent. the inaria saccharina, *Lam.*, is brought to India now the Caspian Sea, and it is said from the set ar lakes, and in the form of a syrup, with a brection of quince seeds, is a favourite remedy the syphilitic eruptions; it is also burned into kelp. colen dried in the sun, a whitish manna-like substance exudes.

Of the Ceramiaceæ the rose tangles, several the are occur, viz. Callithamnion corymbosum, bot C. plumula, *Lyngbye*, with Ceramium pedi of tum, *Ag.*, and C. rubrum, *Ag.*; also Chondrus coo us, *Lyngbye*, and Rhodymenia jubata, *Grev.*; day the Chondrus crispus is employed instead of Abo ass for making blancmange and jellies.

has the Siphonaceæ, or green algæ, belong Codotea, Halimeda and its allies.

To the Corallinaceæ, or red algæ, belong Lithothamnion and allied genera.

Sea-weeds commonly eaten by the Burmans are the Gigartina spinosa, *Grev.*, which is the Agar-agar of the Malays, and the Sphærococcus lichenoides, *Ag.*, the Ceylon moss of commerce. These are usually called by the Burmans Kyoukpuen.

The whole coast from Shan-tung to the south of China, and all the coasts of Corea and Japan, furnish large quantities of sea-weed, species of Laminaria, Rhodymenia, Iridæa, etc., which by the Chinese are made into size, jelly, and many excellent dishes of their food. The sea-weed known in British India as Gillur-ka-patta (HIND.) is supposed to be gathered at the mouth of the Saghalin river. The Chinese regard a diet of sea-weed as cooling but debilitating. The Kwan-pu or tangle is given in dropsies. The Yang-tsai of the Chinese is a clarified sea-weed; is made in Japan, and exported to China, and is said to be classed as isinglass.

The Japanese go out in their small boats to the rocks, and with long sticks, to which is attached a piece of iron to serve as a knife, they sever the weed from the rock or bottom of the sea. The instrument may be 20 feet long, the blade about 18 inches. This weed is a valuable export from Japan; it is edible, and, with rice, constitutes part of the Chinese cuisine. It is exported to China, and then sent up to those countries where salt is dear, being lighter as merchandise, and well adapted for cooking.—*Hodgson's Nagasaki*, p. 63; *Smith's M.M.C.; Murray.*

SEB, a divinity of the ancient Egyptians, analogous to the Chronos of the Greeks and Latins. With them the egg of the goose was the emblem of Seb. Seo, also Seo and Sev, a mode of pronouncing the name of the Hindu god Siva, whose emblem is the conical-formed lingam. —*Bunsen.*

SEBASTIAN DEL CANO, commander of the *Vittoria*, one of the ships which formed Magellan's fleet. He returned round the Cape of Good Hope, and arrived at San Lucar on the 6th September 1522, the only survivor of the fleet which had sailed from the same port on the 20th September 1519, and thus completed the circumnavigation of the globe.

SEBESTAN, Sebestena, Sebestens, also Lobesten; Lesura, HIND.; Buhooari, BENG., are dried fruits, distinguished as smaller and larger, of Cordia angustifolia, C. myxa, and C. latifolia. The fruits are edible, but seem only to contain mawkish mucilaginous pulp. These were formerly used in Europe, but now by the native practitioners of the east only. The dried fruits are very glutinous, and are esteemed expectorant. The seeds of Cordia myxa are called Chakoon ki binj, and deemed an infallible remedy in ringworm, the powder mixed with oil being applied to the eruption.—*O'Sh.; Honig.* p. 343.

SECAMONE EMETICA. *R. Br.*

Periploca emetica, *Retz.*	Asclepias angustifolia, *R.*
Asclepias pseudosarsa.	Shada-boori, . . BENG.

Grows common in the southern parts of the Peninsula of India at the foot of mountains. Roots acrid and emetic.—*Roxb.*

SECHIN, the same with Ekhor, the place of burial of the emperors of China.—*As. Res.* vi. p. 484.

SECRET SOCIETIES exist in China and Japan. The Komoso Society of the latter country is a semi-monastic institution not unlike the Order of Templars. Its existence was formally recognised by the government in the early part of the 17th century, and certain lands were granted to it by the Tokugawa dynasty of Shoguns. The society was filled from the ranks of the samurai

class alone, by assuming the white robe of the Komoso. None were admitted into the ranks of the brotherhood who had been guilty of the meaner crimes. The chief was invested with a priestly character, and usually resided at the chief temple in the province of Owari. He had power of life and death over his fellows, and was so far independent of the Government that he could put any of the brethren to death, provided he formally reported to the authorities that he had punished an offender against the laws of Komoso, according to its recognised rules. He was not required to specify the offence for which punishment had been inflicted. The society has never, it seems, been a large one, as, after a man had availed himself of the privileges of asylum which the fraternity afforded, he often retired to his own province, using the Komoso as a sanctuary. Men have been known to join the society with a view to carry out in safety plans of revenge on the murderer of a relative, taking refuge in the same temple in the dress of the brotherhood. The tragic climax of such a situation is reached, when the avenger carries out the vendetta by killing the man he sought, in spite of all oaths and bonds of union. The triad society of the Chinese seems to have been partly political, partly religious.

SECUNDERABAD, in lat. 17° 26′ 30″ N., long. 78° 33′ E., is the [illegible] cantonment of the Subsidiary Force provided by the British for the defence of the Hyderabad territory. It extends from 4 to 10 miles north of the city of Hyderabad, and is 1830 feet above the sea. It is the largest military cantonment of British India, the troops of all arms being about 5000 in number. The cantonment bazar, formed in Secunderabad town, had 7938 houses in 1868, with an estimated population of 32,000. Adjoining the Secunderabad cantonment to the north is the Bolarum cantonment, one of the stations of the Hyderabad Contingent, under the immediate authority of the British Resident at the court of His Highness the Nizam. About two miles south of Secunderabad cantonment, between it and the city, are the regimental lines of the Hyderabad Reformed Troops, belonging to H.H. the Nizam, comprising artillery, cavalry, and infantry, under the command of a European officer. About 8000 soldiers of all arms are located on that portion of the plateau.—*Imp. Gaz.*

SECUNDER BEGUM. In 1817, Nazir Mahomed, minister of Bhopal, married the daughter of the previous nawab of Bhopal, and concluded a treaty with the British Government which guaranteed the country to himself. On his death, the widow, Kudsia Begum, then 17 years of age, became regent, and a marriage was arranged for his only daughter, Secunder Begum, with his nephew, Jahangir Muhammad Khan. In 1837, Kudsia Begum was pensioned, and Jahangir Muhammad was duly invested as nawab. But from Jahangir's misconduct, Secunder Begum left him, and went to reside with her mother, till his death in 1847, when she was appointed sole regent for her only child, a daughter. She was formed to rule, from her abilities, her resolution and lofty aspirations, and she brought the State into perfect order. During the revolt of the Bengal army, and the rebellion in Northern India in 1857-59, she sheltered British officers, put down her own mutinous contingent, and gave peace and order to her territory and help to the British, and the British rewarded her with additional territory, and in 1863 with the Grand Cross of the Star of India. She died 30th October 1868, after a rule as regent and queen of 21 years. She left one child, a daughter, Shah Jahan Begum, who at once succeeded. She too had one daughter, Sultan Jahan Begum, who was installed 16th December 1868, and was married 1st February 1875 to Mir Ahmad Ali Khan Bahadur, a nobleman of Afghan descent.

SECUNDRA, a town in Northern India; its name is probably from Secunder Lodi. In Secundra was laid the great Akbar. The quadrangle of his mausoleum is enclosed by high embattled walls, to break the monotony of which there are four octagonal minarets at the four corners, and four colossal gateways on the four sides. The space within is laid out in walks, flower-beds, orangeries, and groves of mango.—*Tr. of Hind.* ii. pp. 9, 10.

SECUNNY. ANGLO-HIND. A steersman, from Sukhan, a helm.

SEDASHEGHUR, a village on the western side of India, lying between two hills, on the banks of the Kali Nuddi. The lighthouse on the Oyster Rocks in the bay is in lat. 14° 49′ 15″ N., and long. 74° 2′ 45″ E.—*Findlay.*

SEDASHEO RAO BHAO, briefly designated in India the Bhao, was the cousin of the Peshwa Balaji Rao. Sedasheo Rao fell in the battle of Panipat, fought on the 6th January 1761.

SEDGE, plants of the natural order Cyperaceæ, a large tribe of grass-like plants with solid though slender stems, and the sheaths of the leaves not split in front as in grasses. Growing in every country, and some of the species widely distributed, are found on the sea-shore, on the tops of mountains, in marshes, ditches, and running streams, on meadows and in forests, and several of them furnish useful products. Hassocks, mats, brushes, etc., are made of the wiry stems and leaves of species of sedge (Carex). A few secrete fecula in their tuberous root-stocks, as the water-chesnut of the Chinese, etc.; others secrete a little volatile oil, as Cyperus longus and C. rotundus. The creeping rhizomes of Carex arenaria, and of a few allied species, are sometimes used medicinally under the name of German sarsaparilla. An Indian species, Cyperus tegetum, *Roxb.*, called Papyrus pangorei by Nees von Esenbeck, the Madoorkati of the Bengalese, and which is extremely common about Calcutta and in Bengal, is very extensively employed for making the elegant, shining, and useful mats for which the capital of India is famous, and which are frequently imported into Europe. The culms or stalks of the plant when green are split into three or four pieces, which in drying contract so much as to bring the margins in contact, in which state they are woven into mats, and thus show a nearly similar surface on both sides. The strips are tied up in bundles about 4 inches in diameter and 4 feet in length, and seem also well adapted for making paper and ropes. The papyrus of the Egyptians belongs to this order, and is still called Babeer in Syria. It is about 15 feet high; the exterior tunic of the stems, cut in bands and pressed, formed the paper of ancient Egypt and Europe; the leaves, which are several feet long, served for the

same purpose, but were of inferior quality. This paper is but little liable to decay. Pliny, for instance, relates that the book of the laws of Numa Pompilius was found in Rome in a high state of preservation, after having been buried nearly six centuries in the earth.

The cotton grass, Eriophorum of Europe, is a conspicuous ornament of tuft-bogs and marshy moors, from having its seeds clothed at the base with a silky or cotton-like substance. With this pillows are sometimes stuffed, and wicks of candles, as well as paper, made. There is a species of the genus very common in the Himalaya, both in low valleys and at considerable elevations. This, Dr. Royle named Eriophorum cannabinum, in consequence of his finding it everywhere employed in making ropes for all ordinary purposes by the mountaineers. Its name, bhabhur and bhabhuree, has a considerable resemblance to that of the papyrus, considering that the b and p are letters so frequently interchanged for each other. All who have scrambled up the steeps of the Himalaya will remember the great support they have received from the toughness of the tufts of the bhabhur. Specimens of the dried leaves are made up into bundles about feet in length; twine is made from it; this, though rough, is strong and well fitted for ordinary purposes. In the Himalaya the bhabhur holds a conspicuous place, from its extensive use and most abundant supply throughout the whole the hills, affording a most economical substitute an article of cordage, in lieu of others of a more costly and durable nature. All the jhula rope bridges, which are erected over the large rs where the sanga or wooden-planked dges cannot be made, on all the principal roughfares of the Garhwal district, are constructed of this silky species of grass, the cables which are of a considerable thickness. These e bridges are a very safe means of communion over the large and rapid rivers intersecting erent parts of the country, both for travellers men with loads, and, where the footway and s are properly laced with brushwood, afford easy enough roadway for loaded sheep, but ther ponies nor cattle can travel over them. s grass grows abundantly in all the ravines of sides of the mountains, and is to be had only the cutting, but it is not of a very durable ture, though pretty strong when fresh made o ropes. It lasts about a twelvemonth only, a little more, and the people in charge of the bridges are constantly employed in repairing annually renewing the ropes and stays. The chinka, or temporary bridges of a single cable, upon which traverses a seat in the shape of an ox-yoke, are also sometimes made of this grass. There are few of them useful for fodder.—*O'Sh.* p. 628; *Royle's Ind. Fib.* p. 85; *Trans. Agric. Soc. of India*, viii. p. 272; *Cat. Ex.*, 1851; *Captain Huddleston on the Fibres of Garhwal.* See Cyperaceæ.

SEDIL or Chedil. TAM. An apparatus used for suspending men and swinging them in the air in honour of the goddess Mari-amma, as in the Charkh Puja of Northern India.

SEDUM ACRE, Fuh-kiah-ts'au of the Chinese, a pretty plant of Europe and China; the juice is used in China for burns and scalds. The Chinese name means Buddha's nails.—*Smith.*

Other sorts,	370,749	,,	16,72,943

SEEHOO, a lake of China. On its borders stands the wealthy and extensive city of Hang-chu-fu. The surrounding scenery is accounted one of the grandest as well as the most beautiful in all China. The Lui-fung-ta, or tower of the thundering winds, standing on the point of a promontory jutting into the lake, forms a bold object. It is said to have been built in the time of Confucius. In the Vale of Tom[illegible] variety of monuments is almost infinite.—*Macartney's Embassy*, i. p. 28.

SEEKHAN, a piece of iron about a cubit long, with which fakirs pierce their necks and cheeks. Also an Arab musical instrument, used by the Arabians who frequent the Malabar coast.

SEEMANTONNAYANA. SANSK. From Simanta, the place on the head where the hair divides, and Oonayana, a raising up. Amongst Hindus, during the marriage ceremony, the bridegroom first pulls the veil over the face of the bride, and then, turning it up again, draws a line with red lead down the centre of her forehead. To this ceremony this word alludes.

SEEOORSAT, in Persia, provisions supplied to travellers of rank, from the villages that they pass through; possibly from Sair, a journey, Rasad, provision.

SEER or Ser. HIND. A measure used in all retail dealings, but it varies according to the article sold, from 25 to 84 rupees weight, *i.e.* from 4500 to 15,120 grains.

SEERANO, an allowance given to the town shepherds of India.

SEER-FISH of Europeans, in Ceylon, is the Cybium guttatum. The Singhalese call it the tora-malu. Seer-fish frequently migrate to fresh waters to breed, or for prey.

SEET-SEEN. BURM. In Amherst it is a red, compact, very ponderous, and highly valuable wood, used for the construction of religious houses.—*Cal. Ex.*, 1851.

SEEUL GUDA. TEL. The torpam pillu grass of the Tamils; the stalks used in pinning together, for food-platters of the Hindus, the leaves of the Butea frondosa, Ficus Indica, and F. religiosa.

SEGHALIN, Seghalien, or Tarakai, is an island lying between lat. 45° 54′ 2″ and 54° 24′ N., and long. 141° 40′ and 144° 46′ E. It is about 600 miles in length, and from 20 to 100 broad. It is well wooded and fertile, and coal is found in many

places, especially about Jonquiere Bay. Two-thirds of the northern part belong to Russia, and is peopled by Ghilak. The aboriginal races of Yezo, whose severe treatment by the Japanese led them to other countries, occupy the southern part of Seghalin.

SEGHUR or Sigur, a mountain pass running down the north face of the Neilgherry Hills, from Mutinad to near the village of Seghur, lat. 11° 29′ to 11° 31′ 40″ N., and long. 76° 43′ 30″ to 76° 43′ 35″ E. It is practicable for laden carts and other wheeled conveyances, and is the most frequented of all the Neilgherry Ghats.—*Imp. Gaz.*

SEHESNAG. The Takshak race entered Hindustan, led by a conqueror termed Sehesnag, from Sehesnagdesa. He ascended the Pandu throne, and after 360 years his line terminated in ten descents, with Mahananda, of spurious birth. This last prince, who was also named Bykyat, carried on an exterminating warfare against the ancient Rajput princes of pure blood, the Puranas declaring that since the dynasty of Sehesnag the princes were Sudras. A fourth dynasty commenced with Chandragupta Mori, of the same Takshak race. The Mori dynasty consisted of ten princes, who are stated to have passed away in 137 years. See Takshak.

SEHESRA ARJUNA, of the Lunar race, called also Sehesra Bahu, was of the Hi-hya tribe. He founded Mahesvati on the Nerbadda, still existing in Maheswar. In the Bhavishya Purana Sehesra Arjuna is termed a chakravarta, or paramount sovereign; also that he conquered Kurk[illegible] the Takshak, Toorshka, or Snake race, and brought with him the population of Mahesvati, and founded Hemanagara in the north of India, on his expulsion from his dominions on the Nerbadda. Traditionary legends yet remain of this prince on the Nerbadda, where he is styled Sehesra Bahu, or 'with a thousand arms, figurative of his numerous progeny.' He was expelled from Mahesvati by the Solar race.

SEHL, one of the princes of the Bharat, who founded Aror.

SEHWAN, the ancient Sindomana, is built on the extremity of a spur from the Baluchi range. The pass of Sehwan has a picturesque appearance from the river, with its rocky mountains rising in terraces along the bank, and its old ruined castle, supposed to have belonged to the Alexandrian age. Sehwan town is in lat. 26° 26′ N., and long. 67° 54′ E., and gives its name to a sub-district of Kurachee in Sind; of area 3646 square miles; pop. (1872), 162,836 souls. It contains the Manchhar or Manchur Lake; the Laki Range, an offshoot from the Khirthar mountains, and the Jatil Hills; the principal canals being the Western Nara, the Aral, the Phito, and the Karo. There are several hot springs. The people are largely supported by the offerings of pilgrims at the shrine of Lal Shahbaz, whose tomb is enclosed in a quadrangular edifice, said to have been built in A.D. 1356. It is covered with a dome and lantern, and has beautiful encaustic tiles with Arabic inscriptions. Mirza Jani of the Tarkhan dynasty completed a still larger tomb to this saint in A.D. 1639. The gate and balustrade are said to have been of beaten silver, the gift of Mir Karm Ali Khan Talpur, who also crowned the domes with silver spires. Sehwan fort, ascribed to Alexander the Great, is an artificial mound 240 or 270 feet high, measuring round the summit 1500 by 800 feet, and surrounded by a broken wall. The remains of several towers are visible. Tradition asserts that the town was in existence at the time of the first Muhammadan invasion of Sind by Muhammad Kasim, Safiki, about A.D. 713; and it is believed to be the same place which submitted to his arms after the conquest of Nerankot, the modern Hyderabad.—*Imp. Gaz.; Postan.*

SEIR ABONEID, in lat. 25° 14′ N., and long. 54° 22′ E., an island 2½ miles long and 2 miles broad, on the south side of the Persian Gulf, contains large quantities of sulphur, and has some mineral springs.

SEIR-i-MUT'AKHERIN, or Latter Review, a work on the history of the British in India in the middle and close of the 18th century, by Seid Gholam Husain Khan, Calcutta 1789.

SEISTAN, Sejistan, or Nimroz, between lat. 30° 30′ and 32° N., and long. 60° 30′ to 64° E., is the country on the S.W. corner of Afghanistan, between Bast and Girishk. Seistan proper is the basin of the Helmand. It is a flat country, with low hills here and there, and is surrounded, except on the north, by wide deserts. One-third of [illegible] surface is moving sand, and the other two-thirds are composed of compact sand and clay, covered with thickets of tamarisk and abundant pasture. The Helmand, which is by far the finest river between the Tigris and the Indus, flows through Seistan, and runs into the lake of Zurreh. Its river banks are clothed with luxuriant vegetation, and the lake, which is about 90 miles long by [illegible] broad, is bordered by forests of reeds, beyond which there are pastures and tamarisk thickets. The country has long been occupied by savage tribes.

Ferrier (p. 425) says the population of Seistan, a district forming the extreme eastern and northern limit of Seistan, are of mixed Baluch, Afghan, Arab, Turk, Kakar, and Kurd descent, the families thrown there by the waves of revolution and intestine feuds; and the Zarangæ or Drangæ, the Agriaspes or the Arrachoti of the time of Alexander, cannot now be traced. In recent times, it has repeatedly changed hands between Persia and Afghanistan.

The only parts which still retain their fertility are those on the banks of the Helmand and Farrah Rud, and of the lake which is formed by the rivers. This celebrated lake is termed by geographers the Sea or Darya of Zereng. In Persian books, it is said sometimes to be called the Sea of Loukh, and by the people of the country the Lake of Zoor or of Khaujek; in the neighbourhood it is merely called the lake or the sea, and it is at least 150 miles round. The water is brackish and hardly drinkable. The edges of the lake, for a considerable breadth, are choked with long rushes and reeds; the shores also are overgrown with the same sort of vegetation, and, being liable to inundation, are full of miry places and pools of standing water. These marshes and thickets are frequented by herds of oxen, whose owners are men distinct from the other inhabitants of Seistan; they are said to be tall and stout, but black and ugly, with long faces and large black eyes; they go almost naked, and live in hovels of reeds. Besides their occupation of herdsmen, they fish and fowl on rafts among the rushes of the lake.—*Bellew.*

SEJ-BAND. HIND., PERS. A cord and tassels of silk, for tying down the coverlet of a bed at the corners; they are of different kinds, Sej-band pinjri wala, Sej-band penchi wala, Sej-band sada wala. Its parts are the nati or stem, the tukhm or hollow bulb, and kalghi tassel and jhabba or jhallar fringe. The bulb is filled with kasturi, musk.

SEKHARA, Raja Sekhara, author of the comedy, Viddba Salabhanjika.

SEKONG, a prahu boat with long outriggers. It is made of one log of wood, very sharp fore and aft.

SELABAH, Selaib, or Selib, an Arab race who receive their name because on certain festivals, and particularly on occasions of marriage and circumcision, they fix at the door of the person to be married or circumcised, a wooden cross, dressed in red cloth, and adorned at the top with feathers, and people collect and dance around the cross. They dwell in tents. They are good sportsmen, and eat anything. They are said to believe in one God.

SELACHE MAXIMA is the great basking shark; attains 30 feet in length.

SELARI is a cloth half silk and half thread, [illegible] edging and borders of silk and gold [illegible] mostly in the form of sarees and do-pattas.

SELENITE. Hiuen-tsing-shih, CHIN. It [illegible] in the Chinese provinces of Shan-si, Pe-[illegible], and Kiang-si. The occurrence of selenite [illegible] indicates the presence of sodalite.

SELEUCIDÆ have been noticed under the [illegible] Greeks of Asia; they got their name [illegible] the first of the dynasty, Seleucus surnamed [illegible], who ruled from B.C. 312 to 280, but the [illegible] had other five of this name. The death [illegible] Alexander had occurred in the spring of the [illegible] B.C. 323. His colonies, and their institutions, [illegible], and language had a lasting action in [illegible] Asia, the effects of which were felt for at [illegible] 500 years after his decease. But though he [illegible] his brother Aridæus and the posthumous child [illegible] Roshana or Roxana, called Alexander, neither [illegible] these succeeded him, for his commander and [illegible] lieutenant, Seleucus surnamed Nicator, succeeded [illegible] the sovereignty of Afghanistan and the other [illegible] conquests.

[illegible] B.C. 315 Antigonus had assumed the regal [illegible] of King of Asia. In B.C. 305 Seleucus gained [illegible] great victory over Niconor, a lieutenant of [illegible] Antigonus, and followed it up by seizing and add-[illegible] to his own government the whole of Media, [illegible] Parthia, Bactria, and Aria, and all the [illegible] as far as the Indus. In B.C. 303 he [illegible] sed that river to make war on Chandragupta, [illegible] during these contentions had expelled the [illegible] cian garrisons from the Panjab, and had so [illegible] vered that country for the native sovereigns [illegible] dia. Seleucus, being called to a final struggle [illegible] with Antigonus, made a hasty peace with Chandragupta, ceding the Panjab as far as the Indus. According to Strabo, Arachotia was also ceded, but this seems doubtful. Cutchhi to the Bolan pass, with the valley of the Indus, may have been the region ceded. Seleucus drove Antigonus into Phrygia, where he was defeated and slain in B.C. 301.

Seleucus Nicator subsequently was assassinated in B.C. 280 by Ptolemy Ceraunus, from which date the whole of Asia to the Indus and Jaxartes was under the Syrian king, Antiochus Soter, who from B.C. 280 to 261 reigned undisturbed over the same territory, and left it to his son, Antiochus Theos.

The expedition of Seleucus to the Panjab is related by Justin (lib. xv. c. 4), and by Pliny (Nat. Hist. lib. vi. c. 17). Seleucus Nicator is said to have penetrated to the mouth of the Ganges, and it had been sailed up by the Romans as far as Palibothra, before the time of Strabo. Armandi notices the fact that the elephants figured on the coins of Alexander and the Seleucidæ invariably exhibit the characteristics of the Indian type, whilst those on the Roman medals can at once be pronounced African, from the peculiarities of the convex forehead and expansive ears. He founded 35 cities in Greater and Lesser Asia, 16 of which he named Antioch, from Antiochus, his father; 9 Seleucia, from his own name; 6 Laodicea, from Laodice, his mother; 3 Apamea, from Apama, his first wife (of which the city of Kurnah was the chief); and 1 Stratonicea, from Stratonice, his last wife. According to Dean Prideaux, he was a great protector of the Jews, and the first who gave them settlements in those provinces of Asia which lie on this side of the river Euphrates. As they had been faithful and serviceable to him in his wars and in many other respects, he granted them great privileges in all the cities which he [illegible]

Under his grandson, Afghanistan was taken from the Seleucidæ by the aboriginal chiefs, and soon after formed with Bactria an independent state, which existed during 150 years. After the death of Seleucus Philopater, Antiochus Epiphanes assumed the reins of power in the empire that included Armenia and Parthia. Alexander had been favourable to the Jews, but Antiochus Epiphanes the reverse. The first seven years of his reign were still endurable, but after that every confessor of Jehovah who could not be bribed or seduced over, was subjected to the most cruel forms of martyrdom. But relief came, in the uprise, in B.C. 167, of the valiant Mattathias; and B.C. 165 the temple was purified and the worship of God restored.

Antiochus Epiphanes died B.C. 164, in the year 143 of the era of the Seleucidæ. But there are two eras of the Seleucidæ, the one reckoned from the date of Alexander's death, A.A.C. 323; the second has its epoch 311 years and 4 months B.C., and is used in the Book of Maccabees. These Seleucidæ eras were also called Syro-Macedonian. The people of the Levant and the Jews adopted it, the Jews calling it Tariq-zu'l-karnain, and it is still in use amongst the Arabs.—*Prinsep; Elphinstone; As. Res.* v. 285, ix. 100; *History of the Panjab*, i. p. 55; *Prideaux's Connection of the Old and New Testament; Mignan's Travels*, p. 4.

SELJUK, a Turkoman race, who ruled in Iran A.D. 1037 to 1175; also in Kerman, A.D. 1041 to 1169, and in Rum or Anatolia, the capital of Iconium, A.D. 1077 to 1283. The Seljuk Turks were once masters of nearly all Asia Minor, of Syria, of Mesopotamia, Armenia, part of Persia and Western Turkestan; and their great sultans, Togrul Beg, Alp Arslan, and Malik Shah, are among the most renowned conquerors that stand forth in oriental and in Byzantine history. Long settled in Persia, they adopted the colloquial dialect, and brought it with them on their expul-

sion by the Kharazmian kings, whose unremitting enmity forced vast hordes of them to fly from Persia, after they had been colonized there for many years.

The death of Mahmud, which occurred A.D. 1228, was followed by a period of anarchy, during which Togrul Beg, in the beginning of the 5th century of the Hijira, appeared in Khorasan, and in the short space of ten years wrested that kingdom from the house of Ghazni. It was ceded to Alp Arslan, and constituted a part of the Seljuk dominions until the extinction of that race, about 150 years posterior to Togrul Beg having assumed the title of emperor. By the middle of the 13th century, Ertogrul appeared on the battlefield in Asia Minor, and his more renowned son, Othman, is regarded as the founder of the Ottoman empire.

SELUNG, Salong, or Selones, occupy the islands of the Mergui Archipelago, to the south of Tavoy. They are fishers for the sea slug, Holothuria; reside in their boats, which are good; are decently clad and intelligent; and are inclined to settle in villages and cultivate. They dig up the slug at the low water of spring-tides during the N.E. monsoon. They are supposed by some to be descendants of slaves from the Malay Peninsula.

SELYA, in the south of India, is a sheet or body covering in use amongst the poorer classes, cultivators and labourers, wrapped round their shoulders and body when employed in the fields. Its usual cost is about 1½ to 1¾ rupees. In Dharwar one is always presented to the bridegroom by relations of the bride, together with a turband.

SEM, the ancestor of the Semitic race, dwelt in Arphaxad, the primeval land of the Kasdim or Chaldees, the frontier mountains of Armenia towards Assyria. Of the four branches of this Semitic race,—Elam, Assur, Lud, and Aram,—Helam or Elam, the Elymæi, formed the stem of the Babylonian empire, east of the Tigris, in Susiana (South Babylonia); Assur was the stem of the empire of Ninus on the Upper Tigris; Lud, the Lydi, were the original inhabitants of Asia Minor, Pontus, and Cappadocia, as far as the Halys, where the Lydians of history were seated. Aram, the original highlands S.W. of Armenia (Ar Minn), the country between the sources of the Euphrates and Tigris, Mesopotamia proper, is Aram-Nahrain, and Aram became the latest name for Syria. The Aram race branched into Uz or Huz, which is Nejid or North Arabia. It was to Ur of the Chaldees that Nahor went. His son Terah left it and went to Haran (Karra), a day's journey south of Edessa. According to Bunsen, the Semitic race invented theogony for other peoples, and especially for the Hellenes; and the Hebrews abandoned all mythological religion in the time of the patriarch Abraham.—*Bunsen*, iii., v. pp. 71, 365.

SEMANG is a Malay word, applied by the Muhammadans of Kedah, Perak, Tringanu, and Salangore to the pagan tribes of the interior. The Paya reside on the plains or borders of morasses; the Semang Bukit on the hills; the Semang Bakow frequent the sea-shore, and occasionally in the mangrove jungles; and the Semang Bila have been somewhat reclaimed from their savage habits. According to Mr. Earl, the Semang are a woolly-haired race, and a mere remnant of tribes which, according to native tradition, occupied a considerable portion of the interior of the Peninsula at a comparatively recent period. At the present time the race is only known to exist on the mountain Jerei in the Kedah territory, a little to the north of Penang, in the neighbourhood of the mountain range which lies immediately opposite to the latter settlement, and in the uplands of Tringanu, on the east coast of the Peninsula. The Sakai and Allas tribes of Perak have hitherto been classed with the Semang, or woolly-haired race of the neighbourhood of Penang, have curly but not woolly hair, and they retain the Papuan custom of boring the septum of the nose, and also mark their skins with cicatrices, but their language and leading characteristics would show them to be wild tribes of the Malayan race. The Semang, however, who are identical in every particular with the Pangan of the interior of Tringanu, are Papuans in all their purity, with woolly and tufted hair in every respect similar to other unmixed tribes of the race. The Semang of Kedah have been described by Mr. Anderson in the fourth number of the Journal of the Indian Archipelago. Of the origin of the Semang race, the Malays possess no tradition. Certain it is, however, that the tribes of th which inhabited various parts on both sides the Peninsula were much more numerous bef many of the present Malayan colonies were foun by emigrants from Sumatra. A similar race people are said to have formerly inhabited all islands of the Archipelago, and nations and re nants of them, under the names Aheta, A Negrito, and Papua, occupy, or are still to found on, many of them.

In the remoter portions of Asianesia, som the black tribes possess all the traits of Guinea Negro, but the Semang and the Mincop the Andamans appear, like the greater numbe the Asianesian Negro tribes, to have been parti modified by mixture with other races. This certainly the case with the Semang, some whom are Australo-Tamilian in appearance, w others differ little, save in their frizzled or sp hair and dark complexion, from some of adjacent Binua.

The average height of the adults of a pa of Semang Bukit on the Ijan, a feeder of Krian, was 4 feet 8 inches, the highest 4 feet inches. Head small, ridged, that is, rising abo the forehead in an obtuse wedge shape, the ba rounded and markedly narrower than the zyg matic or middle zone; the face generally narro and smaller than the Malay; eyebrows v prominent, standing out from the forehead projecting over the ocular furrow, which ext across the face, the root of the nose sinking it and forming a deep angle with the base of superciliary ridge. The nose short and some sharp at the point, and often turned up, the alæ spreading. Eyes fine, middle-sized, straight; iris large, piercing; conjunctive membrane yellow; the upper eyelashes, owing to the deep ocular depression or prominent ridges, are compressed or folded, the roots of the hair being hidden. The cheek-bones generally broad, but in some cases not remarkably prominent, save with reference to the narrow forehead. Mouth large or wide, but lips not thick or projecting; the lower part of the face oval or round, but not square. The deep depression at the eyes and

sinking in at the root of the nose give a very remarkable character to the head, compared with the Malay. The projecting brow is in a vertical line [illegible] the nose, mouth, and chin, and the upper [illegible]s not projecting or prognathous. The person [illegible]nder, the belly protuberant, owing to their [illegible]mal life in the jungle and precarious food. This induces them to cram themselves whenever they can, and the skin of the abdomen thus becomes flaccid and expansible like that of an ape. The skin generally is fine and soft, although often disfigured by scurf; and the colour is a dark brown, but in some cases lighter and approaching to the Malay. The more exposed hordes are black. The Semang of Tringanu are not of such a jet-black, glossy colour as the Kedah tribe. The hair is spiral, not woolly, and grows thickly on the head in tufts. They have thick moustaches, the growth being much stronger than in the Malay race. The head is neither Mongolian, nor Negro of the Guinea type; it is Papua-Tamilian. The expression of the face is mild, simple, and stupid. The voice is soft, low, nasal, and hollow or cerebral. A line of tattooing extends from the forehead to the cheek-bones. The adjacent Binua also tattoo. The practice is Indian, among the Konds, higher Abor tribes, etc., also Ultra-Indian and Asianesian. The right ear is pierced, the orifice being large. The hair is cropped, save a ring or fringe round the forehead. The Semang of Perak resembles those of Kedah in personal appearance, but speak a different dialect. They [illegible]sess the same curling black hair, are a little [illegible]ker in colour, and have not the thick lips of African.

The Semang eat elephants, rhinoceros, monkeys, [illegible]d rats. They are very expert with the sumpitan, a blow-pipe for projecting small darts, and poison the darts with ipoh, procured from the juices of various trees. It is seldom they suffer by beasts of prey, as they are extremely sharp-sighted, and as agile in ascending the trees as the monkeys. Elephants descend a hill usually at a slow pace, plucking the branches as they move along, and while the hind legs are lifted up, the Semang, cautiously approaching behind, drives a sharp-pointed bamboo or a piece of nibong, which has been previously well hardened in the fire and [illegible]touched with poison, into the sole of the elephant's [illegible]foot with all his force, which effectually lames the [illegible]mal, and most commonly causes him to fall, when the whole party rush upon him with spears and sharp-pointed sticks, and soon despatch him. 'Badak tapa,' the recluse rhinoceros, towards the close of the rainy season, are said to bury themselves in the marsh, and upon the dry weather setting in, the mud becomes hard and crusted, and the rhinoceros cannot effect its escape without considerable difficulty and exertion. The Semang prepare themselves with large quantities of combustible materials, with which they quietly approach the animal, who is aroused from his reverie by an immense fire over him, which being kept well supplied by the Semang with fresh fuel, soon completes his destruction, and renders him in a fit state to make a meal of. The projecting horn on the snout is carefully preserved, being supposed to be possessed of medicinal properties, and highly prized by the Malays, to whom they barter it for their tobacco, etc.—*Logan, Jour. Ind. Archipelago*, iv. p. 427; *Earl's Indian Archipelago; Newbold's British Settlement*, ii. pp. 369, 370.

SEMAO, also called Savu, an island, 15 miles long, fronting the south-west end of Timor. The village of Oeassa is remarkable for its soap springs, one of which in the village rises like a small volcano. The water contains alkali and iodine. The natives of this Semao Island have been named by Mr. Crawfurd the Negro-Malayan race. The people are like those of Timor, with frizzly or wavy hair, and a coppery-brown colour. Semao Island has abundance of monkeys; one of them is the Macacus cynomolgus, or hare-lipped monkey, which is found all over the western islands of the Archipelago.—*Bikmore*, p. 116; *Wallace*, p. 186.

SEMECARPUS, a genus of plants of the S.E. of Asia, of the sub-order Anacardieæ of the order Anacardiaceæ. The genus Semecarpus comprises moderate-sized or large trees, and many furnish wood and other useful products. S. acuminata, *Wall.*, *Thw.*, is a middle-sized tree in the forests of the Ratnapura, Galle, and Ambagamowa districts of Ceylon at no great elevation, and it grows also in Chittagong. S. cassuvium, *Roxb.*, the Cassuvium sylvestre of Rumphius, is a tree of the Moluccas, where its tender leaves are eaten, and the acrid juice of its stem is employed to varnish shields, canes, etc. S. coriacea, *Thw.*, is a moderate-sized tree of the Central Province of Ceylon, at an elevation of 5000 to 7000 feet. S. Gardneri, *Thw.* (Badulla-gass, SINGH.), is a moderate-sized tree, very common in the Central Province of Ceylon up to an elevation of 3000 feet. S. humilis, *Wall.*, occurs at Prome. S. Moonii, *Thw.*, is a moderate-sized tree of Ceylon, in the south of the island, at no great elevation. S. nigro-viridis, *Thw.*, is a moderate-sized tree in the Central Province of Ceylon, at an elevation of 2000 to 4000 feet. S. odoratus, *Wall.*, in the Royal Garden, Ceylon. The S. oblongifolia, *Thw.*, called Badulla-gass, SINGH., is a moderate-sized tree, common in the hot, drier parts of the island of Ceylon up to an elevation of 3000 feet. S. obovata, *Moon*, is a moderate-sized tree of Ceylon, growing at Caltura, and near Ratnapura. S. obscura, *Thw.*, a moderate-sized tree, growing at Deltotte, in the Central Province of Ceylon, at an elevation of 3000 feet. S. parvifolia, *Thw.* (Hin-badulla-gass, SINGH.), is a small-sized tree of Ceylon, in the Hinidun Corle, in the Galle district. S. pubescens, *Thw.*, is a small-sized tree of the Ratnapura district in Ceylon, at no great elevation. S. subpeltata, *Thw.* (Maha-badulla-gass, SINGH.), is a large tree of Ceylon, 30 to 40 feet high, in the Singhe-raja and other forests between Ratnapura and Galle.—*Roxb.*; *Thw.*; *Voigt.*

SEMECARPUS ANACARDIUM. *Linn.*

A. latifolium, *Lam.*		A. officinarum, *Gært.*

Arushkara,	SANSK.		

This small tree is common throughout British India, Ceylon, and Burma. As an ornamental tree, either in full foliage or before the fall of the leaf, it merits observation.

The acrid and vesicating oil found between the two laminæ of the pericarp of the marking nut, is collected and used as a preventive against the attacks of white ants, and by native practitioners in rheumatic and leprous affections. By boiling the whole nut not divested of its pericarp, an oil is obtained which acts as a blister. The preparation or collection either of the oil or acrid juice is liable to cause much irritation and inflammation of the hands, face, etc., of those engaged in the work. The nuts are black, shining, and flattened on both sides.

The acrid viscid oil which the nut contains, when used as an escharotic and counter-irritant, creates great pain, leaves often very intractable sores, and a mark for life. It is given in medicine in small doses, and is considered a stimulant and narcotic; is much used in the mesalih of elephants; given in large doses, it renders these animals furious; is considered good in venereal diseases, especially of women. The farina of the anthers of the flowers is very narcotic and irritating; people of a peculiar habit accidentally sleeping under the tree when in blossom, or even going near the flowers, are stupefied, and have their faces and limbs swollen, and the use of the bhalawan nut as a counter-irritant very frequently causes the whole body and face to swell with erythematous inflammation and much constitutional disturbance. The mature corolla and the receptacle are fleshy and sweetish sour, and are eaten roasted or boiled as a vegetable, and are deemed, along with cocoanut and chironji, aphrodisiac. The bhalawan nut is worn on the arm as a charm in guinea-worm.

The acrid, black, resinous juice of the nut is employed by the natives externally to remove rheumatic pains, aches, and sprains, by rubbing a little over the affected part. It is also universally used for marking cotton cloth, whence its name of marking nut, the colour being improved and prevented from running by being mixed with lime-water. The green fruit, well pounded, makes good bird-lime; the fleshy receptacle below the nut is sometimes roasted and eaten, and the kernels are also occasionally eaten. A brown-coloured, tasteless gum exudes from the bark.—*Gen. Med. Top.* p. 127; *Beddome, Fl. Sylv.*

SEMECARPUS TRAVANCORICA. *Bedd.* Natu shengote, TAM. This is a very large tree, and, on account of its shining, dark-green foliage, exceedingly handsome; it is very common in the moist forests on the Tinnevelly and Travancore mountains (elevation 1000 to 3000 feet); it abounds with the same caustic, black juice as S. anacardium; it flowers in August and September, and ripens its fruit in the cold season. Another tree of the Travancore Hills is S. auriculata, *Bedd.*—*Beddome, Fl. Sylv.*

SEMEN CONTRA. Sahibi, HIND. The undeveloped calices of Artemisia Judaica, a much-esteemed anthelmintic, especially in the round and long worm of children (Lumbricus teres). The action is heating and stimulant; dose 10 grs. to half a drachm finely powdered, in electuary with honey, or diffused through milk, and taken when the stomach is empty. In infusion or decoction the bitterness is quite disgusting; cathartics should either follow or accompany its use. The use of moxa, or of actual fire, to the surface of the body, is a favourite practice in all savage and even half-civilised nations. In China, the dow of the Artemisia Chinensis is set on fire, and th burning end applied directly to the part. *I India, a red-hot gul or hookah pastille is usu employed. In Italy a small flame of hyd has been lately tried; and in Germany it common practice to place a particle of phospho on the skin, and then ignite it. The object in a* is to effect counter-irritation, and the usual cases in which it is applied are chronic rheumatism, sciatica, neuralgia, deep-seated diseases of the bones, cartilages, or ligaments. In India, guls are used by the native empirics for almost all diseases, especially for enlargements of the spleen and liver.—*O'Sh.* p. 417.

SEMIRAMIS, a great Assyrian queen, wife of Ninus, who extended her conquests into Bactria, which is now represented by the modern Balkh. Semiramis marched on India B.C. 1230. She fitted out her armament in Bactria. She captured on the Kophen (the Kābul river, the Kubha of the Rig Veda) the city of the same name, but was opposed by Jarasandha of Bagadha, the Barhsatide. Semiramis crossed the Indus with a great strength, but Jarasandha, with a formidable force of archers and elephants, drove back the Assyrians in total disorder to the river, which they re-crossed with immense loss. Semiramis herself wounded; she concluded an armistice, and retreated into Bactria with a third of the army she had brought against India. Semiramis was said to have been changed into a dove; she was afterwards worshipped as a dove. The Roman Juno and Chaldæan D'une were derived from one and the same original, this famed queen. Mr. Maurice thinks that Ninus and Semiramis are Vishnu and Siva. Ctesias and Isadore mention a statue and pillar of Semiramis at Baptane; but the sculptures of Semiramis and the inscription in the Syriac character have wholly disappeared. Baghistan is traditionally described as the pleasure-grounds of the queen. The possibility has been surmised of another queen of this name in the 9th century B.C. She is known in India as Sami-Devi. Others point to Sami Rami, suppose it to be the title Zamorin of Calicut.—*Bunsen*, iv. 417; *Sonnerat's Voyages*, p.

SEMITIC LANGUAGES. Hebrew, Chaldaic, Syriac, Arabic, Ethiopic, and Amharic are all found dialects of one original language, and constitute one family of speech, the Semitic. The following nations form a compact mass, and represent one physiologically and historically connected family, viz. the *Hebrews*, with the other tribes of Canaan or Palestine, inclusive of the Phœnicians, who spread their language, through their colonization, as that of the Carthaginians; the *Aramaic* tribes, or the historical nations of Aram, Syria, Mesopotamia, and Babylonia, speaking Syrian in the west, and the so-called Chaldaic in the east; finally, the *Arabians*, whose language is connected (through the Himyaritic) with the Ethiopic, the ancient (now the sacred) language of Abyssinia. The language spoken by Abraham when he left Mesopotamia closely resembled the Hebrew, and his own name was Semitic. Moreover, a dialect of the same tongue is still spoken by the Kaldi (Chaldæans) of Kurdistan, who, there is good reason to suppose, are the descendants of the ancient Assyrians. The common origin of their languages, is, however, the only connecting bond

which unites the widely-separated Semitic nations, —Hebrews, Babylonians, Phœnicians, Carthaginians, and Arabs. The Arab, the Hebrew, and the Palestine descendants of Terah were nomade tribes. The Phœnician, the Syrian, and the people of Mesopotamia and Yemen formed civilised nationalities. In Semitic words the root remains always distinct and unmistakeable. In Aryan, on the contrary, it soon becomes altered and disguised. Hence Semitic dictionaries are mostly arranged according to the roots, a method which in Aryan languages would be most inconvenient, the root being often obscure, and in many cases doubtful. The *Amharic*, as also the Hebrew and Syriac, is derived from the Western Aramoi. Eichhorn adopted the term Semitic from Shem; the language is the oriental language of some author, the Syro-Arabian of Farrer, and the Arabic of Leibnitz.

The Semitic family of languages is divided by Professor Max Muller into three branches,—the Aramaic, the Hebraic, and the Arabic. The Aramaic occupies the north, including Syria, Mesopotamia, and part of the ancient kingdoms of Babylonia and Assyria. It is known to us chiefly in two dialects, the Syriac and Chaldee. The former name is given to the language which has been preserved to us in a translation of the Bible (the Peshito) ascribed to the 2d century, and in rich Christian literature dating from the fourth. It is still spoken, though in a very corrupt form, by the Nestorians of Kurdistan, near the lakes of Van and Urumia, and by some Christian tribes in Mesopotamia; and an attempt has been made by the American missionaries stationed at Urmia to restore this dialect to some grammatical correctness by publishing translations and a grammar of what they call the Neo-Syriac language. The name of Chaldee has been given to the language adopted by the Jews during the Babylonian captivity. Though the Jews always retained a knowledge of their sacred language, they soon began to adopt the dialect of their conquerors, not for conversation only, but also for literary composition. The book of Ezra contains fragments in Chaldee, contemporaneous with the cuneiform inscriptions of Darius and Xerxes, and several of the apocryphal books, though preserved to us in Greek only, were most likely composed originally in Chaldee, and not in Hebrew. The so-called Targums, again, or translations and paraphrases of the Old Testament, written during the centuries immediately preceding and following the Christian era, give us another specimen of the Aramaic, or the language of Babylonia, as transplanted to Palestine. This Aramaic was the dialect spoken by the Lord Jesus Christ and his disciples. The few authentic words preserved in the New Testament as spoken by our Lord in his own language, such as Talitha-kumi, Maranatha, Abba, are not in Hebrew, but in the Chaldee or Aramaic, as then spoken by the Jews.

The second branch of the Semitic family is the *Hebraic*, with which is connected the Carthaginian, Phœnician, and Arabic. This third or *Arabic* branch sprang from the Arabian peninsula, where it is still spoken by a compact mass of aboriginal inhabitants. Its most ancient documents are the Himyaritic inscriptions. In very early times the Arabic branch was transplanted to Africa, where, south of Egypt and Nubia, on the coast opposite Yemen, an ancient Semitic dialect has maintained itself to the present day. This is the Ethiopic or Abyssinian, or, as it is called by the people themselves, the *Gees* language. Though no longer spoken in its purity by the people of Habesh, it is still preserved in their sacred writings, translations of the Bible, and similar works, which date from the 3d and 4th centuries. The modern language of Abyssinia is called *Amharic*. These three branches, the Aramaic, the Hebraic, and Arabic are closely related to each other. Besides these, Egyptian, Babylonian, Assyrian, and the Berber dialects are now considered to have a Semitic character, by Champollion, Bunsen (Egyptian), Lassen, Eugene Bornouf, Dr. Hincks, Sir H. Rawlinson (Assyrian), and Professor F. Newman (Berber). Their language in one form was that of the Judaic portion of Christianity in the Old Testament, the Talmud, and the Syrian fathers. In another form it was that of the Koran or Muhammadanism. It was the language of the earliest alphabet of Phœnicia and the Punic colonies. It fell into the Aramæan, the Arabic, and the Ethiopic divisions. The Aramæan contained the Hebrew, the Samaritan, and the Syriac of Edessa, Palmyra, Damascus, and other important cities, and the people who spoke it were enterprising merchants, bold mariners, and monotheist priests.

The Arabic language, written in the Koran, is the most developed and richest of the Semitic tongues. It is not now spoken in any part of Arabia, as there written. Probably it never was so, any more than the Latin, the English, the German, or Italian have ever been spoken as written in their respective bounds; and Burton quotes from the Arabic Grammar of Clodius that the dialectus Arabum vulgaris tantum differt ab erudita, quantum Isocrates dictio ab hodierna lingua Græca. Indeed, the Arabs themselves divide their spoken and even written language in two orders, the 'Kalam Wati,' or vulgar tongue, sometimes employed in epistolary correspondence; and the 'Nahwi,' or grammatical or classical language. Every man of education uses the former, and can use the latter. And the Koran is no more a model of Arabic (as it is often assumed to be) than Paradise Lost is of English. Inimitable, no man imitates them.

Terah, the father of Abraham, served other gods. But in the book of Job, it is God who can number the clouds in wisdom, who can stay the bottles of heaven (xxxviii. 37), who hath divided a water-course for the overflowing of waters, and a way for the lightning of thunder (25), who hath begotten the drops of dew (28); and in Proverbs (xxx. 4), who hath bound the waters in a garment, who hath established all the ends of the earth. Abraham, indeed, was inspired with a knowledge of the one true God, but his family had images, the teraphim which Rachel stole from her father Laban (Genesis xxxi. 17–35); and when Jacob fled from Esau into Padan-aram, and dreamed the dream at Bethel, he evidently had belief in many gods, for he endeavoured to make a bargain with the deity, saying, 'If God will be with me, and will keep me in this way that I go, and will give me bread to eat, and raiment to put on, so that I come again to my father's house in peace, then shall the Lord be my God' (Genesis xxviii. 20, 21). Such expressions show a belief that there were other gods,

one of whom might be Jacob's own protector. The same principle is invoked in the commandment later proclaimed by Moses to have none other gods but the Lord God; and even more lately Joshua has to urge the people to put away strange gods (xxiv. 15–23), to put away the gods which their fathers served on the other side of the flood. 'Choose ye this day,' he says, 'whom ye will serve; whether the gods which your fathers served on the other side of the flood, or the gods of the Amorites, amongst whom ye dwell: but as for me and my house, we will serve the Lord.' Later still, the Psalmist says (lxxxvi. 8), 'Amongst the gods there is none like unto thee, O Lord; neither are there any works like unto thy works.'

The early Arab religion was Sabæanism, a worship of the heavenly bodies, mixed with idolatry; but with Mahomed commenced the Arab conquests, the creed, science, and literature. At present the Arabic alphabet is in use amongst the Turks, Persians, Malays, some of the people of India and Africa. It was, however, of Syrian origin. The Arab family is Muhammadan, except the Christian Arabs of Malta.—*Max Muller, Sanskrit Literature; Langues Semitiques, par Ernest Renan*, 1858; *Peuples Semitiques, par E. Renan*, 1859; *Wellsted's Tr.; Walk through Algiers; Fontanier; Latham; Bunsen's Egypt; Burton's Mecca*, p. 41; *Pelly; Rawlinson*, i. p. 36; *Sale's Koran*, p. [illegible]; *Lubbock's Origin [illegible]; Muller's Lectures*, p. 263; *Mignan's Travels; Die Abstammung der Chaldaer, Prof. Eb. Schrader; Semitische Culturentlehung, Dr. A. von Kremer; Della Sida Primitiva, Prof. Ignazio Guidi.*

SEMITIC RACES. The subject of the primeval country of the Semitic races and of their languages has engaged the pens of Bunsen, Professor Ignazio Guidi, Dr. Fritz Hommel, Dr. A. von Kremer, Professor Max Muller, M. E. Renan, Professor Sayce, Professor Eberhard Schrader, Professor Spiegel. The Semitic populations in Asia are the Arabians, Syrians, Samaritans, with about ten millions in British India; in Africa, Abyssinians of Tigre and Amhara, Agow, Falasha, Gafat. During the last 3000 years, conquest and commerce, but chiefly the former, has greatly diffused this race. In various inroads, the Arab Semites have gone northward and eastward into Persia, India, and China, and smaller parties are to be found located in Burma, in Malaya, the Archipelago, and Polynesia. Many of them have likewise conquered and migrated westerly along the north of Africa and into Europe, where, as in Spain, they ruled for 700 years, but were again driven back into Africa. They are now found in Africa, as fetish-worshippers, Christians, Muhammadans, and Jews.

Abyssinia is Christian, being acquainted with the chief truths of the Bible, but all much blended with merely human notions. The latest polemics there have been as to the two or three births of Christ,—born of the Father before all worlds, made man, and in the baptism at Jordan receiving the Holy Spirit. As regards the two natures of Christ, they are extreme monophysists. Monogamy is their church law, but concubinage is universal.

The *Adal*, also said to be a Semitic race, are tribes on the west of the Red Sea, who call themselves Afer, but by the Arabs they are called Danakil, from their chief tribe Ad Alli. Dr. Krapf is of opinion that this Afer is the Ophir of Scripture. He thinks that Ophir, in Job xxviii. 16, simply means gold dust.

The *Galla* race, inhabiting Shoa, and one of the finest in Africa, are strong, well-limbed, and of a dark-brown colour, living in a beautiful country, extending from lat. 3° S. to 8° N., with a climate not surpassed by that of Italy or Greece. Speaking a language as soft and musical as pure Tuscan, cultivating the soil, and rearing cattle. They are from 6 to 8 millions in numbers. Their religion, like that of all African savages, is fetish. They acknowledge a supreme being, whom they call heaven (Mulungu), and have a notion of a future state. There seem to be three natures or attributes in their deity,—Wak or Waka, Supreme; Ogli, a masculine, and Ateti, a feminine embodiment. They have two holy days,—Saturday, which they call Saubatta kenna, or little Sabbath; and Sunday, Saubata gudda, or greater Sabbath.

The *Kabila*, south of Algiers, are Berbers, the old Numidians, and differ in language, form, and habit of mind from the Arabs of the plains, being matter of fact in mind, and but little gifted with the glowing imagination of the Arab. The unsubdued portion dwell in the mountainous tract, with bare precipitous peaks, to the south of the Little Atlas and of Algiers. They are spare but robust; and of smaller stature than the nomade, for the Kabila are dwellers in houses or huts (hence their name), are laborious tillers of the soil, and handicraftsmen clever in winning metals from their hills, and even in forging arms. They are wonderful horsemen, and terrible in a fray as in the days of Sallust, and are always at war with the Arabs. The slopes and valleys of their mountain country are all rich, cultivated land, covered with olive trees and corn-fields, and the rocks are said to contain minerals. Their number is about 700,000, possessing some millions of acres of the very best land of Africa, watered by three rivers, and teeming with rich harvests. They approach to within 120 miles of Algiers, which they separate from Constantine. They are a federal republic, and elect their own chiefs. They are the old Quinquegentes, who gave so much trouble to the Romans, who tried the soldiership of Maximinian, and sixty years afterwards again revolted. Tu ferocissimos Mauritaniæ populos, inaccesis montium jugisset, naturali munitione fidentes, expugnasti, recepisti, transtultisti. By Maximinian's system of transtultsi these five nations were reduced to four. The Kabile have feuds amongst themselves.

The Tonareng is a nomade race, dwelling in the Great Desert, very fair, with long hair, aquiline noses, high foreheads, and thin lips. They say prayers in Arabic, and speak a Semitic tongue. Their arms consist of a long lance with a broad head, javelins 6 or 7 feet long, jagged hooks at the pointed end, a round buckler (Darega) of buffalo or elephant hide from Soudan, a poniard, and a broad-bladed scimitar.

If we proceed west to *Morocco*, we find its entire population, computed at 8 millions, to consist of—

Berber,	2,300,000	Jews,	340,000
Shellok,	1,450,000	Negro and Abd,	120,000
Moor,	3,550,000	Christian,	300
Arab,	740,000	Renegades,	200

The *Berber* and *Shellok* are untamed, fighting

tribes dwelling in the mountains. When possible, rovers of the sea, claiming fanciful origins, but impatient of any subjection. They are the same race whom the French call Kabyle and Zouave.

The *Moors* are lowlanders, traders, and dwellers in cities. They are little idle men, who grow fat from indolence; avaricious, perfidious, cowardly, cringing, and insolent. They are said to be descendants of the Carthaginians.

The *Arabs* of Morocco are the Moors of Spain, the Saracens of France, tall, graceful sons of the Arabian desert, courteous, brave, hospitable, and confiding, descendants of the conquerors who in the first ages of the Hijira propagated the religion of Mahomed, crossed the Straits of Gibraltar, destroyed the Gothic chivalry, reigned in Spain for 700 years, invaded France, devastated Italy, and pillaged the suburbs of imperial Rome. When the last Arab king submitted to Ferdinand and Isabella, and the Moorish palaces of Grenada were surrendered to the Christians, the old conquerors went back to Africa and resumed their nomade life. In Tripoli, the Arab has monopolized the country. In Tunis, the native re-appears in a smaller proportion, and in Morocco he is very scarce.

The *Jews* of Morocco are partly urban, partly mountaineers, the latter dating their arrival prior to the nativity. They live in friendship with the Berber, but at hostility with another strange race, who declare themselves descendants of those Philistines whom Joshua drove out of Syria, and who found a refuge in this remote portion of Africa.

The *Rifs*, dwellers of Kalhiya (Cape Tres Forcas), were formerly much engaged in piratical expeditions, which were put down by Muli Abdur Rahman in 1817. Er Rif means shore or bank (Ripa, Pont.), and so long ago as Leo the African was used to designate all the sea-coast between Tetuan and Melilla. It is the country of the chain of the Atlas, and is about 200 to 300 miles long. The word is synonymous with the Arabic Sahila. Thus the inhabitants of the Algerine coast are called Sahali (plural Suahili); those of Morocco Rifi.

The *Arabs* are spread from Syria to the Indian Ocean, and eastwards into the Archipelago. In Arabia, they are chiefly in tribes, and those who occupy the country around Jerusalem are the Anazeh, Shammar, Mowali, and Salhan.

The *Assir* tribe occupy between Mecca and Medina. They have six Kabyla,—Bin-ul-Asmar, Bin-ul-Akhmar, Charaan, Assir, Roufeida, and Abida—and muster about 44,500 fighting men.

The *Cha'ab Arabs* occupy the lower part of Mesopotamia. They are a tall, martial race, strong-limbed and muscular, active and healthy.

It is necessary, when considering the Arabs, to distinguish between a series of grades towards civilisation, in which they may at present be found.

The *Bedouin* is wandering, pastoral, tent-loving, disdaining to trade, yet avaricious, and willing to sell his ghi, his mutton, or his horse, and always found in wide and open wastes, unpressed upon by adequate exterior power. Yet even the Bedouin bends to circumstances. He accepts the region allotted for his pasture-grounds. Plunder has its laws, and vengeance its chivalry. If he will not trade, he still has wants, and suffers the presence of a Jew or Salebah, as the Afghan suffers that of the Hindu. A little higher in the scale, as with the Cha'ab, is the original wandering pastoral Arab, in a district where he is pressed upon from without, and where boundless plunder and roaming are restrained by exterior force. The Arab then partly turns to agriculture, and for this he must in some degree settle. Society harmonizes to this level. Trade is possible; corn is sold; the abba cloaks are woven and exported; dates are planted. Huts of reeds replace tents; and one sees in their feeble efforts at reed-ornamentation, and in their rough twisting of their reed-rope for their bunds, the possible germ of some architectural efforts. Yet higher in the scale is the Arab flourishing as an experienced and wealthy merchant in a town, or administering a well-ordered and comfortable rural district. Passing among these people, society is seen in its transitional state towards civilisation.

The present *Arabians*, according to their own historians, are sprung from two stocks,—Kahtan, the same with Joktan or Yoktan of the Bible, the son of Eber, whose descendants occupy the south; and Adnan, descended in a direct line from Ishmael, the son of Abraham and Hagar, who occupy the north. Yoktan, according to Ch. Bunsen, was one of the two sons of Nimrud, and was the chief of the first Arabian emigration that proceeded southwards. Tradition points to the mountains of [redacted] as the birthplace of the Arab and Canaanitish races. It is supposed that they travelled along the banks of the Tigris into [redacted]potamia, from which a portion of them commenced a great migration southwards, the result of which was the foundation of the primeval kingdoms of Southern Arabia, the kingdoms of the Adites in Yemen, who believe that they came from the sacred North, and once lived in a glorious garden of the earth which they are to restore.

It has not been unusual to describe the Semites as essentially monotheistic, but their tribes and nations were worshippers of El, Elohim, Jehovah, Sabaoth, Moloch, Nisroch, Rimmon, Nebo, Dagon, Ashtaroth, Baal or Baal-peor, Baal-zebub, Chemosh, Milcom, Adra-Melek, Anna-Melek, Nibhaz, Tartak, Ashima, Nergal, Succoth-benoth, the sun, the moon, the planets, and all the host of heaven. Amongst the nomade branch, there seems early to have been a monotheistic belief, but the great bulk of the Hebrew nation continued to worship idols of their own manufacture; and the prophet, when ordered by inspiration to proceed to the wilderness of Damascus, was told that there were only in Israel 7000 people who believed in the one God. Some branches of the Semitic race, ignorant of science theocratic, have devoted themselves to the expression of religious instincts and intuitions,—in one word, to the establishment of monotheism. The doctrine of a future life and retribution, which in one form or other was inwoven with the religious ideas of Egypt, appears to have been unknown to the Semitic nations. The Assyrians were Semites. The names of the Assyrian gods, as Baal or Belus (the supreme deity amongst many of the Semitic races), Nisroch and Mylitta (known by a nearly similar name to the Arabians), of members of the family of the king, such as Adra-Melek (son of Sennacherib), and of many of the principal officers of state mentioned in Scripture, such as Rabsaris, the chief of the eunuchs, and Rabshakeh, the chief of the cup-bearers, are

purely Semitic. Phœnicians, Carthaginians, Syrians, Assyrians have presented forms of worship as gross and sensuous as those of Greece or India. Until the return of the Jews from Babylon, the people generally were ever prone to fall into a worship of gods many and lords many, like the nations around them, which the few thinking minds amongst them could not prevent. Their entire history shows that the people fell into the lower forms of thought and speech, their very worship of Jehovah became polytheistic, even fetish in its nature, and it was in protest against this that their lawgivers, prophets, and psalmists spoke; and when Mahomed appeared with a monotheism the most rigorous and exclusive that the world had witnessed, he was one of a Semitic race who were polytheists and fetish-worshippers. The Jews' belief had as a basis, not monotheism, the belief in a deity numerically one, but in a living God, the Father and the King of men. But when Mahomed proclaimed that the Lord was One, he did so as reviving the faith of Abraham, who derived his knowledge through a special revelation of God.—*E. H. Plumptre, Review of Max Muller's Science of Religion; Contemporary Review*, January 1868.

SEMNAI, a name by which Clemens of Alexandria designates the Buddhist nuns of his day. He mentions Buddhist pyramids, and the habit of depositing bones in [illegible] their practice of foretelling events; of their continence, and of the Buddhist Semnai or holy virgins, and he names their god Bouta. Porphyry tells us the Brahmans were born to their dignity, while the Semnai were elected. Cyril of Alexandria states that there were Samans in Bactria.

SEMOLINO. It. Semoule, Gruau, Fr.; Soojie, Hind. The fine, hard, inner part of wheat, rounded by attrition in the mill-stones, is used exclusively in India for making loaf-bread. It is imported into England from Italy. The best semolino is obtained from the wheat of the southern parts of Europe. In France the name of semolino is given to the large hard grains of wheat retained in the *bolting-machine* after the finer parts have been pressed through its meshes. Semola, It., is bran, but often employed by grocers and other vendors to designate semolino. See Farina; Soojie.

SEN, in Bengal, a patronymic of persons of the medical caste, as Ram Komal Sen, author of a Bengali and English dictionary.

SENA, a dynasty of kings who ruled in Eastern and Deltaic Bengal, and afterward in all Bengal, from A.D. 986 to 1142. They were of the Hindu faith. Adisur was the founder of the Sen dynasty; he brought from Kanouj five Sagnic Brahmans, of the tribes or gotra Sanhila, Kashyapa, Vatsa, Saverna, and Bharadwaja; also five Sudra families, Ghose, Bhose, Dutt, Guha, and Mittra, accompanied them, and these take the position of Kulin Kayasths. In the reign of Bullal Sen, about 284 years before the Muhammadan invasion, all these Kulin Brahmans and Kulin Sudras had greatly increased, and Bullal Sen ennobled these Brahmans by giving to them the title of Kulin, and though degenerated in learning they arrogated to themselves a position above all the Sapta-sali or prior Brahmans. The Kulin Brahmans subsequently consented to marry the daughters of the aboriginal Brahmans, who now eagerly seek alliances with the Kulin, and the Kulin have taken advantage of this, and have established a scale of premiums for condescending to accept a daughter of an inferior. They marry gold. Of the Kayasths who came from Kanouj, Bhose, Ghose, and Mittra were ennobled by Bullal Sen into Kulin Kayasths. Das, Day, Dutt, Guha, Kar, Paulit, Sen, and Sing hold a second rank. Kulin Brahman women are married with difficulty, and generally to aged men. In A.D. 1868, there were 11 Kulins in Hoogly and 1 in Bardwan, each of whom had contracted 50 to 80 marriages; 24 in Hoogly and 12 in Bardwan, who had contracted from 20 to 50 marriages; and 48 in Hoogly and 20 in Bardwan, who had contracted between 10 and 20 marriages. Kulinism is thus a great polygamic institution, and a few women have become prostitutes. In A.D. 1867, the abolition of this polygamy was contemplated, and will doubtless some day be carried out.—*Calcutta Review*, May 1868.

SENA, the barber disciple of Ramanand, founder of a separate sect; the Sena Panthi, an extinct Hindu sect of Vaishnavas. Sena was barber of the raja of Bandhagurh.—*As. Res.* xvi. p. 85.

SENA. Sansk. An army. Sena-pati and Sena-dhipati, general commanding, lord of the army.

SENAA, a town in the mountains in the S.W. part of Arabia. After the expulsion of the Turks in A.D 1630, the whole of Yemen came under the government of the Imams of Senaa; but at the time of Carsten Niebuhr's visit to Senaa in 1763, the native Arab tribes of the provinces of Aden, Abu Areesh, Taez, and others had thrown off allegiance to the Imams. In 1799, when the British Government took measures to oppose the expected invasion of India by the French, and to revive the lost trade of the Red Sea, Dr. Pringle obtained facilities for trade, but Sir Home Popham subsequently lost these. At the beginning of the 19th century, Imam Ali Mansur suffered severely at the hands of the Wahabee sect, who overran and wrested from him some of the best districts of his dominions. In 1816, Muhammad Ali Pasha, after he destroyed the Wahabee power, restored the districts to Imam Ali. In 1817, in consequence of a dispute in which an Arab had been temporarily detained at the factory at Mocha, the Residency was attacked and plundered, and a British officer was dragged before the Governor, by whom he was subjected to the most brutal insults. In 1840, a commercial treaty was concluded with the Governor of Mocha by Captain Moresby, similar to that concluded in the same year with the chief of Zaila. For some years the country of Senaa fell into absolute anarchy. In 1832, Mocha and all the sea-coast fell under the suzerainty of the Turks. It was afterwards recovered for a time, but again finally lost in 1848. Ali Mansur, who succeeded his father as Imam of Senaa in 1834, was deposed three years after. During the internal revolutions in Senaa and the desultory warfare with the Turks, the Imams repeatedly endeavoured to enlist the aid and advice of the British Government in their cause. A rigid abstinence, however, was maintained from all interference in their affairs.—*Playfair's Yemen; Papers in the Foreign Office; Treaties, Engagements, and Sunnuds.*

SENAN, a Sabæan physician, astronomer, and mathematician of the 10th century. His full name was Abu Said Senan.

SEND'HI. HIND. The tuft of hair or scalp-lock which Hindus leave at the top of their head. In Tamil it is called kurmi, and in Telugu, juttu.

SENDOBAD. This book was, like the Pancha Tantra, originally written in Sanskrit, from which it was translated into Persian, and thence into Arabic. From the Arabic it passed into Syriac, and from the latter arose a Greek version under the title of Syntipas. A Hebrew version, supposed to have been made from the Arabic, was translated into Latin by Dam Jehans, a monk, at the end of the 12th or beginning of the 13th century, and was named Historia Septem Sapientum Romæ. Of this last, various translations appeared in English, French, and other modern languages, under the titles of 'The Seven Wise Masters,' 'Dolopathos,' 'Eurastus,' etc.—*Des Longchamps Essai sur les Fables Indiennes.*

SENGAR-CHAORI. HIND. The nuptial hall, from the purpose to which it is applied. Sengar means ornament; Chaori is the term always applied to the place of nuptials.—*Tod's Rajasthan*, ii. p. 709.

SENG-MUNG, among the Abor an interchange of meat as food; on any engagement so cemented their action is inviolate.

SENJERO, a race of Eastern Central Af[illegible]. Like the old Romans, they elect their king [illegible] flight of birds, and choose the individual on wh[illegible] a vulture alights. They sell their women into slavery, and sacrifice their first-born to secure a propitious harvest.—*Krapf.*

SENNA, Cassia senna.

The leaves of Cassia elongata, C. acutifolia, C. lanceolata, and C. obovata all agree in certain properties,—the odour of the leaves is heavy and peculiar, taste bitter, nauseous, and glutinous, powder yellowish-green, and all yield the purgative senna of commerce. At least eight varieties of senna leaf were known in commerce in Europe. —Senna palthe, Senna of Sennaar or Alexandria, of Tripoli, of Aleppo, of Mocha, of Senegambia, false or Arguel, and the Tinnevelly. The Senna palthe is known to have contained Cynanchum oleæfolium, and in this variety of the drug the poisonous leaves of Coriaria myrtifolia were found by M. Dublanc. The Mocha senna is common in all the bazars of India. The Tinnevelly drug is in species identical with the Mocha. Tinnevelly senna is that most esteemed by the profession, and is known by the size of the leaflets, which are much larger than those of any other variety; they are also less brittle and thinner, and are generally found in a very perfect state; while the other varieties, especially the Alexandrian, are more or less broken. Senna grown in the southern provinces of the Madras Presidency is highly esteemed in Britain, and is preferred by many to all other sorts, as being both cheaper and purer. Senna raised at Dapuri from Tinnevelly seed, has been found equal to the best Arabian senna. The picking of senna leaves in Gujerat of sowings in August, is made in September; and Dr. Burn states that the virtues of the leaf depend greatly on the time of the picking.

SENNACHERIB, king of Assyria, son of Sargon, ruled in Nineveh. He was coeval with the latter years of Hezekiah, and contemporary with Nabonassar. Sennacherib reigned B.C. 705, and was slain by his two sons B.C. 681. His chief wars were with Babylon, with the mountain races north of Elam, against the Chaldæans of Elam, with Hezekiah king of Judah, Lulia king of Tyre, overrunning all Palestine. He was worshipping in a temple when assassinated by his two sons, Adra-Melek and Sharezer.

SENSITIVE PLANTS. The best known is Mimosa pudica. A knock upon the ground at a short distance from the plant is sufficient to produce an influence on its leaves. Bichloride of mercury, sulphuric acid, caustic potash, etc., applied to the knots of the joints set the leaves in motion. The removal of the plant to a higher temperature, as well as exposing it to a lower temperature or a draught of cold air, produce the same result. They are destroyed by the application of chloroform and other anæsthetic agents. Its leaflets rapidly fold together and droop when touched, and its leaf-stalk, to its base, droops downwards. On the approach of evening, the foliage of this plant assumes [illegible] appearance. Besides M. [illegible]lica, the M. sensitiva, M. viva, M. casta, M. [illegible] M. quadrivalvis, M. Pernambucana, M. [illegible] humilis, M. peltata, M. dormiens, possess the same property, though not in so remarkable a degree. Species of other genera of the Leguminosæ exhibiting these movements are Smithia sinsitiva, Æschynomene Indica, Æ. pumila, and Desmanthus stolonifer. The locust tree, when its branches are roughly shaken, closes up its leaves, and the same has been observed of Gleditschia triacantha. Oxalis sensitiva, called by De Candolle, on account of its sensitive properties, Biophytum, has long been known to possess this property. Oxalis stricta, if hit smartly on a warm day, will contract its leaves and assume a position as in the ordinary sleep of the leaves of these plants; and the same movements occur in O. acetosella, O. corniculata, and many other species. The movements in these plants consist in the folding up of their leaves, so that the two halves of the leaf approach each other by their upper surface. The midrib is also slightly bent, so that its inferior surface presents a convexity; and the petioles of the leaflets bend downwards, so that the leaf, when irritated, becomes dependent. Averrhoa bilimbi and A. carambola fold their leaves on the application of a stimulus. The leaves of Dionœa muscipula or Venus fly-trap contract upon insects that may happen to alight upon their surface. The surface of their leaves is covered with long hairs, which secrete a viscous matter. When any insect settles upon the leaf, it is entangled with the viscous secretions, and before it has time to escape, the hairs exhibit a considerable degree of irritability, and, curving round, pin the animal down on the surface of the leaf. Other instances of vegetable irritability occur in the Berberis vulgaris, Mimulus, and Stylidium. In the Desmodium gyrans, one of the Fabaceæ called the telegraph plant, a native of the East Indies, the large terminal leaflet when

exposed to the bright light of the sun, forms a direct and continuous line with its leaf-stock, but is manifestly depressed if placed in the shade for a few minutes. Its position varies with the increase or decrease of light during the day.—*Bulletins de l'Academie Royale de Bruxelles*, vi. *in Eng. Cyc.; Chambers' Journal*, 1863.

SEO-JI, in the Bhaka tongue, is a title of Siva; the Ji is merely an adjunct of respect.

SEONI, in lat. 22° 5′ 30″ N., and long. 79° 35′ E., a town in the Central Provinces of British India which gives its name to a revenue district. The beauty of its scenery, the fertility of its valleys, the elevation of its plateau, its salubrity and moderate temperature, make it attractive. The plateaux of Seoni and Lakhnadon have a varying height of from 1800 to 2200 feet. They are well cultivated, clear of jungle, and their temperature is always moderate. The most numerous of the aboriginal tribes are the Gond (148,183 in 1872), the remainder consisting of Kurku, Bharia; Dher or Mhar (40,207), Ponwar (30,305), Ahir or Gauli (26,907), Mali or Maral (24,873), and other cultivating or inferior castes. The Ponwar supply the most industrious and enterprising agriculturists. Their appearance in Seoni dates from the middle of the 18th century, their first settlements being about Sangarhi and Partabgarh, whence they ultimately spread into Katangi. The pastoral Gauli occupy the fine grazing ground to be found in most parts of the district, and the rocky strip of Don[illegible] the south-west.—*Imp. Gaz.*

SEORI or Siviri, a race in Ghazipur, Gorakhpur, Behar, Benares, and Mirzapore, whom Buchanan thinks distinct from the Kol and the Cheru. The Cheru aborigines in Ghazipur, a part of Gorakhpur, the southern part of Benares and Mirzapore, and of Behar, are sometimes said to be a branch of the Bhar, but Buchanan considers them distinct.

SEPIADÆ, a family of mollusca of the class Cephalopoda, order Dibranchiata, and section Decapoda, including the genera belemnosis, beloptera, helicerus, sepia or cuttle-fish, and spirulirostra. Belemnosis, beloptera, and spirulirostra are fossil, and sepia has 10 fossil and 30 living species, of which the type is the common cuttle-fish, whose bone is so often thrown up by the waves on the beach. The ink (nigræ succus loliginis), common to this and other species of cephalopods, is not only ejected as a defence to colour the water in order to favour the escape of the animal, as was well known to the ancients (Oppian, Halient, iii.; Pliny's Nat. Hist. ix. p. 29), but as a direct means of annoyance. The fluid was used by the ancients as ink, as shown in the lines in the graphic description of the idler by Persius (Sat. iii. lin. 10, et seq). The flesh of the naked cephalopods was rather esteemed of old, as it is, indeed, now in Italy and eastern countries. Mr. F. D. Bennett states that the Fe, or cuttle-fish, is considered a luxury by all classes of the Sandwich islanders, and that when fresh and well cooked it is an excellent food, and in consistence and flavour not unlike the flesh of a lobster's claw. Its shell, called cuttle-fish bone, is sometimes 1½ feet long; it is used for rubbing down paint.—*Bennett, Whaling Voyage*, Lond. 1840; *Woodward*.

SEPOY. Anglo-Hind. Sipahi, Pers. A native soldier of the Indian army.

SEPSIDÆ, the family of sand lizards, one of them, Sphenocephalus tridactylus, *Blyth*, occurs in Afghanistan.

SEPTACANTHIS WALKERI, one of the Acanthacea (quere, Nillhoo of Ceylon), perfumes by its fragrance the jungles, especially around Needuwattum and paths leading to Gudalur.

SEPTARIA. Shih-pieh, Chin. Nodular stony concretions used in Chinese medicine.

SEQUIN, a Venetian coin known in the S. of India as Shanar kassu. The figure of the Pope, with a tall crozier, is supposed to be a Shanar toddy-drawer about to ascend a cocoanut tree.

SEQUOIA GIGANTEA. *Decaisne.* The Wellingtonia gigantea, *Lindley.* A huge tree of California, some of which measured 420 to 470 feet, average height 275 feet. It might be introduced into India. Sequoia sempervirens, discovered by Menzies in 1796, in California, is nearly as tall as the Wellingtonia. One tree, known as the Giant of the Forest, was 270 feet high, and 55 feet in circumference at 6 feet from the ground. This species is interesting as being the nearest living representative of a sequoia which, during the tertiary period, enjoyed a very wide distribution in Europe, where no congener is now indigenous.

SER. Hind. An Indian weight of varying quantities from 25 tolas to 2 lbs. 2 oz.

SERAI. Hind. A lodge for travellers.

SERAJGANJ, Narainganj, and other N.E. [illegible]icts of Bengal, are the chief seats producing [illegible]e fibre. The yield is 2000 to 4000 lbs. of [illegible]bre, and 1000 to 1200 lbs. of seed per acre. The common or desi sort yields only 600 to 1000 lbs. of fibre, but an increase of seed, viz. 1500 to 1600 lbs. Jute is sown broadcast, 22 to 28 lbs. of seed per acre. In the N.E. districts it is planted in February and March, and cut in June and July; the common kind in July and August, and cut in August and September.

SERAMPUR, a town in the Hoogly district of Bengal, lat. 22° 46′ N., long. 88° 24′ E., 13 miles from Calcutta, on the right bank of the river Hoogly. The town gives its name to the Serampur subdivision of the Hoogly. It is famed as the residence of a body of Protestant Baptist missionaries from England who made it the centre of their Christianizing efforts. Amongst them were the celebrated William Carey, Ward, and Marshman. Carey set up his missionary press there, and printed the Bible in 40 different Indian tongues. He founded here a college, which has fallen into decay. Until the middle of the 19th century, Serampur and Negapatam belonged to the Danes. The mission still flourishes, and its founders have established a church, school, college, and noble library in connection with it; there is also a dispensary here.—*Imp. Gaz.*

SEREGIUS, a Manichæan who appeared in the character of Christ and Paraclete.—*As. Res.* ix. pp. 217, 218.

SERES, a term which Horace and the ancients use, seems to have been strictly applicable to some nation in the west of China. The western term China is not traceable, but many authors have surmised that it was given to the country when the Tsin dynasty carried their arms to the west. Whatever may have been its origin, the term China (Cheena) was that early given by the people of the N.W. of India to the race whom Europe now calls the Chinese. There are two mentions of the Seres which may be much earlier.

One is in a passage ascribed to Ctesias, which speaks of the Seres as a people of portentous stature and longevity.—*Yule, Cathay*, i. p. 39.

SERIATOPORA SUBULATA, a coral reef-building polypifer at the Mauritius.

SERINGAPATAM, in lat. 12° 25′ 33″ N., and long. 76° 43′ 8″ E., in Mysore, is built on an island in the Cauvery river, 3 miles long and 1 mile broad. The mean height of the station is 2558 feet; the level of the Cauvery is 2321 feet. The fort is placed at the upper end of the island. It is a large irregular fortification, protected on two sides by the river; the complete Hindu name is Sri-ranga-patana. One canal is carried across the western branch of the river Cauvery 40 feet above its level. The existing fortifications were almost entirely constructed by Tipu. In 1791, Lord Cornwallis, the Governor-General, commanding in person, advanced up to the walls, but was compelled to retire through want of provisions. In the following year, 6th February 1792, he won a decisive victory in the field, and had invested the city on all sides, when Tipu purchased peace by the cession of half his dominions. Finally, the fort was stormed, led by Sir David Baird under General Harris, 4th May 1799, and Tipu fell in the breach. The siége was begun in April of that year with a powerful battering train, and the assault was delivered after a bombardment of nearly one month's duration. The place is malarious, which the natives attribute to the destruction of the sweet flag, a plant to which they assign extraordinary virtue as a febrifuge. The fort stands at the upper or western end of the island. At the eastern end is the Lal Bagh, containing a mausoleum built by Tipu Sultan for his father Hyder Ali, in which Tipu himself also lies. It is a square building, with dome and minarets, surrounded by a corridor, which is supported by pillars of black trap. The double doors, inlaid with ivory, were the gift of Lord Dalhousie. The inscription on the tombstone of Tipu relates how he died a martyr to Islam. Each of the two tombs is covered with a crimson pall, and the expenses of the place are defrayed by the British Indian Government.—*Imp. Gaz.*

SERONCHA, the chief station of the Upper Godavery district of the Central Provinces.

SEROW. HIND. ? Nemorhœdus bubalina, *Jerdon.*

SERPA, a Bhot people in Nepal and Sikkim, who speak a dialect of Tibetan.

SERPENT.

Serpents or snakes are alluded to in the most ancient of the writings and traditions of the world. They are very numerous in many parts in the south of Asia, admired yet dreaded by many, but protected and worshipped by other, of the races. The colours of the backs of such as creep on the ground are generally of a brownish hue, much resembling the soil on which they move. The colours of the Dendrophidæ, or tree snakes, are of various shades of green, so that, aided by their quiet gliding motion, snakes, though numerous, unless looked for, are seldom seen by any person. But a search in the least promising places will always produce to the naturalist some specimens. The backs of the water-snakes, the Hydridæ, are also usually of a brownish colour, from which in the green sea water, or in that of quiet lakes or tanks, they are detected as readily as the tree and land snakes escape observance. All snakes have a long bifid tongue, which, usually retracted in a sheath below the windpipe, is capable of rapid and vibrating protrusion through a chink in the rostral shield; it is moved by means of two long elastic bones extending along the greater part of its length in the form of a long V, with the tongue rising perpendicularly from the angle of the V; muscles convert these bones into levers, which jerk the tongue up and down with great celerity and freedom of play. This form of tongue is not peculiar to snakes; the large water lizards (Varanus), for instance, have this bifid organ still more developed. Harmless snakes have a row of about six to sixteen teeth in each upper jaw, besides generally two rows of palate teeth. In the venomous kinds the maxillary teeth are generally replaced by a single tubular tooth of variable length, but hardly exceeding a quarter of an inch in an adult cobra, and half an inch in an adult chain-viper (Daboia elegans). The erection of the fang takes place to a very slight extent in the cobra, which is unprovided with any special erective apparatus; the fang is always recurved backwards at an angle of about 45°, and received into a depression in the lower lip. In some of the vipers there is a special erective muscle, but in every case the uncovering of the fang is a passive act as regards the snake, being effected by the gingival envelope being pushed up mechanically by the object bitten. The fang is at the anterior extremity of the upper jaw-bone, while the poison gland is situated on the cheek behind the eye; the poison, on being ejected either by direct muscular action, or by a reflex nervous action similar to that excited in the human mouth by the idea of eating lemon, proceeds along a duct, which passes below the eye over the jawbone, and terminates at the bottom of the gingival envelope of the fang, and just in front of the superior orifice of its canal. There is no continuity between the orifice of the poison duct and that of the poison fang. They are merely in apposition, and the poisonous salivary secretion is directed into the fang by the retraction of the gingival envelope round the fang in the act of biting. Every tooth in the snake's mouth, whether simple tooth or poison fang, is enveloped more or less in a gingival envelope, which contains at its base the matrix of a series of other teeth; these young teeth are constantly growing, and the eldest of them periodically replaces the fixed tooth, and becomes fixed until it is shed in its turn. This shedding is a gradual process compared to the shedding of the epidermis, but the two operations coincide in time, and take place about once in two months. The common exceptions are the cobra and the bungarus. In India the usual snake of the latter genus is Bungarus arcuatus, the white-arched bungarus; it has a white belly, from which pairs

of white arches cross the black back. In Burma this is replaced by Bungarus fasciatus, the yellow and black-banded bungarus; it has alternate complete rings of black and yellow. The Hamadryad, Ophiophagus elaps, a member of the Elapidæ family, is extremely rare; it resembles a huge cobra. This family is also distinguished from the rest of the shield-headed or harmless colubrine snakes, by the absence of the loreal-shield, a small shield usually separating the antocular shield from the posterior nasal, so that there are but two shields instead of three between the eye and the nostril The sea-snakes which have shielded heads are also an exceptional family, being all or nearly all venomous. They are known from other aquatic snakes by their perpendicularly-flattened tail. A scaly head (that is, the crown covered with scales as on the rest of the body) is generally the sign of a poisonous snake. The scaly-headed snakes are usually vipers. The Viperidæ have usually a high flat head, very distinct at the neck, and broad behind the jaws. They have long, more or less erectile fangs, with an erect pupil. The only one fatal to human life is the chain-viper, Daboia elegans, known by a triple chain of oval black links, and an indistinct yellow on its head. The green tree viper, Trimesurus, is a short, stout snake, very different in build from the long, slender green tree snake; it is venomous in a very slight degree. As exceptions to these general remarks, however, the Erycidæ and Acrochordidæ have also scaly heads; a common sand snake, Eryx Johnii, might possibly be mistaken for a viper, but its small head is very different from that of the vipers. It is a popular belief that the male and female cobra are very different in appearance. The origin of this error appears to be as follows: The Ptyas (mucosus or korros), dhaman in Hindustani, sarai or sara pamboo in Tamil, chera pamboo in Malayalam, lem-we in Burmese, is generally supposed by natives of the south of India and of Burma, to unite with the cobra, producing a very venomous hybrid offspring, of doubtful identity; hence it is frequently called the male cobra. Ptyas, the dhaman, is indifferently known as the whip snake, the rat snake, the rock snake in Madras; whilst in Bengal the name rock snake is usually given to the python. Any snake found near or in the water is usually called a water snake, from ignorance of the fact that nearly all snakes can swim, and will readily take to the water if necessary. Indeed, a snake which rejoices in the highly terrestrial name of Psammodynastes pulverulentus, the dusty king of the desert, was captured whilst it was swimming across the Rangoon lake. Also, if any word could be more inappropriate and deceptive than another, it is the term 'hood' as applied to the broad expansion produced by the elevation of the cervical ribs of Naga tripudians and Ophiophagus elaps. The native terms used to describe it, putum in Tamil and Malayalam, meaning a cloth, a picture, a map, and phun in Hindustani, both give an idea of breadth and expansion entirely wanting in the terms capella and hood.

Naturalists arrange the order of snakes into the two sub-orders, innocuous and venomous colubrine snakes, and the names of these will be found detailed under the Reptiles. Though the non-scientific world regard all snakes as poisonous, and though many deaths do occur from snake-bite, the numbers of poisonous snakes are not great, and comprise species of the genera Aipysurus, Acalyptus, Bungarus, Callophis, Daboia, Disteria, Calloselasma, Echis, Hydrophis, Enhydrina, Halys, Hypnale, Megærophis, Naja, Ophiophagus, Platurus, Pelamis, Peltopelor, Trimeresurus, Xenurelaps; 18 genera, and about 80 species. Deaths frequently occur from them in the south and east of Asia, because of the difficulty of avoiding them. In the six years 1875 to 1880, the deaths from snake-bites in British India were as under. In 1861 they were 18,670:

1875, . . .	17,070	1878, . . .	16,812
1876, . . .	15,946	1879, . . .	17,388
1877, . . .	16,777	1880, . . .	19,150

Yet they have many enemies. Mr. Bennett, who resided much in the south-east of Ceylon, ascribed the rarity of serpents in the jungle to the abundance of the wild pea-fowl, whose partiality to young snakes renders them the chief destroyers of these reptiles. It is likely, too, that they are killed by the jungle-fowl, for they are frequently eaten by the common barn-door fowl in Ceylon. This is rendered the more probable, by the fact that in those districts where the extension of cultivation and the visits of sportsmen have reduced the numbers of the jungle-fowl and pea-fowl, snakes have perceptibly increased. The deer also are enemies of the snakes, and the natives who have had opportunities of watching their encounters, assert that they have seen deer rush upon a serpent, and crush it by leaping on it with all its four feet.

Snakes are said to avoid the fennel plant, as well as all places where the fennel seed (Nigella sativa) is strewed.

In some parts of the country are serpents of great length, up to 26 feet long. They feed on all the smaller animals, but they can exist an indefinite time without food.

Snakes cast their skins periodically, and the Chinese and Hindu physicians use the skins medicinally.

Most serpents or snakes can move by springs or leaps, often of considerable extent. The Editor has seen a large snake cross the high-road in the flats at Bombay by two leaps.

Nearly all with a hood are poisonous; the Coluposososoma radiatum and Tropidonotus macrophthalmus are exceptions.

Naja tripudians, cobra, cobra di capello, occurs in several varieties, to each of which the natives give a name. They are all poisonous. The Gokurrah has spectacles on the hood. Those with one ocellus or other mark on the hood, are called Keautiah.

Ophiophagus elaps is the Hamadryad of Gunther, the Sunkerchor of Bengal, and Ai Raj of Orissa. One variety, olive-green above, is found in Bengal, Assam, Malay Peninsula, and S. India. The brownish-olive is found in Bengal, the Philippines, and perhaps in Burma; and the black variety is a Borneo reptile. The genus is widely distributed in Cuttack, Bengal, Sunderbuns, Rangoon, in the Andamans, Philippines, Java, Sumatra, Borneo, N. Guinea. It is the most aggressive of all the Indian poisonous snakes. It lives upon snakes.

Bungarus fasciatus is the Sankni or Raj Samp of Bengal, the Bangaraw pamu of S. India, and

the Koklia Krait of the N.W. Provinces. It is from 4 to 8 feet long. It occurs in Hindustan, S. India, and Burma. Its bite is very dangerous; dogs die in 4 to 28 hours.

Bungarus cæruleus.

Dhomun chiti, . BENG.	Krait, ... HIND.

Gedi Paragoodoo, TEL., of Russell. It occurs throughout India, N.W. Provinces, Rajputana, Gujerat, Dekhan, Madras. It has three varieties, one of them, B. lividus, *Cantor*, is blackish-brown above; another variety has a series of vertebral white spots; and a third, the B. arcuatus, *Dum. and Bib.*, has narrow white streaks in pairs on its upper parts. It is from 2 to 4½ feet. The Lycodon aulicus, an innocent snake, and it, are frequently mistaken. All the species of Bungarus and Hamadryas are fierce snakes.

Callophis M'Clellandia has two varieties from Nepal and Darjiling, and a third variety from Assam.

Daboia Russelli.

D. elegans; Russell's viper; Chain viper.

Jessur, ... BENG.	Tic-polonga . of CEYLON.
Siah-chunder, . ,,	Katuka, Rekula, . TAM.
Amaiter, . . . ,,	Poda-ge . . . . ,,

It is to be found in most parts of India, in the plains and hills, also in Kulu up to 5000 feet, and in Kashmir 2000 to 6000 feet. It is of a greyish-brown colour, 3½ feet long; it is less deadly than the cobra. Its size and nocturnal habits render it more dangerous than the Trimeresures and Hypnales.

Echis carinata.

Afae, ... HIND.	Horatta pamu, . . TAM.
Kuppur, . . . SIND.	

Occurs in most parts of India. It is brown or brownish-grey, 22 inches long; it is very active, is fiercely aggressive, is always ready to attack, and throws itself into a double coil, the folds of which as they rub against each other make a rustling sound. It can dart a foot or more to strike its prey.

Trimeresurus carinatus, one of the Crotalidæ or pit vipers, found in Bengal, Sikkim, and Burma; 36 inches long, and grass-green above.

Trimeresurus Animallensis, 27 inches long, yellowish-green in colour, occurs in the Animallay Hills in S. India.

Trimeresurus erythrurus occurs in the Nicobars, Moulmein, Penang, and Java. It is 33 inches long, and of a grass-green colour.

Trimeresurus monticola occurs in the Sub-Himalaya, Darjiling, Nepal, Sikkim, Khassya, Neilgherries, and Animallay. It is 33 inches long, of various shades of dark-brown.

Mr. Theobald describes two others, viz. Trimeresurus Andersonii, *Theobald*, found in Assam, and Trimeresurus obscurus, *Theobald*, of a uniform black colour, also of Assam.

Trimeresurus strigatus, of a brown colour, is 14½ to 19 inches long, is found in the Dekhan, the Animallays, and Neilgherries.

Halys Himalayanus, 23 inches long, occurs in the Hatu mountain near Kotgurh, is very common in the N.W. Himalayas. It is brownish-green to brownish-black above.

Hypnale nepa, Kara willa, TAM., a much-dreaded snake, 19 inches long, found in Malabar, Animallay, Ceylon; colour brown, or grey, or reddish-olive.

Pelamis bicolor, a sea-snake, with four varieties,—α. black above, sides and belly brownish-olive; β. a second, back black, belly and sides brown; γ. a third, black of back narrow; δ. fourth, yellow, with 50 brown bands. It abounds in all the eastern seas. It is very poisonous.

Enhydrina Bengalensis, a very virulent sea-snake, common in the tidal waters of the Sunderbuns and Bay of Bengal; 36 to 48 inches long. One killed a fowl in seven minutes.

Platurus Fischeri, a sea-snake, 30 to 48 inches long, found in Tollys nullah, a tidal stream near Calcutta.

Hydrophis Jerdonii, *Anderson*, 36 inches long.

H. robusta, *Fischer*, 70 inches, occurs on the coast of India and in the Archipelago.

H. crassicollis, *Anderson*, 51 inches long, is found in the tidal streams near Calcutta.

H. cyanocincta, 69 inches long, is common in the Bay of Bengal, the Archipelago, and China, and Japan seas.

H. Stewartii, *Anderson*, is 38 inches long, occurs at Puri, Cuttack.

H. nigra, *Anderson*, is of a uniform dense black, occurs at Puri, Cuttack.

H. nigrocincta, 23 inches long, colour yellow, with complete rings of a black colour.

H. coronata.

H. chlorosis. See Reptiles, pp. 386, 393.

This serpent eagle is found in the south of Europe, North Africa, common all over India and Asia; has been killed in Denmark, but never in the British Islands; prefers the open ground, questing like a harrier. It eats any creature, but snakes and lizards are its chief food. Hovering in the air, and suddenly like a stone pouncing down, it seizes with its talons the snake by the back of the head, and the snake often twines its body around the bird and encumbers it.

The crested serpent eagle is found all over India, in Assam, and Burma. It lives on snakes, lizards, rats, frogs, and insects.

S. bacha, *Daud.*, from Java and Sumatra; is the Falco bido of Horsfield.

S. spilogaster, *Blainv.*, from Ceylon and Southern India.

S. holospilus, *Vigors*, is from the Philippines.

SERPENTINE is a term which has been applied to diallage, to crystallized and fine-grained greenstone, and also to a magnesian limestone, and when of the latter composition is called verd antique marble. It is found in the form of dykes and thick beds in the schistose rocks of Salem, also near Bezwarah on the Kistna. A serpentine of great beauty occurs at Turivacary in Mysore. It is composed of a dark-grey or black talcose paste imbedding numerous small black crystals of a mineral containing a large proportion of iron, being strongly attracted by the magnet. It takes a high polish, and is said to be the material of the beautiful pillars of the

mausoleum of Hyder Ali at Seringapatam, which Buchanan Hamilton, Benza, and Malcolmson designated basaltic greenstone.

A beautiful serpentinous marble is obtainable in the eastern part of the Cuddapah district, and in the Kurnool district. The serpentine of the Panjab is made into cups.

Precious serpentine exists in the Hukong valley, north-west of Ava, whence it is exported to China, and brought into the southern parts of the empire. It is also found in the country of the Singpho, about 8 or 9 miles to the north of a large lake, the Eng-dan-gyi, over a hilly country of 18 or 20 miles in length. At particular seasons, about a thousand men—Burman, Chinese, Shan, and Singpho—are at work in the serpentine mines.—*Waterston; Faulkner; Mason; Walton's State; Tomlinson.*

SERPENT'S EGG.

Glain naider, . . CELT.	Serpent's gem.
Glaine nan Druidhe, „	Druid's head.
Ovum anguinum, . LAT.	

It was held in high estimation by the Druids.

Serpent Gem is a superstition still lingering in Scotland, and amongst the ruins of Tadmor.

SERPENT STONE. Shi-hwang, CHIN. The bezoar. Tavernier says (Tr. p. 155) some are almost oval, thick in the middle, and thin about the sides. 'The Indians,' he says, 'report that it is bred in the [redacted] of certain serpent[redacted] but I [redacted] supposed it rather to be a story of the idolatr[redacted]riests, and that the stone is rather a composition of certain drugs. Whatever it be, he says it is of excellent virtue to drive any venom out of those that are bit by venomous creatures. If the person bit be not much wounded, the place must be incised, and the stone being applied thereto, will not fall off till it has drawn all the poison to it. To cleanse it, you must steep it in woman's milk, or for want of that, in cow's milk; after the stone has lain ten or twelve hours, the milk will turn to the colour of an apostemated matter.' The Archbishop of Goa, carrying Tavernier to his cabinet of rarities, showed him one of these stones, and after he had assured him of the rare qualities it had, gave it to Tavernier. Once as he crossed a marsh in the island of Salsette, where Goa stands, one of the men that carried his pallequis, being half-naked, was bit by a serpent, and healed at the same time. He bought several, but there were none but the Brahmans that sold them, which made him believe that they compound them. 'There are,' he says, 'two ways to try whether the serpent stone be true or false. The first is by putting the stone in your mouth, for then it will give a leap, and fix to the palate. The other is, by putting it in a glassful of water; for if the stone be true, the water will fall a-boiling, and rise in little bubbles up to the top of the glass. There is another stone, which is called the serpent stone with the hood. This is a kind of serpent that has a kind of hood hanging down behind the head. Behind this hood the stone is found, many times as big as a pullet's egg.' There are some serpents both in Asia and America of a monstrous size, 25 feet long; as was that, the skin whereof is kept in Batavia, which had swallowed a maid of ten years of age. These stones are not found in any of those serpents that are not at least 2 feet long. This stone being rubbed against another stone, yields another flime, which being drunk in water by the person that has the poison in his body, powerfully dr[redacted] against. These serpents are nowhere to be f[redacted]nd but upon the coast of Melinde; but for th[redacted] stones you may buy them of the Portuguese [redacted]rriners and soldiers that come from Mozambi[redacted]—*Tavernier's Tr.* 155.

SERPENT WORSHIP and Spirit Worship are the prevalent cults in the East Indies; and throughout British India, spirits, snakes, stones, shells, trees, and fossils are worshipped. The last is the saligramma of the Hindus, and is found in the river Gandak. Also the ban-lang, or rude lingam of the Hindus, is a stone rounded by attrition, found in the rivers of Rajputana. According to the Earl of Roden, a stone at Mayo was carefully wrapped up in flannel, periodically worshipped, and supplicated to send wrecks on the coast. Stones were till recently worshipped in Fiji, New Hebrides, and related to the lingam worship of other races. The chank shell, species of Turbinella, is found in abundance in the Pambaun Channel, between Ceylon and Tinnevelly; some fetch great prices. 'Psalm lxxxi. 3, says," Blow up the trumpet in the new moon, in the time appointed, on our solemn feast-day.' And Hindus similarly announce some of their festivals by the sound of this sacred shell.

Snakes have been worshipped by many races; the Jews, 2000 years B.C., adopted this worship. At Lanuvium, 16 miles from Rome, was a dark grove sacred to Juno, and near it the abode of a great serpent, the oracle of female chastity.

The naga snake of India, cobra di capello, is revered by all Hindus, and Hindu women resort to the white ant nests in which the cobra generally takes up its home. If a cobra be killed, the Hindus give it a funeral, as if it were a human being; their gods and deified warriors, and the lingam, are figured shadowed by the outspreading hoods of 3, 5, 7, 9, or 11 cobras.

In all mythological language the snake is an emblem of immortality; its endless figure, when its tail is inserted in its mouth, and the repeated renewal of its skin and vigour, afford symbols of continued youth and eternity. In Hindu mythology serpents are of universal occurrence and importance, and the fabulous histories of Egypt and Greece are also decorated with serpentine machinery. The accepted explanation of the traditions of the Garuda, and his victories over the snakes, is that Garuda is the type of the religion of Vishnu, and the snakes alluded to are the naga or snake race who followed the Buddhist faith of Sakya Muni. There is ample proof to show that at one time the ophite or snake worship extended all over India; and everywhere throughout the Peninsula and Ceylon, snakes are to this day worshipped. In the holy books of the Hindus, the destruction of the entire serpent race by the raja Janamejaya, the son of Pariesshit, is chronicled as a historical event, but probably it is merely a typical and emblematical shadowing forth of the actual fact, i.e. that the faith of the Vedas was founded on the ruins of the original and local superstition of the nagas, when Janamejaya subverted the ancient ophite worship. At all events, there is no doubt whatever that this singular superstition existed originally in Kashmir, as snakes and snake deities play an important part in the legendary history of the valley. Abul Fazl (alluding to an epoch about 350 or 400

it as the serpent's Laq, believe that it is most fortunate to witness snakes so engaged, and that if they can throw a cloth at the pair to touch them with it, the cloth becomes a representative form of Lakshmi, of the highest virtue, and is taken home to their houses and preserved as such. The snakes when in congress rise on the tips of their tails and approach each other, not twining as represented in the Esculapian rod, though, at a little distance, they seem to be twining.

Ordinarily no Hindu will kill a snake, but turns aside on seeing it. Young men who have been educated at English schools, however, have no such great reserve, and a Mahratta Brahman so educated, informed the Editor that he had killed three of them. Snakes are kept in houses in Ceylon and Gujerat, partly, seemingly, as objects of worship and partly to destroy rats. In Gujerat no one will kill a snake, but it is taken outside the town and released. Esculapius, amongst the Greeks and Romans, was the god to whom the care of medicine and health pertained. Esmun, the snake-god of the Phœnicians, is identified by Bunsen with the Egyptian Hermes, called Tet and Taautes in Phœnician. Esmun Esculapius is strictly a Phœnician god. He was especially worshipped at Berytus. At Carthage he was called the highest god, together with Astarte and Hercules. At Babylon, Bel corresponded with him. According to [illegible] and the [illegible] books, the Egyptian name of Esculapius was Kameph. The Aswini Kumara, the sons of Surya, amongst the Hindus, correspond with the western Greek and Roman Esculapius, but they do not have the twining snake rod. Mr. Fergusson has expressed his belief that serpent-worship mixed with Buddhism must have prevailed all through the Nizam's country and Berar, from at least the 4th to the 10th or 12th centuries. A great serpent is said to have been worshipped at Sumbulpore on the Mahanadi ever since the world began. The snake-worship of the Takshak travelled from Scythia to Kashmir and thence to Hindustan.

Few subjects have more occupied the notice of the learned world than the mysteries of ophite-worship, which are to be traced wherever there existed a semblance of civilisation, or indeed of humanity; have in general been associated with tree-worship, and attended by human sacrifices. Serpent-worship has been supposed by Mr. Bathurst Deane to have been the only universal idolatry. In Asia evidence of serpent-worship has been found in Africa, Palestine, Chaldæa, Babylon, Persia, Kashmir, Cambodia, Tibet, India, China (traces), Ceylon, and among the Kalmuks. It has been found among the races of Europe, among the tribes in America, and is practised to the present day in Africa. The only part of Asia which seems to have remained free from it is China; but throughout all the S. of British India snake-worship still prevails amongst all classes of Hindus. The naga, or serpent-genii of the Rajputs, have a semi-human structure, precisely as Diodorus describes the snake-mother of the Scythæ; and Olaus Magnus, writing in the sixteenth century, speaks of serpents as still kept as household gods in Sweden. The origin of this form of worship is lost in antiquity. One possible surmise has been obtained from the known love of many races for totems, animal or vegetable gods, after which they

are named. The American Indians all possessed them, as also the Australian tribes. In Central Asia, most of the Kirghiz tribes trace their origin back to some animal which they venerate and worship; and amongst the Tartar races, who designated their septs after some beast, as the naga or snake, the langaha or wolf, the lumri or numri or fox, the sessu or hare, cutchwah or tortoise, etc., the sept reverenced the creature from which they took their name. If the totemic origin of serpent-worship be the correct one, the serpent, like other totemic deities, would, from its origin, have a benevolent character. M. Boudin says, 'Le culte du serpent est independent de toute influence ethnique;' and M. Lajard says, 'Dans la plupart des langues dites Semitique, le mot que signifie la vie, hayy, ou hay, haya, heyo, hayya signifie egalement le serpent.' In several of the ancient religious systems the serpent presides at the creation of the world, and is the god of life or health.

The Chiun mentioned in Amos v. 26 is supposed to be the deity Siva. Professor Sayce thinks it is the planet Saturn. Givun is a Phœnician word signifying serpent. Cabrera thinks Chivun has the same signification as Givun or Hivim, *i.e.* descendant of Heth, son of Canaan. The Giviun or Hivites were descendants of Cadmus and Hermione, his wife, who, according to Ovid's metamorphosis [redacted] changed into serpents and had divine honours paid to them. Tripoli[redacted]rly called Chivun; Votar says, I am a serpent [redacted]e I am a Chivun, which can also be rendered, 'I am a Hivite from Tripoli.' In Egypt, both tree and serpent worship prevailed, as parts only of the general animal and vegetable worship. The serpent was honoured in Tyre from an early period down to the time of Alexander. Solomon says 'they worshipped serpents void of reason.' It seems to have been repressed, but it again cropped up amongst the same people in the Christian sects of Ophites, Nicolaitans, and Gnostics. According to Tertullian, De Præscript. Hereticorum cxlvii., the Ophites even preferred the serpent to Christ. They kept a living serpent in a chest, as, or to represent, the god. Serpent-worship does not seem to have been known in Germany, though the tree was worshipped there, as also in Gaul. In ancient Sarmatia and modern Poland both trees and serpents were worshipped by the peasantry, even to the limits of the 19th century.

The totem cult may explain why with most races the serpent has been regarded as a protecting deity, an agathos demon, and would also explain the claims made by races and individuals to be of snake or naga descent.

Scipio Africanus is said to have believed himself the son of a snake; and Augustus allowed it to be understood that his mother Atia had received him from a serpent. Alexander the Great, before he undertook to prove himself the son of Jupiter-Ammon, was supposed (apparently by Philip himself) to be the son of a serpent, who actually appeared to him in a dream in later years to save the life of his general Ptolemy. In the Turanian form of Buddhism, Sakya and Buddhist kings are invariably represented under the protection of the hooded snake, or of three or more snakes, which are figured as rising behind, and with the hood shadowing the seated image. This form of protection has been transferred to the lingam (phallus, priapus), the emblem of modern Saiva Brahmanism; and everywhere are to be seen, throughout all the south of India, the sculptured figures of one, three, or nine naga heads, overshadowing this symbol of reproduction.

In the earliest records of the Semitic thought, the serpent and the tree take a prominent position. Adam and Eve are taught by the serpent more subtile than any beast of the field, and the tree of knowledge supplies the fruit to enlighten them. Moses' rod was turned into a serpent, but pressure by the thumb on the back of a serpent's neck produces temporary catalepsy, and Moses and Aaron, and afterwards the Egyptian magicians, imitated this. An image of a snake was made for the Jews, and snake-worship continued amongst that race for seven hundred years; and in the days of Hezekiah 'the children of Israel did burn incense' to the self-same brazen serpent, which was actually preserved in the very temple (2 Kings xviii. 4). The reformer king at the same time 'cut down the groves, and brake in pieces the serpent,' thus combining in common ruin the two ever-parallel idolatries.

The serpent was worshipped in Chaldæa, where, as in Egypt, it was called Oub, hence the Greek ὄφις. This word, as Oboth, is translated familar spirit in Leviticus xx. 6, 27. (See also 1 Samuel xxviii. 3, 7, 9; 2 Kings xxi. 6, xxiii. 24; 2 Chron. xxxiii. 6.) The woman of Endor is called a mistress of Ob; and Jotham, king of Israel, built much on the wall of Ophiel, *i.e.* the serpent-god, for the worship of snakes. Obi men and Obi women, the designation of the pretended diviners amongst the negroes of the West India colonies, is the same word, and probably brought with them from Africa. The pethen of the Hebrews, the python of the Greeks, and bæten of the Arabs, from which we have the words python and pythoness, is that form alluded to in Acts xvi. 16, as the damsel with the spirit of divination. In the theology of Zoroaster, Dahaka or Zohak was an evil being created by Ahrimanes. In Persian mythology, Zohak is a king who reigned at Babel for 1000 years, having two serpents growing between his shoulders, and daily devouring men, until his own destruction by Faridun, the servant of Hormazd.

Persius speaks of the custom of painting certain conventional figures of serpents on walls, to indicate the sanctity of the spot, a practice of which there are several examples at Herculaneum and Pompeii. The serpent is seen as 'genius loci' upon the coins of many of the towns of Asia Minor,—Cyzicum, Pergamos, Marcianapolis, in Mysia, Aboniteichos and Amastris in Paphlagonia, Nice and Nicomedia in Bithynia, Tomos in Pontus, and Mindus in Criaa, all exhibit the serpent as their ensign. In Epidaurus, down to the time of Pausanias, serpents were kept and fed in the grove attached to the temple of Esculapius. The Greeks had myths regarding the python and hydra, the echidna and the dragon of the garden of the Hesperides; but in historic times the Athenians kept a serpent in the Erectheum, and its escape warned them to fly from the Persians; and Pausanians tells us that the Epidaurian serpents held their place amongst the gods of Greece till long after the age of Christ. Livy (x. 47), Valerius Maximus (i. 8, 2), Aurelius Victor (xxii. 1), and Ovid (Met. xv. 5) mention

within him, and he shouted out, 'There is no deity save God; Shams-ud-Din is the apostle of God!' One of the market people came forward to cut him down, but Shams uttered so terrific a shout that the man at once fell down dead. The rest of the market people submitted. Shams now took the disciple by the hand and led him away, remarking to him, 'My good friend, my name is Mahomed. Thou shouldst have shouted, "Mahomed is the apostle of God." The rabble will not take gold that is not coined.' Shams-ud-Din's arrogance and violence at length brought him into difficulties, for he was arrested during a tumult which his followers had raised, and removed by the police. All his pupil Jalal's miraculous powers failed to find out his whereabouts after this. He is said to have been flayed alive at Multan, and over his supposed remains a magnificent shrine has been erected. Tradition ascribes the intense heat of Multan to his prayer, from which the sun descended from the heavens to cook his food. Burton says the Multan people slew him in order to have his body among them.

SHAMS-ud-DIN ALTAMSH was purchased by Kutub-ud-Din Aibak for 50,000 pieces of silver. He rose through different offices to be governor of Behar at the time of the revolt, A.D. 1211, A.H. 607. Taj-ud-Din Eldoz gave him investiture unasked, but subsequently made an attempt to establish himself in India, and was defeated and taken prisoner (A.D. 1215, A.H. 612), ending his days in confinement. His reign was marked by the approach of the Moghuls under Chengiz Khan, but after withdrawal he conquered Sind to the south of Tatta (A.D. 1225, A.H. 622), also Behar and Bengal. In the next six years (A.D. 1226, A.H. 623, to A.D. 1232, A.H. 630) he was employed reducing Hindustan, taking Rintambor, Mandu, Gwalior, Bhilsa, and Ujjain. He died at Dehli, April 1236, 20th Shaban 633. He had received investiture from the khalif of Baghdad. The author of the Jama-ul-Hikayat resided at his court. The Kutub Minar near Dehli was completed in his reign. He was succeeded by his son Rukn-ud-Din, and then his daughter, Razzia Begum.—*Elphin.* p. 322.

SHAN. The Shan, or Tai, or Thai, as they call themselves, are the most extensively diffused, and probably the most numerous, of the Indo-Chinese races. Their tribes and clans are distributed from lat. 25½° N. to the Gulf of Siam, in lat. 13½ N., in the valleys of the Munipur river, the Kyendwen river, the Irawadi, the Salwin, and the tributaries of the Menam. Thai is the native name of the Siamese, and their chief divisions are Laos, Shan, Ahom, and Khamti. The race swarm in many tribes over the countries stretching from the valleys between China and Tibet on the north, to the Gulf of Siam in the south. They occupy all the territories between the Irawadi and the mountains of Annam, and if united would form a most formidable state in Eastern Asia.

Lapping the Burmese round, from N.W. by N. and E. to S.W., from Assam and the Brahmaputra to the Gulf of Siam, they are found from the borders of Manipur to the heart of Yunnan, and from the valley of Assam to Bankok and Kamboja, everywhere Buddhist, everywhere to some extent civilised, and everywhere speaking the same language with little variation. Their traditions, as also those of Siam, speak of a great kingdom held by this race in the north of the present Burmese empire, but the race is now split into a great number of unconnected principalities, and the kingdom of Siam is now perhaps the only independent Shan State in existence. All the others are subject or tributary to British India, Ava, China, or Cochin-China. In lat. 24½° to 25½° north-east of the Kakhyen, the Shan tribe occupy the left bank of the Nam Kathe or Munipur river, between the 23d and 24th degree of north latitude, south of the Kathe or Moi tai tribe, and west of the Kubo valley; also, near Bamo on the right bank of the Irawadi, with the Kakhyen on the north and on the east, mixed up with the Pwo and with the Kadu on the south. Shan States are extensive at the forks of the rivers which in lat. 18° N. form the sources of the Menam river; and in lat. 15° N., and between long. 99° and 100° E., they dwell in the mountains on which grow the sappan-wood forests. The Shan, who are tributary to the Burmese empire, consist of twelve petty states, the hereditary chiefs of which, called Tsawbwa, hold from Mandalay. Of the twelve states, seven are on the west and five on the east of the Salwin. Mobye and Mohmo, the states nearest to the Red Karen, pay tribute to them. The other states are named Nyung-yu-we, Myelat, Mone, Legya, Theinne, Mormeit, and Thung-bain, Kaingma-Maing-maing, Maingleng-gye, Kiang[redacted]tung, and [redacted] in the M[redacted]

The S[redacted] Leaving [redacted] interspr[redacted] Burmans *march on the north with rude tribes of their own* family, collectively termed Singpho (properly Sing Phoi), who occupy the Upper Irawadi. On the extreme north, the linguistic boundaries of the Singpho are unknown. It is possible that they march with the Khampa or ruder Tibetans of the S.E., unless the snowy mountains which there form the watershed between the Irawadi and the Tsang-po cut them off, as is more probable, from all intercourse with their northern neighbours. The Shan or Tai, the powerful Siamese, on the extreme south-east, are the youngest, but the most powerful, member of the Shan family. They trace their origin to an offshoot from the Laos, whom they formerly denominated Great Tai, while they called themselves Little Tai. They were originally tributary to Cambodia, but became independent in A.D. 1350.

About the 13th century, the Lau were a powerful and conquering people in the upper portion of the basin of the Irawadi, where their capital was at Mo-gaung (Muang-gaung or Mung Khong), and whence, in A.D. 1224, they sent an expedition which subjugated Assam and established Ahom rule. Their native country was a portion of the basins of the Mei-kong and the Menam, including Yunnan.

The Ahom, on the extreme north-west, came into Assam about the beginning of the 12th century, about the same time that the Siamese went south.

Before the 13th century, the Tai formed a compact body on the east, and perhaps north of Burma, probably pressed on by the Moghuls in China, Kablai Khan having fixed himself in Assam in the time of the first Ahom chief.

The exact position of the Great Tai, the Laos of geographers, is unknown.

In A.D. 1228, Chukupha, king of Pong, assumed for himself and people the title of Ahom, the peerless, now softened to Assam. About the same time, they took possession of a higher portion of the upper basin of the Mili, where their chief seat was at Khamti, whence the name by which this branch is still known.

In the basin of the Irawadi, the Shan are intermixed with the Tibeto-Burman tribes, amongst whom they have intruded; but in large portions of it they are the principal population, and in the N.E. corner of the empire the Khamti may be considered as independent. It is probable that the Siamese, with the tribes of the Upper Menam and of the Mei-kong, are directly connected with those of Yunnan, and are not offshoots from the colony of Muang-gaung. The Siamese have advanced more than half-way down the Malay Peninsula, and but for the check given to them towards the close of the 18th century, by the establishment of Penang as a British settlement, their sway would now have embraced Perak, and probably have extended to the confines of Malacca. The northern clans almost everywhere retain their independence, although owning a nominal allegiance, and in some instances paying tribute, to Burma, to China, or to Siam, those on the frontiers of Yunnan propitiating both the [redacted] n, by an ending a ang river, the Kamjang [redacted] s settlements of the Khamti race, are all colonies of this Shan race, retaining the costume, customs, and religion they brought with them into the Assam valley. Of these the Khamti are the most numerous and important. Whatever may have been the original seat of the Khamti people, they immigrated to Assam, since the middle of the 18th century, from the country known to the British as Bor-Khamti, near the sources of the Irawadi, which was visited by Wilcox in 1826.

At present the Lau, under the names of Shan and Khamti, are found in Upper Assam, and scattered over a large portion of the northern half of the basin of the Irawadi, near to the confluence of the Kyendwen with the principal stream. Scattered villages are even found in Arakan, on the eastern side.

Their general complexion is light-brown, their hair black and abundant, nose not flattened.

Those residing in Burma are generally smaller than the Burmese, from whom they are readily distinguished by their black jackets of glazed calico and short blue breeches. The Siamese may be considered as having a remarkable modification of the Burma-Chinese head, with a peculiar tendency to elongation and verticality. They have large straight faces, flat occiputs, lowness of the hairy scalp, comparatively small and firm mouth, hard staring eye, and a grave expression. Siamese appears by far the most widely-spoken language of Ultra-India. It was at one time the lingua franca of Kidah, almost as much as the Malay, and even that wandering Negro tribe the Semang, spoke it in some places. It was also current in Assam and Yunnan, at the opposite extremities of Ultra-India.

At Bhamo, to the north, east, and south-east of which they are numerous, the language of the Shan corresponds with that of the Siamese.

The Lau, on the borders of China, differ little from the Chinese of Yunnan, and their stock was probably the same. Where they are in contact with the old races they have considerably altered. In the valley of the Menam, their height is about 1½ inches less than the average Chinese, but the average stature of the French is the same, viz. 5 feet 3 inches.

The Lau or Shan race speak a language which was primarily East Himalaic, like Mon, Kambojan, Annam, and Pa-long. Like them, it was carried at some remote period into the Brahmaputra Gangetic province, and received some Dravidian roots. Subsequently it shared in the great eastern movement of Himalaic dialects from the basin of the Ganges into that of the Irawadi, where it was intimately connected with some of the intrusive West Himalaic or Tibeto-Burman dialects. It was then pressed further into the east, into the basin of the Upper Mei-kong and Tonkin, and became the language of Yunnan. During the Han dynasty, Chinese colonies began to occupy the valleys of Yunnan, and from that time Lau was exposed to the influence of Chinese, and began to receive the modified form it possessed when the pressure of that great race on the older tribes of Yunnan caused the Lau to swarm to the westward and southward. When they re-entered the basin of the Irawadi, they had acquired from their partially Chinese civilisation, a superiority over the Tibeto-Burman tribes of northern Ultra-India, which made the Lau clans predominant along the central belt of Ultra-India, from the Himalaya to the mouth of the Menam.

The Shan are great workers in silver, and the art of embossing on different utensils of silver seems to be known to the Kathay Shan, of whom there were in the middle of the 19th century 20,000 or 25,000 between Ava and Amirapura. Tin exists in the Shan States to the south-west of Mandalay, but the mines have never been worked. The tin consumed in the country now is all imported. Iron abounds in the Shan States, and the district of Pagan, to the south of Mandalay, is noted for it. A manufactory exists on a rough-and-ready scale in this district at Ponpah Toung, but the out-turn is inconsiderable. To the west of Sagaing, for miles up the Irawadi river, the ore abounds—a rich hæmatite.—*Yule, Jour. Geog. Soc.* xxvii., 1857; *Mason, Tenasserim; Latham's Ethnology*, pp. 157-257.

SHANAR or Sanan, a race in the south of India, about Tinnevelly, Madura, and Travancore, who are toddy-drawers, merchants, traders, shopkeepers, some of whom have been very successful in business. They are also styled Nadan, and they append to their names the term gramani as a tribal title. They are a dark-skinned race, with low foreheads, sunken eyes, and prominent cheek-bones, timid and superstitious. They are not so good-looking even as the Maravar. They are largely worshippers of evil spirits (see Devil-Worship), but since the middle of the 19th century many have accepted Christianity.

SHANAR CASSOO, a Venetian sequin.

SHAN-BAF, a cotton fabric made at Dacca.

SHAND. HIND. of Kohat. A third quality of

land; it is allowed to be fallow, and is cultivated for paddy.

SHANDUSE, a cotton scarf, coloured border and ends, used in Khyrpur.

SHA-NE. BURM. A bast of Arakan, of a reddish-brown colour, rough and coarse.

SHANG, the second dynasty of China, began B.C. 1559, lasted 509 years to 1050. Twenty-eight reigns in fifteen generations.

SHANGHAI is the most northerly and most important of the Chinese ports that have been opened to foreigners. It is a heen, a district city of Sun-kiang-fu, in the province of Kiang-si, is situate on the right bank of the Woo-sung river, lies in lat. 30° 25′ N., and in long. 120° 32′ E., being distant from Chusan about 100 miles, in a north-westerly direction. The Woo-sung, its river, flows into the Yang-tze-kiang (child of the ocean), which is called by many, and most appropriately, the main artery of China, as it flows through many provinces, and some of the most wealthy cities of China are built upon its banks. The Woo-sung, or Shanghai river, is deep, and easily navigable when the bearings are understood. Cannel coal is found in abundance near Shanghai.

SHANGRI or Sangri. HIND. The seed-pods of the jhand, Prosopis spicigera, one of the common shrubs of the rakh or waste lands of the Panjab.

SHANG-TI. CHIN. A title which some Chinese scholars apply to designate the God of the Christian Scriptures, but which others render supreme ruler, supreme emperor, or ruler or emperor on high, Le Seigneur and Le Souverain Maitre of Gaubil. The discussion on this point has been going on since the 16th century, the Jesuit missionary Matteo Ricci on the one side, and Lingobardi on the other; Drs. Medhurst, Legge, Edkins, and Chalmers on one side, and Bishop Boone, with Drs. Bridgmans and Williams and the Archimandrite Palladius, on the other.

SHAN OIL, used in Burma for mixing with paints; made by the Shan from, it is said, the fruit of the wood-oil tree, a species of Dipterocarpus.

SHAN-SI and Shen-si, two provinces of Northern China, separated by the Hoang-ho or Yellow River. Shan-si is one of the smallest provinces in China. It resembles in form an oblong lozenge, and is bounded on the north by Tartary, on the south and south-west by Ho-nan, on the east by Peh-chi-li, and on the west by Shen-si.

SHAN-TUNG is a long peninsula, extending towards Corea, dividing the Gulf of Peh-chi-li from the Yellow Sea. It is bounded on the north-west by Peh-chi-li, on the south-east by Ho-nan, and on the south by Kiang-si. It means east of the hills. Its surface is estimated at 56,000 square miles, and the population is nearly 29 millions. Besides grain, this province supplies large quantities of fish, a great portion of which, packed in ice, is sent to Pekin by the Imperial Canal. Among the vegetable oils imported into Ningpo and other Chinese ports from Shan-tung, Leatong, and Teisin, are oil of teuss, obtained from green and dried peas, black oil of the fruit of the tree kin (?), and oil from the pea of Suchau. —*Fortune.*

SHA-PHYU, a bast of Arakan; long, thin, smooth layers, light-coloured, tough, and flexible.

SHAPOO, or wild sheep of Ladakh. Moorcroft in his Travels mentions seeing one killed near Lameru.—*Adams.*

SHARBAT. HIND. A beverage made of lime-juice or pomegranate juice, or merely sugar and water, the French Eau-sucré. When a Bedouin prepares coffee, he drinks the first cup; the Sharbat-i-kajari of the Persians, and the Sulaymani of Egypt, render this precaution necessary. The Sharbat-i-kajari is the Acqetta of Persia, and derives its name from the present royal family. It is said to be a mixture of verdigris with milk, more probably a poison of more activity. In Egypt and Mosul, Sulaymani (the common name for an Afghan) is used to signify poison. The banks of the Nile are infamous for these arts, and Muhammad Ali Pacha imported, it is said, professional poisoners from Europe. Sharbat, ARAB., is from Sharb, he did drink. Those esteemed are Sharab-ul-Laimun, lemon sherbet; Banafshah, violet sherbet; Toot, mulberry sherbet; Hommeyd, sorrel sherbet; Zebeed, raisin sherbet. Sherbets are favourite beverages, made with the juice of fruits, mixed with water and sugar, with the addition of rose-water, or some other fragrant ingredient. The Persian sharbets are most esteemed. —*Burton's Mecca*, iii. 43; *Faulkner.*

SHARIF. ARAB., HIND., PERS. Noble; the tribal title of the offspring of a Syud and woman of another Muhammadan tribe; also the title of the hereditary ruler of Mecca.

SHARK.

Kalb-ul-bahr (sea-dog), AR.	Pesce-cane, . . . IT.
Goulu de mer, . . FR.	Jyu, Yu, . . . MALAY.
Hai-fisch, ... GER.	Tiburon, ... SP.
Auwal, ... HIND.	

Sharks belong to the cartilaginous fishes; they abound in numbers and species, and are remarkable for their wide geographical distribution. They enter rivers to a considerable distance from the sea. The name for the shark in Malay and Javanese is Iyu, or, abbreviated, Yu, and is even found in some dialects of the islands of the Pacific. The Carcharodon Rondelettii is the shark of Australia; one of them measured 36½ feet. The great basking shark is the Selache maxima. The shark of the Tigris river, of Indian rivers, and Fiji river is Carcharias Gangeticus.

The hammer-headed shark, shuang-chi-sha, is caught on the coasts of China and Formosa. The fins are considered a great delicacy, and in their dried state sell at 60 dollars a pikul; when skinned, cleaned, and cooked, often as much as 200 dollars a pikul. The fins of species of Carcharias and Zygæna are the most prized. The meat is tolerably good.

The white shark, or sha-mu-lung of the Chinese, grows to 20 feet in length; its fins are of less value.

The lung-men-sha is the shovel-nosed sucker. Its fins and flesh are more esteemed than any other.

The saw-fish of China, also called shark saw-fish or sha-chu-yu, grows to 15 feet in length. Its meat is eaten, and fins are esteemed. The saw is kept as a talisman to ward off evil spirits.

The fishermen of Auping, in Formosa, distinguish sixteen sharks. The most dangerous to man is the ta-yuan-t'ou-sha, or big round-headed shark. Its fins are of second quality, and flesh indifferent. Chinese say that the eat-bird shark, shih-niao-sha, simulates death, and floats on the

surface of the water. Sea birds thinking it dead, alight on it, and are caught by the shark sinking its tail, on which the birds move towards its head.

Shark skin is used by the native workmen for polishing wood and ivory; and shark-fins are largely exported to China. In the Gulf of Manaar they are taken for the sake of their oil, of which they yield such a quantity that shark's oil is a recognised export. A trade also exists in drying their fins, for which, owing to the gelatine contained in them, a ready market is found in China, whither the skin of the basking shark is also sent, to be converted, it is said, into shagreen. Sharks are said to attack the fair-skinned races more frequently than men of darker hues, and the pearl-divers of the Persian Gulf used to blacken their skins with a view to avoid these monsters.

In the South Pacific and Sandwich Islands sharks were formerly worshipped. When the king or the priests of this divinity imagined that the shark wanted food, they sallied forth with attendants, one of whom carried a lasso, which they threw at random amongst any crowd, and whoever was caught was strangled, cut in pieces, and thrown into the sea.

There are many large boats, with crews of twelve men each, constantly employed in the shark fishery in Kurachee. The value of the fins (Paak, DUK., GUJ., HIND.; Iyu sirap, Yu sirap, [illegible]LAY; Soora meen sopputay, TAM.) sent to Bombay varies from Rs. 13,000 to Rs. 18,000 a year. Of this a portion only passes directly into the hands of the fishermen, each boat earning perhaps Rs. 1000 annually, or Rs. 100 for each man. From this falls to be deducted the cost of material and other charges. This trade was noticed by Dr. Royle in 1842. It affords on some occasions to Bombay alone, taking fish-maws and shark-fins together, as much as four lakhs of rupees (£40,000), and furnishes the chief means of support to at least 3000 fishermen, or, including their families, to probably not less than 15,000 human beings. One boat will sometimes capture at a draught as many as a hundred sharks of different sizes, but sometimes they will be a week, sometimes a month, without securing a single fish. The fishermen are very averse to revealing the amount of their captures. Inquiries of this sort are supposed by them to be made exclusively for the purpose of taxation. The great basking shark, or mhor, is always harpooned. It is found floating or asleep near the surface of the water, and is then struck with a harpoon 8 feet long. The fish once struck is allowed to run till tired, and is then pulled in and beaten with clubs till stunned. A large hook is now hooked into its eyes or nostrils, or wherever it can be got most easily attached, and by this the shark is towed in-shore. Several boats are requisite for towing. The mhor is often 40, sometimes 60 feet in length; the mouth is occasionally 4 feet wide. All other varieties of shark are caught in nets in something like the way in which herrings are caught in Europe. The net is made of strong English whip-cord, the mesh about 6 inches; they are generally 6 feet wide, and are from six to eight hundred fathoms, from three-quarters to nearly a mile in length. On the one side are floats of wood about 4 feet in length, at intervals of 6 feet; on the other, pieces of stone. The nuts are sunk in deep water from 80 to 150 feet, well out at sea. They are put in one day and taken out the next, so that they are down two or three times a week, according to the state of the weather and success of the fishing. The lesser sharks are occasionally found dead,—the larger ones much exhausted. On being taken home, the fins are cut off and dried on the sands in the sun; the flesh is cut up in long stripes and salted for food, and the liver is taken out and crushed down for oil. The head, backbone, and entrails are left on the shore to rot, or thrown into the sea, where numberless little sharks are generally on the watch to eat up the remains of their kindred. The fishermen themselves are only concerned in the capture of the sharks. So soon as they are landed they are purchased by Bania merchants, on whose account all the other operasions are performed. The Bania collect them in large quantities, and transmit them to agents in Bombay, by whom they are sold for shipment to China. Not only are the fins of all the ordinary varieties of shark prepared for the market, but those also of the saw-fish, of the cat-fish, and of some varieties of ray or skate,—the latter, indeed, merges almost insensibly into the form of those of the shark. The cat-fish, known in India by the same name as in Britain, has a head very like that of its European congener, from which it differs in all other respects most remarkably. Its skin is of a tawny yellowish-brown, shading from dark-brown on the back to dirty-yellow on the belly. It is beautifully covered all over with spots of the shape and size of those of the leopard, similarly arranged. The value of sharks' fins annually exported from Bombay amounts to betwixt a lakh and a half and two lakhs of rupees. The largest fishery at any given port is probably that of Kurachee, which affords nearly one-tenth of the whole, but the shark fishery is conducted all along the Bombay coast. In Fiji they are said to be caught by means of a curiously-formed piece of wood, about 4 feet long, and in shape very much like a whale boat, but solid. From a hole in the centre descends a strong cord of twisted rattan, forming a running noose.

Sharks of the south of Asia are a regular article of trade for the market of China, where they are prized for their restorative qualities. They are sought for from every maritime country between the Arabian Gulf and the East Indian Islands.

The shark fins of commerce are not exclusively selected from sharks (Squali), but equally from Raiæ. Quantities examined at Penang were composed of fins of the genera Stegostoma, Carcharias, Sphyrna, Pristis, Rhinobatus, Trygon, and Myliobatis. But of all fishes, sharks and rays are the most valued by the Chinese. The fish and entrails of all, not even the electric rays (Torpedinideæ) excepted, are eaten either fresh or dried. The skin is used for polishing, or converted into shagreen. Gelatine is obtained from the larger fins, glue from the smaller. All, except the caudal fins, are cut at the root so as to leave as little flesh as possible. The root is dipped in wetted lime (chunam), in the erroneous belief of preventing attacks of insects, and then the fins are dried in the sun. Those imported in the Straits Settlements are packed promiscuously in gunny bags, each containing from one-half to one pikul. According to the value in the Chinese market, the fishmongers assort the fins in two

kinds, white and black. The white consists exclusively of the dorsal fins, which are on both sides of a uniform light colour, and reputed to yield more gelatine than the other fins. In China, the lovers of gelatinous soups pay from 30 to 40 Spanish dollars per pikul for white fins. The pectoral, ventral, and anal fins pass under the denomination of black fins. The colour, however, varies, according to the species, from buff to grey or brown, and most of them are of two different colours, the upper surface being dark, the lower light. The black fins, for obvious reasons the most numerous, are supposed to yield a comparatively small quantity of gelatine, and sell in China from 15 to 20 Spanish dollars per pikul.—*Montgomery*, i. p. 422; *Tennent's Ceylon*, p. 325; *Keppel's Ind. Arch.* ii. p. 205; *Low's Sarawak*, p. 89; *Bombay Monthly Times; Royle on Isinglass.*

SHARRA. ARAB. Law, equity, the precepts of Mahomed; religion, faith, justice. Written properly Shar'a. In the Muhammadan religion, the law, as the precepts of Mahomed derived from the Koran, is sometimes classed as (1) Itikādat, articles of faith; (2) Ibādat, religious worship; (3) Muamalat, civil law or social transactions; (4) Muzajar, criminal law, punishment; and (5) Adāb, moral conduct.

The fakir or darvesh act in accordance with religion (Ba-sharra) or differently (Be-sharra). The Ba-sharra are family men, and living according to the laws of the Koran.

The Be-sharra, without the law, are majzuh, celibates, whose sanctity places them above the laws of the Koran.

In India, the chief fakirs are—Kadaria or Banawa, whose founder lived at Baghdad; Chistia, followers of Banda nawaz, whose shrine is at Kulburga; Shuturiah; Tabkatia or Madria; Malanej; Rafai or Gurzmar; Jalalia; Sohagia; Nakshbandia; Bawapiari ka Fakir.— *Wilson's Gloss.*

SHART. ARAB. Employed by Muhammadans in Southern India to indicate a horse conveyance, either buggy or palanquin carriage. In Bombay, the Tamil words Sikram-po, literally go quickly, are applied to the latter conveyance.

SHASTHI. HIND. The sixth day of the new moon; in Hindu belief is dugdha, or unpropitious for any good work. (2) A Hindu goddess, protector of children.

SHASTRA. SANSK. The holy books of the Hindus. Of the six Vedanga or bodies of learning, three belong to grammar; one relates to religious ceremonies; a fifth to the whole compass of mathematics; and the sixth to the explanation of obscure words or phrases in the Vedas. Subordinate to these Anga (though the reason of the arrangement is not obvious) are the series of sacred poems, the body of law, and the six philosophical shastras. Shastra, SANSK., is from Shas, to rule.

SHASTREE or Shastri, a Brahman learned in the religious books of the Hindus.

SHATATAPA, a Hindu ascetic mentioned in the Markandeya Purana. He was one of the Smriti writers, and wrote the Karma Vivaka.—*Ward*, iv. p. 27.

SHAT-u-DIJLAH, a name of the Tigris as far as Kut-ul-Amarah, a small town on the left bank nearly midway between Baghdad and Koornah, being about 178 miles by water from the former city, and 97½ miles directly S.S.E. from the latter. Lower down, after passing for about 40 miles through marshes, and coming near the tomb of Ezra, the river resumes it former size and character, as it winds in the general southern direction to Koornah, which place is 232 miles from Kut-ul-Amarah by the windings, and 144½ in direct distance.

SHAT-ul-ARAB is the united stream of the Tigris and Euphrates, the two rivers of Mesopotamia. It is called by British sailors the Basrah or Euphrates. It is a fine river, about 1200 yards wide at its mouth, and is navigable for large vessels drawing 18 feet to beyond Basrah, a distance of 80 miles from its bar, in lat. 29° 46′ N., and long. 48° 40′ E. The rise and fall at spring-tides ranges from 8 to 10 feet. It disembogues into the Persian Gulf.

SHAT-ul-HAI, a canal which leaves the Tigris nearly opposite the town of Kut-ul-Amarah, and runs to the Euphrates about 80 miles above Koornah.—*MacGregor.*

SHAWL GOAT, Capra hircus, *L.*, the shawl goat of Spiti, yields inferior wool to that of Tibet. Shawl goats' hair is called Pashm in Hindi, and Kashmiri lena in Tibetan. The common domestic goat of Ladakh is the well-known shawl goat, of which there are said to be two varieties. One is a large animal with great horns called Rampoo; the other, smaller and with slender horns, is called Tilloo. It thrives only in the most elevated districts. It is bred in Nubra, Zanskar, and Rukchu, but the finest wool is brought from Ruthog and Gnari, which formerly belonged to Ladakh, and from Chang-Thang, or the southern and mountainous districts of Khotan. It is only shorn once a year, and the wool is at once separated from the coarser hair. The hair is pulled out, and is manufactured into blanketing, for tents, coarse sacking, and ropes for home consumption. The wool is shorn, and is exported to Kashmir, and to Nurpur, Amritsar, Lahore, Ludhiana, Ambala, Rampur on the Sutlej, and Nepal. To Rampur and Nepal, the wool is exported direct from Ruthog and Gnari, but Leh is the entrepot between the other shawl marts and the wool-producing countries. The fine shawl-wool is called Lena (Lana, LAT.), the common wool Bal, and the hair Pu. In Kashmir, the wool is sold to the merchants at Kashmiri Rs. 4.8 or Company's Rs. 2.10 per seer. The average quantity of shawl-wool exported from Ladakh to Kashmir and other places is about 16 loads or 6400 maunds of 16 seers each, half of which goes to Kashmir alone. The average price in Ladakh is about two rupees per seer, or £20,400 a ton. Each shawl goat yields about half a seer. The goats are about 80,000 in number, and their value £32,000, each goat being priced at four rupees. The Kashmirian merchants purchase the wool at Leh, at the rate of 80 pul (small handfuls) for a small rupee. Shawl-wool is produced most abundantly and of the finest quality in the steppes between the Shayuk and the main branch of the Indus. About £10,000 worth may be carried down the Sutlej to Ludhiana and Dehli. Mr. Moorcroft estimated the importation into Kashmir alone at £75,000 of value, and the annual value of the shawl manufacture of Kashmir at £300,000.—*Vigne; Cunningham; Hooker's Journal*, ii. p. 88.

SHAWLS.

Kayin-rambut, Malay.	

In eastern countries the shawl is considered the most essential and graceful part of ornamental dress, and in India it was by no means unusual to pay 10,000 rupees (£1000) for one of the finest Kashmir shawls, which in all probability had cost the labour of a whole family for a lifetime. Those by far the most valuable are taken by native rulers.

In the 11 years 1850-61, the Kashmir shawls exported from India were valued as under:—

1850-51, £171,709	1854-55, £197,890	1858-59, £310,027
1851-52, 146,270	1855-56, 209,279	1859-60, 252-828
1852-53, 215,659	1856-57, 290,640	1860-61, 351-093
1853-54, 170-153	1857-58, 227,618	

Of the above, 80 per cent. was shipped to the United Kingdom, Suez, the Arabian and Persian Gulfs,—America, France, and China taking the remaining part. The imports and exports in latter years were as under:—

	Imports.		Exports.	
	No.	Rs.	No.	Rs.
1875-76, . .	321,284	10,14,939	30,053	16,12,980
1876-77, . .	255,262	7,55,823	28,385	16,69,132
1877-78, . .	271,466	7,09,037	32,970	15,08,535
1878-79, . .	427,412	9,85,341	26,113	12,40,116

1882-83, . .	813,585	8,19,310	12,090	7,71,718

Although in many branches of textile manufacture Europe has outstripped her oriental teacher, there is still found among the workmen of the east a degree of taste in the adjustment of their designs, an amount of skill applied to the getting up of the fabric and the blending of patterns, and colours so aptly combined, as to leave nothing to be desired, but rather to show that what Europe is now arriving at in arts design by the aid of scientific teachings, has been practised amongst those ancient races during the last thousand years. The correct principle which science has laid down in the schools of the west, that the patterns and colours of woven goods should diversify plain surfaces without disturbing the impression of flatness, has evidently been known to them from the earliest times. Nor is it in this alone that the workmen of the east excel; they are equally celebrated for the rich and varied beauty of their patterns, and the strict appropriateness of these to the colours employed. Foremost amongst the woven fabrics are the world-famed shawls, the finest of which, in spite of many imitations in Europe, are still produced in the vale of Kashmir. From the neck and underpart of the body of the wool goat is taken the fine flossy silk-like wool, which is worked up into those beautiful shawls with an exquisite taste and skill, which all the mechanical ingenuity of Europe has never been able to imitate with more than partial success.

From the Ayin Akbari, written in the 16th century, we gather that the emperor Akbar encouraged the manufacture of these shawls by every means in his power, even designing some himself, and introducing a greater and richer variety of colours in their patterns. The same work informs us of the extension of this manufacture to the State of Lahore, where it is said there were then 1000 manufactories employed on them. A mixture of wool and silk for turbands is also spoken of. Akbar was very fond of woollen stuffs, especially of shawls. He ordered four kinds to be made. First, Toos Assal, which is wool in general grey, inclining to red, though some are perfectly white, and these shawls are incomparable for lightness, warmth, and softness. Formerly they were always made with wool in its original state, but His Majesty had some of them dyed, and it was said that they will not take a red colour. Secondly, Safed Alcheh, which they also called Terehdar. The natural colours of the wool are white and black, and they wove three sorts of them,—white, black, and grey. Formerly there were not above three or four different colours for shawls, but Akbar had them made of various hues. Third, Zerody, Gulabatun, Kishydeh, the Bundhenun, Cheet, Alcheh, and the Purzdar, which were of His Majesty's invention. Fourth, from being short pieces, he had them made long enough for Jamahs. His Majesty introduced the custom of wearing two shawls, one under the other, which is a considerable addition to their beauty. By the attention of Akbar, the manufacture of shawls in Kashmir was in a very flourishing state, and in Lahore there were upwards of 1000 manufacturers of this kind. They also made an imitation of shawls with the warp of silk and the woof of wool, and this kind were called Mayan. Of both kinds were made turbands, etc.

This is now by far the most important manufacture in the Panjab; but it was almost entirely confined to Kashmir, until about 1820; a terrible famine visited Kashmir, and, in consequence, numbers of the shawl-weavers emigrated to the Panjab and settled in Amritsar, Nurpur, Dinanagar, Tilaknath, Jalalpur, and Ludhiana, in all of which places the manufacture continues to flourish. The best shawls of Panjab manufacture are made at Amritsar, which is also an emporium of the shawl trade. But none of the shawls made in the Panjab can compete with the best shawls made in Kashmir itself, —first, because the Panjab manufacturers are unable to obtain the finest kinds of wool; and, secondly, by reason of the inferiority of the dyeing, the excellence of which in Kashmir is attributed to some chemical peculiarity in the water there. On receipt of the raw pashm or shawl-wool, the first operation is that of cleaning it; this is done generally by women. The best kind is cleaned with lime and water, but ordinarily the wool is cleaned by being shaken up with flour. The next operation is that of separating the hair from the pashm; this is a tedious operation, but the value of the cloth subsequently manufactured varies with the amount of care bestowed upon it. The wool thus cleaned and sorted is spun into thread with the common churka or native spinning machine. This is also an operation requiring great care. White pashmina thread of the finest quality will sometimes cost as much as £2, 10s. a pouud. The thread is next dyed, and is then ready for the loom.

Plain shawls are simply woven with a long, narrow, and heavy shuttle, but variegated shawls are worked with wooden needles instead of a

shuttle, there being a separate needle for each colour.

The shawls are made both long and square, the former generally measuring 54 inches wide and 126 long, the latter 63 to 72 inches square. In some parts of Asia these shawls are worn just as they come from the loom; but all those destined for India are carefully washed and packed near Lahore.

About A.D. 1860, the maharaja of Kashmir, to check the deterioration in the quality of shawls manufactured in his dominions, issued the following circular:—

Be it known that in the city of Siree Nugger, alias Kashmir, a paradise on earth, the number of men and women employed in the occupation of shawl-weaving aggregates 70,000, and, in fact, nearly all the inhabitants of this far-famed city are connected with the trade. That owing to the dulness of the market in England and France, caused chiefly by the inferior description of shawls manufactured, many tradesmen and merchants have been subjected to heavy loss and some to bankruptcy, and a large proportion of the weavers have been thrown out of employ. On the maharaja's late tour through Kashmir, the circumstance occupied his chief attention, and from the information he obtained he ordered the following rules to be established in order to serve both manufacturers and traders:—

1. Shawls to be uniform in size as follows:—Ladies' shawls, 3½ yards by 1½; turbands, 2 yards by 2; jamawar, 4½ yards by 3.

2. Any shawl badly wove to be destroyed—the value to be recovered by the proprietor from the weaver. Should the fault lie with the proprietor, he will be punished by the Government.

3. A designer is at liberty to dispose of his designs, but should he attempt to conceal any part of a design which is purchased from him, he will be severely punished.

4. Any person convicted of robbing a firm of a design will be severely punished.

5. One designer is not at liberty to transfer designs to another, and as the Government has now relinquished the tax, it is hoped that there will be considerable improvement in the art.

6. Not more than six shawls are to be wove from one design, or a heavy fine will be inflicted.

7. The seller of a design is not to retain a duplicate or attempt to form another exactly like the one sold; in such case a fine will be levied equal to ¼th its value.

8. In future, duty will be levied by measurement of wool and worsted, and not by weight as heretofore; this will induce spinners to produce a finer description of the material, and will be more profitable to the wearer.

9. His Highness, taking into consideration the distressed condition of all manufactories for want of sufficient funds, and seeing that tradesmen are not disposed to assist them with advances, has placed in the hands of Pandit Hunna Nundjoe and Hajee Mooktiar Shah, a sum of Rs. 1,00,000 for the purchase of raw material, the same to be delivered proportionately to manufacturers, the value of which is to be refunded to Government on the sale of shawls.

10. His Highness the maharaja is greatly indebted to Dewan Kirparam, who, from his experience, had assisted greatly in framing these rules, and encouraging this important branch of manufacture.

A weaving-shop may be occupied with one shawl, provided it be a remarkably fine one, above a year, while other shops make six or eight in the course of that period. Of the best and most worked kinds, not so much as a quarter of an inch is completed in one day by three people, which is the usual number employed at most of the shops. Sometimes, in order to hasten the process, a shawl is made in separate pieces in different looms, and the pieces are afterwards sewed together. This is done with great dexterity, so that it is not immediately detected. It very rarely happens that the pieces, when completed, correspond in size. The shops consist of a framework, at which the persons employed sit on a bench; their number is from two to four. On plain shawls, two people alone are employed, and a long, narrow, but heavy shuttle is used; those of which the pattern is variegated are worked with wooden needles, there being a separate needle for the thread of each colour; for the latter no shuttle is required. The operation of their manufacture is, of course, proportionate to the quantity of work which their patterns may require. The Ustad, or head workman, superintends, while his journeymen are employed near him immediately under his directions. If they have any new pattern in hand, or one with which they are not familiar, he describes to them the figures, colours, and threads which they are to use, while he keeps before him the pattern on which they happen to be employed, drawn upon paper. During the operation of making, the rough side of the shawl is uppermost on the frame, notwithstanding which the Ustad never mistakes the regularity of the most figured patterns. The wages of the Ustad (the employer furnishing materials) are from six to eight pice per day; of the common workmen, from one to four pice in Kashmir may be about three halfpence.

The shawl bafs, or weavers, of the Panjab, according to their means, keep up an establishment of from 300 to 400 Shagird or apprentices of children from five years of age, to old men and women of eighty; or else they supply a certain number of overseers, called Ustad, with yarn, delivering to them at the same time instructions as to the quality, colour, patterns, etc., of the goods, and these men carry on the manufacture at their own houses, with the help of ordinary weavers.

Though the shawl-weavers of Kashmir are thus scantily rewarded, the fabric they produce has often been sold in London at from £100 to £400 the shawl. But it is fair to state that the manufacture of a remarkably fine and elaborate shawl will sometimes occupy a shop for a whole year, two or three or perhaps four persons being constantly engaged on it.

The shawls are divided into two great classes, viz. woven shawls, called Teliwala, and worked shawls. Shawls of the former class are woven in separate pieces, which are, when required, sewn together with such precision that the sewing is imperceptible. These are the more highly prized. In worked shawls, the pattern is worked with the needle upon a piece of plain pashmina or shawl-cloth.

Many shawls are made up of pieces, sewn together by a rafugar with such delicacy that the suture is imperceptible. Merchants take advantage of this. When they buy a shawl which they think only partly good, they cut out of it such parts as displease them. They then draw on paper a design for a new piece to fill up the gap, and give it to a shawl-weaver to execute. As soon as the new piece is completed, it is sewn into the shawl, which is entirely changed in appearance, and often immensely increased in value by the process. Shawls are often purchased with indifferent borders, and improved by putting new ones on. The border is always worked on a web

of silk, as this gives it weight and solidity, and causes the whole fabric to set well.

In Kashmir, when a shawl is about to be made, a small square piece showing the design, by way of pattern, is made and carried to the maharaja's inspector. On approval, the piece is worked into the shawl.

Great complaints have been made by European firms of the adulteration of the texture of Kashmir shawls, and there is no doubt that such adulteration was practised, especially by mixing up Kashmir wool with real pashm. In order to provide some guarantee against this, it was proposed that a guild of respectable traders should be formed, who should be empowered to affix on all genuine shawls a trade-mark, which should be a guarantee to the public that the material of the shawl is genuine pashm. At a meeting of merchants connected with the shawl trade, held at Amritsar in 1861, to consider the then depressed state of the shawl trade in the Panjab, and its causes, taking an average of ten years, the transactions in shawl goods amounted to nearly £500,000 per annum, of which a large proportion belonged to Amritsar and its shawl dependencies, and the proportion of the Panjab trade to that of Kashmir was then stated to be as 3 to 6. The chief shawl-brokers in London and Paris had urgently impressed upon the Amritsar merchants the suicidal policy of sending to the market shawls made of adulterated wool, for unless the manufacturers abstained from mixing sheep's wool with the pashm, or from using inferior pashm, the trade would undoubtedly die out. Adulteration was caused by the fraudulent admixture of coarse sheep's wool, such as Kirmani, Tibet, and even country lamb's wool. The beauty of a Kashmir or Amritsar shawl depends as much on the brilliancy and durability of its unrivalled colours, and their being carefully harmonized, and the material of which it is made, as on the quality of the workmanship. Sheep's wool, however fine, never does assume that permanent brilliancy of colour which is the peculiar character of the pashm. Kirman, the ancient Carmania, has been celebrated from the days of the Persian empire for its woollen shawls, though they never were able to compete with the Kashmir manufactures in softness or brilliancy. The wool obtained from the Kirman sheep is long and somewhat thick and silky, but it does not retain the bright colours which distinguish a genuine Kashmir shawl. It is somewhat cheaper than the best shawl pashm, and, being thicker, is more economical for the manufacture. The merchants, attracted by the apparent advantages of the Kirman wool, and knowing nothing of the hidden dangers in its use, largely adopted this wool as an admixture with the genuine pashm.

Colonies of Kashmiri settled in the Panjab are known by their fair complexion, their peculiar dialect, their way of closely shaving the head, and wearing small skull-caps. These people have emigrated at various times from Kashmir. They are divided among themselves into several gradations, and, like all Musalman races, have no restrictions on marriage, except immediate relations; marriages with first cousins are not only allowable, but frequently occur. They are almost exclusively employed in the shawl trade. There are two classes in the profession, the master workmen or Ustads, and the apprentices or Shagirds. The former supply the capital, and the apprentices earn their livelihood by task-work. The more opulent Kashmiri not only keep large manufactories for shawls, but trade in wool and other produce of Ladakh and Chinese Tartary. The rooms devoted to the workmen are long apartments with looms placed in the centre, and benches ranged parallel for the weavers; they are well lighted and airy; the workmen, all males, sit hard employed the whole day, and sometimes enliven the labour by singing choruses. They are a discontented and quarrelsome race, very deficient in personal courage, but so litigious, that their disposition for law has become a proverb.

They speak a dialect intelligible only to themselves, though they are also conversant with the vernacular. The shawls of Nurpur and Tilaknath are not much prized; the work is inferior, but the great cause of inferiority is the hardness of the water, which communicates a roughness to the shawls, greatly detracting from their marketable value. The Kashmiri themselves say that there is no water like the river Jhelum, and that the superiority of the shawls of the valley is mainly ascribable to the virtue of the water. The weavers of Kashmir possess also greater artistic qualifications, since none but the worst, who fail to get a livelihood in their native country, would consent to leave the charming valley for the heats of the Panjab and the discomforts of a strange country. The present population consists almost entirely of the descendants of original emigrants, and are now acclimated. They still retain the dress and dialect of Kashmir, and are constantly reinforced by new arrivals from the valley. In the cold winter months, the women adopt a peculiar custom of carrying under their frocks little pans of heated charcoal, over which they warm their hands, and maintain the circulation, like English ladies with their muffs.

The shawls of Nurpur are scarcely ever found in the foreign market, while those of Amritsar and Gujerat are sold in London and in France in considerable numbers.

The Deputy Commissioner of Gujerat, writing in August 1864, reported that at the last sale in London, the Gujerat shawls had sold at a loss of four annas in the rupee, and those of Amritsar at a loss of eight annas, or 50 per cent., the Kashmiri genuine shawls realizing a profit of 25 per cent.

In Ludhiana there are as many as 500 shops of pashmina workers, giving occupation to more than 1000 persons; the regular pattern shawl is much less woven than plain pashmina alwan, gloves, and stockings, etc., of pashmina thread. Of these fabrics about Rs. 70,000 worth are annually exported, but by far the largest manufacture is that of the shawls and chadars made of soft Rampuri wool, and which is often passed off as pashmina or genuine shawl-wool. Of these fabrics no less than Rs. 1, 30,000 worth are annually made and exported. The import of real pashmina wool from Rampur amounts to about Rs. 30,000 or 40,000 a year, that of Rampuri wool about Rs. 20,000. A number of Rampur chadars are, however, made of real Kashmir pashm.

The Amritsar shawl-weaving approaches nearest in excellence to the Kashmir valley. In this city several European merchants and agents have been supervising the manufacture and furnishing designs. In the Amritsar district, according to

Mr. Cust, the total number of houses of Kashmiri shal baf is 6493, of which 5111 are in the city itself.

Amritsar, besides being the seat of manufacture, is also an emporium of the Kashmir shawl trade. At one time the shawl manufacture of Amritsar had so deteriorated, from the use of mixed or adulterated pashm, that the trade was threatened with extinction in Europe, and in 1861 large meetings were held at Amritsar with a view to the adoption of measures to prevent adulteration, — a considerable and fraudulent admixture of coarse sheep's wool. On the other hand, it was maintained that the difficulty of ascertaining, by the most experienced judges, before shawl goods are washed and exposed for a while to the action of the air, the amount of admixture, if any, that may have taken place in the weaving of shawls ;—and it may be here mentioned that the length of the staples of sheep's wool offering great facilities in spinning the thread is the chief inducement to its being used, the pashm being very short, and consequently more difficult to spin ; secondly, the total indifference of the manufacturers to the frequent and urgent remonstrance of the dealers against practices which they were assured would lead to the discovery of frauds that must affect all interested in the trade and manufacture of shawl-wool goods.

The principal kind of wool used in adulteration was a soft white wool imported from Kirman. A shawl even of adulterated pashm still sells for double what a shawl of sheep's wool would, though the work would otherwise be the same.

The shawls designated in India are—

Shal-kitani-kar, a shawl woven of twisted thread, giving it a peculiar, regular, serrated texture.

Shal-sada, a plain woollen shawl without embroidery.

Shal-doridar, a shawl having a dori or edging.

Do-shala is a double shawl.

Formerly, Kashmir shawls were exquisitely woven, with an elegance and chasteness of design, softness and finish in quality, arrangement of colours and use of dyes, which the finest Paisley and French shawls do not approach. These exquisite shawls of Kashmir became rarer, and their place was usurped by hand-embroidered fabrics of lower value, with more showy and more vulgar patterns. In the Panjab and in Dehli, also, workmen commenced to embroider Kashmir cloths and net with floss silk and braid, for sale to Europeans, who wear them as tunics, jackets, scarfs, and the like. In the hand-worked Kashmir shawls, as also in the Dehli work, wooden needles of hard wood are used, slightly charred, with a hole in the centre of the needle to receive the yarn. The scarfs of brocaded gold and silver, laid upon red, white, and green grounds, and worked in and interspersed with beetles' wings and other ornaments, are admired by Europeans. One of the causes of deterioration in this manufacture has been in Europeans inducing the weavers to produce fabrics of a style far inferior to the artistic articles of the Kashmiri.

Paris shawls are principally of the kind known as French Kashmir, in which, by the aid of the draw-loom and of the jacquard, a surface appearance is given precisely similar to that of the oriental shawls. The figures and colours of Indian shawls are faithfully copied, and the yarns of the weft are not only equal in number to the colours of the pattern, but there are also as many little shuttles or pirns filled with these yarns as there are colours to be repeated in the breadth of the piece. Each of these small pirns or bobbins passes through only that portion of the flower in which the colour of its yarn is to appear, and stops on the one side and the other of the cloth exactly at its limit; it then returns upon itself, after having crossed the thread of the adjoining shuttle. From this reciprocal interweaving of the various yarns of the shuttles, it happens that, although the weft is made up of a great number of different threads, yet they form a continuous line in the whole breadth of the web, upon which the lay or batten acts in the usual manner. The great art consists in avoiding confusion of the shuttles, and in not striking up the lay till all have done their part. A woman, assisted by two girls, is able to conduct the whole operation. But this close imitation of the oriental shawl is a very slow process, and therefore the shawls must be necessarily costly. Lyons is famous for its 'Tibet' shawls, the weft of which is yarn, with a mixture of spun silk. The shawls of Nismes are celebrated for their low price, and the ingenuity with which spun silk, Tibet down, and cotton are all worked up together.—*Powell, Panjab; Moorcroft, Tr.; Watson & Kaye; Hinlinson; M'Culloch; Cal. Cat.*, 1862; *Kashmir and its Shawls; Times of India.*

SHAYUK, a valley and river in the N.W. Himalaya. The river rises near Kara-korum pass, runs S.E. to N.W. into Indus near Iskardo; length 300 miles. It receives the Chang-chen-mo 58, and Nubra river 66 miles. Floods have at different periods devastated the whole course of the Shayuk valley, from the glaciers of Sassar. These floods appear to be due to the blocking up of the upper course of the river by the ice, and have been most destructive to the prosperity of the valley. An encamping-ground on the plain of the Shayuk river is called by the Turki merchants Murgai, by the Tibetans Murgo-chumik.—*Thomson's Tr.*

SHEA BUTTER is a solid oil obtained from the nuts of Bassia Parkii or Pentadisma butyracea, a tree of the interior of W. Africa. The nuts are allowed to ripen on the tree, and are gathered from the ground in the morning by women and children. The pulp surrounding the nuts is rubbed off, and generally eaten. As a fruit it resembles an over-ripe pear; but it is too sweet to be much relished by Europeans. The nut is next dried by exposing it to a slow heat in large clay caldrons with perforated bottoms. This, besides carrying off moisture, causes the nut to shrink in its shell, of which it is divested in the next operation, viz. threshing. This is done on floors, or sometimes it is done in large wooden mortars instead. The nut, now free, is next thoroughly pounded with pestle and mortar, then ground between stones; at this stage it looks just like black mud in paste. This mass is washed in cold water, then boiled till the butter rises white, and is skimmed from the surface. Shea butter remains hard at a high temperature when well prepared, and does not become rancid with age. It has a slightly smoky taste, acquired during its preparation. Some people dislike it. It has been used in cooking; and Mr. Barter lived on it and yams without inconvenience. It is also called Galam

butter.—*Letter from Mr. Barter to Sir William Hooker.*

SHEBA, mentioned in Ezekiel xxxviii. 13. 'The merchants of Sheba and Raamah,' etc.; 'Haran and Canneh and Eden, the merchants of Sheba, Asshur, and Chilmad,' etc., Ezekiel xxvii. 22, 23. The Balad-ul-Jahaf, a district of Yemen, is the land of Sheba, the Ard-us-Shaba, so called to the present day by the Arabs. There are two hills of Balak in the district, 600 paces apart, between which a queen of Sheba built a masonry dam, which burst, and the bursting is famed as the Sail-ul-Arun. Balkees, queen of Sheba, was stated to Soliman to have hairy legs; the Koran (ch. xxii.) mentions the plan he adopted to ascertain the fact.—*Ouseley's Tr.* i. p. 336.

SHECHEM, the modern Nablus, has in its neighbourhood the two mountains, Gerizim and Ebal, each about 2500 feet high, with Joseph's tomb and Jacob's well at the eastern end of the valley, the former near the foot of Ebal, and the latter near the foot of Gerizim. One Tur is the mountain mass near Sinai. Another Tur, the Et Tur, is Mount Gerizim near Nablus. Shechem was made the metropolis of the conquering Israelites. Jerusalem only became of importance after the vision of David in 2 Chronicles iii. 1. It was from Gerizim and Ebal that Moses ordered the law to be read. It [redacted] here that the field was bought by [redacted] (Genes[redacted]). Shechem of Samaria (Josh. xx. 7) was a refuge city. See Bast.

The shawl goat, and a dwarf variety (black, with short horn), also a race of blackfaced sheep, and the dumba or broad-tail, are reared in Ladakh in great numbers. Four-horned varieties of this sheep are not uncommon. The blackface, or hunniah, stands high, and is a handsome animal. Moorcroft says (Tr. R. As. Soc. i. p. 51) the Purik sheep of Ladakh gives two lambs in a twelvemonth, and is twice shorn in that period. Good ewes appear to be obtained in Coimbatore and Baramahal; but Jalna and Beder used to be the best places whence to obtain the white-woolled breed. The results obtained both at Bangalore and on the Neilgherry Hills, from crossing the white-woolled sheep of the country with Saxon, Merino, and Southdown rams, have been satisfactory, both as to quantity and quality of wool, and size of carcase. At the Madras Exhibition of 1855, of specimens of woollen manufactures, the most remarkable were those from Hoonsoor, comprising white and coloured blankets of various textures made in the native loom, some being imitations of English articles, and a decided improvement upon the country cumbli, and cheap in price. In Mysore, the wool is largely used in carpet manufacturing. In the Mysore country sheep thrive well. About the year 1840, General Cubbon collected a flock at a farm about 60 miles west of Bangalore, and imported three or four rams annually from Sydney; these amalgamate so well with the country sheep, both in figure and size, that in the fourth cross it was not possible to distinguish farm-bred from the imported ram. (See Ovis.) Sheep skins are employed for purposes for which a thin cheap leather is required, such as for common bookbinding, leathering for common bellows, whip-lashes, bags, aprons, etc. Sheep skins also form the cheaper kinds of wash-leather for breeches, gloves, and under-waistcoats; as also coloured and dyed leathers and mock morocco, used for women's shoes, for covering writing-tables, stools, chairs, and sofas, lining carriages, etc.

SHEETALA. SANSK. Cold. In Hindu mythology the goddess who cools the body when afflicted with the smallpox; she receives many honours from the lower orders of Hindus.

SHEETALA-PATI, from Sheetala, cold, and Pati, a mat, from Pat, to move. The mat is from the Maranta dichotoma.—*Ward's Hindoos.*

SHEFTAH or Shafta, called in Syriac Agal, is a skein of camel's wool thread, about nine feet long, bound at distances of about twelve inches with silk and gold thread. It is wound round the kufia, forming a large turband, and is principally worn by the Anazeh.—*Hamilton's Sinai*, 183

SHEKHAWATTI. This province extends about 80 miles from north to south, and less from east to west. It has the extensive dominions of the raja of Jeypore on the south, on the east the dependencies of the British Government, on the west the territories of Bikanir, and on the north-west it has the barren country of the Batti clan, formerly a plundering tribe, remarkable for carrying on their depredations on foot and still more so for the length and rapidity of the incursions thus made. On the north is Hurriana, the scene of the exploits of George Thomas.—*Elphinstone's Caubul*, p. 3.

SHEK-U. CHIN. A mineral substance used in China as a dentifrice, also as a tisan in fever. It is brought from the north of China, and is said to be gypsum or alabaster.—*Bennett.*

SHELL.

Sadaf, ...	ARAB.	Sipi, ...	HIND.
Ecaille, ...	FR.	Conchiglia, ...	IT.
Coquille, ...	,,	Cascara, ...	SP.
Schale, ...	GER.	Kabuk, ...	TURK.

The ordinary shell is the protective covering of the molluscous class of animals, in most cases large enough to enclose the whole body of the mollusc, but in some cases it is interior, and only of sufficient size to protect the heart and lungs. The snail affords a familiar instance of an external shell. Shells are called univalve or bivalve, according as they consist of one part, or of two parts joined together by a hinge. The snail is univalve, the oyster is bivalve. The generality of the bivalve shells, including various oysters, mussels, etc., are termed nacreous shells, from Nacre, the French for mother-of-pearl. The so-called shell of the tortoise is a horny covering, and it is obtained from Ceylon, the Eastern Archipelago, France, Trinidad, etc. The glistening lining of oyster shells, known as mother-of-pearl, is manufactured into articles of great beauty. Most of the univalve shells are of the character called porcelanous, from their brittleness, translucence, and the resemblance of their fracture to that of porcelain.

The trade in shells is one of extreme antiquity in Ceylon. The Gulf of Manaar has been fished from the earliest times for the large chank shell, Turbinella rapa, to be exported to India, where it

is sawn into rings, and worn as anklets and bracelets by the women of Hindustan, Dacca being the chief place of manufacture. Another use for those shells is their conversion into trumpets, which are sounded in the Hindu temples on all ritual occasions. A chank, in which the whorls, instead of running from left to right, as in the ordinary shells, are reversed, and run from right to left, is regarded with such reverence that a specimen formerly sold for its weight in gold, but one may now be had for £4 or £5. Abu Zaid, an Arab, who wrote an account of the trade and productions of India, speaks of these shells by the name they still bear, which he states to be Schenek. In general, shells are more prized for their beauty than valued for their rarity, though Argus cowries have been sold as high as four guineas a pair.

One of the principal sources whence the Ceylon supplies of shells are derived is the beautiful Bay of Venloos, to the north of Batticaloa, formed by the embouchure of the Natoor river. The scenery at this spot is enchanting.

Shells are used as a flux in the furnaces instead of lime, and along the coast, near Madras, the finest plaster is made from calcined shells. The Placuna placenta or window shell is still used as a substitute for glass.

The chanks and large ornamental shells imported into India are between 7 and 8 millions annually, valued from about two to four lakhs, and from 21 to over 28 million cwt. of cowries, valued about a lakh.

Shell middens occur at the mouth of one of the [illegible] of Perak.—*M'Nair*, p. 23 ; *Tomlinson ; J. [illegible] Asiat.* 1847 ; *Tennent's Ceylon ; Cosmas [illegible], in Thevenot*, i. p. 21.

SHELLAC or Shell-lac, Chapta-lac, HIND., is the most common form in which lac is generally known ; it is the substance liquefied, strained, and formed into thin transparent laminæ.—*Faulkner.*

SHEMSAN, an inferior deity of the Kuki. A large block of wood put up in every quarter of the village ; to it a goat is offered, and they place before it the heads of the slain in battle, or the heads of animals killed in the chase.

SHEN, SANSK., TAM. Meaning fine, beautiful, [illegible] Schöne of the Germans. It is applied in several ways. The Shen Tamil (Sen Damir) is that in which Tamil classical poetry is written, and differs considerably from what is termed Kodun Tamil, or common Tamil, the spoken language of the people.

SHENDOO, a Burmese tribe, who call themselves Heu-ma, and dwell in the mountains north of Arakan. The Khyoung-tha, or children of the river, are of Arakanese origin, speak the old Arakan dialect, and conform to Buddhist customs. The Toung-tha, or children of the hills, are of mixed origin, if indeed they are not aborigines of the country. They speak numerous dialects, and worship the deities of the elements and spirits of the hills and streams. The Shendoo occupy the very remote mountainous country at the heads of the several rivers. They are said to comprise twelve powerful clans, whose habitations extend from the Blue Mountain to Cachar and Burma proper. They are much feared, but little or nothing is known respecting them. Captain Lewin describes them as much taller than ordinary hillmen, and of much fairer complexion ; and the faces of those he saw bore no signs of that Mongolian type of physiognomy which generally prevails amongst the Toung-tha tribes. Both males and females are more decorous in their dress than the other hill tribes, and field labour as a general rule is performed only by the men, and never by the women, excepting in the case of poverty. The Shendoo possess muskets which do not appear to be of European manufacture ; the stocks are painted red, black, and yellow, and are highly varnished. Their powder-flasks are made of gyal horns, and are polished and beautifully inlaid with silver and ivory. Captain Hughes, in charge of the Arakan hill tribes, writing in 1872, mentioned that they have no Ka-mi, or Koo-mee, or Quay-mee ; Koon, or Mru. The Shendoo tribe divides itself into five or six branches, who each speak a different dialect, the most powerful of whom are the Shaing Tee and Tna-krai-mi, the latter approaching Burma proper, Chyn or Khyn. Dr. Mason never before A.D. 1872 heard of the Tee and Tna-krai-mi, but thought it probable the names only are new.—*Dr. Mason in literis.*

SHENG-KWANG, a Chinese pupil of Ta-mo, the Indian patriarch Bodhidharma. At the town of Yu-hwang he is represented standing before Ta-mo, holding his own left arm in his right hand, which he had just cut off near the shoulder as a sign of his devotion and dominion over the body. This is said to have taken place in the 5th century. —*Dr. Edkin.*

SHEN-SI, one of the most extensive Chinese provinces, but the western part of it has been erected into a province under the name of Kan-su.

SHENSOY. The Parsees in India have two sects, the Shensoy and Kudmi, whose only dissimilarity arises from their different mode of computing, since 1746, the era of Yezdejird, which occasions a difference amongst the two sects as to the time of celebrating their festivals. The numbers of the Shensoy ten times exceed those of the Kudmi.

SHEORANEE HILLS, a little south of the Goomul river, stretch from the latitude of Dehra Ismail Khan, downwards to nearly the latitude of Dehra Futteh Khan, a distance of fifty miles. In these hills is the lofty square-shaped mountain, Takht-i-Suliman, which gives its name to the Sulimani range, running parallel for 300 miles to the Indus, and forming the western frontier of British India. At the base of this mountain runs the important Zerkunni pass, the high-road for caravans to and from Kandahar. The Sheoranee tribe are of Pathan lineage, are of inferior stature to the Waziri ; they are warlike and predatory, and quite independent. The number of their fighting men has been set down at 10,000 ; but this is high. They can muster 1000 men within a day's notice ; in the course of three or four days they will muster 3000 more. They adjoin the British tracts of Tak (partially) in the north, then Kolachee, then Durrabund, and lastly Choudwan, —all in the Dehra Ismail Khan district, and forming the border plains of the Upper Dehrajat. With all the above tracts, the Sheoranee, up to A.D. 1850, had been at feud.

SHEPHERD. Most of the nomade races of Asia are shepherds. The Israelites largely herded sheep. Moses herded the flock of his father-in-law Jethro, a priest of Midian. David tended his father's sheep. The chief shepherds of the S. of India are the Kurumbar race, their name being from Kuru, a sheep. Oree golla wanloo, Koraba galla wanloo,

Hunde koraba wanloo, are divisions. In the Tamil country, shepherds are divided into many classes, as Manyakarar, Kuruku, Pavalangattee, Sambar, the Sival Idyar, etc. They are called Pillay and Kouar. The Dhangar shepherd race are a very numerous body. There are 55,947 Dhangar in the Berars, a quiet race, who wander in search of pasture for their herds and flocks, but often return to their settled homes on the plains or mountains. The temples in which they worship their deities are piles of large unhewn stones, resembling the places of worship of the old Druids. These people render great service to cultivators, who invite them with an offer of a reward to pen their flocks in their fields, so that they may leave behind them valuable manure. The founder of the Holkar family of Malwa sprang from this race. The shepherds of India have a custom, which is purely Asiatic, of preceding their flocks to pasture. 'He shall feed me in a green pasture, and lead me forth beside the waters of comfort,' said the Psalmist; and the daily custom of the shepherd tribe of Hindustan proves that this poetical and beautiful simile was drawn from the practice of common life. The Ahir of Northern India now rear cattle, though seemingly in former times shepherds. Near Benares there are sixteen clans. The Ahar of Moradabad and Rohilkhand seem identical with the Ahir. The Gadariya of [illegible] sheep and goats. The Rewari of the Rajputana oases rear camels.

SHEPHERD'S PURSE, Capsella Bursa Pastoris. Tsai-tsai, Ti-mi-tsai, CHIN. In China the plant is largely eaten as food by the poor. The root is used in ophthalmia.—*Smith.*

SHER. PERS. A lion, a tiger. The title Sherwa-Khurshid (lion and sun) was devised in 1808 by Fat'h Ali Shah, to decorate foreign envoys and Europeans who had rendered important service to Persia. It is never conferred on any Persian officials.

SHER AFKUN, a famous athlete. His victory over a tiger is a recorded fact in Moghul history. He lies buried in old Bardwan, far away from the place of his birth in Turkomania.—*Tr. of Hind.* i. p. 157.

SHER-DALA, in Hindu sculpture, conventional lions, the emblems of the Hoisala Bellala dynasty.

SHERIF. ARAB. Noble; in British India, a lineage social title of a Muhammadan whose father was a Shaikh and mother a Syudani; also the title of the ruler of Mecca. Hamilton, an old writer, describes the Sherif of Mecca of this day as having three slashes on each side of the face, called masha-ly, which though then falling into disuse, had been the mark of all persons born within the sacred territory. In his hand he carried the mashab, the camel-stick of almond-wood, which is undoubtedly the original of the jackal-headed wand with which some of the Egyptian deities are represented, and which is here almost regarded as the symbol of royal power. In his Kashmir waistband was stuck a poniard with a gold and jewel-studded handle.—*Hamilton, Sinai*, p. 116.

SHER KHAN, an Afghan who raised a large force in Bengal and drove the emperor Humayun from the throne. He reigned about five years, and was killed by the explosion of a magazine. He was an able soldier. He was succeeded by his son Selim, who reigned nine years.

SHERKI. ARAB. The east wind of Scripture. Rich notices an exclamation, 'The sherki is come!' As soon as this wind came on, the thermometer rose ten degrees, from 80° to 90°. The so-much-dreaded sherki seems to blow from any quarter from E. to N.E. It resembles the Italian sirocco, pronounced scirocco, and no doubt the same word as sherki, *i.e.* easterly. The Kurds calls it Baya Rish, or black wind.—*Rich's Kurdistan*, i. p. 125.

SHERKIST. HIND. A sort of manna found on the Hedysarum alhagi, one of the Leguminosæ, produced principally in Kābul. It occurs in unequal, dark-brown pieces, of a bitter-sweetish taste, and is mixed with the stalks of the plant on which it is produced. It is used by the natives as a laxative and refrigerant in fever, in doses of ʒj. It is imported into India from Kābul and Khorasan.

SHERKUN, a six-pointed diagram, for which the Brahmans have several mysterious names; but it is generally called sherkun, which means little else than six-pointed. If it have five points, it is also replete with mythological allusions; Siva and Brahma have, or had, five heads. The diagrams have also mathematical properties of a mysterious description; and they serve, like the fox and goose or solitaire boards, for a game, played with cowries or with dice, guiding the movements of the men. It is a popular game, and the instruments of play are always at hand; the lines drawn in the dust with the finger, and a few stones picked up, can furnish the means of gaming. Cowries being used as money, two or three of them are rarely wanting to a party disposed to play. The triangle is called trikun, which it literally means, and has been explained by a Brahman as the symbol *of* ce[illegible] deities or powers, and the type of triune equality; and hence applied by some to the [illegible] great deities conjointly. A point, called p[illegible] represents the deity, having neither length breadth, self-existing, containing nothing. circle is Brahm, eternity; having neither begin[illegible] nor end; unity, perfection.—*Moor*, p. 404.

SHERLEY. Three brothers of this name, Thomas, Sir Anthony, and Sir Robert, who trave[illegible] in Persia, Russia, Turkey, and Spain, in the la[illegible] part of the 16th and beginning of the 1[illegible] centuries.

SHERRY, a wine, principally produced in vicinity of Xeres in Spain, of a deep or light am[illegible] colour, and fine aromatic odour; its taste is wa[illegible] with some degree of the agreeable bitterness the peach kernel. It is extensively used as a dinner wine.—*Faulkner.*

SHER SHAH. His tomb is on a square terrace in the middle of a large tank near Sasseram in Shahabad.

SHERWATTY, a river on the western side of India, in the Dharwar collectorate, which falls 1000 feet, near the village of Garsipa.

SHEVA GANGA, a large zamindari in the Madura district, 1460 square miles. It contains 2070 villages and 1265 hamlets. It formed part of the Ramnad chiefship until 1729.

SHEVAROY HILLS, Survarayar Malai, a hill range in Salem district, Madras, situated between lat. 11° 43′ and 11° 55′ N., and between long. 78° 13′ and 78° 24′ 30″ E., are a mass of densely-wooded flat-topped hills, the mean height being 4600 feet, and the highest peak 5260 feet. These hills are an irregular mass of mountains, separated by deep valleys. Their entire length from north

Notices of the various kinds of ships will be found under the head of Boats. On the eastern side of the Peninsula of India, the ship is built with her keel parallel to the shore, and, as it may happen, from 200 to 300 feet from low-water mark. When completed, she is placed on two strong pieces of timber, called dogs (in the nature of a sledge of enormous dimensions), and on these a sort of moveable cradle is constructed to keep the vessel upright. Two long palmyra trees, a lever of the second kind, are then applied to the ends of the dogs, and by means of these powers, they, together with the vessel that rests on them, are gradually pushed forward over a platform of logs until they arrive at the lowest pitch of low water, or as far beyond it as the levers can be used. Tackles are applied to the ends of the levers to increase the power; the fulcrums are wreaths of rope, fastened to the logs on which the vessel slides, and are removed forwards as she advances. Two cables from the land side are fastened to the vessel to prevent her from sliding too rapidly, and these are gradually let out as she advances. It is commonly the work of two days to transport the vessel to the margin of low water. If the tide does not rise high enough to float her from thence (which it seldom does if the vessel be of any considerable burden), part of the cradle is taken away, and the ship left chiefly to the support of the cradles till high water, when they are suddenly let go, and the vessel falls on her side, and with the fall disengages herself from the remains of the cradle, and at the same time plunges into deeper water. A ship of 500 tons has been launched in this manner. — *Rennell's Memoir*, p. 245.

SHIRÁR, the inspissated juice of grapes.

SHIRAZ, the capital of the province of Fars, founded A.D. 622. It was taken by Timur 1380. It is in lat. 29° 37′ 56″ N., and long. 40′ 22″ E.; is 4850 feet above the sea, in the centre of a plain 25 miles long and 10 or 12 miles broad, amidst mountains. It has a low wall of mud and six gates, surrounded by gardens, some of them, as the Jahan Numa, beautiful. It has 30 houses. The tomb of the poet Hafiz is in a garden 1½ miles from the city. The climate is agreeable, but not favourable to Europeans in the summer months. The tomb of Sadi stands by itself in a recess, but that of Hafiz requires to be pointed out from a multitude of others around it. The wine of Shiraz is a fine, powerful, dry wine, not so dark as brown sherry. Near the Jahan Numa in Shiraz is a building called Chahal Tan, 'the forty bodies or persons.' Another, the Haft Tan, or 'seven persons,' so named from the number of holy men there buried. At Shiraz, Hassa, and in India, African slaves are distinguished by flowery names or epithets, expressing beauty and fragrance, in proportion to their natural ugliness or offensive smell, — as Yasmin, the jasmine; Sumbul, the hyacinth; Jauhar, the jewel; and Makbul, the pleasing or agreeable.— *Vigne; Ouseley's Tr.; Morier; Fraser; Chesney; Abbott; Rich; Henell; Taylor; Clerk; Pelly; Kinneir.*

SHIRHAWTI RIVER falls into the Arabian Sea; at its embouchure it is about 400 yards in width, and in the rainy season some 30 feet in depth. This immense body of water rushes down a rocky slope for 300 feet at an angle of 45°, at the bottom of which it makes a perpendicular plunge of 850 feet into a black and dismal abyss, with noise like the loudest thunder. The whole descent is therefore 1150 feet, or several times that of Niagara, but the volume of water in the latter is somewhat larger than in the former.

SHIR KHISHT. HIND. Manna from Fraxinus, *sp.* Khorasan manna, from Khorasan, is supposed to be the produce from an olive.

SHIRNA. HIND. Shinaz, PUSHTU. The inflated large buffalo or bullock skin used for crossing streams in the Himalaya hills. In Kashmir these large skins are not used, but small ones tied two together. See Shina.

SHIRWAN, in lat. 38° 31′ to 40° 44′ N., a province of Georgia, about 135 miles long and 20 to 40 miles broad, with an area of 10,386 square miles. It was the finest province of Persia, but was ceded to Russia in 1724, and again in 1826. Its people are Armenians, Muhammadans, and Tartars.—*MacGregor.*

SHIRZY RAO GHATGAY, a Mahratta leader and minister of great notoriety. He was the father of Baiza Bai, who married Dowlat Rao Sindia.

SHISHAK. According to Professor Duncker, the first fixed starting-point in Egyptian chronology is the invasion of Palestine by Shishak, who appears as Sesonchis, the first king of the 22d dynasty of Manetho, and [illegible] reign begins in the year B.C. 934. But according to the Hebrew chronology this date would be too late by perhaps a generation. In his belief, five centuries had passed from the expulsion of the Hyksos before Shishak began to reign. If we allow, as he thinks we ought to allow, another five centuries for the occupation of these nomadic intruders, the end of the old monarchy will be synchronous with the beginning of the second millennium B.C. Calculations of a like kind would lead to the conclusion that the pyramids of Memphis were built about B.C. 2500; nor can a less period than that of five more centuries be allowed for the growth of a civilisation which should render the erection of such stupendous monuments possible. In support of this conclusion, we have the indubitable fact 'that the oldest monuments of Egypt—and they are also the oldest in the world—exhibit the Egyptians in possession of the art of writing;' and when we remember that all writing must proceed from pictures, we may well be staggered at the length of time which must pass while the first actual imitative drawings were being rubbed down until they were reduced to a form approaching that of mere phonetic characters.

SHITTIM TREE, mentioned by Isaiah and also in Exodus, is supposed to have been an acacia. Hippocrates speaks of the Egyptian acacia and of the white acacia, distinguished, he says, by its white bark, white wood, and white flowers; and from this tree his 'white fragrant ointment' was probably made.

SHIVE-u-DOUNG, a great mass of mountains which runs parallel to the Irawadi as far as Amarapura; one peak is estimated to be 6000 feet in height.

SHOA. In 1840, Sahela Selassie, king of Shoa, in Southern Abyssinia, expressed a desire to cultivate the friendship of the British Government, and wrote to the Government of Bombay

asking to be furnished with guns and warlike stores. Shoa was then one of the most powerful and important provinces in Abyssinia. It is inhabited by the Galla tribe. At the time when Sahela Selassie made these advances, the steam navigation of the Red Sea had given an exaggerated importance to the tribes of Abyssinia, and a mission was sent to Shoa, with which country the French also appeared anxious to establish friendly connections. A commercial treaty was concluded with the king on 15th November 1841. —*Treaties*, vii. p. 310.

SHOES.

Markub, Hida,	ARAB.	Baschmaki,	RUS.

Kasut, Sapatu,	MALAY.		

The sandal was doubtless the foot-clothing of all ancient times, and the flinging of one on a territory was a symbol of taking possession. The Psalmist says, 'Upon the land of Edom do I cast my shoe.' In Ireland, after the chief took the white rod, the sub-chieftain placed sandals on his chief's feet, retained one as an honourable perquisite, and threw the other over his chief's head as an augury of good luck. The sandal is still worn by the Hindu and Muhammadan nations in the south of Asia. Shoes, as articles of covering for the feet, are generally made of leather, but cloth of kinds is also used, and in the Panjab Himalaya, straw and grass. The shoes, or rather slippers, worn by the natives of Southern India are generally of red leather if for men. The patterns are called Appa-shahee, Chandduru, Chappal, and Nokdar. The rich natives use a buff-coloured cloth. The slippers of females are ornamented with spangles. Their price is from four annas to a rupee. Thunberg says that in his time the shoes of Japan were always the shabbiest part of the dress of the Japanese, and being of straw they [illegible] but a little time. But they were made in [illegible]ense numbers, and cost but a trifle. Dignies sometimes wore slippers made of fine rattan s neatly plaited. In Exodus iii. 5, the Lord mmanded Moses, saying, 'Put off thy shoes from f thy feet; for the place whereon thou standest is holy ground.' The natives of British India never go into their own houses, nor into the houses of others, with their shoes on, but always leave them at the door. It is a great affront not to attend to this mark of respect in visiting; and to enter a temple, mosque, or kyoung without pulling off the shoes would be an unpardonable offence. A shoe-bearer is a very humble office; and in Matthew iii. 11, John says of Christ, 'He that cometh after me is mightier than I, whose shoes I am not worthy to bear.' Luke xv. 22 says, 'And put shoes on his feet.' In Bengal, shoes of a superior quality make one of the distinguishing parts of a person's dress. Some of these shoes cost as much as a hundred rupees a pair, but are put off the feet before entering a room.—*Faulkner; Herklots; American Expedition to Japan*, p. 65; *Thunberg*.

SHO-GUN or Tycoon, in Japan, until the revolution of 1868, was the chief noble of the Mikado, and was called by foreigners the Temporal Emperor. The full title was Sei-i-Tai Sho-gun, *i.e.* barbarian-quelling generalissimo, and it was bestowed by the Mikado on his son Ya-ma-to Da-ke-no-mi-ka-to, who B.C. 86 conquered the aborigines of the N. and W. of the main island. The first hereditary Sho-gun was Mi-no-mo-to Yo-ri-to-mo, A.D. 1190. The greatest of all the Sho-gun was Iye-ya-su, the founder of the To-ku-ga-wa dynasty of the 17th century. The last of these temporal sovereigns was Kei-ki, who was set aside in 1868, when the Mikado assumed direct rule, and he was still living at Shid-zu-o-ka in A.D. 1883.

SHO-JIN. CHIN. Pigmies, fabulous beings.

SHOLA or Sola, HIND., is the root of the Æschynomene aspera. It is made into toys, artificial flowers, birds, garlands, floats for nets, or in bundles for crossing rivers. When charred it answers for tinder. Phool-sola or Bhendi is Æ. aspera, Æ. Roxburghii is the Bhat-sola, Æ. paludosa is the Kat-sola. The skill of the Indian carver is conspicuously shown in the beauty of the figures and buildings in the pith-like Æ. aspera.

SHOLA, in the S. of Peninsular India, a grove, a copse, a small forest in a valley or on the slope of the hills; in Wynad, a ravine filled with tree thickets. The whole of the sholas or woods in the reserved woods at the neighbourhood of the Ootacamund station are absolutely reserved, not only for their beauty, but also from fear of injuring the water-springs. Their limits are marked; no private cutters are allowed inside; old trees to be felled are brought outside, and sold by public auction. Trees to be planted where required in vacant places.—*Madras Conservator of Forests*, 1859-60.

SHOLAGUR, a hill race who lived in the jungles of the Kollegol taluk of Coimbatore.

SHOLAPUR, a town and fortress in the Dekhan part of the Bombay Presidency. It is in lat. 17° 40′ 18″ N., and long. 75° 56′ 38″ E., in the valley of Seena river; and the surrounding land have been formed into a revenue district, with an area of 3925 square miles, and a population in 1872 of 662,986 souls, that of the town being 53,403. The people are largely Mahrattas, and on its east, south, and west are the estates of the Akalkot, Patwardhan, Phaltan, and Panth Pradhadhi chiefs. In 1818, on the downfall of the Peshwa, it fell to the British. In 1877 it suffered from famine.

SHOLASAGAMANY. Fine rubies have from time to time been discovered in many of the corundum localities, particularly in the gneiss at Viralimodos and Sholasigamany; also in the Trichingode taluk, and at Mallapollye, but are comparatively speaking, rare.

SHOMIYO, in Japan, a territorial noble, with an annual revenue of less than 10,000 koku of rice. The words mean small name.

SHOOAY-DAGON, a great Buddhist pagoda at Rangoon in Burma, and the most venerated object of worship in all the Indo-Chinese countries. It is in lat. 16° 46′ 40″ N., and long. 96° 13′ 50″ E., and stands upon a mound, partly natural and in part artificial, in the angle formed by the junction of the Rangoon and Pegu rivers. This mound has been cut into two terraces, the upper of which is 166 feet above the level of the ground, and 900 feet long by 685 wide. On the east side is a bell, 7 feet 7½ inches in diameter at the mouth, which was presented by Bhodaw Bhura. The legend concerning its erection assigns it to the year 588 B.C. The pagoda has been several times

added to and regilt,—the last time in 1871, when, with the sanction of the British Government, the king of Burma sent a new H'tee from Mandalay, valued at £62,000. The name Shooay-dagon is derived from the Talaing word Takun, meaning a tree or log lying athwart, which has been corrupted in Burmese into Dagon or Dagun. The Burmese word Shooay or Shwe means golden. The hill on which it stands has been strongly fortified. It is said to contain relics of all the four Buddhas of the present kalpa (Buddha-gabba), viz. the staff of Kakusanda, the water-dipper of Konagamma, the bathing garment of Kasyapa, and eight hairs from the head of Sakya Sinha, Gautama Buddha.—*Hough's Great Bell at Rangoon; Imp. Gaz.*

SHOOAY-GYENG, the chief town and headquarters of Shooay-gyen district, Tenasserim division, British Burma, in lat. 17° 55′ N., and long. 96° 57′ 30″ E., on the left bank of the Sitang (Tsit-toung) river. The Poung-loung range, at the Tsik-le Hill, opposite Shooay-gyeng, attains a height of about 4000 feet, and terminates above Keng-rwa in Ke-la-tha, a peak crowned by a conspicuous pagoda. The Sitang river rises in Independent Burma. It enters Shooay-gyeng at its northern end, and, after an exceedingly tortuous course, falls into the Gulf of Martaban by a funnel-shaped mouth seven or eight miles wide, up which the spring-tides rush with great violence. A chopping sea follows the rolling crest of the bore, and sometimes wrecks a boat in a few minutes. The population in 1872 was 120,485. Karens, 43,475; Burmese, 41,562; ing, 35,401; Toungthu, 4887; Shans, 3189; hammadans, 421; Hindus, 291; Chinese, 157. e Karens are most numerous in the tract of the Sitang, and belong to two great ilies, Sgaw and Pwo. Many of them have been verted to Christianity by the American Baptist sionaries. The Talaings chiefly inhabit the ns; the Burmese, the country lying north of Sitang. The Yabaings, who are engaged in rearing of silk-worms, are found mainly on eastern slopes of the Pegu Yomas in Bhawni.

SHOOAY-HMAW-DAW, literally golden great l, a pagoda in the old fortified town of Pegu, ngoon district, British Burma. It is a pyral, solid brick building, rising to a height of feet from an octagonal base, each side of which is 162 feet long. It stands upon two terraces, the lower one being a parallelogram, with its sides 1390 feet long. The pagoda is surrounded by two tiers of smaller temples; the lower tier contains 75, and the upper 53. Shooay-hmaw-daw, in common with most of the sacred edifices in Burma, is connected with a visit of Gautama, though there can be no doubt that he never came so far as Burma. In June 1852, on the outbreak of the second Burmese war, the pagoda was the scene of some sharp fighting previous to the capture of the town of Pegu by the British.—*Imp. Gaz.*

SHOOAY-TSHAN-DAW, a pagoda in Prome town, Prome district, Pegu division, British Burma. It is situated on a hill about half a mile from the bank of the Irawadi, and gives its name to a quarter of the town. The building is gilt all over, and is solid. Its height is 180 feet, and it occupies an area of 11,025 square feet. It is surrounded by 83 small gilt niches, called Zedi-yan, each containing an image of Gautama. Tradition alleges that when Gautama arrived near Prome, and was walking on the island of Zengyan, he was accosted by a naga or dragon, who begged for some sacred hairs to enshrine in a temple.—*Imp. Gaz.*

SHOONDOAH is a tiny ship which Hindus launch on the Ganges, ornamented with garlands of flowers, and illuminated with lamps. It is a ceremony performed by Hindu mothers to propitiate the goddess in behalf of their sons. The goddess resembles Amphitrite. It is supposed to be a propitiatory rite handed down from times when the Hindus were engaged in maritime avocations. It is held on the day on which, according to Hindu astronomy, the sun turns back from Capricornus to resume his northern ascension, and when the steady N.W. wind blows favourably for outward bound voyages. Feastings are held on that day, and farewell entertainments are given to the voyagers.

SHORABAK lies due east of Seistan, on the banks of the Lora, and is occupied by the Baraich Afghans, great camel-breeders, and acknowledging the supremacy of the amir of Kābul.

SHORAPUR, a tributary state of the Nizam, situated on the south-west corner of the Hyderabad territory. Its chief and their people are of the Beder race, parties of whom are scattered southwards into Mysore, and eastwards Bellary. Their race name is the source of the word Pindara.—*Imp. Gaz.* viii.

SHORE, Sir JOHN, afterwards Lord Teignmouth. He arrived in Calcutta on the (12?) 14th September 1786, along with Lord Cornwallis. He succeeded Lord Cornwallis as Governor-General on the 28th October 1793, and retained the office till he embarked for England on the 12th March 1798. On the death of Sir William Jones he was nominated President of the Royal Asiatic Society of Bengal. He wrote an account of Nepal in the Bengal Asiatic Researches.

SHOREA, a genus of plants of the order Dipterocarpeæ, which many botanists arran under the genus Vatica, *q.v.* The species n are Assamica, floribunda, gratissima, lacci obtusa, robusta, Siamensis, stellata, talura, tumbuggaia. S. robusta is the sal tree; S. lac fera, *Heyne*, is a timber tree of Madura; S. obtus *Wallich*, is of Prome; and S. stipularis, *Thw.*, is a great tree of Ceylon, between Ratnapura and Galle.—*Thw.* i. p. 36.

SHORTT. Deputy Surgeon-General John Shortt, a Madras medical officer, a voluminous writer, and original investigator; author of a Report on the Medical Topography of the South-West Political Districts, 1853; Essay on Indigo, 1860, for which he received from Government a prize of Rs. 800; Essay on Cotton Culture, prize Rs. 1000, and gold medal from the Manchester Cotton Supply Association; Handbook to Coffee Planting, 1864; Treatise on Vaccination, 1865-66, translated into Canarese, Hindustani, Tamil, Telugu, Uriya; on the Hill Ranges of S. India. He wrote also on the Medical History of Women, 1864; on the Leaf-Wearing Rite; and on the Hanging Festivals of the Hindus.

SHOTRIANDAR. Tam. A person holding land on easy rent, or for a number of lives; generally as a reward to Brahmans only for public services; also written Shrotriyandar.

SHOUNG, a tributary of the Sitang, on the northern boundary of Tounghoo. It is occupied by a tribe who call themselves Shoun-khi-pho, or sons of the headwaters of Shoung.—*Mason, Burma*, p. 92.

SHOWERS OF FISH. Prinsep on, Journal, 1833, p. 34: Grant on, Trans. of Civil Engineers; Naut. Mag. 1838; Bombay Times, 1840, p. 652. Showers of Blood in Kandesh in 1828, Rep. Brit. As. 1839. SHRADDHA, SANSK., from Shraddha, firm faith. It is the Latin Credo and English Creed. The Shraddha is a Hindu ceremonial for the repose of the dead. The oblation consists of rice, flowers, water to the manes of the deceased. There are three shraddha for the dead,—one eleven days after death, another every month, and another at the close of the year after a person's decease. During the ten days of mourning the relations hold a family council, and consult on the means of performing the shraddha. On the last of these days, after making an offering for the dead by the side of the river, they are shaved. This offering consists of boiled rice, sugar, curds, sweetmeats, milk, plantains, etc., made into ten balls, and presented with prayers. [redacted] tion given duly to [redacted] for a long [redacted] says, 'What sort of oblat[redacted] the manes is capable of satisfying the[redacted] time, or for eternity, I will now declare, without omission. Brahmans are unclean for ten days after the death of a relation; Kshatriyas, twelve; Vaisyas, fifteen; and Sudras, thirty.' The next day, after bathing, the family prepare an open place for the ceremonies. If it be the shraddha of a rich man, all the learned Hindus and respectable people of the neighbouring villages are invited. The company being seated under an awning, the sons and other relations of the deceased, dressed in new garments, place themselves in the midst of the company with their faces eastward, having [redacted]ar them sixteen different gifts, as brass cups, [redacted]llesticks, umbrellas, shoes, etc. Next are [redacted]ught seeds of sesamum, a small piece of gold, [redacted]d another of a different metal, wrapped up in new [redacted]oths. The son of the deceased now puts a piece of new cloth across his neck, and offers an atonement for the sin of having killed insects, in sweeping the room, in cooking, grinding spices, and in moving the water jar; then follows an offering to the sun; then, rising and bringing his hands forward in a supplicating posture, he solicits leave from the company to make the offering, after which he offers the sesamum, gold, and metal for the happiness of the deceased; takes the kosha, and sprinkles the sixteen gifts with water; then, placing a flower on each, and repeating prayers, he offers them in the presence of the shalgrama or saligrama, one by one, in the name of the deceased, that he may obtain heaven. The son after this, if in circumstances sufficiently affluent, presents large gifts to the Brahmans, as elephants, horses, palanquins, boats, etc., the receiving of which, however, is not honourable. A Brahman then marks the foreheads of all present with sandal powder, and puts round the neck of each a garland of flowers. To the Ugrudanee Brahmans and others are now given, amidst much confusion among the receivers, the sesamum, the morsel of gold, the metal, a large basin full of cowries, and a conch or two, as well as the sixteen different gifts; after which the assembly breaks up. The son then goes into the house, and, placing a Brahman and his wife on a seat, covers them with ornaments, worships them, and, adding a large present of money, dismisses them. After this the son of the deceased requests five Brahmans, of some note for learning, to offer a male calf; in doing which they take two cloths each, four poita, four betel-nuts, and some cowries provided for the purpose, and go with the company to a spot where an altar has been prepared one cubit high and four cubits square. Four of the Brahmans sit on the four sides of the altar and then worship certain gods, and offer a burnt sacrifice. Near the altar are placed the saligrama, four female calves, a male calf, and a vilva post. The fifth Brahman reads certain parts of a Purana, to drive away evil spirits. The female calves are tied to four vilva posts, and the male calf to a vrisha post. To the necks of the female calves four small slender baskets are suspended, in which are placed, among other things, a comb, and the iron stilette with which the Hindu women paint their eyebrows black. A sheet of metal is placed under the belly of the male calf; on the back a sheet of copper; the hoofs are covered with silver, and the horns with gold, if the shraddha be performed by a rich man. On the hips of [redacted] marks of Siva's trident are [redacted] son of [redacted] f, and [redacted] impressed with a hot iron. After this the [redacted] the deceased washes the tail of the male cal[redacted] with the same water presents a drink-offeri[redacted] his deceased ancestors, and afterwards marries [redacted] male calf to the four female calves, repeat[redacted] many formulas, in which they are recommen[redacted] to cultivate love and mutual sympathy. The [redacted] next liberates the female calves, forbidding [redacted] one to detain them, or partake of their milk[redacted] future. In liberating the male calf, he says, [redacted] have given thee these four wives to live [redacted] them. Thou art the living image of Yama; [redacted] goest upon four legs. Devour not the cor[redacted] others, go not near a cow in calf,' etc. [redacted] female calves are generally taken by Brahma[redacted] the male calf is let loose, to go where he plea[redacted] To this succeeds what is peculiarly termed [redacted] shraddha. The river side, or the cow-house, [redacted] some retired place, is chosen; after cleans[redacted] which, they collect all kinds of eatables, cloth[redacted] sesamum, flowers, etc., and place them into [redacted] dishes made of the excavated trunks of th[redacted] plantain tree. The son then washes his feet, and sits with his face towards the east, with a sali[redacted] grama before him, and repeats many prayers to purify himself. He then worships the sali[redacted] grama, presents to his deceased parent the seven dishes placed to the east, repeating various prayers, and worships Ganga, Vishnu, and th[redacted] household gods, adding an offering to the ancestors of the king as an acknowledgment fo[redacted] using the king's land at worship.

SHRAVAN or Purnima, a Hindu feast which occurs about the middle of August, on the 15th of Shravan Shukla. It is attended, on the western coast of India, about Bombay, with much ceremonial. The S.W. monsoon is supposed to be ended. Cocoanuts and flowers are thrown into the sea to obtain favour for those who are to trust themselves on the ocean.

SILK-WORM.

lishment of the manufacture at the two
places seems to be due to the Portuguese.

In Europe, the silk-worm is the caterpillar of
Bombyx mori. The eggs are smaller than
mustard seed, very numerous, slightly
yellowish at first, but changing in a few
to a blue or slate colour. In temperate
climates they can be preserved through the winter
without hatching until the time when the mul-
berry tree puts forth its leaves in the following
spring. The silk-worm, when first hatched, is
about a quarter of an inch long, and of a dark
colour. If supplied with appropriate food, it
remains contentedly in one spot; this is the case
throughout its changes, so that there is no trouble
in retaining it within bounds, as there would be
with some other caterpillars. After eight days'
feeding and rapid increase of size, it prepares to
change its skin, the first skin having become too
small for its body. It remains three days without
food, during which time a secretion forms on the
surface of the new skin, which helps the cater-
pillar to cast off the old one; but the operation
is further facilitated by silken lines which the
insect casts off and fixes to the adjacent objects;
these hold the old skin tightly, while the cater-
pillar creeps out of it. The whole covering of
the body is thus cast off, including that of the
feet, and of the teeth and jaws; but it is done with
difficulty, and sometimes the skin breaks, and a
portion of it remains attached to the hinder part
of the body, compressing it, and usually causing
death. The newly moulted worm is pale in colour,
and wrinkled; but it immediately recovers its
appetite, and grows so rapidly that the new skin
is soon filled out, and in five days another moult
becomes necessary. Four of these moultings and
renewals of the skin bring the caterpillar to its
full size, when its appetite becomes voracious, and
the succulent parts of the mulberry leaves dis-
appear with extraordinary rapidity. The insect
is now nearly 3 inches long; its structure con-
sists of 12 membranous rings, which contract
and elongate as the body moves. There are 8
pairs of legs, the first 3 pairs being covered with
a shelly or scaly substance, which also invests the
head. The mandibles are strong, and indented
like a saw. Beneath the jaw are two small orifices
through which the insect draws its silken lines.
The silk is a fine yellow transparent gum, secreted
in slender vessels, which are described as being
wound, as it were, on two spindles in the stomach;
these vessels, if unfolded, would be about 10
inches long. The insect breathes through 9 pairs
of spiracles distributed along the sides of the
body. The caterpillar has 7 small eyes near the
mouth; the two spots higher up are not eyes, but
portions of the skull. Arrived at maturity, the
caterpillar is of a rich golden hue; it leaves off
eating, and selects a corner in which to spin its
cocoon. It first forms a loose structure of floss
silk, and then within it the closer texture of its
nest, of an oval shape. Here the caterpillar remains
working until it is gradually lost sight of within
its own beautiful winding-sheet. Taking no food,
and emitting this large quantity of silk, its body
diminishes one-half, and on the completion of the
cocoon it changes its skin once more, but the
becomes an apparently inanimate chrysalis
aurelia, with a smooth brown skin, and pota
at one end. It remains in this corpse-like
for a fortnight or three weeks, when it
forth a perfect winged insect,—the silk moth
escaping from the cocoon, it pushes aside the

tasteless fluid from its mouth to dissolv
which holds the fibres together. The
no teeth, therefore it cannot gnaw it

generally supposed. In the perfect form, the insect takes no food, and only lives two or three days. The female dies soon after laying her eggs, and the male does not long survive her.

The domestic treatment of the silk-worm has been brought to great perfection in Italy. Formerly the eggs were hatched at uncertain periods, depending on the natural warmth of the season, or they were put in manure-beds, or were worn in little bags about the person next the skin. They are now hatched in an apartment heated to the proper degree by a stove; but they are first washed in water, and afterwards in wine, to separate light eggs, as well as dirt, and the gummy envelope which surrounds the heavy ones. The temperature of the hatching-room is at first 64°, but is gradually raised 1 or 2 degrees daily, until it reaches 82°, which it is not to exceed. Pieces of coarse muslin, or of white paper pierced with holes, are placed over the eggs when they are about to be hatched. Through these the worms creep to the upper surface, and are removed as soon as possible to a cooler place. Young leaves and sprigs of mulberry are laid upon the muslin or paper, when the worms eagerly settle on the leaves, and can thus be transferred to trays, and removed to the nursery. This is a dry room of regulated warmth, with windows on both sides, so that free ventilation may be attainable. Chloride of lime should be in use to purify the air, and a thermometer and hygrometer to regulate the heat and moisture; the latter is apt to abound where silk-worms are kept, and is very prejudicial to them. Moist exhalations arise from the leaves and from their bodies. Fermentation, also, soon takes place if litter and dung be not speedily removed from their trays; these are fertile sources of disease among the worms, and may carry off thousands in a day. 80 lbs. French (=88 lbs. English) of cocoons are the average produce from one ounce of eggs.

Diseases.—One of those to which silk-worms are liable consists of the formation of a minute cryptogamous plant of mildew within the body of the living insect. Damp and fermenting food and litter produce, in the first place, among the fatty matter of the body of the caterpillar, an infinite number of sporules supported by minute stems. These increase to such a degree that the vegetation soon pierces the skin, gives a general mealy appearance to the body of the caterpillar, ripens its seed, which is borne by the winds to every part of the nursery, carrying contagion with it, and at length causes the death of the worms. The dead bodies of worms or moths (for the insect is infected in all stages) are sources of contagion, unless immediately destroyed. This disease is called muscardine in France, calcinetto in Italy. The French name arises from the resemblance of the diseased caterpillar to a mealy kind of sugar-plum made in Provence, and sold under the name of muscardine; the Italian name refers to the chalky or mealy surface of the

Various fumigations and washes have been [illegible] in order to purify infected nurseries, and to [illegible] others from the ravages of this malady; [illegible] of blue vitriol, the sulphate of copper [illegible] to the wood-work, frames, etc., of the [illegible] of great use in destroying the seeds of [illegible] but nothing is so good a preservative [illegible] to cleanliness and good ventilation. The improved [illegible] Italy, for preserving the health of [illegible] insects, are due to [illegible] particular and scientific attention to [illegible] and superseded by an absurd [illegible] rearing of silk-worms. According to [illegible] wicker shelves are arranged in a room [illegible] venient distances, and are lined with paper [illegible] which the worms are placed. Such worms [illegible] are placed together as have been hatched [illegible] same time, the space allowed them being [illegible] ounce of egg, 8 square feet during the first age, 15 feet for the second age, 35 feet for the third age, 82½ feet for the fourth, and about [illegible] for the fifth age. The mulberry leaves are [illegible] in order to present a large number of fresh edges to the young insect. Four meals a day, a regular rule, and luncheons between when the worms are particularly voracious, is the [illegible] allowance for their subsistence. The temperature at which silk-worms are healthiest and [illegible] from 68° to 75°, though they are also [illegible] much higher temperature. Alternations of heat and cold are exceedingly injurious to them.

The muscardine disease is produced by *Botrytis Bassiana*; the still more terrible pebrine or [illegible] is caused by a minute vibrio-like organism.

In *Madagascar*, there is said to be an indigenous silk-worm of great size, fed in the open woods on the pigeon-pea (*Ambira vatry*), and yielding very large cocoons. Little attention, however, is paid to it by the natives. This is probably the silk of which Mr. Consul Pakenham writes, 11th August 1869, 'There is another silk in Madagascar much esteemed on account of its strength, which is said to be collected in a state of floss in the interior and afterwards treated much the same as cotton.' Mr. Pakenham states that M. de Lastelle procured Bombyx eggs from China, introduced the mulberry, and set up a regular establishment at Tamatave, which produced several thousand pounds of fine silk.—*Von Mueller; Four Reports on Indian Silk, by F. SILK-WORM GUT. The substance which is secreted through the mouth of the silk-worm, while in the body of the animal appears as a viscous liquid, which becomes solid when in contact with the air. If a silk-worm be taken when about to spin its cocoon, and immersed for twelve hours in vinegar, on opening the reservoir which contains the liquid silk, this may be drawn out in the form of threads as thick as a common-sized [illegible]

passed from one error to another. As they had previously over-estimated silver, they now under-estimated it, and the result was precisely the reverse of what had before occurred. The whole of the silver was exported, and gold took its place. So complete was the substitution, indeed, that since 1854 not a single silver dollar had been coined by the American mints, although the law making silver a legal tender equally with gold remained upon the Statute Book until 1873. Here we have a double illustration, as complete as if it had been intended for verification, of the influence of mere coinage laws on the movement of the precious metals. In the course of half a century we find gold expelled from the United States and silver from France, and then silver swept away from the former and gold from the latter. Notwithstanding previous experience, Germany has recently demonetized a silver coinage, substituting for it a gold one.

The discovery of gold in California and Australia had a considerable effect upon the monetary systems of the world, but to a far less extent than the discoveries of the 16th century. M. Juglar compiled a series of tables which show what that effect was. From 1850 to 1864 the excess of gold imported into France over that exported amounted to the enormous sum of £136,000,000 sterling. On the other hand, the exports of silver exceeded the imports by as much as £63,000,000. While, therefore, the amount of the precious metals in France was increased by £73,000,000, not only was the total augmentation in gold, but also a not much smaller value of silver was displaced by that metal. The first effects of the gold discoveries was thus to undo what had taken place between 1834 and 1854, and to replace gold in the French circulation. But the exported silver was sent, not to the United States, but to the east. The Public Works policy initiated by Lord Dalhousie, the Mutiny, and the demand for Indian cotton caused by the American Civil War, the opening up of China, and subsequently of Japan, all created an extraordinary demand for silver, which the abundance of gold enabled Europe to spare. In the period 1864–74 a change took place. The excess of the imports of gold over the exports in this period was less than £68,000,000, or about half the former excess. But in the case of silver, instead of an excess of exports, we now find an excess of imports amounting to £49,000,000. Thus in the latter period there was an excess of imports of both metals, but the imports of gold had greatly fallen off, whereas those of silver had taken the place of a much larger deficit. And this occurred in spite of the large sums of silver exported to Germany to pay the indemnity! Another fact to be borne in mind is that the change set in before the war, consequently before the demonetization of silver in Germany, before the depreciation of silver showed itself, and before the increased production of the American silver mines. In the spring of 1865 the American Civil War came to a close. The Southern ports were then opened, American cotton began to arrive in Liverpool, and the demand for the Indian article fell off.

In London, between the years 1833 and 1872, the price of a standard ounce of bar silver ranged between $59\frac{3}{16}$d. and $62\frac{1}{16}$d. In 1873, the price of silver began to decline, and since then it has been selling as under:—

1873,	59 1/16 d.	1877,	54 13/16 d.	1881,	51 1/16 d.
1874,	58 5/16 d.	1878,	52 7/16 d.	1882,	51 1/16 d.
1875,	56 1/16 d.	1879,	51 7/16 d.	1883,	50 15/16 d.
1876,	52 13/16 d.	1880,	52 1/16 d.		

In 1871 peace was declared between France and Germany; in 1873 the German Government announced the demonetizing of silver; in 1874 there was an enormous increase of bullion, £32,000,000, mostly gold. In 1876 there were remarkable fluctuations in rates of Indian exchanges and bar silver, and the latter touched the lowest price on record.

Value of gold and silver imported from, and exported to, foreign countries at ports in British India:—

SILVER COINAGE. Silver is the legally constituted medium of exchange in all money transactions throughout the British Indian possessions. The extent to which the Hindu, Muhammadan, and British rulers of India have issued coins, may be shown by mentioning that in 1868 Surgeon-Major Shekhton in a pamphlet gave the assays of 102 gold mohurs, 62 hun or pagodas, and 1 half pagoda, 24 gold fanams of from 2·6 to 5·9 grains, and 21 foreign cold coins; but of silver coins he gave 456 rupees, 23 half rupees, 6 fanams, and a damri.

The English East India Company kept up mints at several of the large towns, but since the 31st August 1869, when that at Madras was closed, minting has been continued only at Calcutta and Bombay, and that chiefly for silver; for in the ten years 1873 to 1882, the total of gold coined was £156,253; for silver, £60,153,158; and of copper, £679,171.

	Silver.	Copper.		Silver.	Copper.
1873,	£3,980,914	£11,012	1878,	£16,180,326	£148,591
1874,	2,370,006	14,461	1879,	7,210,770	66,648
1875,	4,896,884	111,024	1880,	10,256,967	70,790

Indian System of Coinage and Currency.—The *silver rupee* was introduced, according to Abul Fazl, by Sher Shah, who took the throne of Dehli from Humayun in the year 1542. Previous to his time, the Arabic dirham (silver drachma), the gold dinar (denarius auri), and the copper fulus (follis), formed the currency of the Moghul dominions. Sher Shah's rupee had on one side the Muhammadan creed, on the other the emperor's name and the date in Persian, both encircled in an annular Hindi inscription. Since the same coin was revised and made more pure in Akbar's reign, we may assume the original weight of the rupee from Abul Fazl's statement to have been 11¼ masha. Akbar's square rupee, called from its [illegible] was of the same weight and [illegible] called char-yari, from the names [illegible] successors of Mahomed, Abubakr, Omar, Ga[illegible] and Ali, being inscribed on the [illegible] rupee is supposed by the vulgar to have talismanic power.

Masha.—Concerning the weight of the [illegible] of the Muhammadans, some difficulty prevail[illegible] this unit now varies in different parts of [illegible] Mr. Colebrooke makes it 17⅞ grains nearly; [illegible] the average of several gold and silver jalali[illegible] Akbar's reign, found in good preservation, gives [illegible] 15·5 grains, which also agrees better with the actual masha of many parts of Hindustan. By this calculation the rupee originally weighed 172·4 grains troy, and was of pure silver, or such as was esteemed to be pure. The same standard was adopted by the emperor Akbar, and according[illegible] we find coins of Akbar's reign dug up at various places weighing from 170 to 175 grains. Cabinet specimens of Jahangir, Shah Jahan, and Aurangzeb have also an average weight of 175 grains pure, and the same prevails with little variation up to the time of Muhammad Shah, in the coins of opposite extremities of the empire, or struck in the subahs of Surat, Ahmadabad, Dehli, and Bengal as in the Akbari, Jahangiri, Shah Jahani, Dehli Sonat, Old Surat rupee, Murshidabad, Persian rupee of 1745, Old Dehli Muhammad Shahi, Ahmad Shahi, and Shah Alam of 1772. The Moghul emperors thus maintained a great uniformity in the currency of their empire, and they were very tenacious of the privilege of coining. On the breaking up of the empire in the reigns succeeding Muhammad Shah numerous mints were established by mutsaddis or by the viceroys of the principal subahs who, assuming independence, and the coin was gradually debased as the confusion and exigencies of the time increased. The Mahratta and other Hindu states also established mints of their own, retaining, for form sake, however, the emperor's name and superscription, as a titular avowal of Delhi supremacy. As the British dominion spread, the differences gave rise to the difference in the currencies of the British provinces, and by a happy chance brought those of Madras, Bombay, Tarakhabad to a close approximation. Regulation xxxv. of 1793 was the first of those of the East India Company which treats of mint matters. At this time the differences in the values of the currencies were very great, but the dates of the coins on each coin facilitated the work of the sirafs or money-changers in applying the batta to allow for the known debasement of each coin entering. In 1793, the E.I. Company resolved to remedy the inconveniences which had thus arisen, by declaring that all rupees coined for the future should bear the impression of the 19th year of Shah Alam, and thus by its adoption at that early date it happened that the Sicca rupee was the purest of the Company's coins which retained the full value of the original Dehli rupee. At the same time, the Surat rupee of the Moghul emperors, weighing 178·314 grains, was adopted as the currency of the Bombay Presidency. It was 172·4 pure, and was thus nearly equal to the Dehli rupee. From depreciations made in the coin by the nawab, the coinage at Bombay was [illegible] for twenty years; but in 1800 the Surat [illegible]

Reverse—'One-twelfth anna. India, 1862.'

On the 31st August 1835, five rupees, viz. the Sicca, the Farrakhabad, the Surat, the Bombay, and the Arcot or Madras, were the only legal tender in British India, within their specified local limits. On the following day, 1st September 1835, Act xvii. of 1835 took effect; it directed the coinage of a Company's rupee weighing 180 grains, of a standard $\frac{11}{12}$ths or 165 grains of pure silver, and $\frac{1}{12}$th or 15 grains of alloy, and declared it equivalent to the Bombay, Madras, Farrakhabad, and Surat rupees, and to $\frac{175}{176}$ths of the Calcutta Sicca rupee.

In 1836, an Act discontinued the Sicca rupee as legal tender in discharge of any debt, but permitted its receipt by collectors of land revenue, or by weight, and subject to a charge of 1 per cent. for re-coinage.

In 1862, after the E.I. Company was deprived of their power to rule India, and its government was assumed by the Queen of the United Kingdom of Great Britain and Ireland, Act xiii. of 1862 continued the weight and fineness of the coin of 1835, but changed its designation from 'Company's' to 'Government.'

At present the following British Indian coins are current:—

a. Legal tender in satisfaction of all engagements, viz.:—Silver coins—A Government rupee (weight, 180 grains; touch, 916·6). A half rupee (weight, 90 grains; touch, 916·6).

b. Legal tender for fractions of a rupee only, viz.:—A quarter of a rupee or four-anna piece (weight, 45 grains; touch, 916·6). An eighth of a rupee or two-anna piece (weight, 22½ grains; touch, 916·6).

Copper Coins.	Weight.

A half pice or ⅛ anna, ...	50 ,, ,,
A pie, 1/3 of a pice, or 1/12 anna, .	33⅓ ,, ,,

Gold.—The old standard for gold coinage in Bengal was 99¼ parts of pure gold to ¾ of a part of alloy. This was altered by Regulation xiv. of 1818 to $\frac{11}{12}$ths of pure gold to $\frac{1}{12}$th of alloy; but the law having become inoperative, the old standard was reverted to for a time, until Act xvii. of 1835 re-established the standard of $\frac{11}{12}$ths fine (*i.e.* = 916·6 touch), but declared that no gold coin should thenceforth be legal tender in India.

Under the Act xvii. of 1835, the following were the coins:—A double gold mohur, 30 rupees piece; a gold mohur (weight, 180 grains), 15 rupees piece; two-thirds of a gold mohur, 10 rupees piece; one-third of a gold mohur, 5 rupees piece.

By a financial notification of October 1868, sovereigns and half-sovereigns coined at any royal mint in England or Australia, of current weight, may be received in all the treasuries of British India and its dependencies, in payment of sums due to Government, as the equivalent of 10 rupees 4 annas and 5 rupees 2 annas respectively; and whenever available at any Government treasury, they may be paid at the same rates to any person

willing to receive them in payment of claims against the Government.

An Indian Coinage Act (xxiii. of 1870) became law on 6th September 1870. It provides that the under-mentioned (as a matter of fact, gold coinage is confined as yet to the Calcutta mint) gold coins only shall be coined at the mints, viz. at Calcutta and Bombay, and at such other places, if any, as the Governor-General in Council may by notification direct, viz. :—A gold mohur or 15 rupees piece, a 5 rupees piece, a 10 rupees piece, a 32 rupees piece or double gold. The respective weights and fineness as before, *i.e.* relatively to 180 grains for the mohur; touch, 916·666.

Silver.—1 rupee, ½ rupee, ¼ rupee, ⅛ rupee. Weight of rupee, 180 grains.

Copper.—1 double pice, 1 pice, ½ pice or one-eighth of an anna, a pie or one-twelfth of an anna. The weight of the double pice to be 200 grains. The other copper coins to be of proportionate weight.

Remedy on copper coins not to exceed one-fortieth in weight.

Device.—The coins struck under this Act bear on the obverse the likeness of H.M. Queen Victoria, and the inscription 'Victoria Queen.' On the reverse, the designation of the coin in English, filled by the word 'India;' with such date and embellishments on each coin as the Governor-General in Council may from time to time determine.

Legal Tender.—No gold coin shall be a legal tender in payment or on account. The said rupee and half rupee shall be a legal tender, provided that the coin has not lost more than 2 per cent. in weight, and has not been defaced or diminished otherwise than by use. The ¼ and ⅛ rupee shall be legal tender only for the fractions of a rupee. None of the copper coins shall be legal tender except for the fraction of a rupee.

Coinage of Bullion.—Subject to the mint rules for the time being in force, the mint-master shall receive all gold and silver bullion and coin brought to the mint, provided it be fit for coinage, and that the quantity so brought at one time by one person is not less, in the case of gold, than fifty tolas, and in the case of silver, than one thousand tolas.

All silver bullion or coin brought for coinage shall be subject to a duty of 2 per cent. on the produce of such bullion; and this duty shall be deducted from the return to be made to the proprietor.

The charge levied for premelting or for cutting such bullion, shall be, in the case of gold, ¼th per mille, and in the case of silver, 1 per mille.

The mint-master, on the delivery of gold or silver bullion or coin into the mint for coinage, shall grant to the proprietor a receipt, which shall entitle him to a certificate from the assay-master for the net produce of such bullion or coin, payable at the general treasury. Assay certificates in case of silver are payable on demand; in case of gold, are payable in gold twenty days after date of mint-master's receipt. When bullion is brought to the mints in the shape of foreign or of uncurrent coin, it is always melted prior to assay.

The following table exhibits the scheme of the British Indian monetary system :—

Rupee.	Anna.	Paisa.	Pai.
1	16	64	192
...	1	4	12
...	...	1	3

Small cowrie or kauri shells are also made of for fractional payments, and are reckoned follows :—

4 kauri make 1 ganda.
20 ganda make 1 pan.
5 pan make 1 anna.

but their value is subject to considerable fluctuati

The maharajas Sindia of Gwalior and Hol of Indore use the Ujjain rupee. In the Hyderal State, ruled by the Asof Jahi dynasty, the Sha shiri and Hali Sikka silver rupees are current, a many rude copper coins. In the Travancore Stat fanams and chakrams.

The following notes on the names of the coins and the schemes of the coinage of Eastern and Southern Asia may be interesting :—

Annam people have one silver coin weighing 569 grains, and another of 5895 grains, possibly the largest silver coin.

Ashrafi, Murshidabad gold mohur, has a weight of 190·895 grains troy.

Adhela, from Adha, HIND., half, signifies the half of a paisa.

Burma has a coinage of 1, ½, and ¼ rupees; device, a peacock; weight of Ava rupee of 1866 = 180 grains; touch, 898.

The expressions employed by the Burmese goldsmiths in declaring the quality of bullion, requir a knowledge of the Burmese numerals, and a fe other words.

Numerals.		Metals.	Assay Term
1. Ta.	6. Khyouk.	Shew, gold.	Det, better, above.
2. Nhect.	7. Khwon.	Shwenee, red or pure gold.	Mee, diffe
3. Thoun,	8. Sheet.	Nguee, silver.	or—
		Ge or khle, lead or alloy.	Meedet, bet in assay.
4. Le.	9. Ko.	Nee, copper.	Meeshyouk, worse, do.
5. Nga.	10. Tshay.	Byoo, tin.	Ma, adulterat

The usual weight of the small lumps of silv current in the place of coin, is from twenty t thirty tikals (thirty or forty tolas); they bear variety of names from their quality and appearance, the figures given by the action of the fire upon a thick brown coating of glaze (of the oxides of lead and antimony) answering in some degree the purpose of a die impression.

Ban signifies pure or touch, and is the purest obtainable of the Burmese process of refinage. The word ban is synonymous with the bani of the Ayin-i-Akbari. Banwari is the Indian name of the touch-needles used in roughly valuing the precious metals.

Kharoobat, shelly or spiral circled, is applied to a silver cake, with marks upon its surface, produced by the crystallization of the lead-scoria in the process of refinement. It is supposed to denote a particular fineness, which by Burmese law ought to be ten-ninths yowet-nee in value, *i.e.* nine tikals of kharoobat pass for ten of yowet-nee silver, or it should contain nineteen and a quarter ban and three-quarter copper.

Yowet-nee, red-leafed flowers, or star silver, is so named from the starry appearance of the melted litharge on its surface. Yowet is a corruption of Rowek, leaf, and the word is sometimes written by Europeans, rowanee, rouni, rougahnee, etc. Yowet-nee is the Government standard of Ava, and contains by law eighty-five ban and fifteen alloy per cent. Taking it at nine-tenths of purity of kharoobat, which last is 94·6 touch, its quality

be 85·2 fine; which closely accord with the al value. The average of 60,000 tolas of yowet- in an Ava remittance, turned out two dwt. se (90·8); but there was a loss of more than er cent. in melting, from the exterior scoria.

Dain, the most common form of Ava bullion with in circulation, is so called from an assess- nt levied, during the king's reign, upon villages horses; dain signifying a stage or distance of o miles. These cakes weigh from twenty to rty tikals each. Their prescribed legal quality 10 per cent. better than yowet-nee, which puts is species of silver on a par with kharoobat. In actice, however, the quality varies from 1 to 0 per cent. better (five better to thirteen and a lf worse) than Calcutta standard. The average fifty-two lakhs of dain turned out three penny- eights better.

The following will serve as examples of the ode of valuing bullion:—

Dain ko-moo-det is dain 9 per cent. better. Nga-moo-det, 5 per cent. better. Yowet-nee, standard (85 touch).

Kyat-ge or *ta-tshay-ge*, one tikal or tenth of alloy (meaning one-tenth weight of alloy added to standard).

Kyouk-tshay nga-kyat ge, six tens, five tikals lloy (meaning 60 per cent. of alloy added). Gyan, alf yowet-nee (and half alloy).

Gold.—The purity of gold is expressed by moss ... only; ten moss, tshay moo (100 touch), ng esteemed pure gold.

King's gold, or standard, is called ka-moo-ta e-yowe (nine moss, one pe, four seeds), or nine three-quarter moss fine.

Merchant's gold is ko-moo-ta-be, nine and a half s fine. Gold mohurs are called eight and a half ss fine by the Ava assayers.

Bactria.—In the reign of Antiochus II., the d of the Seleucidæ, Theodotus, the governor Bactria, revolted and established an independent monarchy; his capital was the modern Balkh, and is extensive kingdom included parts of Kābul, horasan, and Bokhara. By aid of their coins, he names of nine of their princes have been rought down to us. Their coins have been dis- vered at Surapura and Mathura, between Agra d Etawa, and others in the Panjab. Indeed, th Grecian and Persian coins are met with equently in India. General Ventura and Sir Alexander Burnes collected many Greek coins in ncient Bactria and the Panjab. Major Tod dis- covered one of Apollodotus and one of Menander t Mathura.

Kashmir has the Pookta rupee.

Cash or *Kas*, was a small coin current in South- rn India till early in the 19th century; twenty cash being equal in value to four fulus. Kas may be a corruption of the Sanskrit word karsha, which is mentioned in Colebrooke's Essay on Indian Weights, as the same with the word pan. A karsha, or eighty raktika (rati) of copper is called a pana or karsha-pana. It is now the eightieth part of a pan, but the simple word is all that can be identified as having survived the changes of systems. According to the old Madras system, accounts were kept in star pagodas, fanams, and kas,—8 kas = 1 fanam, 336 kas = 42 (silver) fanams = 1 pagoda.

Pagoda. The E. I. Co. reckoned twelve fanams to the rupee, and three and a half rupees to the pagoda. But the bazar exchange fluctuated between thirty-five and forty-five silver fanams per pagoda. Fanams were also coined in a base gold. Copper one, five, ten, and twenty kas pieces were coined in England, by contract, for Madras, so early as 1797. The twenty kas was also called dodo and fulus.

The star pagoda weighed 52·56 grains; touch, 812 per 1000. It was commonly valued at 3½ Madras rupees. Many varieties of the pagoda used to circulate on the Coromandel coast; but since 1833 they have been only obtainable when sought for.

In 1811, a coinage from Spanish dollars took place, consisting of double rupees, rupees, halves, and quarters; and pieces one, two, three, and five fanams; the rupee weighed 186·7 grains. A silver coinage of half and quarter pagodas, of dollar fineness, also then took place; the half pagoda weighed 326·73 grains troy, and was equal to 1¾ Arcot rupees. By a proclamation of 7th January 1818, the silver rupee of 180 grains was constituted the standard coin, and all accounts and public engagements were ordered to be converted at the exchange of 350 rupees per hundred pagodas. The proportion between the old and new currency then became 3½ rupees per pagoda, and in copper 75 kas old currency = 14 paisa new currency.

Chinese Currency.—Sycee silver, in Chinese Wan yin, is the only approach to a silver currency among the Chinese. In it the Government taxes and duties, and the salaries of officers, are paid; and it is also current among merchants in general. The term Sycee is derived from two Chinese words, Se-sze, fine floss silk, which expression is synonymous with the signification of the term Wan. This silver is formed into ingots (by the Chinese called shoes, and by the natives of India, khuri, or hoofs), which are stamped with the mark of the office that issues them, and the date of their issue. The ingots are of various weights, but most commonly of ten taels each. Sycee silver is divided into several classes, according to its fineness and freedom from alloy. The kinds most current at Canton are the five following:—

(*a*) *Kwan-heang*, the hoppo's duties, or the silver which is forwarded to the imperial treasury at Pekin. This is 97 to 99 touch. On all the imperial duties, a certain percentage is levied for the purpose of turning them into Sycee of this high standard, and of conveying them to Pekin without any loss in the full amount.

(*b*) *Fan-koo* or *Fan-foo*, the treasurer's receipts, or that in which the land-tax is paid. This is also of a high standard, but inferior to that of the hoppo's duties, and being intended for use in the province, not for conveyance to Pekin, no percentage is levied on the taxes for it.

(*c*) *Yuen-paou* or *Une-po*, literally chief in value. This kind is usually imported from Soochow, in large pieces of fifty taels each. It does not appear to belong to any particular Government tax.

(*d*) *Yen* or *Eem-heang*, salt duties. This class is superior only to

(*e*) *Mut-tae* or *Wuh-tae*, signifying uncleansed or unpurified, designated the worst of all. It is seldom used, except for the purpose of plating, or rather washing, baser metals.

The tael of Sycee in the East India Company's accounts was reckoned at 6s. 8d. sterling. When

assayed in London, this metal was frequently found to contain a small admixture of gold.

Copper Coins of India.—Throughout Central India, until long past the middle of the 19th century, in the Nizam's territories, much perplexity existed in the varieties of paisa, and in the great range of their value, as also, indeed, in the coins of the more precious metals; so that every town and village almost had its separate currency and its established nirkh or rate of exchange with the rupee, to the great inconvenience of the traveller and of the poorer classes. In weight they varied from 280 grains (the Jeyporei, etc.) to 34 grains (the Maiwari); the former passing at about 35, the latter at 378, paisa for a rupee; but the paisa also differs in each district. From the small advantage of melting up copper money, it happens that part of the circulation in this metal is of very great antiquity; and not only many ancient Hindu coins are met with, but Bactrian and Roman copper coins are also at times procurable at fairs, and in the neighbourhood of old towns in Upper India.

The paisa was in some cases adopted as the unit for determining the larger weights of the bazars, as the Gorakhpur paisa, of which 530 were held equal to a passeri (five seers) at Ghazipur; and generally through the Benares province, 2881 'chalāns' of Futtehghur in like manner were assumed as the weight of a mān in that district. The Delhi paisa, coined till 1818, was twelve masha or one tola in weight.

Most of the paisa of Native States contained more copper in proportion to their value than the E.I. Company's coin, which was, however, originally one tola in weight, and was gradually reduced to 100 grains. The Sagar mint was for several years employed in converting the native copper money into Benares or trisuli paisa of 100 grains weight, and 64 to the rupee. At Bombay, the old paisa were bought up by Government, for the purpose of removing them entirely from circulation, and substituting the new coin. The Bengal Government also adopted a measure to withdraw the trisuli paisa from circulation, in consequence of their becoming much depreciated in public estimation from a large admixture of spurious coin and other causes; the Calcutta mint being ordered to grant 64 new paisa for 72 trisuli, for an amount not under twenty rupees in value brought for exchange.

The *Cowrie shell*, Cypræa moneta, has greatly fallen in value, in consequence of the facilities of commerce. In 1740, a rupee exchanged for 2400 cowries; in 1756, for 2500; but latterly in Calcutta, so many as 6500 cowries could be obtained for a rupee. In Madras, from 1850, cowries had ceased to be used as money; but in Hyderabad of the Dekhan, in 1856, 2688 cowries were to be had for a rupee. Cowrie, in Persian, is simply khar-mohra, literally donkey or mule-shell, because mules are ornamented in that country with trappings of shells, as a gosain's bullock and riding horses are in India. In Arabic, it is known by Wuda, which Ibn Batuta says were carried in large quantities from the Maldive Islands to Bengal, where it was used as a coin, and therefore no doubt can be entertained that the Cypræa moneta was meant. It is employed throughout all Southern Asia as an amulet in sickness and to avert the evil eye, provided the neck-shell be split or broken. Among Europ nations, these shells, on account of the fan resemblance of their shape to that of the bac a little pig, are known by the names of porc porcellian, porcellanen, and porcelaine, wh we have porcelain, the glaze or varnish on China-ware being similar to that of the cow The English phrases, 'not a cowrie, and no cash,' would seem to be derived from these t minute Indian monies.

Dam.—A copper coin of India, now obsol In Akbar's time, 40 dam of copper were equival in account to one rupee, and the dam of copp is itself defined at 5 tank, or 1 tola 8 masha a 7 rati in weight, which, at 186 grains per tola, equal to 323·5625 grains. There seem to ha been 9·29 chital in each dam, and in the Sh Shahi rupee 371·8 chital, instead of the old 3 divisional coins of that name and value, whi went to the lighter silver piece of former da In the Ayin-i-Akbari, and in most revenue accounts, the dam is considered the fortieth part of a rupee; but to the common people it is known as the fiftieth of a tuka; 25 therefore go to a paisa, and 12½ to an adhela.

Denar, a Persian gold coin, from the Lati denarius.

Dirham, an Arabo-Persian silver coin, from th Latin drachma.

Dilli-all or *Dili-wal*, in A.H. 614, A.D. 1217, w the ordinary coin of the country about Del The original currency, it is supposed, correspond with the bullion money of Prithi raja and othe which was imitatively adopted by the Muha madans in the early days of their occupation Hindustan.

Dumree or *Damree* is commonly known as nominal coin, equal to 3⅛ or 3¼ dam, or betwe 2 and 3 gandas; so that a damree varies fro 8 to 12 cowries, according to the goodwill an pleasure of the money-changers.

Fulus or *fals*, an ancient Arabic copper coin named from the Roman follis, the modern fulu of the Persian Gulf.

Ganda, HIND., is four pice.

Japan has the silver ichibu, 132·5 grains; n shoo, 25·3 grains. The gold koban or koba of Japan, A.D. 1783 and 1796, 240 grains, w coined by the Dutch E.I. Company.

Japan, in 1877, imported 2,072,673 dollar but exported 10,079,200.

The Osaco mint coined 690,602 gold yen, 3,895,136½ silver sen, and 1,115,817¼ copper se and rin; total, 5,701,555¾.

The silver yen is identical in size with th Mexican dollar. The ichibu silver coin is n longer current. Since 1875, the new Japanes trade silver dollar is four grains heavier than the silver yen, and is identical with the American dollar.

Masha, a weight in India varying from 14·687 to 18·5 grains troy, the average being 15½ grains. The rupee of Akbar, which was based upon that of Sher Shah, weighed eleven and a half masha.

Mohur, from Muhr, HIND., a seal, is a gold coin of value 15 or 16 rupees, now uncurrent in India.

Nepal coins.—Nepal was conquered by the Gurkhas in the Newar year 888, corresponding with A.D. 1768. Prior to this epoch, the valley of Khatmandu was divided into three sovereignties, Patan, Bhatgaon, and Khatmandu, each governed

by a raja. Hence, on the Newar coins, three series of rajas' names are found, those of Bhatgaon being generally distinguished by a shell, those of Patan by a trisul, and those of Khatmandu by a sword.

The old coins of the Mal or Newar rajas are much valued for their purity, and are worn by the women, strung to necklaces or armlets, as tokens in memory of their ancestors. The gold mohur of Nepal is 83 to 85 grains. The damree is current in Nepal.

The Nepalese procure all their silver from China, in the form of stamped lumps, as they are current in Lhassa; for the Tibetans generally follow the Chinese custom in their money transactions, of paying and receiving by weight, and the merchants carry scales with them for the purpose. Since the Gurkha conquest the Vikrama era has superseded that of Newar for ordinary purposes, and the Saka, commonly used in Hindustan, has been introduced upon the Nepalese coins.

Netherland India has the silver gulden of 166 grains, also its half and quarter.

Pagoda, a Portuguese appellation of a gold the hoon, derived from the pyramidal ple depicted on one side of the coin. The per Hindu name is Varaha, wild boar, and ibtless originated in a device of the boar inrnation or avatar of Vishnu upon the ancient nage of the Carnatic, for the same figure ears as the signet of the rajas of that country some old copper grants of lands in the Maczie collection. The Hindu name probably ied according to the image of the coin; thus find the Rama Tanka having the device of ma and his attendants; and the Matsya Hun Vijayanagar with four fishes on the obverse. ther pagodas have Vishnu, Jaganath, Vencatesar, etc., on them; those with three Swami or gures are of the best gold, and are valued 10 per ent. higher than the common pagoda. Hun is the ommon term used by the Muhammadan writers, nd, indeed, generally by the natives, for the agoda. It signifies gold in the old Carnatic nguage.

The hun was subdivided into fanams and kas. anam, or more properly panam, is identical with the word pan, known in Bengal as one of the divisions of the Hindu metrical system, now applied chiefly to a certain measure of cowries and copper money. The old fanam was of gold only, and was the one-sixteenth of a hun. In the Lilavati we find,—16 para = 1 dharan, 16 dharan = 1 nishk, where the dharan (or dharam) seems accord with the hun, which is identical in ight with the Greek drachma. The Ikkeri goda contains sixteen fanams; that of Varari d Anandrui, fourteen; and the Kalyan pagoda, enty-eight. The division adopted by the itish was forty-two.

Panna.—The standard of panna under the shwa was called the Ankusi rupee, from kus, the instrument used by the mahout to guide the elephant; probably a symbol marked on the coin.

The *Parthian* or *Arsacian* monarchy was erected by Arsaces, who filled the office of satrap in Bactria, in the year B.C. 256. Vaillant wrote a history of this powerful dynasty, and endeavoured to classify the coins of the twenty-nine Arsacidæ kings. It was subsequently absorbed in the Persian empire in the reign of Alexander Severus, A.D. 226. Their coins have often been found in Southern Asia, the greater number having the Greek word Arsacoy, with different epithets.

Persian ancient coins.—According to Marsden, it was not until the khalifat of Abdul Malik, in the year of the Hijira 76 (A.D. 695), that a distinct coinage was instituted with a view of superseding the currency of Greek or Byzantine and Persian gold and silver.

Persian modern coins.—The Futteh Ali Shah rupee of Shiraz and Hamadan weighs 105 grains; the Karan of Muhammad Shah, 82 grains, minted at several places of 79 to 82 grains; the Huzur dinar, 106 grains; the Larin of Persia, 74·5 grains. Of gold coins, Persia has one of A.H. 1127, weight 166·48 grains, and the Toman, A.H. 1240 and 1248, weighing 68·9 to 73 grains.

Piastre.—The gold piastre of Turkey, A.H. 1115-1171, weight, 53·35 grains.

Pool, PEHLAVI, or Phool, PARSEE. Obolus et res quævis obolo similis ut squama piscis simil (fulus), Borhani Katiu, inde. Be Poolee; Abdul Malik, n. c. Pecuniæ defectus. Abul Fazl says that the pool of olden days was equal to four tolas; Ferishta, again, gives 1 or $1\frac{3}{4}$ tolas.

Rati. — Colonel Anderson considers the rati may be assumed as high as 1·93 grains, and the masha at 15·44 grains.

Sanat, ARAB., year, generally used in coinage of Muhammadan rulers, as the year of their reign, also as the Hijira year.

Sikka, HIND., a coining die, applied to a coin formerly current in India.

Tibet. — M. Csoma de Koros states that the English rupee circulates freely through Western Tibet. The common Chinese brass money, with a square hole in the centre, is likewise current in Lhassa, as generally through the whole of the Chinese empire. The Lhassa (silver) of Tibet is 58 grains.

Tola, HIND., a weight in India, equal to 180 grains troy, the weight of the present rupee.

The gold zecchino or sequin, A.D. 1797, of Ludovico Manin, the last doge of Venice, was current in many parts of India under the names sultani, putli, and putli dukkun; it weighs 53·5 grains.

SILVER FISH. The bodies of the genus Chanda are more or less diaphanous. The name Chanda is from the Hindi word Chandi, silver. They are much prized by the Chinese.

SILVER SKIN of the coffee bean enwraps the bean. See Parchment.

SIMANTONYANA, a Hindu household ceremony of parting the hair of an enceinte woman, on the fourth, sixth, and eighth months.

SIMBUL, an umbellifer, resembling the 'jira' or cummin seed; it has an edible bulbous root, said to be much relished by bears.—*Cleghorn's Panjab Report*, p. 100.

SIMEON SETH, at the command of Alexis Comnenis, made a Greek translation of the fables of Badpai.

SIMIADÆ, or monkeys, a family of the mammalia of the order Primates, viz.:

Order. Primates.
Fam. Simiadæ, Monkeys.

Quadrumana.	Catarrhinæ, *Geoffrey.*
Heopitheci, *van Hœven.*	

Sub-Fam. Siminæ, Apes.

Troglodytes niger, chimpanzee, Africa.
Tr. gorilla, gorilla, Africa.
Simia satyrus, orang-utang of Borneo.
S. morio, orang-utang of Sumatra.
Simanga syndactyla, *Raffles*, Sumatra.

Sub-Fam. Hybolatinæ, Gibbons of Indo-Chinese countries and Malayana.

Hylobates hoolook, hoolook of Assam, Cachar, Khassya, and Sylhet.
H. lar, gibbon of Tenasserim.
H. agilis, gibbon of Malay Peninsula; others from the Malay Islands.

Sub-Fam. Colobinæ, Entellus Monkeys.

Gen. Presbytis, *Illiger.* Semnopithecus, *F. Cuvier.* Hunuman, Langur, HIND.

Presbytis entellus, Bengal langur.

Simia, *Dufresn.*	P. anchises, *Ell.*
Musya, ... CAN.	Hanuman, . . . HIND.
Langur, ... HIND.	Wanur, Makur, . MAHR.

Common in Bengal and Central India.

Pr. schistaceus, *Hodgs.*, *Horsf.*

Kubup, ... BHOT.	Langur, . . . HIND.
Himalayan langur, ENG.	Kamba Suhu, . LEPCH.

Occurs throughout the Himalaya.

Pr. priamus, *Ell.*, *Bly.*, *Horsf.*

Madras langur, . ENG.	Gandangi, . . . TEL.

Inhabits the eastern side of the Peninsula and the north of Ceylon.

Pr. Johnii, *Jerdon.*

Simia Johnii, *Fisher.*	S. Johnii, *var.*, *Martin.*
Semnopithecus Dussumierii, *Schinz.*	S. cucullatus, *Is. Geoff.* S. hypoleucos, *Blyth*, *Horsf.*

The Malabar langur of Travancore, Cochin, Malabar, and South Canara.

Pr. jubatus, *Jerdon.* Semnopithecus Johnii, *Blyth*, *Martin.* The Neilgherry langur of Neilgherries, Animallay, Pulney, and Wynad, not below 2500 and 3000 feet.

Pr. pileatus, *Blyth*, Sylhet, Cachar, Chittagong.
Pr. barbei, *Blyth*, interior of Tiperah Hills.
Pr. obscurus, *Reid*, Mergui.
Pr. phayrei, *Blyth*, Arakan.
Pr. albo-cinereus, Malayan Peninsula.
Pr. cephalopterus, *Blyth*, Ceylon.
Pr. ursinus, *Blyth*, Ceylon.

Sub-Fam. Papioninæ, Baboons.

The true baboons of Africa and monkey-like baboons of India.

Inuus silenus, *Jerdon*, lion-monkey.

Simia leonina, *Linn.*	Silenus veter, *Gray*, *Blyth.*
Nil-bandar, . . BENG.	Nella-manthi, . MALEAL.
Siah bandar, . . HIND.	

Western Ghats, Cochin, Travancore.

I. rhesus, *Jerdon*, Bengal monkey.

I. erythræus, *Schreb.*	Pithex oinops, *Hodg.*, *Hors.*, *Blyth.*
Morkot, ... BENG.	Marcut banur, . LEPCH.
Piyu, ... BHOT.	Banur, ... ,,
Bandar, ... HIND.	Suhu, ... ,,

Inhabits nearly all India.

I. pelops, *Jerdon.*
Macacus Assamensis, *M'Cl.* Inuus Sikkimensis, *Jer.?* Macacus Sikkimensis, *Hodg.?*
The hill monkey, high up in the Mussoori Hills.
Inuus nemestrinus, *Jerdon*, Tenasserim, Malayana.
I. leoninus, *Blyth*, Arakan.
I. arctoides, *Is. Geoffrey*, Arakan.
Gen. Macacus radiatus, *Jerdon.*
Simia sinica, *Linn.*, *Ell.*, *Blyth.*, *Horsf.*

Munga, ... CAN.	Wanur, MAHR. of Sykes.
Madras monkey, . ENG.	Kerda, MAHR. of Ghats.
Bandar, ... HIND.	Vella Munthi, . . TAM.
Makadu, . . . MAHR.	Koti, ... TEL.

All over Southern India.

Macacus pileatus, *Shaw*, of Ceylon.
M. carbonarius, *F. Cuvier*, of Burma.
M. cynomolgos, *Linn.*, of Burma.

Mr. A. Russell Wallace tells us that, with the exception of the orang-utang, the siamang, the Tarsius spectrum, and the Galeopithecus, all the Malayan genera of quadrumana are represented in India by closely-allied species. The Indo-Malay islands have 170 species of mammalia. Of these 24 are quadrumana. The orang-utang species occur in Sumatra and Borneo; the siamang, next to them in size, in Malacca and Sumatra; the long-nosed monkey in Borneo, and gibbons, long-armed apes and monkeys. In Timor, there are 15 bats and 7 land mammals; amongst them the Macacus cynomolgos, the common monkey of all the Indo-Malay islands. Hylobates, the wa-wa or long-armed ape, is the most beautiful of all the monkey tribe. The fur of this gentle little animal is grey, its face, hands and feet are jet-black; in features it more resembl those of the human race than the orang-utang. *Jerdon; Blyth, Cat.; Horsfield; Wallace.*

SIMLA, a sanatorium in the Simla district o British India, situated on a transverse spur o the Central Himalayan system, in lat. 31° 6′ N and long. 77° 11′ E. Mean elevation above sea level, 7084 feet. The Simla district is under Lieutenant-Governor of the Panjab, and sists of several detached plots of terri among the hills of the Lower Himalayan syst Area, 18 square miles; population in 1868, 33,9 The mountains of Simla district and the surrou ing Native States compose the southern out of the great central chain of the Eastern Hi layas. The climate of Simla Hills is admira adapted to the European constitution, and district has therefore been selected as the site numerous sanatoria and cantonments. The pl at the foot of the Simla Hills attain 1000 f elevation, and the outer ranges are lower th those of Garhwal and Kamaon. Rupar, close the Sutlej amongst the outer hills, is under 10 feet, but Subathu, a little farther in, is 4200; a Kussowlee, 6500 feet. The name is the Hind Shyea Malay. Simla was taken from the Jun raj in 1815, and given to the Patiala raja, but agai obtained from him as a sanatorium; the hous are scattered over an extent of about 7 miles, a series of heights varying from 6500 to 8000 fee which is the highest elevation. The portion o the Himalaya visible from Simla is a depressed continuation of the chain, extending from the emergence of the Sutlej through the snow, to an abrupt limit bordering close upon the plain of the Panjab near the debouche of the Ravi; few, if any, of the detached peaks rise beyond 20,000 feet.

The range bears wild thyme, wild strawberri various oaks, pines, the deodar, and all the for of Europe. Pinus excelsa is a very common tree Simla, particularly on the southern face of Mou Jako, which is the highest part of the ridge. Abi Smithiana is rare, while the deodar is common the southern and western slopes of Jako, abo 7000 feet; and again in shady groves at t bottom of the valleys on both sides of the ridg as low as 5000 feet. Pinus longifolia is common at the western or lower extremity of the Simla station, and prevails, to the exclusion of any other tree, on the dry, sunny spurs which run towards the south, at elevations from 5000 to 7000 feet. The trees furnishing the supply of firewood at Simla are chiefly Quercus incana, Rhododendron arboreum, Andromeda ovalifolia, Pinus excelsa,

and Cedrus deodara. The fruit of the trimal, or Ficus macrophylla, is sold in the bazar at Simla.

Koli is the name given to the lower class of cultivators in the Simla Hills. The Kanait are an agricultural race in the Simla Hills and east of the Sutlej, holding most of the land in the Simla Hills. They are inferior in position to Rajputs, but they are often educated, and are generally ministers to the Rajput chiefs. Their women are nice-looking, and all the tribe who are not (in the upper hills) in contact with Tartars are quite Aryan, though not very large. In certain places there is a partial and local practice of polyandry among them, but it is not the general custom of the tribe. The hillmen of Simla are offspring of the dark Kayasth races and Rajputs who have for eight centuries been flying to the mountains to escape Muhammadan invasions. They are filthy in their persons; they have clear, almost Anglo-Saxon, complexion; many have goitres, and they hate Muhammadans. Their chiefs, as the ranas Dati and Kat, are of Rajput origin, and they have municipal system, with shamilik or commons, and a lombardar or mukhia, *i.e.* chief. Polyandry prevails among the hillmen beyond Kotghur, but is on the decline, polygamy often taking its place. In the winter the men almost hybernate, spending months in eating and sleeping.

Simla district produces iron-ore, plumbago, fire-clay, red ochre, limestone, sandstone, and tiles. — *Imp. Gaz.* viii.; *Cal. Review*, 1867; *Thomson's Trs.* p. 22; *Mrs. Hervey, Adventures in Tartary; Hooker and Thomson, Flora Indica*, 202; *Ann. Ind. Adm.*

SIMON JANUENSIS, physician to Pope Nicholas IV. (A.D. 1288-92), mentions meconium as the inspissated juice of the pounded capsules and leaves of the poppy.

SIMOOM. Arab., a hurtful hot wind. One blows in the hot season on the Dasht or plain of Dattekotee between Hazar-nao and Jalalabad, where the mountains on both sides are covered with perpetual snow. It is said to be generally fatal to all men, horses, and cattle who encounter it, and as severe in its effects in the night as in the day. The simoom, samiel, or samm of Arabia, the khamsin of Egypt, and the harmattan of the coast of Guinea, is described as being hot and pestiferous, sweeping over the country with such speed, that travellers might be stifled in a moment, unless they throw themselves close to the burning sand and cover their faces with their cloths. Mr. Werry, Consul-General for Syria in 1838, had a meeting of the chief Aghel and of the Anazeh Shaikhs, who stated that the simoom is hot and suffocating, and has frequently caused the death of persons who have been unable to shelter themselves from its deleterious influence. Ferrier says this hot blast, called Sirocco in the south of Europe, is the Sharkia or East Wind of Scripture. In Egypt, Damascus, Arabia, and Baghdad, it blows by sudden squalls, the approach of which is indicated by a certain perturbed state of the atmosphere. The real samm or simoom, if it actually occur, seems a current of air, probably electric, of rare occurrence, and causing instant death, and peculiar to the deserts. It has no injurious effect on vegetation, perhaps because it does not come in contact with it, as it rarely approaches within one or two feet of the ground. The camel, being aware of its approach, instinctively kneels down, and lays its head close to the ground, thus escaping its effects. Where the hot winds or simoom blow, they often become, above Sehwan, dangerous in their effects. The natives, aware of their power, avoid travelling at the season of their occurrence. There is probably great exaggeration. — *Col. Chesney, Euphrates*, i. p. 578; *Ferrier's Journ.*; *Postan.*

SIMURG, Pers., a fabulous bird of the Persians.

SIN. Chin. The gods. Among existing religions of Japan, the Sin-tu (Sin, the gods, and Tu, faith) and the Buddhist are the most extended. The Sin-tu embraces a cosmogony hero-worship, the Ten-sio-dai-siu, the Sin goddess, being the principal object of worship. The religion has a trace of Buddhism. See Japan.

SIN. Five great sins in the Hindu code are,—stealing gold, drinking spirituous liquors, murder of a Brahman, adultery with the wife of a spiritual teacher, and association with a person guilty of any of these crimes. To kill a Brahman is one of their greatest sins; to kill a cow is also very heinous, as also to kill a woman or an infant. Most of the sins of the Brahmanical Hindus are, however, breaches of ceremonial observances.— *Hindoo Theatre*, p. 30.

SIN or Aba-Sin, a name of the river Indus. Sin is a Scythic word for river, so applied by the Hindus. Aba-Sin is the river Indus, and h and s being interchangeable along the line of the Indus, the Hafta Hindu are the seven rivers, Sat-sind of the Panjab. In classical-Persian literature, siah (black) is synonymous with hind, and Hindu is identical with siah-fam, dark-complexioned. Thus hind-hanna is the equivalent of siahi-hanna, the darkening colour of hanna. Sadi of Shiraz sang that he would give Samarcand and Bokhara for the black (Hindu) mole on a Turkish girl's cheek.

SINAI, a mountain in Arabia, celebrated amongst the followers of the Hebrew, Christian, and Muhammadan religions as that near which the Israelites encamped in their route from Egypt to Palestine. It was from Sinai that Moses proclaimed the Ten Commandments. The Arabs indicate Jabl Tur as the site. The peninsula of Sinai is a triangular tongue of land between the gulfs of Suez and Akaba, comprehended between lat. 27° 40′ and 30° N., and long. 30½° and 35° E., and terminating to the south in the apex of Ras Mahomed, where the two gulfs unite in the common channel of the Red Sea. The average length of the peninsula from N. to S. is about 108 miles.

SINA PATI. Sansk. A commander-in-chief; from Sina, an army, Pati, lord or master.

SINAPIS, Mustard.

Khardal, .	Arab., Heb.	Tuverica, . . .	Sansk.
Moung ngyin, . .	Burm.	Surai-bij, . . .	Sind.
Napu, ...	Gr.	Gan-aba, Rata-aba,	Singh.
Sarson, Rae, . .	Hind.	Kadaghoo, . . .	Tam.
Sarshuf, ...	Pers.	Avaloo, ...	Tel.
Rajika, Sarshapa,	Sansk.		

The Sinapis genus of plants belongs to the natural order Cruciferæ. There are 40 or 50 species. S. alba and S. nigra, the white and black mustard, are best known in Europe. Five or six species are cultivated in all parts of India for the sake of the valuable oil their seeds yield. Those most frequently seen are S. glauca, toria, racemosa, ramosa, dichotoma, and juncea.

Sinapis alba, white mustard.

Hu-kai, Peh-lui, .	Chin.	Safed rai, . . .	Hind.
Hu-lui, ...	,,		

White mustard is a native of most countries in the south of Europe. It is cultivated, and when young is eaten as a salad. The seeds yield by expression 36 per cent. of a bright yellow, pleasant tasted edible oil, having a strong smell and slight taste of mustard. The seeds of S. nigra yield only 28 per cent. of an oil, but in all respects similar to the above. The oil of this species is used in India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine it is sometimes given internally, but is more frequently applied as a rubefacient. The best flour of mustard is prepared by crushing the seeds of both black and white mustard between rollers, and then pounding them in mortars, when they are twice sifted to yield pure flour of mustard. Two bushels of black and three of white seed yield, when ground, 145 lbs. of flour; which, to diminish the pungency and improve the colour, is mixed with 56 lbs. of wheat flour and 2 lbs. of turmeric; and the acrimony is restored without the pungency, by the addition of a pound of (capsicum) chilli pods, and half a pound of ginger.

Sinapis dichotoma, *Roxb.*

Tha-ba-mee, . . BURM. | Suhota, Sighta, . HIND.
Toreea, Kali surson, HIND.

Cultivated in British India. Much prized for its oil.

Sinapis erucea, Taramira, HIND., a kind of mustard, with a red seed somewhat elongate. The oil it produces is used as food and for burning, and as a medicine for cattle and horses. It is called 'assu' in Panjabi.

Sinapis glauca, *Cleghorn*, is found in the Sutlej valley between Rampur and Sungnam at elevations up to 11,000 feet, and is much cultivated. Several species of Sinapis are grown in the N.W. Himalaya as salads and condiments.

Sinapis juncea.

Khardel, Kubbr, . ARAB. | Tsze-kai, ... CHIN.

Sinapis juncea and S. ramosa are not sown together, but each is cultivated as a mixed crop, with either grain, barley, wheat, or peas.—*Cleghorn's Panjab Reports*, p. 68.

SIND, the name of the Indus river, and of two rivers in Central India. One of these rises at Latouti, on the table-land near Seronj, and, falling into the Chambal river at its junction with the Jumna, forms that sacred spot Triveni, where a shrine has been erected to Siva. The Chot'ha or Little Sind rises on the table-land forming the buttress of Malwa, skirting the Nerbadda, and joins the Par. The term is from Sin, an Indo-Scythic or Tatar term, the river Indus being the Aba-Sin or Father Stream.—*Tod in Tr. R.As. Soc.* iii. p. 145.

SIND, a province of British India, consists of the lower valley and delta of the Indus, lying between lat. 23° and 28° 40′ N., and long. 66° 50′ and 71° E. Its area, including the Native State of Khairpur, is 54,123 square miles, and its population in 1881 was 2,537,976. It is bounded on the west by Baluchistan; on its north is Baluchistan, the Panjab, and Bakhawulpur; on the east it has the Rajputana States of Jeysulmir and Jodhpur, and on the south the Arabian Sea and Runn of Cutch. Its sea-coast is that of the delta of the Indus, and extends about 125 miles between Cape Monze on the W. and the Koree mouth, which is the S.E. entrance and the boundary of Sind. The delta shore is low, flat, and swampy throughout; but west of Kurachee is a high range of mountains terminating in Ras Muari called Ras Mouari and Cape Monze. The contrasts presented by this province are striking. In the central tracts liable to inundation are picturesque-looking villages, with, in the cold season, waving fields, beautiful small lakes, and the land throughout its length and breadth partitioned by numerous canals and irrigation channels; but outside of the fertilized tracts are bare mountains and sandy deserts. Eastward, Sind is bounded by some of the most desert portions of Bahawulpur, Jeysulmir, and Balmir, a dependency of Jodhpur; and the eastern portions of Sind itself, for from ten to sixty miles within the frontier, are desert wastes. Northwards and westwards are rugged ranges of inhospitable stone-heaps, varying in height from 2000 to 5000 feet, where inhabitants, animal life, vegetation, and water are altogether wanting, and divide the province from the territories of th many Baluch clans that compose the State o Kalat. The more habitable part of Sind is a lon narrow tract of country yearly fertilized by th inundation of the Indus, with shifting sand-heap on the east, and bare stony mountains on th west. In the delta of the Indus expansive lak abound. From the easternmost mouth of Indus to the Kurachee harbour, nearly the w coast is a network of channels and marine lago and of sand-banks and mud-banks, more less covered by each advancing tide. Du December and the two succeeding months, cold at night is often severe, being frequ Fahrenheit at daybreak, while at noon mounts to 75° or 86° in the shade.

To the Western Arabs, all eastward Persian Gulf was known as Hind; b distinguished the two regions on and b the Indus river by the term Hind-wa-Sind. Th name of Sind is of great antiquity, and is me tioned both by Pliny and Arrian; the one writ it Sindus and the other Sind. Ancient orient geographers divide the country into two district Lar and Siro, a town called Halah, lying a litt north of Hyderabad, forming the point where the Lar and Siro frontiers unite.

In the 7th century it was described as comprising four principalities, viz. Upper, Middle, and Lower Sind, and Cutch, their native names being Siro, head or upper, Vichalo or midland, and Lar or lower.

The district of Lar or Lower Sind, the ancient Pitasila, is the delta of the Indus from Hyderabad to the sea..

In the time of Alexander, the only places mentioned are Sindomana, supposed to be the modern Sehwan, and a city of Brahmans, named by Diodorus, Harmatelia, which seems to have been the Brahmana city destroyed by an earthquake, A.D. 757. At the present day the principal places in Middle Sind are Sehwan, Hala, Hyderabad, and Omarkot. Hyderabad is supposed to be the ancient Patala and the Nerunkot of the Middle Ages.

Ptolemy has preserved the names of several places, as Barbara, Sousikana, Bonis, and Kolaka, of which the first is probably the same as the Barbarike emporium of the Periplus, and perhaps also the same as the Barce of Justin. In

the time of the author of the Periplus, the capital of Lower Sind was Minnagara, which the foreign merchants reached by ascending the river from Barbarike. In the middle of the 7th century, Hiwen Thsang mentions only Pitasila or Patala.

In the Middle Ages Debal was the chief seaport of Sind, hence called Debal Sindi. It was the emporium of the Indus, and seems to have been situated on the western bank of the Baghan river, below the junction of the southern branch of the Ghara or Sagara branch, five miles to the north of Lari Bandar. Lari Bandar has been deserted, and the present part of the western half of the delta is Dharaja, a few miles east of Lari Bandar. Dewal or Debal means a temple, and several Sind towns had it as a prefix, as Debal Thatta, Debal Kangra. Debal Sindi seems to have been the port at which Zabeida of the Arabian Nights landed from Basra, and found all the people turned into stone.

Debal or Dewal is from Deo, God, Alaya, house = the house of God, a sacred city. Hima-alaya is the snow abode.

Sind was found by Alexander (B.C. 327) well peopled, in a high state of cultivation, under several chiefs. From the time of Alexander till the khalifat of Walid (A.D. 705-715), Sind seems to have been chiefly under Rajputs professing Hinduism. No Buddhist remains have hitherto been observed.

In the early centuries of the Christian era, the Rai dynasty ruled from Kashmir and Kanouj to Makran and the port of Debal on the shores of the Sea of Oman, and from Surat to Kandahar and the Suliman range. The commencement of this dynasty has not been ascertained, but in the time of Rai Diwaij the capital was Alor. He was a powerful chief, who contracted alliances with the rulers of India. He was succeeded by his son, Rai Siharas I. Rai Sihasi was the celebrated son of Rai Siharas, and the next was Siharas II., who reigned 42 years, and was killed in battle. He was a contemporary of Nushirwan. After Siharas II., a Brahman dynasty succeeded. The reign of the Rai dynasty seems to have extended to 137 years.

Several places on the Indus are named after the Chach dynasty, viz. Chachpur, Chachar, Chachgaon, Chachi. Chach was the Brahman who usurped the kingdom of the Rai dynasty of Sind. He was a contemporary of Shahram or Shahrear, and he is supposed to have invented the game of chess. He seems to have reigned about A.H. 2, A.D. 623-24, and to have been succeeded by his brother. In A.H. 93-94, A.D. 711-712, Muhammad Kasim, nephew of the ruling khalif, Walid I., led an army of 15,000 men against the ruler of Sind, raja Daher, who fell in battle before Alor, A.H. 10 Ramzan 93, A.D. 711. Kasim pursued his conquests northwards to Multan. In A.H. 99, A.D. 717, on the invitation of the ruling khalif, Umar-bin-Abdul Aziz, many of the Sind princes adopted Muhammadanism.

After the Ummia khalifs, the Abbassi held Sind until A.D. 1025, when Al Qadar B'Illah, the khalifs' viceroy, surrendered it to Mahmud of Ghazni. In the confusion that resulted on Mahmud's death, a Rajput tribe in Sind, called Sumrah or Sumera, established themselves, A.D. 1054, and held sway until overthrown by the Sammah, another Rajput tribe, A.D. 1315. A brief period of changes was followed by the Sammah tribe re-establishing themselves; and in A.D. 1360 Muhammad Taghalaq took Jam Beni, the reigning prince, to Dehli, from whence he was honourably dismissed, and in 1380 adopted Muhammadanism. The Sammah family continued to reign until A.D. 1519-20, when the last prince was dethroned by Shah Beg Arghun, prince of Kandahar. Arghun Khan Tarkhan was grandson of Hulaku Khan, grandson of Chengiz Khan. One of his descendants, Shah Beg Arghun, occupied Siwi, and his troops in December 1514 took the villages of Kakan and Baghban, and returned to Siwi. In December 1520 he defeated the Sammah army, led by Darya Khan, and gave Thatta up to plunder. He resolved to retain Siwisthan north of the Lukhi Hills, of which he took possession after defeating the Sa'ta and Sumera tribes. He subsequently occupied Bakkar, and moved down the river with the object of invading Gujerat, but died at Chainduka in June 1522. He was succeeded by Mirza Shah Husain Arghun, who defeated a great army near Thatta, composed of the Sind and Sammah races, led on by Jam Firoz. In A.D. 1543, Sind was invaded by the emperor Humayun. Shah Husain died A.D. 1552, at a village 20 cos from Thatta, after a reign of 32 years. Elphinstone says he was drowned in the Indus, and that the Arghun family then became extinct. He was succeeded by Muza Isa Tar Khan (great-grandson of Arghun Khan, grandson of Hulaku Khan, grandson of Chengiz Khan), who, after a comparatively peaceful reign, died A.D. 1566, after a reign of 14 years. His son and successor was Muhammad Baki. There are members of the Tar Khan family still in Sind, and 219,591 in the Panjab.

The last two Asiatic dynasties were the Kullora and Talpur tribes. In the early part of the 18th century, the Kullora, a Sind tribe, took possession of Sind, and were recognised by Nadir Shah or his deputies. The Kullora traced their descent from the Abbasside khalifs, and the Talpuri from Mahomed, but both seem to be Baluch. The Talpuri (Tal or Tar, Borassus flabelliformis or palmyra, and Pura, a town) amount to one-fourth of the population of Hyderabad, which they call Lohri or Little Sind. Previous to the invasion of Nadir Shah, the Kullora, a religious sect, had risen to power in Sind, and the chief of the tribe, Nur Muhammad, had been recognised as governor of the province. During the rule of his brother, Gholam Shah, the connection of the British Government with Sind commenced by the establishment of factories at Thatta and Shah-bunder in 1758. In that year Gholam Shah granted an order for the establishment of the factories and for certain immunities to trade. This order was renewed in 1761; but during the rule of Sirfaraz Khan, the eldest son of Gholam Shah, the trade was so much interfered with, that in 1775 the British withdrew their factories. The violence and tyranny of Sirfaraz Khan and his successors, who from jealousy put to death three of the chiefs of the Talpur tribe, led to the overthrow of the Kullora dynasty. The Talpur chiefs had long held the first place in the service of the rulers of Sind. To avenge the death of their chiefs, the Talpur tribe rose, and, headed by Mir Futteh Ali Khan Talpur,

in A.D. 1786 expelled the Kullora ruler Abdul-Nabbi. The measures which Futteh Ali Khan took to establish his authority alarmed his relatives, Mir Sohrab and Mir Thara, who fled, seized on Khairpur and Shah-bunder, and renounced the authority of their kinsman. Mir Futteh Ali Khan was never again able to extend his authority over the whole province, which henceforth remained divided into three separate principalities, viz. Hyderabad or Lower Sind, under Futteh Ali Khan; Khairpur or Upper Sind, under Mir Sohrab; and Mirpur, under Mir Thara. In Hyderabad, Futteh Ali divided his power with his three brothers, Gholam Ali, Kurm Ali, and Murad Ali, and from their real or apparent unanimity, the brothers received the appellation of the Char Yar, or four friends. In 1799, the commercial intercourse between the British Government and Sind was revived, and Futteh Ali Khan issued an order granting certain privileges in favour of British trade.

Sind fell to the Indian Government, from the Muhammadan Talpur dynasty, after the battles of Hyderabad on the 15th, of Meanee on the 17th February 1843, and of Dubba on the 24th March 1843, all fought by Sir Charles Napier, and this gave to the British the course of the Indus up to Multan. In August 1842, Sir C. Napier had been appointed to the military command in Sind and Baluchistan, and invested with authority over all civil and political officers in these territories. On the 14th February 1843, the Amirs, except Nasir Khan of Khairpur, signed a treaty, leaving Mir Roostum's rights to future investigation. Next day the residence of Major Outram was attacked by 8000 of their troops. After a most gallant defence, the escort made their way to the main army. The battles of Meanee and Dubba subjected the whole of Sind to the British Government, with the exception of the possessions of Ali Murad, who was established as chief of Khairpur, in the territories which belonged to Mir Roostum, both by inheritance and in right of the turband, as well as in the lands of which he himself stood rightfully possessed at the time of the conquest. But a fraud was clearly established by a commission, which met in 1850, and Ali Murad was degraded from the rank of rais of Khairpur, and deprived of all his territories, except those which he inherited under his father's will. The revenue of his possessions in A.D. 1860 was estimated at Rs. 3,50,000, with power to try for capital offences any persons except British subjects. After the conquest, the deposed Amirs were removed from Sind, and pensions were granted them by the British Government.

For British administrative purposes Sind is arranged into the five districts of Kurachee, Hyderabad, Thar and Parkar, Shikarpur, and Upper Sind frontier. The valley is fertilized by the great river, which, like the Ganges, the Irawadi, and the Nile, has an annual rise in the summer months, overflowing its banks and fertilizing the soil to a distance on both sides. Strabo (Geogr. lib. xv.) and Arrian (Hist. Ind. c. 2) compare the delta of the river Indus to that formed by the Nile, and almost every part of the delta has at some time or other formed a channel for the river or one of its many branches. Parts of the territory are almost rainless; the average fall of Sind and Cutch is given by Mr. Blanford at 9·2 inches. Sometimes, indeed, for two or three succe[illegible] no rain falls in the province. The [illegible] soon deluges the Baluchistan hills, bu[illegible] in long. 67° 2′ E., is its eastern li[illegible] S.W. monsoon ends abruptly at Lak[illegible] on the boundary of Cutch. In Upp[illegible] country is diversified. The Lakhi [illegible] an abrupt escarpment facing the riv[illegible] high. The towns of Sukkur and [illegible] hang the stream, and lying in the ri[illegible] them is the island fortress of Bukk[illegible] lofty castellated walls, crowning th[illegible] limestone hills through which the Ind[illegible] A little to the south of Bukkur is t[illegible] Sad'h Bela, with its sacred shrine. In [illegible] district is the Manchar lake, formed [illegible] pansion of the Western Nara. During [illegible] tion it measures 20 miles in length, ar[illegible] area of about 180 square miles; while [illegible] Nara, at the same season, forms dan[illegible] lakes. The extreme S.E. border of Sin[illegible] by the Runn, a salt-water waste with [illegible] 7000 square miles. In the Thar [illegible] district, in the eastern portions of Kh[illegible] in Rohri subdivision, is the desert, wh[illegible] of sand-hills which succeed one anothe[illegible] waves. The soil of Sind consists [illegible] clay, strongly impregnated with sal[illegible] strip which borders either bank of th[illegible] a distance of 12 miles, is for produc[illegible] best in Sind, and in places on it are [illegible] forests of acacia. The exhalations a[illegible] the pools left after the annual inund[illegible] rise to fever.

Religion.—Two-thirds of the popula[illegible] Muhammadanism, 17·84 per cent. Hin[illegible] all retain their clan designations. The[illegible] tudinous, and many of the tribal nam[illegible] the country from which the first immig[illegible] —Syuds from Arabia, Baluch from th[illegible] region on the west, descendants of [illegible] Zanzibar or Abyssinia, with Mehman and Kh[illegible] of Hindu origin, with Awan, Chuvan, [illegible] Nakhuda, and Solang. Burton (pp. 36[illegible]) [illegible] 79 names of Baluch tribes. Other Muha[illegible] generally known as Sindi, of whom there [illegible] about 300 clans of tribes, are descendants [illegible] converts from Hinduism.

Language.—Persian was the language of [illegible] ture, ceremony, office, and epistolary [illegible] ence. But Sindi, the language of the people, [illegible] spoken from the N. boundary of Katty[illegible] north as Bahawulpur, and extends fro[illegible] on the west to the desert which separates Sind from the eastern portion of the Indian Peninsula. There are several dialects of it. It abounds in Arabic words. These in the Urdu constitute the language of the learned men, but in Sindi they are the words in common use for name[illegible] literature consists of translations of Arabic religious and moral works, and popular traditions in poetry, and the Arabic Nashki character is used by the Muhammadans, but the Hindus have a separate written character.

The Sindi is superior to most of the dialects of Western India in various minor points of refinement and cultivation, as, for instance, in the authorized change of terminations in poetical words, the reduplication of final or penultimate letters to assist the rhyme, and many similar signs of elaboration.

lture.—The crops consist of rice, sor- enicillaria spicata (spiked millet), Indian d in Upper Sind wheat and barley. hod of clearing water-courses adopted irers is peculiar to Sind. They are in their work by musicians, and the nt is kept up by beating drums and horns. Without these they make no but with them the canal-diggers of do more manual labour than any natives They work uninterruptedly for twelve d use a large hoe (phaorah) with a short The period for clearing the water- s the first appearance of a rise in the rch or April). The seasons for crops in two, Rabi or spring, and Kharif or the produce varying in portions of the These divisions of the year do not climate, for they hardly exist. Saltpetre n the soil of Sind, particularly the lower and is collected in great quantities. In ricts the surface of the land is covered ine efflorescence.

mber trees of Sind are species of Acacia, lebec, Avicennia tomentosa, Azaderachta pecies of Capparis, Ceriops, Cordia, Dal- Populus Euphratica, Prosopis spicigera, es of Tamarix and Zizyphus.

rests, under the rule of the Amirs, were ting preserves, and were admirably from the thickness of their underwood, over of wild animals of every sort. No whatever was paid to their timber.

the grass called Sar, which perhaps is karka, has its culms, sur jo kanee, made s, and its flower-stalks, beaten to form called moonyah, are made into string (moonyah jo naree), and into ropes (moonyah jo russa).

Nine-tenths of the Sind vegetation consist of plants which are indigenous in Africa, the desert regions assimilating with that country. At least one-half are common Nubian or Egyptian plants, and a considerable number is common to tropical Africa, and South Arabian and Persian plants also occur largely.

The pasture grasses most relished by horses, cattle, and sheep, are Cynodon dactylon, the sweetest and most nutritious of grasses, and abundant everywhere; also Poa cynosuroides, Andropogon involutus, *Stend.;* Anthistiria ciliata, Alopecurus pratensis, *W.;* Dactylis glomerata, and Digitaria sanguinalis, *P.S.;* with the straw of all the grain grasses and millets.

Amongst other wild animals may be mentioned the Gor-khar or wild ass of the deserts, the Equus onager of naturalists.

The river fisheries afford a considerable export trade in dried pullah. Among domestic animals, the camel, of the one-humped variety, ranks first as a beast of burden, immense numbers being bred in the salt marshes of the Indus.

The wool of Sind forms a staple of almost equal importance, though the larger portion of the quantity exported comes, not from the province itself, but from Ferozpur district in the Panjab, and from Afghanistan and Baluchistan.

The spirituous liquors are the gura from molasses, and kuttala from dates; wine called angur is from the Sind grape; and liqueurs sonf, mushki, turanji, nusri, gulabi, and kaisari. It abounds in mineral waters, but the situation of the province and its climate alike preclude the hope of their ever being extensively useful to Europeans, though they might be more employed for sepoys and the people of the country.—*Burton's Scinde; Cunningham's India; Elliot's India; Elphinstone's India; Gibson's Forest Reports; Ouseley's Travels; Pennant's Hindustan David Ross, C.I.E, The Land of the Five Rivers and Sind; J. A. Murray, The Plants and Drugs of Sind.*

SINDBAD, well known to Europe as having the history of his voyages incorporated in the Thousand and One Nights, but they form in Arabic a distinct and separate work, which Baron Walkenaer (in Nouvelles Annales des Voyages, tom. liii. p. 6) regards of equal value with those of Soliman and Abu Said. The voyages belong to the 9th century, when the commerce of the Arabs under the khalifs of Baghdad was at its highest activity. In his first voyage Sindbad reaches the country of the maharaja. This title was given so far back as the 2d century to a Hindu king, whose monarchy is said to have comprised the greater part of Southern India, the Malay Peninsula, Sumatra, and Java in the Indian Archipelago, and whose title continued to be borne afterwards by one of the sovereigns of the disintegrated empire, who reigned over the kingdom of Bijanagar or Vijayanagar. In Sindbad's second voyage mention is made of the kingdom of Riha (the Malay Peninsula according to some), and the manner of the preparation of camphor, produced in the mountain forests there, is accurately described. In the third voyage the island of Silaheth is mentioned. In the fourth he was carried to a country (Malabar) where he found men gathering pepper, and from it he went to the island of Nacous (the Nicobars?) and on to Kela (Quedah or Keydah?). In the fifth voyage he is shipwrecked on the island (*i.e.* country) of the Old Man of the Sea, probably somewhere on the Konkan coast. Thence he crossed the sea to the Maldives, and back again to the pepper country of Malabar, passing on to the peninsula of Comorin, where he found the aloes-wood, called santy, and afterwards to the pearl fisheries of the Gulf of Manaar, whence he travelled back to Baghdad. In the sixth voyage he visited an island (*i.e.* country) where were superb trees, of the kinds named santy and comary, and the island of Serendib (Ceylon), which was also the limit of his seventh and last voyage.

SINDHU. India was first known to the Chinese in the time of the emperor Wu-ti of the Han dynasty, in the 2d century before Christ. It was then called Yuan-tu or Yin-tu, that is Hindu and Shintu or Sindhu. At a later date it was named Thian-tu, and this is the form which the historian Mat-wan-lin has adopted. The name Sindhu was taken from the Romans, the Romans from the Greeks, the Greeks from the Persians. In Persian the initial s is changed into h, which initial h was as usual dropped in Greek. It is only in Persian that the country of the Sindhu (Sindhu is the Sanskrit name for river), or of the seven Sindhu, could have been called Hindia or India instead of Sindia. Unless the followers of Zoroaster had pronounced every s like h, we should never have heard of the West Indies. The name of India, *i.e.* Hoddu, does not occur in the Bible

before the book of Esther, where it is noticed as the limit of the territories of Ahasuerus in the east, as Ethiopia was in the west (i. 1, viii. 9). The names are similarly connected by Herodotus (vii. p. 9). The Hebrew form Hoddu is an abbreviation of Hondu, which is identical with the indigenous names of the river India, Hindu or Sindhu, and again with the ancient name of the country as it appears in the Vendidad, Hapta Hendu. The native form Sindus is noticed by Pliny (vi. p. 23). But though the name of India occurs so seldom in the Old Testament, an active trade was carried on between India and Western Asia. The Tyrians established their depots on the shores of the Persian Gulf, and procured 'horns of ivory,' 'broidered work and rich apparel' (Ezekiel xxvii. 15, 24), by a route which crossed the Arabian desert by land, and then followed the coasts of the Indian Ocean by sea. The trade opened by Solomon with Ophir through the Red Sea chiefly consisted of Indian articles. Algummim (sandal-wood), kophim (apes), thuccim (peacocks), are words of Indian origin (Humboldt, Kosmos, ii. p. 185), to which we may add the Hebrew names of the topaz, pitdah, derived from the Sanskrit pita.—*Muller's Lectures*, p. 215.

SINDHU, a Jat clan in the Panjab. They are steady, good farmers, a sturdy, stalwart people.

SINDIA, the family name and regal title which designate the sovereign whose capital is Gwalior, and who has the title of maharaja. The territories over which the Maharaja Sindia rules form part of what the British term Central India. The Sindia family are Mahrattas, and came from near Satara. Ranaji, the first member of the Sindia family of note (1724), commenced his career as the carrier of the slippers of Balaji Rao, Peshwa. His care in the performance of this menial duty attracted his master's attention, who appointed him to a command in the pagah or bodyguard horse. From this his rise to the first rank of Mahratta chiefs was rapid. He placed himself at the head of several bodies of horse, with which he carried on raids, even into the territory of the emperor of Dehli, and some of the lands he then overran still form part of the appendages of the Gwalior rule. Ranaji's achievements might have perished with him after his death in 1759, had he not been succeeded by a man of still more striking capacity than his own. His youngest son, Mahdaji, although he did not at once succeed to the family jaghir in Malwa, has always been considered his political heir, because it was he who continued the work of establishing the fortunes of the house of Sindia.

Mahdaji Sindia's career had little more than begun when he found a great opportunity for showing the nobility of his character on the fatal plains of Panipat. On that day Mahdaji proved himself the bravest of the brave. The contingents of Holkar and Sindia formed the right wing of the Indian army, but Mulhar Rao left his youthful comrade to bear the brunt of the engagement alone, and the Mahratta forces were utterly defeated. Among the principal consequences of this signal defeat were the accession of Mahdaji to the full title of Sindia, in consequence of the death of all his relatives, and the commencement of a bitter rivalry between him and his neighbour Holkar. The disaster of Panipat, which threatened the family with extinction, was really the main cause of the after-fame of the house of Sindia, by bringing Mahdaji to the front as its responsible leader. Mahdaji escaped from the battle more by accident than by the fleetness of his steed. Pursued by an Afghan horseman, his horse was unable to carry him to a place of safety, stumbling over a ditch. Mahdaji fell at the mercy of his assailant. The Afghan struck him on the knee with his battle-axe, but was content to retire with the spoil of his accoutrements and of his horse. Mahdaji received the assistance of a water-carrier, also the sole survivor of the battle, but he carried the lump to his grave.

The overthrow at Panipat was so complete that the Mahrattas, who before it had seemed to grasp the empire of Hindustan, were after it glad for a time to content themselves with a position subsidiary part in its affairs, but Mahdaji succeeded to regain supremacy. By the aid of Najaf Khan's army, the emperor Shah Alam was restored upon the throne of Dehli, and Rohilkhand was overrun by the Mahratta horsemen.

Mahdaji had, after his return from the Doab, devoted himself to the task of establishing his authority throughout the possessions he had inherited. But when he had secured his estates, his next thought became how he might turn them into a kingdom. In order to attain this object he formulated a policy of his own, by means of which he hoped to render himself as independent of his own suzerain, the peshwa, as of the Mogul emperor. He reorganized his army, and was the first of his race to train an infantry force, and to employ European officers,—De Boigne, 1784; Colonel Fremont, 1792-93; Major Gardner, 1794; Colonel Perron, 1794; Colonel Drugdor, 1797; Colonel Duprat, 1798; Colonel Sutherland, 1795; Colonel Pohlmann, 1799.

For thirty years he thus made himself the greatest potentate in Central India, and it was during this period that the house of Sindia was first arrayed in arms against the British. The early encounters of this campaign were in his favour. The convention of Wargaum closed a campaign of incapacity, and Mahdaji issued from his first contest with the British with increased reputation. The next campaign, under the conduct of Colonel Goddard, left Mahdaji's position intact, although the capture of Gwalior fort was a rude shock to the self-esteem of native warriors. With the signing of the treaty of Salbye, Mahdaji was again left to prosecute his schemes for establishing his supremacy among the Mahrattas. In 1788 he again entered Dehli to replace the aged Shah Alam on the throne, and five years later he marched on Poona to assert his pre-eminence in the councils of the peshwa. He succeeded in his object, and his prospects were rendered still more brilliant by the intelligence of a decisive victory gained by his troops over his rival Holkar, when his career was suddenly terminated by death in 1794 near Poona. His formidable army, organized under French officers, had made him in reality the ruler of Hindustan, though nominally the servant of the peshwa. He had played a most important part in the struggle which took place for the peshwa's office, after the death of Madho Rao, Bullal. He was the chief support of the party of Nana Farnavis. When peace was concluded with the Mahrattas by the treaty of Salbye in 1781, Sindia was the

ual guarantee of both powers for its observ-e. Under the 3d article of this treaty, the ght of the British Government to the pargana and town of Broach was recognised. By this treaty the independent power of Mahdaji Sindia, the relation of the British Government, was recognised, but in all other respects he consented ostensibly to proffer subjection to the

Mahdaji Sindia died in 1794, and was succeeded by his grand-nephew Dowlat Rao Sindia. During the distractions which followed on the death of the peshwa Madho Rao Narain, Sindia was able to place Baji Rao in power. When by the treaty of Bassein the British Government had recovered its influence at Poona, and established a subsidiary force there, Dowlat Rao Sindia entered into a league with the raja of Berar to defeat the objects of the treaty, and he opposed General Wellesley's plan. But in the campaign which followed, the power of Sindia was completely broken, both in Upper and Central India, and he was compelled to sue for peace, and to sign the treaty of Surjee Anjengaum in 1803, by which he was stripped of his territories in Hindustan and south of the Ajunta Hills, with the exception of some hereditary villages, and resigned his claims on his former feudatory rajas with whom the British Government had made treaties. A subsequent treaty was concluded on the 23d November 1805. Sindia, however, countenanced the Pindaras in 1817. The subsequent open defection of the peshwa and the raja of Berar showed the stedfastness of Sindia to his engagements. The strong fortress of Asirgarh was not surrendered as stipulated by the treaty, and it therefore became necessary to reduce it by force. In the captured fort a letter was found in which Sindia directed the governor to obey all orders of the peshwa, who, by attacking the Residency at Poona, had declared war with the British Government. In consequence of this want of good faith, Sindia was required permanently to cede the fort of Asirgarh. Dowlat Rao Sindia died in March 1827. He left no son, and a youth of eleven years, named Moogut Rao, declared to be the nearest relation of Dowlat Rao, was adopted, was married to the granddaughter of Dowlat Rao by Baiza Bai, and was placed in power, with the title of Alí Jah Jankoji Rao Sindia, under the regency of Baiza Bai. Baiza Bai acknowledged this succession most reluctantly, and maintained that it was her late husband's intention that she should hold the regency during her life. The rule of maharaja Jankoji Sindia was very weak. Although the Baiza Bai had no strong party within Gwalior territories, she did not cease to intrigue and to use freely for this purpose a sum of Rs. 37,00,000, which she had been awarded as her private property. Jankoji Sindia died on 7th February 1843. He had no children. Tara Rani, however, the maharaja's widow, a young girl of twelve years of age, with the concurrence of the chiefs of the state and the army, adopted Bugeerut Rao, son of Hunwunt Rao, usually called Babaji Sindia, the nearest, though a very distant, relative of the maharaja, and the adoption was recognised by the British Government. The boy was then about eight years of age. He assumed the title of Ali Jah Jyoji Rao Sindia. The Mama Sahib, who appeared to possess the greatest influence, and was attached to British interests, was chosen by the chiefs as regent. But troubles again arose through the instigations of Dada Khasji Wala, who was at length delivered up. An interview was agreed upon between the governor-general and the maharaja, which was to take place at Hingoona on 26th December 1843, but the maharani and her son were held in restraint by the mutinous troops, and on the 29th December, when the British army was taking up its advanced ground, it was fired on by the Gwalior troops. The battles of Maharajpur and Punniar were fought the same day, and ended in the total defeat of the Gwalior army, and the conclusion of a treaty, by which it was agreed that territory yielding 18 lakhs a year should be ceded to the British Government for the maintenance of a contingent force, and other lands for the payment of the debts of the state to the British Government, and expenses of the war; that the army should be reduced to 6000 cavalry, 3000 infantry, and 200 gunners, with 32 guns; that the government during the minority should be conducted according to the advice of the British Resident; and that the just territorial rights of the Gwalior State should be maintained by the British Government. From that time till the rebellion and revolt of 1857 there was little change in the relations of the British Government with the Gwalior State. By the mutiny of the Contingent in June 1857, the Political Agent was forced to quit Gwalior. In June 1858 the maharaja was deserted by his troops on the approach of the rebels under Tantia Topee. He and his minister were compelled to flee to Agra. On 19th June, Gwalior was retaken by Sir Hugh Rose's force, and the maharaja was re-established in his palace. From that date the confidence of the maharaja was entirely withdrawn from his minister, to whom he conceived an intense dislike. Dinkur Rao was at last removed from office in December 1859, and Balaji Chimnaji was appointed in his stead, with the concurrence of the British Government. Since that time the maharaja has himself superintended the whole of his affairs. For his services during the mutinies, Sindia received a sunnud conferring on him the right of adoption. He was also informed that lands yielding three lakhs of rupees a year would be added to his territories; that permission would be given to him to raise his infantry from 3000 to 5000 men, and his artillery from 32 to 36 guns; that the arrears due to the British Government on account of the deficiency in revenues of the districts assigned under the treaty of 1844 would be remitted, and that no payments would in future be claimed should these revenues fall short of 18 lakhs; and the annual payment of 10,000 rupees out of the revenues of Burwa Saugor in the Jhansi district would be hereditary. These modifications of the treaty of 1844 were embodied in a new treaty concluded on 12th December 1860. The raja of Amjhera, tributary to Sindia, paid annually to the Gwalior State a tribute of 35,000 rupees, under an engagement mediated by the British Government. This tribute was part of the sums assigned in 1844 for the payment of the Contingent, and is now payable by Sindia to the British Government under the treaty of 1860. Besides this, the maharaja contributes 20,000 Halee

rupees towards the payment of the Malwa Bhil corps. Formerly Sindia contributed only 8000 rupees to this corps, and the raja of Amjhera contributed 4000 rupees. But when Amjhera was confiscated and made over to Sindia in consequence of the rebellion of the raja in 1857, it was made subject to a payment of 20,000 rupees, no further contribution being required on account of Gwalior. Including the cessions to Sindia under the treaty of 1860, the territories of the Gwalior State are estimated to contain a population of about 2,500,000 souls, and to yield a revenue of 93,09,102 rupees, of which 78,38,900 rupees are derived from the land-tax, 14,70,202 rupees from customs, and the rest from the tributes of feudatories. After the [illegible] of Gwalior by the force under Sir [illegible] in 1858, the fort of Gwalior continued to be held by British troops. [illegible] negotiations, however, which ended in the treaty of 12th December 1860, Lord Canning agreed that the fort should be restored to Sindia when this could with safety be done. It was, however, finally decided in 1[illegible] that the [illegible] should be [illegible] it therefore became necessary that the Gwalior fort should continue to be garrisoned by British troops. [illegible] *Engagements* [illegible] *Administration*.

SIND-SAGUR, a [illegible] the Panjab. Its population are chiefly [illegible]. They are a fine hardy race, with [illegible] and large turbands. The la[illegible] relate that all Sind-Sagur formerly belonged to them.—*Rajasthan*, ii. p. 233.

SING. No nation is more closely united by the ties of clanship, which is thus signified by the word sing, than the Chinese. All the many millions are divided into rather more than 400 sing; those who belong to the same sing consider each other as relations, descended from the same ancestor, and bound in duty to lend mutual help. This excellent custom degenerates frequently into that exclusive partiality which is so repugnant to the spirit of true philanthropy. One sing is opposed to the other, one clan oppresses the other; they proceed even so far as to engage in open hostilities. The ties of nearer relationship are still closer. A Chinese is taught by his sages to love his relations.—*Gutzlaff's Chinese History*, i. p. 207.

SINGALLY and Sozille are the maws or sounds of two fishes, and largely exported from Calcutta.

SINGAPORE ISLAND, at the southern extremity of the Malay Peninsula, in lat. 1° 17′ N., and long. 103° 50′ E., is separated from the continent by a narrow strait, in some places less than a mile in width. Singapore was first settled in A.D. 1160 by Sri Sura Bawana, and from an inscription, now destroyed, on a sandstone rock on a narrow point to the left of the entrance of the Singapore river, it would appear that raja Suran of Amdan Nagara, after conquering the state of Johore with his Kling troops, proceeded to Tamask about A.D. 1201, returned to Kling, and left this stone monument.

The island consists of a number of low hills and ridges, with narrow and rather swampy flats intervening. In several places the sea-face is elevated, but the greater portion of the circumference is fringed by a pretty deep belt of mangrove fore[illegible]. Bukit Timah is a granitic hill about 530 feet hig[illegible], but the rest of the island is composed of sedimentary rocks, amongst which sandstone occupies a prominent place. Government Hill is about 160 feet high. The Bukit Timah is in the centre of the island.

During the administration of Sir Stamford Raffles, on the 6th February 1819, for a sum [illegible] 60,000 dollars, and a yearly stipend of 24[illegible] dollars for life, the sultan of Johore made over the island of Singapore to the British and it was finally ceded by treaty on 2d August [illegible] to the British by the sultan.

The island is 25 miles in length, and about one-third of that distance in breadth; its area is [illegible] 206 square miles (1,423,000 acres); and its population (at the census 3d April 1881) [illegible].

The total imports and exports [illegible] during the last decade were as follow:—

Imports.	Exports.		
1870, 39,058,564	31,731,022	1876, [illegible]	[illegible]
1871, 36,760,530	32,003,807	1877, [illegible]	37,41[illegible]
1872, 43,415,383	39,020,121	1878, [illegible]	36,421,021
1873, 47,880,090	41,752,145	1879, [illegible]	[illegible]
1874, 46,887,070	41,508,798	1880, 60,[illegible]	54,576,081
1875, 43,766,201	41,619,519	1881, 76,[illegible]	[illegible]

In Singapore free port, the only charges are the Straits light dues, which are 4 annas or 25 cents per registered ton on [illegible] vessels. All national ships are free of the [illegible]. In Singapore, measures of capacity are rarely used, and these only with certain articles, such as tobacco, etc.

16 tael make 1 catty = 1 lb. 5 oz. 5½ grs., or 1¼ lb. avoirdupois.
100 catties make 1 (Chinese) pikul = 133⅓ lbs. avoirdupois.
40 (Chinese) pikuls make 1 royan.
2 (Malay) pikuls make 1 char.

The Malay catty weighs 24 Spanish dollars. The Chinese catty weighs 22½ Spanish dollars. Rice is sold by the royan of 40 pikuls. The native merchants buy imported produce from the islands by the Malay pikul, but sell it by the Chinese pikul. Singapore timber is conveyed in huge rafts, 500 or 600 feet long and 60 or 70 feet broad, with atap-leaved houses on the top; each raft containing about 2000 logs, bound together by rattan rope.

SINGASUN is the ancient term for the Hindu throne, signifying 'the lion-seat.' Charun bards, who are all maharajas, 'great princes,' by courtesy, have their seats of the hide of the lion, tiger, panther, or black antelope.—*Rajasthan*, i. p. 293.

SINGAURGARH, hill fort in the Central Provinces, situated in lat. 23° 32′ 30″ N., and long. 79° 47′ E., 26 miles N.W. of Jubbulpur city. It is on a high hill, commanding the narrow Sangrampur valley. It was founded by raja Bel, a Chandela Rajput; it was enlarged by raja Dolpat Sa of Garha-Mandla, who made it the seat of government about 1540. It was the scene of the defeat of Rani Durgavati by Asaf Khan, an officer of Akbar; and the fort stood a siege of nine months in the days of Aurangzeb.—*Imp. Gaz.*

SINGBHUM, a British district in Bengal, lying between lat. 21° 59′ and 22° 53′ N., and between long. 85° 2′ and 86° 56′ E.; area, 3897 square miles; population, 322,396. The district forms the S.E. portion of the Chutia Nagpur

division. It is made up of the Government estate of Kolhan or Ho-desam, the fiscal division of Dhalbhum, and the political estates of Parahat, Saraikala, and Kharsawan.

The central portion of Singbhum consists of a long, undulating tract of country, running east and west, and enclosed by great hill ranges. The Ho or Larka Kol would not allow any strangers to settle in or even pass through the Kolhan, and [illegible] to Jagannath had to make a circuit of several days' journey to avoid it. Among aboriginal tribes the most numerous are the Kol, [illegible],925 in 1872; Santal, 51,132; Bhumij, [illegible],253; and the Bhuiya, 12,078. The bulk of the Kol enumerated above are Ho, otherwise called Larka or 'fighting' Kol. Physically, the Singbhum Ho are the finest of all the Kolarian tribes. The men average 5 feet 5 or 6 inches in height, the women 5 feet 2 inches; and both men and women are noticeable for their fine erect carriage, and long, free stride. Even wealthy men go about all but naked as proudly as if they were clad in purple and fine linen. The Ho are fair marksmen with the bow and arrow, and great sportsmen. They are a purely agricultural people, and their festivals are all connected with that pursuit. Brahmans in Singbhum in 1872, 4095; Khandait, 2255; Rajputs, 1718; Pastoral Goalas, 4,987; Tanti, or weavers, 20,758; and Kurmi cultivators, 19,667.

In Singbhum occasionally, in the markets, a young man will pounce on a girl and carry her off by force, his friends covering the retreat. In 1857 the raja of Purahat joined in the rebellion, many of the Larka Kol following him. A Christian mission went to Chutia Nagpur in 1845, and has made much progress amongst the Dhangar race.—*Dalton*, pp. 163, 181; *Imp. Gaz.*

SINGH, from Sin'h or Sinha, a lion; a title borne by several military castes of Northern India, by Rajputs, by Brahmans, and likewise by Sikhs of Jat race when following the military profession. When a Manjhi Singh dies, leaving no male offspring, his brothers or his nephews of the full blood assume the right of succession, to which the widows become competitors. According to the Shastras (if they may be considered applicable to public property and chiefships), the prior title of the widows is held; but the Sikhs, with a view to avoid an open and direct violation of a known law, have a custom, termed Kurawa or Chadardalna, which obtains in every family with the exception of those of the Bhai: the eldest surviving brother of the deceased places a white robe over, and the nat'h or ring in the nose of the widow, which ceremony constitutes her his wife.—*Steinbach's Panjab*, p. 79; *Wilson.*

SINGHALESE, the general term in use to designate the inhabitants of Ceylon, and also the Ceylon language. The population comprises Europeans and persons of mixed descent, with the Burgher of pure Dutch descent, also Tamil or Dravida, Rhodia, Chalia, Veddah, Kandyan, and Gattaru. See Ceylon; India.

SINGHANA, town in Jeypore State, Rajputana, situated in lat. 28° 5′ N., and long. 75° 44′ E., 95 miles S.W. of Dehli and 80 miles north of Jeypore city. A rocky hill, 2 miles S.E. of the town, contains abundance of copper ore of a poor quality, yielding from 2 to 7 per cent. of metal.—*Imp. Gaz.*

SINGPHO, an uncivilised tribe occupying the hills bordering the extreme eastern frontier of Assam. They entered the Assam valley from Burma about A.D. 1773, and are now settled in the tract in lat. 26° and 27° N., and long. 96° E. Colonel Dalton says they are known to the Burmese as Ka-Ku and Ka-Khyen, but that on entering Assam they called themselves Singpho, which in their language means man. They occupy both the north and the south of the Patkoi mountain, and are near the Hukong valley or Pavendwen, 1000 feet above the sea. Another body, the Mirip Singpho, dwell farther east, in long. 97° E., between the Shooay-doung-gyee and the Irawadi, and near them, near the Hukong valley, are the amber mines, 1000 feet above the sea-level, in lat. 26° 20′ N., and long. 96° E. Their first settlements in Assam were on the Tengaprani, E. of Sadiya, and on the Bori Dihang river in Namrup, under their chiefs called Gam, La, and Thu or Du. They are a fine athletic Mongoloid, olive-yellow coloured race, above the usual standard, capable of enduring great fatigue, but addicted to opium and spirits; hair abundant; fond of amber ear ornaments and of the deomani (god-bead), a bright-coloured bead. The men tattoo their lower limbs, and the married women from the ankles to the knees. They are polygamists. They bury their dead until decomposed, and afterwards the bones are placed in a coffin and decked out. On the demise of a parent, the eldest son takes the landed property and the youngest son the personal property, the intermediate sons remaining with their eldest brother.

The principal tribes on the frontier of Upper Assam are the Muttuk, the Khamti, and the Singpho. The Bur Senaputti, or chief of the Muttuk branch of the Singpho, entered into an engagement in May 1826, whereby he acknowledged the supremacy of the British, and bound himself to supply 300 soldiers in time of war. The management of the country was left in his own hands, except as regards capital offences. In January 1835 the obligation to supply troops was commuted to a money payment of Rs. 1800 a year. In 1826, similar agreements were made with the Khamti chief of Sadiya, but in 1839 they attacked the town of Sadiya, and many persons, as also Colonel White, the political agent, were slain. Agreements were also made in May 1836 with the Singpho. These tribes were implicated in the Khamti rising in 1839, but they were allowed to surrender under conditions. Many of the Singpho clans have become extinct, and the main body have left Assam for Hukong in Upper Burma.

SINHACHALAM, a temple in the Vizagapatam district of the Madras Presidency, in lat. 17° 46′ N., and long. 83° 11′ 8″ E. It is on a hill (800 feet above sea-level), 6 miles N.W. of Vizagapatam town. The shrine is in a wooded glen, containing springs and beautiful cascades. It is dedicated to the lion incarnation of Vishnu, and held in great veneration. It is believed to have been built by the Gajapati kings of Orissa about the 13th century A.D.—*Imp. Gaz.*

SINHALA, a Buddhist king, of whose coronation a representation occurs in the caves of Ajunta.

SINHASANA, or Lion Seat, the throne on which a sitting Buddha is figured. When the

Mahayana sect became popular, other beings were associated with the Indras, Bodhisatwas, Padmapani, Manjasri. In Hindu temples the sinhasan or throne is very handsome; the usual supporters are the sinha, or lions rampant, trampling on elephants couchant, and ridden by amazons armed with shields and swords. It was applied particularly to the throne of the Chalukya dynasty whilst ruling at Kalian, and literally means the lion's seat.

SINHASANA DWATRINSATIKA, or the Thirty-two Stories of the Speaking Statues; stories which were related by the female statues forming the pedestal of a throne belonging to the renowned Vikramaditya, king of Ujjain. They refer to Bhoj, a king of Ujjain, who obtained possession of a valuable throne, but when he attempted to sit on it the statues met him with uncontrollable laughter, and on his asking why they laughed, one of them related the story of king Vikram, how the throne was given to Vikram by raja Sin Bul, and the other statues followed by other stories.

SIN-HOA, the country named Aurea Chersonesus of the great geographer Ptolemy, has been shown by D'Anville to be the Malay Peninsula, and Sin-hoa the western part of Cochin-China.—*Ind. & the Ind. Cent.*

SINGH, Chin. A gigantic creeping plant which grows spontaneously, extensively used both by natives and Europeans in making a lye or wash for the hair, which it is said to clean and strengthen in a remarkable degree.

SIN-TU or Sin-to or Shin-to, the state religion in Japan, but its followers are much less numerous than the Buddhists; the term is derived from Sin, the gods, and Tu, faith. The priests of the Buddhist religion use the Chinese language in their worship, except in their poetry, which is in the Japanese tongue. The Sin-tu religion, like the old pagan religion of Europe, consists of an apotheosis of all great heroes or saints, amongst whom the Japanese include Buddha, which explains the great consideration shown by the various sects there. Sin-tu temples have as gods the emperors, empress, the gods of the sea (kami), and a round mirror is a sacred emblem.—*Sir J. E. Reed.*

SIPAHI. Hind., Pers., Turk. A sepoy or foot soldier, from Persian Sipah, an army; and hence the words Sipah-salar, commander-in-chief; Sipah-dar, etc. Under the emperor Akbar, the Sipah-salar was a viceroy of a subah or province, from which, in Akbar's time, he was given the designation of Subahdar. The Dewan was a revenue officer under the Subahdar.

SI-PAIT, Malay, meaning 'bitter wood,' is the root of a tree of Sarawak. In substance, appearance, and lightness it precisely resembles the plye; but while plye is tasteless, si-pait is very bitter to the taste. Pait, in Malay, means bitter.—*Low's Sarawak.*

SIPAL, a name of the Bhotia race occupying Sibu in Darma, in the N.W. Himalaya.

SIPATTA or Sih-patt. Hind. A woman's veil or wrapper, formed of three pieces sewn together.

SIPHONESTEGIA CHINENSIS. *Tatarinov.* A plant of Ho-nan and other parts of China. It has square stems, topped with the dehiscent fruit, containing millet-like seeds, useful in fluxes.—*Smith.*

SIPHONIA ELASTICA, common in the forests of Guiana and Brazil, and has been introduced into the E. and W. Indies. Condamine frequently mentions it in his Voyage down the Amazon. Caoutchouc is the milky juice of the plant, which exudes on incisions being made, and solidifies on exposure to the air.—*Eng. Cyc.*

SIR, also Sar. Hind. The head. Hence Sardar, a chief; Sir-pesh, a forehead jewel; Sir-kar, a government, a superintendent; Sar-posh, a cover. Sar-band, or head-binder, becomes with the Turks turband. Sir, in Pushtu, a peak.

SIRA, a municipal town in the Tumkur district of Mysore, in lat. 13° 44′ 43″ N., and long. 76° 57′ 16″ E. A large proportion of the inhabitants are Kurubar, who manufacture cumblis or coarse blankets.

SIRAF. Arab., Hind., Pers. A banker, a money dealer, a cashier. It is from the Arabic.

SIRAJGANJ, a town in the Pabna district, Bengal, and the most important river mart in the province. It is situated near the Jamuna or eastern stream of the Brahmaputra, in lat. 24° 26′ 30″ N. and long. 89° 47′ 5″ E. It formerly stood upon the bank of the Jamuna; but in 1848 an excessive flood of the river washed the entire town away. The traders thereupon retreated some 5 miles backward to the new bank. Scarcely a warehouse stands on the river's brink, nor a tree to afford shelter. Large boats and flats lie anchored in mid-stream; fleets of smaller craft take shelter in the natural bends of the river; while the merchants and brokers move to and fro in light dinghis, to conduct their transactions on the spot. The principal native merchants are Marwari, locally known as Kaya, who are immigrants from Rajputana. They are described as honest, frugal, and diligent, but quite uneducated.—*Imp. Gaz.*

SIRAT. Arab. In Muhammadan belief, a bridge over which all must pass on the day of judgment. It is said to extend over the midst of hell, and to be sharper than the edge of a sword. In moving along on it the feet of the infidel will slip, and he will fall into hell fire, but the feet of the Muslim will be firm, and carry him safe into paradise. See Bridge.

SIRENIA. Zeiren, Gr. Herbivorous cetacea, a sub-order of the Cetaceæ, as under:—

Order. Cetaceæ, Whale tribe. 2 fam., 8 gen., 21 sp., viz.—
Fam. Delphinidæ, 5 gen., 14 sp., porpoises; Delphinus, 8 sp.; Steno, 2 sp.; Neomeris, 1 sp.; Platanista, 2 sp.; Globiocephalus, 1 sp.
Fam. Balænidæ, whales, 4 gen., 7 sp.; Balænoptera, 1 sp.; Balæna, 4 sp.; Physeter, 1 sp.; Phocæna, 1 sp.
Sub-Order. Sirenia, herbivorous cetacea. Gen. Halicore, 3 sp.

SIRGUJA, a mountainous tract rising 600 to 700 feet above the level of Chutia Nagpur. Chutia Nagpur is the country on the eastern part of the extensive plateau of Central India, on which the Koel, the Subunreka, the Damuda, and other rivers have their sources. It extends into Sirguja, and forms what is called the Upar-ghat or highland of Jashpur, and it is connected by a continuous chain of hills with the Vindhyan and Kymor ranges, from which flow affluents of the Ganges, and with the highlands of Amarkantak, on which are the sources of the Nerbadda. The plateau averages 2000 to 3000 feet above the level of the sea, with an area of about 7000 square miles. It is on all sides difficult of access. It is

a well-wooded, undulating country, diversified by ranges of hills, and has a genial climate. The population in 1866 was estimated at about a million, and is formed of a number of non-Aryan tribes who had fallen back to that refuge from the plains, more than half of them being the race known to Europeans as Kol. There are 21 mahals which form the S.W. frontier, and which may be thus classified :—

The Sumbulpur Group.

Sumbulpur pro-	Sukti.	Bamra.
	Gangpoore.	Rehra Cole.
	Surunghur.	Sonepore.
	Bunnia.	

The Patna Group.

Patna proper.	Bora Samur.	Bindra Nowa-
Koolihur.	Kuttiar	garh.

The Sirguja Group.

Sirguja proper.	Udeypore.	Chang Bahar.
Jushpur.	Korea	

Singbhum.

The territories comprised in the Sumbulpur and Patna groups were ceded to the British Indian Government by the treaty of 1803 with Ragoji Bhonsla. They were all, except Raigarh, restored in 1806, but finally reverted to the British in 1826. The Sumbulpur and Patna groups are in the circle of the Cuttack Tributary Mahals. Singbhum was never Mahratta, and in 1857 its chief, the raja of Purahat, joined in the rebellion, many of the Larka Kol following him. The territories forming the Sirguja group were ceded in 1817, and in 1818 the British Government sent a superintendent to Sirguja to restore order in the country, which had become distracted by domestic feuds. In 1820 and 1825, engagements were made with the chief of Sirguja. In 1819 engagements were also taken from the chiefs of Jashpur and Korea, of which latter state Chang Bahar was then a feudal dependency; but in 1848 separate settlements were made with Korea and Chang Bahar. The Sirguja mountains are [illegible] length 90 miles, breadth 85 miles, and lie [illegible] lat. 22° 34′ and 24° 54′ N., and long. [illegible] 84° 6′ E. Sirguja is rugged and [illegible] from 500 to 600 feet above the [illegible] land of Chutia Nagpur. Dra[illegible] between Kunher and Rhern, with [illegible]2° 40′ and [illegible] mountainous, [illegible]c. Sea adjoining table- [illegible]ined by the rivers [illegible]its feeder. — *Major* [illegible] *Administration*; *Aitche-* [illegible] Kol; Saont; Singbhum.

[illegible]R, in Hazara district, Panjab, a [illegible] Indus. Rises at the head of the [illegible]en, in lat. 34° 46′ N., long. 73° 19′ [illegible]n fish, especially the mahsir. The [illegible] call the Sirhan their female slave, [illegible]heir fields, grinds their corn, husks [illegible] cleans their cotton. Numerous [illegible]ank.—*Imp. Gaz.*

[illegible]the capital of a province of that [illegible]a town in the state of Patiala. Its [illegible] described by Abul Fazl as laid out [illegible]ahmat, a grandee of Humayun's court. [illegible]in Sirhind, on the route from Kurnool [illegible]a, was the object of one of Mahmud [illegible]conoclastic expeditions. It is still [illegible] a ruined wall evidently once of [illegible]ht, connected with which is a [illegible]merous towers. Sirhind [illegible]rth-east portion of the [illegible]en the rivers Jumna [illegible]British districts of Ambala, Ludhiana, and Ferozpur, together [illegible] the Native States of Patiala, Jheend, and N[illegible] This tract comprises the whole watershed of [illegible] now deserted stream which once formed the gr[illegible] river Saraswati. In 1882, during the administra[illegible] tion of the Marquis of Ripon, a canal was completed designed to irrigate 2500 square miles, 750,000 acres of thirsty soil. It passes through the territory of several native chiefs, as well as through what is directly under British administration. They all gave active co-operation, ranging themselves alongside of the Imperial Government in the efforts it makes for the amelioration of the poverty that presses with terrible severity upon large classes of the Indian populations. The total length of the canal was 502 statute miles; and when the works were completed, 2500 miles of channel were to be maintained. The canal was designed to irrigate, through branches, 5[illegible],000 acres in British, and 261,000 acres in Native States. The total cost was estimated at [illegible] lakhs, of which 278 lakhs were being advanced by the British Government, and 129 lakhs by the Native States.—*Cal. Rev.*, Jan. 1871.

SIRI, Sri, or Siris was [illegible] of the principal deities of Arabian [illegible] Ethiopian theologies. Deodorus says the Greek [illegible] as O, and made it Osiris.

SIRI, the ancient nam[illegible] capture in A.H. 587, [illegible] p. 326.

SIRI. MALAY [illegible] betel. Amo[illegible] are in forms [illegible] spective ow[illegible] were exhib[illegible] the raja Mu[illegible] treasurer, a[illegible] war and poli[illegible]

SIRIKUL[illegible] the Pamir pla[illegible] [illegible] Wood to be the sou[illegible] Oxus. It is about 14 miles [illegible] in breadth. The surrounding mountains are covered by perpetual snow.—*Tr. C. As.*

SIRIPUL, a town in Afghan Turkestan, 100 miles S.W. of Balkh, with about 18,000 souls, in houses and tents, mostly Uzbak. The chief is an Uzbak.—*MacGregor*, p. 645.

SIR-KAP, part of Taxila. Hatial is a strong fortified position on the west end of a spur of the Margala range, and immediately to the north-east of the Bir mound, from which it is separated by the Tabra Nala. The fortified city of Sir-kap is situated on a large level mound immediately at the north foot of Hatial, of which it really forms a part, as its walls are joined to those of the Kot or citadel.—*Cunningham's India*, p. 115.

SIRKELE, the minister of the Puducottah State, ruled over by the Tondaman raja.

SIRKI and Kanna, stems of Saccharum munja and of Saccharum sara; also thatch made of the tapering top of the flower-stalk of munj grass.

SIR KOTAHA. HIND. Level land; sir cultivation, on the plains, means the land that a man retains for his own individual cultivation.

SIRMUR, one of the Sub-Himalayan hill states, under the government of the Panjab, frequently called Nahan, from the name of the chief town. In 1803, the country was brought into subjection by the Gurkhas, who in turn were expelled in

by the British under Sir David Ochterlony. height of the trigonometrical station on the r mountain on the northern frontier is 11,982 t, and that of the confluence of the Giri and umna on the southern frontier about 1500 feet above sea-level. The Raja Ban forest yields much sal timber. A sportsman finds difficulty in making his way through them in search of wild elephants, tigers, leopards, bears, and hyænas, with which they abound. Wild pea-fowl abound, and are sacred. The Kanet, a Rajput tribe, are per cent. of the population; they purchase their wives and widows re-marry. In recognition of the services rendered by Raja Shamshir Purgass during the mutiny, he received a khilat of Rs. and a salute of seven guns. Population, ; revenue, 1 The raja is bound to render feudal service. Some women are to be in form and feature, but to the forward the female countenance is generally good-humoured, but the form coarse.—*Drew's Jammoo Mountains*, p. 35.

SIRNA, sanctuary, in all ages and countries the rights of sanctuary have been admitted, and however they may be abused, their institution arising from humane motives. To check the impulse of to shelter the weak from objects, and the surest test ce is the extent to which remotest times sirna lege of Rajputs, refuge Moses, after lands of six slain unintentionally, for until he stood or until the

ch event appears to have been considered as the termination of revenge. In India the infraction of political sanctuary (sirna torna) often gave rise to the most inveterate feuds, and its abuse by the priests was highly prejudicial to society. Moses limited priestly interference, by appointing but six cities of refuge to the whole Levite tribe; but the rana of Mewar assigned more to one shrine than the entire possession of that branch of the Israelites, who had but 42 cities, while the god Kaniya had 46. The motive of sanctuary in Rajasthan may have been originally the same as that of Moses, but the privilege was abused, and the most notorious criminals deemed the temple their best safeguard. Yet some princes were hardy enough to violate, though indirectly, the sacred sirna. Zalim Singh of Kotah, a zealot in all the observances of religion, though he would not demand the culprit, or sacrilegiously drag him from the altar, forced him thence by prohibiting the admission of food, and threatening to build up the door of the temple; and the Greeks evaded the laws, and compelled the criminal's surrender by kindling fires around the sanctuary. There was an ancient law of Athens by which he who committed 'chance-medley' should fly the country for a year, during which his relatives made satisfaction to the relatives of the deceased. The Greeks had asyla for every description of criminals, which could not be violated without infamy; but Gibbon gives a memorable instance of disregard to the sanctuary of St. Julian in Auvergne, by the soldiers of the Frank king Theodoric, who divided the spoils of the altar, and made the priests captives, an impiety unsanctioned by the son of Clovis, and punished by the death of the offenders, the restoration of the plunder, and the extension of the right of sanctuary five miles around the sepulchre of the holy martyr. Within the sacred bounds of Mount Abu was the sanctuary (sirna) of Kaniya, where the criminal was free from pursuit.—*Tod's Rajasthan*, i, pp. 523, 526, ii, pp. 378, 551. See Bast; Sanctuary.

SIROCCO. The sirocco wind in the Mediterranean has little effect on the healthy, but the weak and diseased are materially injured by its depressing influence. The term has an Arabic origin from Sharq, the east wind.

SIROHI, a Native State in Rajputana, lying between lat. 24° 22' and 25° 18' N., and long. 72° 22' and 73° 18' E. Area, 3000 square miles; population, 158,000. The Banas, rising in the Aravalli Hills, flows through the State into Gujerat, and after passing the cantonment of Deesa, is finally lost in the Runn of Cutch. The people comprise the Banya and Mahajan class of the Oswal and Porewal, following the Jain faith. The Rajputs are the dominant race, their septs or clans are Deora, Chauhan, Sesodia, and Rahtor. But Kalbi, Rebari, and Dher are numerous; and also aboriginal Bhil, Grassia, and Mina. Grassia are principally in the bhakar or hilly tract in the S.E. corner of the Sirohi. They claim to be the descendants of Rajputs married to Bhil women. There are some Koli, who are believed to have immigrated from Gujerat. Rao Sheo Singh, with whom the British Government concluded a treaty in 1812, was called to power, in 1818, by the unanimous voice of the chiefs, who had deposed and imprisoned his elder brother Oudeybhan-ji tyranny and oppression. Maharaja Man Singh ur, who laid claim to supremacy over force in 1819 to liberate Oudeybhan-d; and Oudeybhan-ji continued his death, without children, in for disturbances incident on the of Jodhpur Rao Sheo Singh craved the Sirohi, sent Government ji, but he fail Gover in confinement til 1847. During the Jodhpur invasion, protection of the British made over to the British some lands on Mount Abu for of a sanatorium, but fettered b that no kine should be killed. O sions he was requested to cancel but he always refused. The rao d in the mutinies, in consideration o ceived a remission of half his trib been fixed at Rs. 15,000, to Rs. 750 ceived the right of adoption and guns. In 1868 it was discovered Sirohi and in Marwar the practice of burying alive, prevailed to a considera but confined almost entirely to persons stage of leprosy, by whom it was pract an end to their sufferings. His High proclamation declaring that Samadh and that any one assisting at would be liable to impris years, and that the ja took place would be l and the forfeiture of

through whose culpable neglect a case might occur, would also incur the same liability.—*Treaties*, iv. p. 157.

SIRONCHA, lat. 18° 51′ N., and long. 80° 1′ E., in the Central Provinces, is the headquarters station of the Upper Godavery district, pleasantly situated on the left bank of the Pranhita, two miles above its confluence with the Godavery, and 120 miles S.S.E. of Chanda, the nearest station of the Central Provinces. It is 520 feet above the sea-level according to the topographical survey maps. 40 miles above Sironcha occurs what is known as the third barrier.

SIROPA, the Rajput term for a khillat or robe of honour; properly Sir-a-pa (from head, Sir, to foot, Pa), and means a complete dress; in short, cap-à-pie.—*Rajasthan*, i. p. 265.

SIRPHERRA, a tribe who reside in summer in Gurghina and winter in Cutch Gandava.

SIRR. Salt lakes of the Indian desert are termed sirr, though none are of the same consequence as those of Marwar. The largest is at the town of Sirr, so named after the lake, which is about six miles in circumference. There is another at Chaupur about two miles in length. Although each of them frequently contains a depth of four feet of water, this entirely evaporates in the hot winds, leaving a thick sheet of saline incrustation. The salt of both is deemed of inferior quality to that of the more southerly lakes.—*Tod.*

SIRSA, a British district in the Panjab, lying between lat. 29° 13′ and 30° 40′ N., and long. 73° 57′ and 75° 23″ E.; when conquered by the British in 1803, it was found almost entirely uninhabited. The Bhatti were lords of the soil, but they tilled little, and only used it as a site for their scattered forts, from which bands of marauders made occasional raids into the surrounding regions. Sirsa is entirely dependent for its harvests upon the scanty rainfall; it is peculiarly liable to famine. The Bhatti are graziers, and are still predatory. Other races are Jat, Banya, Arora, and the Muhammadan Waller and Kharal.—*Ann. Ind. Ad.* xii.

SISTER is a term applied to cousins, and in such degrees inter-marriages occur. Indeed, a Muhammadan claims for his bride, by right, the daughter of his mother's brother. The polygamic Israelites seem, from Genesis xx. 12, 13, and Esther ii. 3, also Genesis xi. 29, and xxiv. 4, to have held these views; but eastern nations in general shrink from calling their wives sisters, as Abraham called Sarah, Genesis xx. 12, 13, and he was suitably rebuked for his impropriety.—*Hind. Theat.* ii. p. 314.

SISUNAGA, a Maghadha dynasty, which ruled in India from B.C. 691 to 395. These are dates given by Mr. Fergusson, who says Sakhya was born B.C. 623, in the reign of Bimbasara, the fifth king of the dynasty, and died B.C. 543, at the age of 80 years, in the eighth year of Ajata Satra, the eighth king. They are said to have succeeded the parricide Battya kings, B.C. 446, by the murder by Sisunagaga of the last Bhatti. This was brought about by a learned Brahman named Chanacya, through whose intrigues Chandragupta was raised to power.

Sisunagaga, ...	reigned	18 years,	B.C. 446
Kalasoka, ...	,,	28 ,,	,, 428
Bhadyasena and his 9 brothers,	,,	22 ,,	,, 379

The last brother, Pingamakha, was dethroned by Nanda.—*Fergusson*, p. 14. See Bhattya.

SISYMBRIUM ATROVIRENO. Ting-lih, CHIN. A plant of several parts of China, given in dropsy, fevers, amenorrhœa. Sisymbrium iris, Khub, Kalan, Khakshi, HIND. Small, oval, bright-yellow seeds. Used for coughs. Formerly used as a pot-herb in England.—*Powell.*

SITA, daughter of Janaka, king of Kosala, and wife of Rama. Rama was the son of Desaratha, of the Solar race, king of Ayodhya, now termed Oudh, a potent sovereign of Hindustan, who, having been banished by his father in consequence of the machinations of his queens, retired to the banks of the Godavery, accompanied by his brother Lakshmana and his wife Sita, and lived in the neighbouring forests the austere and secluded life of an ascetic; but Sita having been forcibly taken from him by Ravana, the king of Lanka (Ceylon), Rama, with the aid of Sugriva, the sovereign of Carnata, invaded the kingdom of Ravana, and, having conquered him, placed his brother on the throne of Lanka in his stead. The war seems to have been protracted, and its events are related in the Ramayana, one of the finest epic poems (in spite of many extravagances) extant, which beautifully describes the incidents of Rama's life, and the exploits of the contending foes. Sita was highly loved by her husband, who says she gave him excellent counsel, and his impatience without a murmur to him in the time of need, and of joy. The Uttara-Kanda his wife on her own oath gods as to her purity. the Uttara-Rama-Charita the fire ordeal. This is who took back his wife years with Paris.—*Ward*

SITABALDI, lat. 21° E., in Berar, a large s Mean height of the plain Sitabaldi, standing close consists of two eminences narrow neck of ground, about 300 yards in length, of considerably lesser elevation than either of the two hills. The whole surface is rock. It is near to the town of Nagpur, and a battle was fought near Sitabaldi, 26th and 27th November 1817, and won by the British.—*Schl. Ad. S.*

SITAKUND, highest peak in the Sitakund range, Chittagong district, Bengal, a sacred hill, 1155 feet above sea-level; lat. 22° 37′ 40″ N., long. 91° 41′ 40″ E. It has a hot spring, said to be bituminous, and is a great place of pilgrimage for Hindus from all parts of India. The principal gathering is the Siva Chaturdasi festival, on the 14th day of the moon, sacred to Siva (usually in February); it lasts about ten days, and is attended by from 10,000 to 20,000 devotees. The pilgrims live at lodging-houses kept for the purpose by Brahmans, called adhikaris, each of whom is said to realize from £300 to £400 during this feast. A meeting of Buddhists (chiefly hillmen) takes place on the last day of the Bengali year, at a spot on Chandranath Hill, where the body of Gautama, the last Buddha, is locally reported to have been burned after death. Bones of deceased relatives are brought here, and deposited in a pit sacred to Gautama.—*Imp. Gaz.*

SITAKUND, an oblong tank, about 100 feet long by 50 feet wide, excavated in the Mandar

Hill, Bhagulpur district, Bengal, nearly 500 feet above the surrounding plain. The pilgrims who visit it are persuaded that Sita used to bathe in it during her stay on the hill with her husband when banished from Oudh.

Sitakund, a hot spring, is two or three miles from the town of Monghir, and one of the sights of that pleasant and picturesque station.

SITAL SINGH, moonshi to the raja of Benares, author of a history of the various Hindu sects.

SITANA. Below Derbund lies the district of Sitana, about 15 miles north of Torbaila, [illegible] the base of Mahaban, and on the bank of the [illegible]. The Syuds of this place are the remn[illegible] of the followers of Syud Ahmad, who, gathe[illegible] a handful of Gazee (warlike devotees) f[illegible] various parts of India, raised a formidabl[illegible] band in Peshawur. After winning [illegible] Peshawur and Yusufzai, the Syud was eventually slain in the mouth of the Kaghan glen by Sher Singh, the son of Maharaja Runjit Singh. Many of his adherents, chiefly foreigners to the Punjab, dispersed, and the remainder settled at Sitana, on the slopes of the Mahaban. They were [illegible] attacked by the British in 1858 [illegible] under Sir S. Co[illegible] *Papers, East India, Afghan[illegible]* p. 20.

[illegible] Burma, rises in lat. [illegible] E., runs [illegible] the Chir[illegible] 120 miles; [illegible] 40 [illegible] It is a navigable river for [illegible] ns the boundary between [illegible] s and Pegu. Its valley [illegible] The whole extent of the [illegible], of which one-half lies [illegible] ces of Pegu and Martaban, separates Pegu from [illegible] o a broad estuary, 55 [illegible] e. It consists of hard [illegible] by narrow but deep [illegible] ch the tide rushes with [illegible] e form of a bore, which advances like a wall, broken into foam at the top, filling the river from bank to bank. In the dry season, the tide is felt as high as Mūn.—*Findlay.*

SITANUK, one valve of a mussel shell, with the dried fish attached. The Punsari of Ajmir call it 'the small head of a sea animal;' used in Ajmir as an aphrodisiac, and also said to cure the cynanche of children; comes from Bombay via Pali. One seer costs two rupees.—*Gen. Med. Top.* p. 132.

SITAR or Sitara, a musical instrument similar to the cither, supposed to have obtained its name from the Sih-tara, the three-stringed, and believed to be the source of the word guitar. Ek Tara, when with one steel wire; sometimes it has nine or eleven steel wires; but generally three, whence its name. See Kemanchi.

SITONA, a species of this genus of insects is one of the most destructive in Indian granaries, attacking poppy seed, maize, millets, wheat, barley, and rice. It is about one-eighth of an inch long, and of a pale-chesnut colour.

SIVA, a Hindu deity, the object of worship of the Saiva sect, which is the most numerous of all the Hindu sectaries. Nearly all the Rajput races, most of the Hindus in the valley of the Ganges, and three-fourths of all the Hindus of the south of India, worship Siva in some of his emblematic forms, the most received of which is that of the lingam. Magnificent temples have been erected to him all over British India, to each of which from thousands to hundreds of thousands of pilgrims annually resort. Those in the Madras Presidency, at Conjeveram, Jambukeswara, Tirunamale, Chedambara, and Kalahasti, are the most celebrated. Siva and his worship are confined to British India, where the name is variously pronounced and written Siva, Shiva, Sivin, Seo, Sheo, Shev, Seb, Shiu, Shib, Shivu, and Chiva, and there is mention of this god in the book of Amos (v. 25-27). 'Have ye offered unto me sacrifices and offerings in the wilderness forty years, O house of Israel? But ye have borne the tabernacle of your Moloch and Chiun your images, the star of your god, which ye made yourselves. Therefore will I cause you to go into captivity beyond Damascus.' And it is evident from this that even then, B.C. [illegible] the emblem under which Siva is still worshipped, and the marks which his followers put on their foreheads, were both well known. About 300 years B.C. the pantheism of the Vedas became transformed into the respective symbolic embodiments of Siva and Vishnu, and, in later times, Siva has since been accepted as the same with the Vedic deity Rudra. Siva is a god unknown to the Vedas; the name is a word of not infrequent occurrence in the hymns, indeed, but means simply propitious; not even in the Atharvan is it the epithet of a particular divinity, or distinguished by its usage from any other adjective. As applied to him whose title it has since become, it seems one of those euphemisms so frequent in the Hindu religions, applied as a soothing and flattering address to the most awe-inspiring god in the whole pantheon.

Siva is mentioned by Bardasanes, a Greek author, as worshipped in a cave not far from Peshawur in the early part of the third century. The worship of Siva seems to have been introduced into India about the beginning of the Christian era, and apparently came from the west, and embodied the sun-worship and the physiologial philosophy of Baal. Colonel Tod tells us that there are numerous temples in Rajasthan of Baalim; and that Balpur (Mahadeo) has several in Saurashtra, all representing the sun.

One of the great teachers of the Saiva sect was Sankaracharya, A.D. 850. He was born in Malabar. He extended his teachings to Kashmir and Kedarnath, where he died at the early age of 32. He wrote in Sanskrit many religious works, and has exercised a great influence on the religion of the people of India. He had ten disciples, and the appellation Das-namah, applied to the ten Saiva sects, has reference to their names. Of these, six and a half sects have fallen away from Sankara's doctrines. They are called Atith, from 'a tita,' passed away from worldly cares. They are still religious mendicants, are frequently collected in maths or monasteries, but they are not ascetics, as they use clothes, ornaments, and money, carry on trade, accumulate property, and mix in the business of the world.

The Dandi of Sankara, three and a half in number, are compelled to retain his doctrines in a pure form. The doctrines of the Dandi and of the Atith are those of the Vedanta system. What the Sri-Vaishnava are to the Vaishnava

sects, that the Dandi are to the Saiva sects; and what Ramanand was to the Sri-Vaishnava, that Gorakhnath was to the Dandi.

The attributes of Siva are many. He is named Isa or Iswara, Rudra, Hara, Sambhu, Mahadeva, Mahesha. Siva is Time, the Sun; he is Fire, the destroyer, the regenerator. His consort Parvati, a mountain nymph, is the symbol of created nature, and in that character named Prakriti. As the deity presiding over generation, his type is the linga, which is the phallic emblem of Egypt, Greece, and Rome. As the god of justice, which character he shares with Yama and other deities, he rides a bull as his vahan, the symbol of divine justice. He holds, as his commonest attribute, a trident, called trisula, in this and in some other points resembling Neptune. His colour, as well as that of the bull, is white, and his hair of a reddish colour. He is sometimes represented as with two, four, eight, or ten hands, and with five faces. He has a third eye on his forehead, pointing up and down, a distinction peculiar to him. As Mahadeva, he is abundantly decked with serpents, emblems of immortality, and common ornaments to many deities. He is often represented with his trisula or trident in one hand; as also with the pasa, string or rope, also often depicted in the hands of his consort Kali, for binding and strangling incorrigible offenders. Serpents, emblems of eternity, form his ear-rings, called Nag-mundala; his pendent collar of human heads, his Mund-Mala, marks his character of destruction or time; and his frontal crescent points at its most obvious measurement by the phases of the moon. Occasionally, in his hands is represented the warlike mace (Gadha or Parasha), and Mrigu or Sasin, a name for the antelope, given also as an attribute of the god Chandra, the Moon. Frequently Siva's loins are seen wrapped in a tiger's skin, and the river goddess Ganga smiles serenely from his Mugut, or headpiece. His sectaries give various explanations and comments on these symbols.

Siva is principally worshipped under the form of the linga. Some of these lingams, usually of basalt or dark-coloured greenstone, are of an enormous size; but they are also made, morning and evening, of clay of the Ganges, and after worship are thrown into the river. The linga is never carried in procession. The temples dedicated to it are square Gothic buildings, the roofs of which are round and tapering to a point. In many parts of Hindustan they are more numerous than those dedicated to the worship of any other of the Hindu idols, as are the numbers of the worshippers of this symbol beyond comparison more extensive than the worshippers of the other deities or their emblems. The Binlang stone is also sacred to Siva. In the temples erected in honour of Siva, the officiating Brahman, after bathing in the morning, enters the temple and bows to Siva. He anoints the image with clarified butter, after which he bathes the image with water which has not been defiled by the touch of a Sudra, nor of a Brahman who has not performed his ablutions, by pouring water on it, and afterwards wiping it with a napkin. He next grinds some white powder in water, and, dipping the ends of his three forefingers in it, draws them across the linga, marking it as the worshippers of Siva mark their foreheads. He next sits down before the image, and, shutting his eyes, meditates on the work he is commencing; then places rice and durva grass on the linga; next a flower on his own head, and then on the top of the linga; then another flower on the linga; then others, one by one, repeating prayers. He then places white powder, flowers, vilva leaves, incense, meat offerings, and a lamp before the image; also some rice and a plantain. He next repeats the name Siv, with some forms of praise, and finally prostrates himself before the image.

On the 14th of the increase of the moon in Phalguna, in the night, a vigil in honour of Siva is kept at his temple, the image is bathed four times, and four separate services are performed during the night.

The temples of Siva in most parts of India are small, and with one chamber, in the centre of which stands a linga, usually of white or black stone; but occasionally 12 such temples, or even up to 108, are arranged immediately adjoining, in a group. Yet these temples are little resorted to by votaries; they are regarded with comparatively little ven[illegible] by the Hindus, and flowers and fruit ar[illegible] with little solemnity before the ima[illegible]ception to this is the temple of [illegible]ares, which is thronged with[illegible] of admirers. Along the[illegible] the worship of Siva is no[illegible] popular condition of th[illegible] is only in the south of[illegible] possess popular legends [illegible]

The worship of Siva is a[illegible] and his consort, in the for[illegible] the dread agents for the[illegible] The opposing worshipp[illegible] long desolated India with[illegible] Krishna appears to have[illegible] the Saiva and Indra sects.[illegible] be given to the Hindu legends, Ravana, who reigned over Ceylon and the southern part of the Peninsula at the time of Rama's invasion, was the head of a civilised and powerful state, a Hindu follower of Siva. The Hindus who worship both Siva and Vishnu are of the sect of Bhagavat Sampradai, or devotees of a two-fold deity, these being ordinarily the lingam and yoni as emblems of Siva and his sakti (Devi), and of Krishna, of the Yadu form, with Lakshmi. Vaishnava Brahmans will never worship Siva nor any emblem of that deity, nor even enter his temple, nor fast on the days of Siva's fast days. Saiva sectarians, generally, worship all deities; they are, in truth, polytheists. But the Vira-Saiva Lingaets, and Smartta Brahmans, and those who recognise the Rig Veda, do not worship at the Vaishnava temples. The period of sectarian intolerance is now past or in abeyance; and, as far as observation goes, the worshippers of Vishnu, Siva, and Buddhists view each other without malignity; which feeling appears never to have influenced the laity of either sects, who are uniformly respectful to the ministers of other religions, whatever be their tenets.

Siva, from the legendary destruction of the three cities of a demon, is named Tripura or Tripura-sura, the supposed origin of the modern Tiperah. Siva is represented with three eyes; hence his

title of Trinitira and Tri-lochun, and in this form he is the Tri-ophthalmic Jupiter of the Greeks. From the fire of the central eye of Siva is to proceed Pralaya, or the final destruction of the universe; this eye is placed vertically, resembling the flame of a taper, is a distinguishing mark on the foreheads of his votaries, the eye in the forehead being one peculiar characteristic of Siva and of his consort, when armed with his terrors. This third eye is said to have burst from his forehead on an occasion when his wife playfully placed her hands over his eyes whilst he was engaged in austerities in the Himalayas. With [illegible] he reduced Kama to ashes for daring to inspire [illegible] motous thoughts of Parvati whilst engaged in [illegible] penance, and by his glance the gods and all created [illegible] beings were destroyed at one of the periodical [illegible] destructions of the universe.

The second of Vishnu's ten great avatars or [illegible] incarnations was in the form of a tortoise, and [illegible] those called the Kurma avatara, the principal [illegible] incident in which was churning the ocean with [illegible] the mountain Mandara, the huge serpent Sesha [illegible] serving as a rope to wind the mountain round [illegible] himself, and Vishnu, in the shape of a tortoise, [illegible] sustained the [illegible] The result was fourteen [illegible] kinds of [illegible] genus or Chaodh ratni [illegible] (Nirless ratna), and one of [illegible] but [illegible] and Siva drank [illegible] retained his azure neck. [illegible] very popular gives the [illegible] name the epithet Nila- [illegible] is a name of Siva. [illegible] now not an uncommon [illegible], as is that of the deity, [illegible]

[illegible] of the linga in the [illegible] other periods in which [illegible] shipped under different [illegible] to be seen in numbers, [illegible] streets of Calcutta, after the festivals in honour of Siva, to be cast into the river. In the month Phalguna he is worshipped for one day as a mendicant. On the following day the images of him, with a bloated countenance, matted locks, and inflamed eyes, are carried in procession, attended by a large concourse of people, dancing, singing, and playing on various instruments, and thrown into the river. In the month of Mughut there is another festival in honour of him, called Hari Gauri, in which he is represented riding on a bull, with Parvati on his knee. But the most celebrated occasion of his worship is in the month Choitru, at the time that the ceremony of the Charkha, or swinging by hooks fastened in the flesh of the back, is performed. This festival derives its name (Charkha or Chakra, a wheel or discus) from the circle performed in the swinging part of it, that terminates the ceremonies, which should properly last a lunar month; but the term is now much shortened, and the observances of it are limited to the followers of Siva. The higher classes do not engage in it, although they contribute towards the expense of, and countenance it. The initiatory ceremonies of purification, abstinence, and exercises of devotion take place several days before the commencement of the rites, during which time the sanyasis, or worshippers, form themselves into parties, and wander about the streets with horns, drums, [illegible] a most intolerable and horrid [illegible] exhibition is that of suspension, which is [illegible] formed by two posts being erected, on the [illegible] of which is placed a strong bar, from which the sanyasi or worshipper is suspended by his [illegible] over a fire, kindled beneath him, into which rosin is occasionally cast. His head is often completely enveloped in the smoke, though sufficiently high to be beyond the reach of the flame. On the following day the sanyasis dance and roll themselves upon the beds formed of various descriptions of prickly plants. Their next ceremony is called the Jamp Sanya, or jumping on a couch of pointed steel, which has been thus described. A bamboo scaffolding of three or four stages is erected, on which the sanyasis stand, tier above tier, the principal and most expert occupying the upper row, which is sometimes between 20 and 30 feet high. A bed of bedding, supported by ropes, is stretched beneath the scaffolding by a number of men. Upon the mattress are attached several bars of wood, to which are fixed very loosely, and in a position sloping forward, semicircular knives, upon which the sanyasis throw themselves in succession. In general, the effect of the fall is to turn the knives flat upon the bedding, in which case they do no harm; but occasionally severe wounds, and even death, are the consequences of this rite. When they take their leap, the performers cast fruits, such as cocoanuts, betel, plantains, etc., among the crowd, on which there is a great scramble for them, as they are supposed to possess much virtue. Women desirous of progeny are very anxious to get these donations, and those of the first families send persons to obtain and bring them for their private eating. The ensuing day is spent in revelling and dancing among burning ashes, and afterwards casting them at each other. On the following day they again infest the streets, attended by music. Cruel rites are now forbidden.

Every Hindu has a sect mark on his forehead, of white earth, red ochre, sandal-wood, or ashes. The worshippers of Vishnu place the mark perpendicularly, and two perpendicular lines and a dot between denotes a worshipper of Vishnu as Rama or Krishna. The worshippers of Siva mark horizontally. Any conical or triangular mark is a symbol of the linga.

One distinguishing mark of the faith of Siva is a crescent on the forehead. With his ascetic devotees the hair is braided, and forms a tiara round the head, and with its folds a chaplet of the lotus seed is often entwined. They smear the body with ashes, and use garments dyed of an orange hue. They bury their dead in a sitting posture, and erect tumuli over them, which are generally conical in form. Col. Tod says it is not uncommon for priestesses to officiate at the shrines of Siva. In the south of India, the officiating priests of the Saiva shrines are commonly of the Vira-Saiva, or Jangam, or Lingaet sect, and are designated Aradhya, also Pandaram.

Siva is represented with his person powdered with the greyish-white ashes of burnt cow-dung, termed Vibhuti, which is consequently used in a similar way by all the Saiva and by many of the Vaishnava ascetics. Part of Siva's scanty raiment is the skin of an elephant, or more properly of an Asura or Titan killed by him under

…II, founder of the Mahratta empire, was …d son of Shah-ji. He was born about …627, and was brought up under the care … Condu, a Brahman whom Shah-ji had …n charge of his Poona jaghir. Sivaji's …s were his father's soldiers and predatory …ers, and by the age of sixteen he got …Dadaji's control. He is suspected of …n gang robberies in the Konkan; and he …a band from amongst the Bhil, the Koli, …usi, and the Mahrattas of the Mawals to … of Poona, with whom he surprised the … of Torna (A.D. 1646), a strong hill fort, …W. of Poona. On the death of Dadaji, … possession of his father's jaghir, seized …ill forts, amongst them that of Purandhar …47), and occupied the tract between …and the Neera. Hitherto his acquisitions …n got without bloodshed, but in 1648 he plundered a convoy of royal treasure in the Konkan, and before the court recovered from its surprise at this outrage, it heard that five of the principal hill forts in the ghats had fallen into his hands, and that a Brahman, one of his officers, had obtained possession of Kalian and of all the forts of the Northern Konkan. The Bijapur Government was under the impression that Sivaji was acting by the advice of his father Shah-ji. They therefore seized Shah-ji, threw him into a dungeon, and threatened to build up the entrance unless Sivaji should submit; but on this Sivaji offered his services to Shah Jahan, who appointed him to the rank of commander of 5000, and Shah-ji obtained his release from the dungeon, though for four years, 1649-1653, he remained a prisoner at large within the fortress of Bijapur. No sooner was his father free than Sivaji renewed his plans of aggrandizement. He procured the assassination and seized on the territories of the raja who held the whole of the hilly country south of Poona from the ghats inclusive to the Upper Kistna; and when prince Aurangzéb reached the Dekhan in 1655, Sivaji [illegible] himself recognised as a servant of the Mogl[illegible] Government, and obtained a confirmation of [illegible]ssessions. But when Aurangzeb declared [illegible] the king of Golconda, Sivaji invaded t[illegible]ritories, surprised Juner, and made [illegible]empt on Ahmadnaggur. He [illegible] 1658) on promising to ai[illegible] of horse, a promise whic[illegible] renewed the attacks on [illegible] the commander of the t[illegible] him, Sivaji tendered [illegible] Partabgurh obained a pe[illegible] meeting Sivaji clutched [illegible] called tiger's claws, an[illegible] dagger, and at a signal [illegible] rushed out and slaughte[illegible] Khan's army. He then o[illegible] near the ghats, and took po[illegible] forts. On another army being sent a[illegible]im, he allowed himself to be shut up in the almost inaccessible fort of Panala, May A.D. 1660, from which he at length escaped on a dark night. The king of Bijapur now took the field in person, A.D. 1661, and before the end of a year Sivaji found himself stripped of almost all his conquests; but on the Bijapur king being withdrawn to Carnata for the revolt of Sidi Johar, Sivaji recovered and increased his territories. A peace favourable to Sivaji was mediated by his father Shah-ji, which left Sivaji (A.D. 1662) in possession of a territory including upwards of 250 miles of the Konkan seaboard between Kalian and Goa, while above the ghats its length was more than 150 miles from the north of Poona to the south of Mirich on the Kishna. Its extreme breadth from E. to W. was 100 miles, on which he maintained an army of 7000 horse and 50,000 foot. At the end of 1662, he broke with the Moghuls, ravaged their country near Aurangabad, took their forts near Juner, and occupied the hill fort of Singhar near Poona. Shaistah Khan was sent against him, and occupied Poona, taking up his quarters in the house in which Sivaji had been brought up. Sivaji left Singhar one evening after dark, posted sentries on the road to support him, and went on with 25 Mawali Mahrattas into Poona, where he joined a marriage procession, gained admission

into the house by a back door, and surprised Shaistah Khan in his sleeping room, who received a blow from a sword which cut off two of his fingers, as he was letting himself down from the window to a court below. Shaistah Khan's son and most of his attendants were cut down. Sivaji returned in safety, and reascended Singhar amidst a blaze of torches. This exploit, so congenial to the disposition of his countrymen, is the one of all his actions of which the Mahrattas still speak with the greatest exultation. On this, Aurangzeb superseded Shaistah Khan by sending his son Muazzam and Jeswant Singh. But Sivaji with 4000 horse came suddenly on the rich and defenceless city of Surat, which he plundered at leisure for six days, and carried off his booty in safety to his capital of Rairi or Raigarh in the Konkan. He was beaten off from the Dutch and English factories.

Sivaji was again [illegible] with Bijapur, and carried on his operations chiefly in the Konkan. He embarked with [illegible] men in 87 ships, sacked Barcelore and plundered all the interveaning tract; his ravaged the Bijapur territory, and he led his son on an attack on the Moghul districts. Aurangzeb now superseded Jeswant Singh and Muazzam by Raja Jye Singh and Dilir[illegible] were sent with a large army to [illegible] Jye Singh laid siege to Purandhar, and Sivaji [illegible] up 20 out of the 32 [illegible] her with the territories [illegible] co-operate with Jye Aurangzeb pleased with [illegible] him to court but his humiliating and overbearing and indignation, he [illegible] line of courtiers and reproached Ram Singh [illegible] ordered him to be [illegible] time Sivaji and his son [illegible] guards concealed in baskets, and, [illegible] a horse with his son behind him, he escaped to Muttra, where he put on the dress of a religious mendicant, shaved off his hair and whiskers and rubbed his face over with ashes, and, leaving his son there under the care of a Brahman, he pursued his journey by the least frequented roads to the Dekhan, reaching Raighur in December 1666, nine months after his escape from Dehli. The English factors at Karwar in the Konkan wrote on the 29th September 1666, 'If it be true that Sivaji has escaped, Aurangzeb will quickly hear of him to his sorrow.' In the following year, 1667, Jye Singh failed in an attempt on Bijapur, and he in his turn was superseded by prince Muazzam and Jeswant Singh. Sivaji joined these commanders, his title of raja was acknowledged, his territory partly restored, and a new jaghir was granted to him in Berar. The years 1668 and 1669 were passed in tranquillity, which gave Sivaji time to arrange his government. His army, both horse and foot, was formed in divisions, with a regular chain of officers, from heads of ten, fifty, up to heads of 5000, above which were the generals of the divisions, all regularly mustered and paid by the state, and the utmost economy enforced. His civil officers were all Brahmans, and those of the highest rank were often employed in military commands also. Aurangzeb tried to get Sivaji into his power, but Sivaji turned all the emperor's plans against himself. A[illegible] then ordered an open attempt to seize Si[illegible] peace thus broken, Sivaji's great friend [illegible] fidant, Tanaji Malusri, surprised Sing[illegible] Poona with 1000 Mawali, who escaladed [illegible] at night, though with the loss of their l[illegible] many of their number. Sivaji conferred [illegible] bracelet on each of the survivors: he [illegible] other forts, again plundered Surat, ra[illegible] desh, and for the first time levied the [illegible] fourth share of the revenues, a tax w[illegible] wards formed a prominent feature in [illegible] policy. His progress was almost un[illegible] because of the inactivity of Muazzam a[illegible] bat Khan (A.D. 1671), who considered [illegible] under them insufficient for the country t[illegible] hold. Muazzam remained inactive at A[illegible] and Muhabbat Khan, in an injudicious [illegible] cover a siege in which he was engaged [illegible] body of 20,000 men to a total def[illegible] Mahrattas (A.D. 1672). This was the [illegible] action won by Sivaji's troops, and the [illegible] stance of success in a fair conflict with the [illegible] and Aurangzeb recalled both prince [illegible] and Muhabbat Khan. In the course of t[illegible] A.D. 1673 and 1674, after a succession o[illegible] and sieges, Sivaji made himself maste[illegible] whole of the Southern Konkan, except [illegible] held by the English, Abyssinians, and Po[illegible] and of a tract above the ghats, extend[illegible] to the east than the upper course of th[illegible] He now, 6th June 1674, had himself [illegible] time crowned at Raighur, with all the ce[illegible] of a Moghul coronation, including h[illegible] weighed in gold, and distributing rich pr[illegible] all around him. Mr. Oxenden was the E[illegible] envoy from Bombay to Sivaji, and was pr[illegible] the coronation. At the same time, he cha[illegible] the titles of his principal officers from Persi[illegible] Sanskrit; and while he thenceforth assum[illegible] the pomp of a Mahratta prince, he redoubl[illegible] attention to the duties of his religion, and aff[illegible] greater scrupulosity than ever in food a[illegible] things connected with caste. Soon a[illegible] ceremony the Moghuls made an excursion [illegible] territories. Sivaji retaliated (A.D. 1675) by [illegible] bands into the imperial provinces, plund[illegible] country to the heart of Kandesh and [illegible] even penetrated into Gujerat as far as [illegible] where for the first time his troops cro[illegible] Nerbadda. In 1676, he resolved to re[illegible] father's jaghir in the Peninsula. He fo[illegible] alliance with the king of Golconda, and [illegible] to that fortress with 30,000 horse and 40,[illegible] and it was agreed that he should share [illegible] king all conquests beyond his father's jagh[illegible] the Golconda forces should keep those of B[illegible] check. He crossed the Kistna at Kurnoo[illegible] 1677, proceeded through Cuddapah, and [illegible] close to Madras, presented himself at J[illegible] which he obtained possession, and h[illegible] besieged and took Vellore, Arnee, and [illegible] father's jaghir in Mysore. Hearing of the [illegible] of Golconda by the Moghuls, he left h[illegible] brother Santaji in charge of his new co[illegible] but the king of Golconda had come to a se[illegible] with the Moghuls, and Sivaji, after co[illegible] Adoni and Bellary, returned to Raighur a[illegible] middle of A.D. 1678, from which he h[illegible] absent eighteen months. His brother [illegible] came to a compromise, by which he was [illegible]

ay half the revenue to Sivaji, who himself the places he had con- apur.

Aurangzeb ordered Dilir Khan azzam to make demands on the iment. Its king was a minor, ought the aid of Sivaji, who in- waste the Moghul territory with ary severity. He was thus engaged d intelligence that his son Sambaji the Moghuls. Aurangzeb ordered send Sambaji to the royal camp, d him to return to his father, and by Sivaji and by Bijapur, raised the d. The price of Sivaji's alliance n of the territory between the the Kistna, and shortly after, on 1680, Sivaji died at the age of 53

ous assassination of Afzal Khan le crime. The family was of the Kunbi race, but claimed descent from sore. They admit alike Muhammadans, and Christians as pro- Their cardinal virtues are truth, temper- mercy. Polygamy is prohibited. The founder was Siva Narayan, a Rajput, who flourished about A.D. 1735, in the reign of Muhammad Shah.—*H. H. Wilson*, i. p. 358.

SIVA PUJA is performed by all young Hindu girls in Bengal on the 30th day of the month Choytro, because Siva is regarded as a model husband, and his sakti Durga worshipped him. Krishna in character is supposed to be questionable.

SIVA-RATRI, or Maha Siva-Ratri, a popular festival in honour of Siva, on the 14th of the moon's wane in Magha (January—February). A rigorous fast is observed during the day and night, and Siva is worshipped in the form of the lingam, the priapus of the Romans, and phallus of the Greeks. On the 29th of each month the lingam is worshipped by all Saivites, but in the worship on the Maha Siva-Ratri the many different names of Siva are repeated over the lingam, and a leaf of the Ægle marmelos dropped on it at each name.

SIVASAMUDRAM, lit. Sea of Siva, an island formed by the branching of the Kaveri (Cauvery) river into two streams, each of which makes a series of picturesque descent of about 200 feet in rapids and waterfalls. The island is properly called Heggura, but the name Sivasamudram is derived from an ancient city 12° 6′ N., long. 77° 14′ E.

SIVATHERIUM, from Siva, is a genus of extinct animals of the Giraffidæ. The remains of this genus were found by Dr. Falconer and Cautley in the valley of the Sewalik Hills of the Himalaya. The species are S. giganteum and S. Proscribed. A cranium, lower jaw, bones of the extremities are preserved in the British Museum. The head is nearly as long as the body, the neck is shorter and strong. The posterior portion of the skull is developed, and formed of cells as in the elephant. The face is short, and the nostrils are remarkable for the manner in which the bones are prolonged into a pointed arch above the external nostrils, indicating a trunk or proboscis. The very inclined direction of the front of the face in relation to the triturating surface of the teeth, imparts a physiognomy altogether peculiar. Two horns arise from the brow between the orbits, and diverge from each other, and it is probable that the posterior protuberances of the forehead also supported a pair of short massive horns. When living, the Sivatherium must have resembled an immense gnu or antelope, with a short thick head surmounted with two pairs of horns. The front pair of these horns were small, whilst those behind were probably palmated. The eyes were small, and it had a nasal proboscis, an organ unknown amongst the Ruminantia.—*Mantell, Petrifactions and their Teachings; Jour. As. Soc.; Eng. Cyc.; Falconer's Palæozoic Remains.*

SIVA-VAKYA, the name of a well-known work treating of Siva as the supreme being.

SIVI, son of the king of Usinara near Gandhara. He was famed for his charity and devotion to Siva.—*Dowson.*

SIVIRA or Seoree, a race in Ghazipur, Gorakhpur, Behar, Benares, and Mirzapore, whom Buchanan thinks identical with the Kol and the Cheru.—*Elliot.*

SIWAI. HIND. A quarter more, a title of a Hindu ruler; also, an additional cess of 25 per cent.; properly Sawai.

SIWALIK HILLS, a mountain range which runs parallel with the Himalayan system, from Hardwar on the Ganges to the banks of the Beas (Bias). It belongs to the tertiary deposits of the Outer Himalayas; and it is chiefly composed of low sandstone and conglomerate hills, the solidified and upheaved detritus of the great range on its north. The northern slope leads gently down into the Dehra Doon, a vale between the Himalaya and their outlying Siwalik subordinates. A thick forest of sal and sain clothes the lower slopes, while on the higher crests pine woods indicate a cooler climate. Wild elephants abound; and the fauna in this section also includes tigers, sloth-bears, leopards, hyænas, spotted deer, pigs, and monkeys. The total length of the range from the Ganges to the Beas is about [illegible] miles, and its average breadth about 10 miles. All the great rivers which run at right angles to the Siwaliks —the Ganges, Jumna, Sutlej, and Beas—have worn themselves wide valleys through this chain. The Siwalik Hills [illegible] 5 to 10 miles across, and are a ma[illegible]ower and sandstone hills, [illegible]ost broken up into ravines, [illegible] floods or 'raos' rush in the [illegible]ills which bound the Doon [illegible] 400 to 600 feet.

[illegible] extensive fossil remains [illegible] Falconer and Captain [illegible]manas or monkey tribe [illegible]s of the Palæopithecus, [illegible]acus. One of the carni[illegible]thed tiger, Machairodus [illegible]t, is remarkable for the [illegible]f its canine teeth, and [illegible]on. It has been found [illegible]ay, in the Norfolk forest [illegible]ertiary deposits of Epples[illegible]e Auvergne in France, the [illegible] Italy, the pampas deposits and bone [illegible] of South America, and the upper miocene fresh-water limestones of the Siwalik Hills.

These hills also contain remains of extinct species of the Proboscidea or elephants, various species of Mastodon have lived there, and also in Burma, and also in Armenia, many parts of Europe, and N. and S. America. Dr. Falconer described 13 species of fossil elephants, 9 of which are from India. Amongst these are Elephas ganesa, with tusks 10½ feet long, and it was probably the largest of all the extinct elephants.

One of the ungulata or hoofed animals of the Siwalik, the three-toed miocene ancestor of the horse (the Hipparion or Hippotherium), occurs fossil, and has also been found at Pikermi in Greece, and in France and Germany. Remains of the hippopotamus have also been found in the newer miocene deposits of the Siwalik.

India has also furnished fossil remains of two pigs, the Sus hysudricus and Sus giganteus.

The newer tertiary deposits of the Siwalik also furnished remains of the Sivatherium, a gigantic four-horned ruminant, bearing some resemblance to the living antelope of India. Fossil remains of the camel have also been found there; and, of three extinct species of the ruminant Chalicotherium, one is from India, and one from China, while in the later tertiaries of the Siwalik have been found the heads and horn cores of fossil oxen and antelopes.

In the newer miocene deposits of the Siwalik also have been found the bones of a fossil ostrich, Struthio Asiaticus, and the remains of a huge crane, Argala Falconeri.

The tertiary rocks of India have also furnished remains of alligators, crocodiles, and gavials. Some of the existing species [illegible] extinct Colossochelys atlas [illegible] Falconer in the Siwaliks, exceeds [illegible] chelonian remains. From the pieces [illegible] shell of one has been restored in the [illegible] Museum, and it measures 20 feet in longitudinal and 15 feet in lateral girth.

Mr. W. T. Blanford is of opinion that the [illegible] of the Siwalik Hills belongs to the pliocene formation. In Sind, strata containing [illegible] marine fossils pass up into beds with [illegible] fauna, including some of the older [illegible] such as Mastodon, Chalicotherium, Deinotherium, etc., together with Dinotherium, Hyotherium, Anthracotherium, etc., which have never been found in the true Siwaliks. The Sind beds are apparently equivalent to the Siwaliks, which are unfossiliferous in the typical area. In the Middle and Upper Siwaliks, instead of the old forms just named, elephas, hexodon, cervine, and bovine ruminants in abundance and other recent types, are found. As the Sind beds cannot be older than upper miocene, the typical Siwaliks must be pliocene. The [illegible] (Bubalus) palæindicus, found in the Upper Siwaliks, occurs also in the Nerbadda alluvium associated with palæolithic implements.—*Asiatic Jour.* September 1878; *British Museum Catalogue; Falconer's Palæozoic Remains; Beng. and Roy. As. Soc. Journ.; Imp. Gaz.*

SIYALBET, in Kattyawar, contains the remains of the ancient city of Srilingapura.

SIZE. Siras, GUJ.; Sirisht, HIND. A gelatinous substance, obtained from parchment shavings, fish-skin, and several animal membranes. It is less adhesive than glue, and is used by bookbinders, paperhangers, and painters.

SKAMBHA. SANSK. The Supreme Being. The word means the fulcrum. In this sense it is equivalent of the Arabic Kiblah.

SKANDA, a name of Subhramanya, the Hindu god of war, a six-faced deity. Parvati, the wife of Siva, having produced a son, Ganesa, with [illegible] father, by her intense wishes, Siva, with [illegible] skill, developed Skanda out of his [illegible] consciousness,—or outer substance, [illegible] certainly be stated which. Heaven and [illegible] then cursed by the tyranny of the [illegible] Brahma, Vishnu, and the other deities [illegible] Siva to release them from his thraldom. [illegible] shrank from the task, but promised that [illegible] Skanda should become incarnate for the [illegible] Immediately on conception he was [illegible] Kartikeiya, heavenly virgins, who happened [illegible] that juncture to have descended to the [illegible] sacred tank. While they were bathing [illegible] warm rays of the sun, each one of them [illegible] birth to a son, and they at once departed [illegible] celestial abode. Siva, hearing the cries [illegible] little outcasts, instructed Parvati to nurse and [illegible] rear them. As she hugged them to her [illegible] the six trunks became incorporated in one, and [illegible] the six pairs of hands and feet, and the [illegible]

remained distinct and separate;—hence his other name, Arumugam (six faces). In five years he had completed his course of studies. The following seven years he spent as an ascetic on the banks of the tank which was the scene of his birth. At the age of twelve he collected a thousand hosts of Bhuta or goblins, and sallied forth to conflict with the giant Sura, who had for his defence a hundred thousand hosts of similar goblins, the giant, his two brothers, and his four sons fighting in the forefront of their ghostly battalions. Skanda with one blow of his weapon severed the giant in twain. The separate parts instantly assumed the shapes of a cock and a peacock, and with beak and spur renewed the conflict, only to be re-subdued by Skanda, who mounted the peacock, and has since continued to use it as his chariot, while the cock has remained his warlike emblem and standard. Indra, the god of heaven, rewarded his courage by giving to Skanda his lovely daughter Devani in marriage, while the liberated and joyful inhabitants bowed to him in adorations and worship.

SKANDA PURANA is one of the sacred books of the Hindus. One portion, named Kasi Khanda, of 15,000 stanzas, written prior to the 11th century, describes the Saiva temples in and near Benares. Another fragment, the Utkala Khanda, describes Orissa. The book purports to have been written by Skanda. It is read through once a year in the temples of Siva. Skanda Shasthi, a fast and festival observed in honour of Skanda.—*Dowson.* See Purana.

SKARDO, lat. 35° 20′ 2″ N., long. 75° 44′ E., in Balti, the capital of a province, on the left bank of the Indus. Level of the Indus at the rock Mendok Kar, 7255 feet. In Gilgit, Hunza Nagyr, and all the valleys to the westward, the name Skardo is almost unknown, and the place is called Palor, Balors, Palolo, Balti. It was conquered in 1840, for the Raja Ghulab Singh, by his general Zorawar Singh, with his Dogra troops. The people grow corn, irrigating the land, and using manure. They are fond of out-of-door or manly games. Skardo, or Little Tibet, is a Bhot tract, but the people are Muhammadans. They are strong and hardy; they grow corn and cut water-courses like the people of Rongdo. Skardo is called by the Lamas of Ladakh, Skar-ma-m-do, meaning the enclosed place or the starry place. Iskardo is the Arab-Muhammadan pronunciation, who fail in all attempts to pronounce the double consonant beginning with s, requiring to prefix an i.—*Latham's Ethnology; Adolphe Schlagentweit.*

SKENJEHIL. Pers. A beverage in use with the native Kakims; a syrup of vinegar diluted with water.

SKEWERS, a term by which sailors designate a practice in the Archipelago of transfixing the glans. Dalton says they use copper, the bones of birds and monkeys, and hardwoods. The ceremony, he heard, took place after the birth of the first child; but from subsequent inquiries he found that it is immediately after they have tunnelled or betrothed with a girl; that unless the girl submitted to it, the girl would have nothing to say to him; that they measured the length of the skewers to be used by the length from the knee to the second joint of the woman's third finger; that a great chief often used three, some others one; and that it never seemed to injure them in the slightest degree. The Naga are stated by Fytche (i. p. 350) to wear a ring four to eight lines broad.—*Journ. Ind. Arch.* v.

SKIMMIA LAUREOLA. *Hooker.*

Ner . . . of Jhelum.	Shalangli . . . of Ravi.
Burroo . . . of Ravi.	

A shrub of the N.W. Himalaya. It has been introduced into English gardens, and is greatly admired for its aromatic, evergreen foliage, and clusters of scarlet berries. This plant never bears scarlet berries in Sikkim, apparently owing to the want of sun. The fruit ripens, but is of a greenish-red or purplish colour.—*Hooker; Ste... Gamble.*

skins of young alligators are tanned, converted into leather, and the leather manufactured into boots. They are for sale in many shops in London. The religious Hindu student sits on the skin of an antelope or tiger, and in the south of India the same is used for weddings. Skins were exhibited at the Lahore Exhibition from the hills around Kangra and Simla. The sable from Russia, and the Karakuli lambskins of Bokhara, had been imported. Karakuli are so called from Karakul, a province 20 cos south of Bokhara. They are lambskins with the hair on; as much as [illegible] lakhs' worth are exported to Persia, Tartary, Kabul, and India; other districts of Bokhara produce them, but all are called Karakuli. The soft black lambskins of Karakul are immensely prized for making postins and for coats. They are prepared by taking the skins of [illegible] young lamb's immediately on their being [illegible]. This of course is an expensive method [illegible] skins are proportionately high-priced [illegible].

SKOPTZI. The cerem[illegible] Russian sect of the mutilated (S[illegible] inscribed in a manuscript by [illegible] Metropolitan of Moscow, a[illegible] emperor Alexander [illegible] fully explain the nature of the two [illegible]. The first [illegible] of the Lamb. [illegible] bound to live a life of [illegible] less often happens that this is usually ascribed [illegible] women having broken [illegible] interposition. The [illegible] on the seventh day [illegible] is tied over its eyes, [illegible] over a dish, and a silver [illegible] left side, so as to pierce the [illegible] sect of the Skoptzi then advance in [illegible] suck the child's blood. This is what is called 'the communion of the Blood of the Lamb.' As soon as the ceremony is over, the body is put in another dish full of sugar, where it [illegible] until it dries up; it is then crushed into [illegible] and administered in small cakes to the [illegible] members of the sect as 'the communion [illegible] of the Lamb.'

TIB. A praying cylinder of wood, [illegible] inches long, revolving on an iron [illegible] are wound written prayers and [illegible] lower end of the spindle [illegible] which the cylinder is twirled. [illegible] faster as the praying drums [illegible].

[illegible] Siberica, wild goat or [illegible] 4 feet 3 inches in [illegible] inaccessible rocks, [illegible] are killed in Balti [illegible] forced to descend into [illegible] are snared at night, [illegible] the morning when [illegible] sunk. Their hair [illegible] but the soft [illegible] Asl-Tus, is [illegible] light-brown [illegible] shawls, [illegible] woven [illegible] soft and

delicate texture, much prized for its [illegible]. The term ibex is given in India to several [illegible] of the genus Capra or goats, but Capra [illegible] the Ibex Himalayana, *Blyth*, is the H[illegible] ibex, the Skeen or Sikeen of the H[illegible] the Kyl of Kashmir. These are the name[illegible] male; that of the female in Tibet is L'da[illegible] inhabits Ladakh and Kashmir. A wild s[illegible] ibex, called Paseng by the Persians, o[illegible] Middle and North Asia, but it belon[illegible] genus Ægagrus. See Bovidæ.

SLAID, a Bedouin tribe in Irak. [illegible] cultivators, and have a breed of large wi[illegible] much used in Syria.

Slavery in one form or other exi[illegible] throughout the East Indies. Among all nations slave[illegible] with its accompanying horrors, was the [illegible] of a man's neighbour; but even in the case of an [illegible] conquered in battle, it was by the Egyptians sometimes allowed to stand in place of the triumphant cruelty of slaughter. The Israelites had learned the evils of slavery from [illegible] groaned under it themselves, and they forbade it in every possible case. Exodus xxi. 16. 'He that stealeth a man,' says the law, 'or selleth him, or if he hath one found on his hands, shall be [illegible] death.' Nevertheless, slavery was a [illegible] condition amongst the Hebrew [illegible] as may be observed from reading Matthew xviii. 25 [illegible] the Lord Jesus illustrated his sermon [illegible] remark that, 'as he had not to pay, he [illegible] manded him to be sold, and his wife and [illegible]

A writer of the 17th century, when noticing the races of Cochin, says the slave castes, the members of which belong to individual masters, are the *Cannekaa*, who gather the cocoanuts; the … who make saltpans and collect the salt. These are the most honourable of the slave castes. The *Pulleah*, who are again subdivided into several classes,—the Collamary or smiths, the Weltoe Caren, the Beltoe Pulleah, and the Canna Pulleah, whose occupation is agriculture, sowing, planting, and cutting the Nely, for which they receive both from their proprietors and from strangers one share out of every ten they cut. There was then a dispute between the Cannekaa and the Pulleah as to which is the higher caste; the former maintaining that their caste ranks first, whilst the Pulleah averred that they enjoy more privileges, for instance, that they may employ barbers, wear a fillet on their heads, and a long garment reaching to the knees, which the Cannekaa may not do.

Tod tells us, in the Rajasthan, that the illegitimate sons of the rana of Mewar are called das, literally slave. They have no rank, though they are liberally provided for. Bussee signifies acquired slavery, in contradistinction to gola, a hereditary slave. The gola can only marry a golee; the lowest Rajput would refuse his daughter to a son of the rana of this kind. The bussee can redeem his liberty. The gola has no wish to do so, because he could not improve his condition nor overcome his natural defects. To the bussee nothing dishonourable attaches. The class retain their employments and caste, and are confined to no occupation, but it must be exercised with the chief's sanction. Individuals reclaimed from captivity have in gratitude given up their liberty. Communities, when this or greater evils threatened, have done the same for protection of their lives, religion, and honour. Instances exist of the population of towns being in this situation. The greater part of the inhabitants of the estate of Bijolli were the bussee of its chief, who is of the Pramara tribe. They are his subjects. The only badge denoting the bussee is a small tuft of hair of the crown of the head. The term interpreted has nothing harsh in it, meaning occupant, dweller, or settler. The numerous towns in India called Bussee have their origin in it. Famine in the regions of Rajasthan is the great cause of loss of liberty; thousands were sold in one great famine. The predatory system of the Pindari and mountain tribes aided to keep it up. The Muhammadan slave girl is called Bandi, Londi, but when associating with their master is one of the haram. The das or slave may hold a fief in Rajasthan, but he never can rise above the condition in which this defect of birth has placed him.

Nafr.—In the west of Bengal the Nafr and his offspring were slaves for ever, and were transferable and saleable. In Purneya the Nafr was sometimes a domestic slave, sometimes an agricultural slave.

Slavery in British India is illegal. About the year 1811 a British officer in authority at Dehli abolished all forms of slavery. His name and the exact date have not been handed down. But by Act v. of 7th April 1843 slavery ceased to exist, by law, in any part of British India, though in many parts the people themselves have not yet freed themselves from their bonds, though public works and railways have greatly aided them. Act v. of 1843 appeared in consequence of information obtained by the Commissioners appointed to frame a code of Criminal Law. They reported that the proportion of slaves to freemen varied in number in different parts of British India as one-sixth, one-third, or two-fifths. On many estates most of the cultivators were slaves. 200 or 250 landholders had as many as 2000 slaves each. In Calcutta, most Muhammadan, Portuguese, Armenian, Parsee, and Jew inhabitants possessed slaves.

In the N.W. Provinces slavery was chiefly confined to the towns, and was generally of a domestic character.

In the hill districts of Kamaon, Garhwal, and in the whole border of the Himalaya from Kashmir to Assam inclusive, also in Arakan and the Tenasserim provinces, in all the territory border-

ing the Malay Peninsula, Penang, Malacca, and Singapore, slavery was everywhere common, and in some provinces included almost the whole of the labouring population. Throughout the Tamil country, as also in Malabar and Canara, by far the greater part of the labouring classes of the people had from time immemorial been in a state of acknowledged bondage. In only three districts of the Madras Presidency was this system of bondage unknown. In Malabar and Canara the labourer was the personal slave of the proprietor, and was sold and mortgaged by him independently of his lands. In the Tamil country the labourer was the slave rather of the soil than of its owner, and was seldom sold or mortgaged except along with the land to which he was attached. In every district of Telingana some sort of serfage or bondage and domestic slavery were then still existing.

In the southern parts of the Bombay Presidency, bordering on the Southern Mahratta country, adjoining Malabar and Canara, and in a few of the less civilised districts of Gujerat, there were agricultural slaves; but in the other districts of that part of India only domestic slavery prevailed, and that was confined to the towns and to the houses of people of importance. Comparing the above information, district by district, with the very imperfect estimates of the population, Sir H. B. E. Frere has estimated the total slave population of British India in 1841 at between eight and nine millions of souls. The slaves freed in the British colonies on the 1st of August 1834 were estimated at between 800,000 and 1,000,000, and the slaves in North and South America in 1860 were estimated at 4,000,000; so that the number in British India far exceeded that of the same classes in all the slave-holding colonies and dominions of Great Britain and America put together; and in that number those of Sind, the Panjab, Oudh, Nagpur, and Burma are not included, as these provinces have only since then been added to the empire.

The domestic slave of British India seems to have been treated at least as well as the hired servants. Self sale—of men selling themselves into slavery to secure a provision for old age, to obtain a wife, or to pay a debt—was an ordinary origin of the servile state, and this was not compatible with any prevalence of harsh treatment, and the prevalence of caste privileges aided to protect the slaves. With the Muhammadans the female slaves were liable to become concubines of their masters; but in most Hindu castes a stigma attached to such connection, and often prevented its open avowal. But every kind of service, both domestic and outdoor, was required of slaves.

The Commission further stated that slaves were both heritable and transferable property; they could be mortgaged and let to hire, and they could obtain emancipation only by their owner's consent, except in some special cases.

In Ramghur, in S. Behar, when petty disputes occurred, the slaves were habitually employed to commit crimes, such as theft and murder; and in Assam they were habitually employed in plundering and gang robbery.

Throughout Malabar the whole labouring agricultural population was servile, and the slaves were under fixed rules; could not approach a freeman or his house within a certain number of paces, to avoid defiling the master or free fellow-labourers. The distance was 72 paces aloof from a Brahman, and 24 paces from a freeman. To carry out this rule, the slaves were required to give notice of their approach by uttering a peculiar cry at every four or five paces. If the cry were answered by a passenger of superior caste, the slave was required to quit the road and retire to a distance. The lower class of slaves were generally interdicted the highway, lest they should pollute the houses of the free labourers in passing them.

The punishments inflicted on slaves were not ordinarily severe. The prices paid varied from a single meal in famine times for a child, up to £20 given in Bengal for a handsome domestic slave girl; and African female slaves and eunuchs brought even higher prices. The sale of free female children by their parents, and of slave girls by their owners, for purposes of prostitution, was very prevalent, and kidnapping, with the same object, was frequent. In every province, from the Himalaya to Cape Comorin, stolen children formed part of the establishments of the Hindu temples. Such shrines were among the most sacre India; such, for instance, as those of Jaga at Puri, and of Ragonath in Cuttack, in bo which the salaried officials were the Deva- who, to the number of fifty or sixty famili Jaganath's shrine, were at the service of E devotees, and formed a regular self-gover corporation, all with strict rules of admission government.

In many districts in Bengal a very large portion of the labouring agricultural popula seems to have been in one or other form of ditional bondage. Slavery was kept up by sale or gift by parents of children in time famine, sale by mothers or maternal relatio sale of wives by husbands, sale of widows heirs or relatives of deceased husbands, pe slaves, conquest of aboriginal tribes, self sale adults in times of famines, marrying with a sla kidnapping of female children; and the Megpun Thugs would murder parents wholesale, in orde obtain their children, who were sold for a rupees each; and importation through Arabia African slaves of all ages and both sexes, sty Habshi or Abyssinians; also the children of sla were slaves.

After the great inundation of Saugor Island in 1833, children were commonly hawked about the streets of the town of Calcutta for sale.

The Sylhet and the Cachar tribes were long engaged in selling slaves; and the Law Commissioners reported that a slave could be bought for twenty packets of salt, value about six shillings.

Such was the legal condition up to 1843. There are many slaves in the Feudatory States, and the non-Hindu races in many of the villages of British India, the Pariah and tanner races, are little if any above the condition of predial slaves.

The Adavi slave of Canara is a serf, an unpaid labourer.

The Tamil and Malealam Adima or Udima means any slave; a predial slave attached hereditarily to the land, and only transferable with it. In Malabar, amongst the Nair, it means a feudal dependent.

Adiyan, pl. Adiyar, is a slave, serf, or vassal in Malabar; a low-caste man under the protection of a raja or a religious establishment.

The Wakkalu Jamadalu, in Coorg, is a predial slave attached to the revenue lands. They are the personal property of the proprietors, and may be sold or mortgaged at pleasure.

The Bhumi Jamadalu slaves are attached to the land, and transferable with it.

In Malabar the Kanakan or Kanaka charma are predial slaves, supposed to be a subdivision of the Palayar.

Charumar are predial slaves, whose name Wilson derives from Chera, MALEALAM, the soil. They follow the rule of Maruma-katayam. They are very diminutive, with a very black complexion, and not unfrequently woolly hair.

The Mukkavan is a fisherman caste of Malabar, also called Makwa, and their women Makoti.

The toddy-drawer of Malabar is called Katti Karan.

The Panni Malayan are a servile caste of Malabar.

The Pulichi is a forest tribe in Malabar, who are deemed so unclean that they are not allowed to approach other castes.

The Uradi or Urali of Malabar are a servile race.

The Tiyar race in Malabar are toddy-drawers and agriculturists.

The Palayan, Pulian, or Pullar of Malabar is a servile caste, often slaves.

Balute, in the Mahratta countries, means the village officers, several of whom are predial slaves, as the Mhar, Holeyar or Dher, and Mhang.

Badava-hrita is a female slave; also a man who becomes a slave that he may marry a female slave in the family.

Banda, a Muhammadan slave; Bandi, a slave girl.

Ana-kala-bhrita is a person who has voluntarily become so at a season of famine.

In the Tamil countries about Chingleput the Alandadey are a class of slaves.

In many of the countries bordering on British India, the martial and predatory tribes regard tillage as beneath their dignity, and leave the cultivation of the soil to helots. In 1883, in the Chittagong Hill tracts, slavery or vassalage in its broadest sense prevailed throughout the hill tribes. The rowaja or dewan, who is head of the village, owns his clan. They cannot disown his authority, their names are entered in his books; they pay him poll-tax wherever they go, must work for him, and make him the first offerings of their produce. They have been bondsmen for generations, and the links are never severed until death takes them away, or they abandon their homesteads and leave the country. Rowajas or dewans in their turn own allegiance to their chief, to whom they pay the largest share of the poll-tax. The condition of these tribes was very lamentable before Government took possession of the hills. The people were sold at the mere will of the chiefs or headmen; and although this has been abolished, serfdom still prevails in the form described. Sir Lepel Griffin, writing in 1883, says he remembers the time when the Chamba peasants were little better than slaves, and widows were publicly sold in the market-place as ordinary source of revenue to the state.

With Muhammadans, whose creed sanctions polygamy, and with them the Chinese, whose domestic customs necessitate prolonged isolation, slavery and concubinage are difficult to be avoided.

There are many kinds of slaves in Assam distinguished by distinct appellations. The *Moorukea* is a kind of *Chapunea*, neither servant, slave, nor equal, but partaking of all. The master provides the Moorukea with a pair of bullocks and a plough, and he tills his master's land for two days. On the third day the Moorukea may plough his own ground with his master's bullocks and plough.

Arakan.—The plundering expeditions of the tribes of the interior of Arakan are chiefly to obtain slaves. The village attacked is surrounded at night, and generally set on fire, or a volley of muskets is fired into it, and the inhabitants are seized as they attempt to escape from the burning houses. The males are put to death, and the women and children carried away into slavery. In the distribution of the slaves and plunder, the leader receives a double share. For the release of a captive thus taken, a ransom of Rs. 200 is generally demanded.

The Malays have two kinds of slaves, the ordinary menial creature, originally non-Muhammadan, and the debtor slave. When a debtor fails to pay his debt, the creditor is entitled by Malay law to remove him and his family to the creditor's house or grounds, where they all become part of his household. They work for him without pay, and without credit given for the labour in reduction of the debt. The usual result is that the debt, with the enormous interest commonly charged, is never paid off, and the bondage becomes lifelong. On the death of the debtor the family remains liable for half the debt, and so continues in slavery. Such is the strict law. In practice, it give rise to gross abuses. The creditor sometimes gives the debtor's daughters in marriage, pocketing the sum which the Malay bridegroom pays for the virtue and charms of his bride. Sir James Brooke mentions with strong indignation the case of a man to whom 16 reals were due, selling his debtor's daughter to 'a person of influence' for 30 reals. That English raja put down debtor slavery in Sarawak before he had been long there. The late raja of Kedah, a principality adjoining one of our settlements, certainly did the same thing a few years ago; and Mr. Davidson got it abolished in Salangore during his brief residency there about the year 1876. There is no good reason why slavery in any form should be tolerated in British Malay possessions.

A correspondent, dating 2d February 1882, from the Straits, writes of debt slavery in Perak being then in existence. He says, 'Numbers of grey-haired men and women could be found still in debt slavery in Perak.'

In the Netherland Possessions in India, slavery was abolished about the middle of the 19th century. Slavery still exists in China, and the sale of female children, usually from poverty, is of frequent occurrence.

All along the littoral, from the Red Sea through Sind to the Peninsula of India, are descendants of slaves from Africa and Arabia. They are known as Habshi, and in the plural

Habush, and at Muhammadan courts they were the household troops.

The slaves of the Brahui are of two classes, Negroes brought from Muscat, and the descendants of captives made in the wars with the people of the western provinces of the country, as Kej, Turbat, etc.; some have, at various times, been brought from Kashmir and the eastern provinces of Persia. These in colour and features in no respect vary from their masters, and some of the females are remarkably handsome. They are better treated than their Negro associates in bondage, and less onerous duties are assigned to them. Few of the Negroes, and those only who are really useful, are even decently clad; and it is common for them so to multiply, that their masters, from inability to clothe and feed them, dismiss them to provide for themselves in other lands.

The Afghans have supplied themselves with captives from the Siah Posh Kafir tribes of the mountain race in Kafiristan. But Arabia, Egypt, Southern Persia, Baluchistan, Sind, and Peninsular India have been chiefly supplied from East Africa, from the Soudan southwards to Madagascar, most of the eunuchs in S. Asia being from that region. The slave traffic of this region seems to have gone on from pre-historic times, and it was chiefly from the western coast of Africa that European and American nations obtained the slaves whom they employed in agriculture and as domestic servants.

The Turkoman races in High Asia, as also the Hazara races, continuously at present (1883) make r[illegible] their own tribes, and [illegible]nds on the Persians and on children for sale. The seize on men, women, and [illegible]an others harassed in border Persians are more th[illegible] this way, and they are ad[illegible] markets of Central Asia, because bigoted Sunni Mullah have declared the Shiah sect not to belong to Islam. Shams-ud-Din Herati, a celebrated lawyer, is said to have been the chief promoter of this legal decision (fatwa). Slave-dealing, from immemorial times, has been practised in the northern provinces of Persia. It is conducted by the Turkomans as a regularly organized traffic, which diminishes as the distance from the Turkoman frontier is increased. They were carried on chiefly by the Tekke and Yomut tribes, the victims of the Tekke being the settled inhabitants of the frontier regions of Khorasan, Herat, Seistan, up to West Afghanistan, while the Yomut infest chiefly the southern shores of the Caspian. The Ali-Ali and the Kara occasionally capture caravans on their way to Bokhara. As the Chandor tribe live between the Lower Amu (Oxus) and the Caspian, they can only occasionally capture a few Kirghiz or Khivans. They treat the captives with such great cruelty as even to shock their neighbours. The great proportion of the slaves taken by the Turkoman and Uzbak are Shiah Persians, but they capture also Sunni of Khaf and Herat, also a few Jamshidi, and some Hazara and Western Afghans. The captives are handed over to the slave merchants in exchange for needed supplies. The slave-traders of Central Asia are seldom Uzbaks, but usually Tajaks or Sarts, with a few Persians; and their principal marts are at Karakol, Karshi, Charjui, and Bokhara. There are, however, other dealers who are employed by friends to ransom the slaves. By the custom of Muhammadan countries, a servant marrying a slave be[illegible] also a slave.

Owing to the Russian advances and the [illegible]ference of Britain in the affairs of Afghan[illegible] the slave area in Central Asia has been grad[illegible] diminished, until it is only composed of [illegible] country lying between Herat and Merv, [illegible] between Herat along the slopes of the H[illegible] Kush to Badakhshan. In Sher Ali's time [illegible] khanates of Afghan-Turkestan used to suppl[illegible] Amir with a periodical consignment of w[illegible] and boy-slaves as tribute. Mr. Schuyler [illegible] during his journey through Bokhara in 1873, [illegible] covered evidence of secret dealings in wo[illegible] and boys in defiance of Russia's prohibition [illegible] the contrary.

A writer attached to the staff of the Turkes[illegible] ski Vedemosti compiled a chronicle of the num[illegible] of Russian slaves who had been at various epo[illegible] detained in Central Asia. The aggregate t[illegible] amounted to some thousands.

Many generations have passed away since [illegible] Tartars sacked Moscow and Kieff, and carried [illegible] men and women into bondage in Asia; but [illegible] men are still living in South Russia whose fath[illegible] were bought and sold in the Tartar slave mark[illegible] of the Crimea; and both in the Caucasus an[illegible] Orenburg may be seen middle-aged men wh[illegible] youth was spent in bondage in Khiva and B[illegible] hara. The gunner Kidaeff, captured from [illegible] garrison at Fort Petro Alexandrovsk on the O[illegible] shortly after the Khivan campaign, and taken [illegible] a slave to Merv, was perhaps the last of the lo[illegible] list of Russian unfortunates whose tears have moistened the sands of Central Asia.

When Major Abbott visited the khanate of Khiva in 1841, upwards of 700,000 persons out [illegible] a population of 2,468,500, or 1 in every 3, w[illegible] In the city of Khiva alo[illegible] 12,00[illegible] slaves. In the cr[illegible]ians alone were [illegible] Herati and 30,000 Pers[illegible] the rest of the bo[illegible]dsmen being scattered about the country as ti[illegible]ers of the soil. Writing of the same period, W[illegible] the missionary, calculated that out of th[illegible] millions composing the population of Bok[illegible] 200,000 were in a state of bondage. Bu[illegible] another traveller, observed of a Bokharan vi[illegible] near the Oxus in 1832, that 'though not [illegible]ing of more than 20 houses, there were yet 7 [illegible] Persian slaves.' To capture these slaves w[illegible] regular pursuit on the part of the nomade tribes living adjacent to Khiva and Bokhara. The Khivans annihilated the expedition that Peter the Great despatched against them under Prince Bekovitch-Tcherkassky; and, more re[illegible] the Tekke-Turkomans of Merv captured [illegible] Persian soldiers in 1861 just outside their stronghold, and glutted the market to such a degree that the price of an able-bodied man fell to a pound.

The alaman or Turkoman raiding expeditions may be said to have received a death-blow when the Russians breached the walls of Goek Tepe. Already, years before, the slave market had been closed at Khiva and Bokhara by the Russian invaders; and the task they have achieved, of suppressing slavery outside Afghanistan and Merv, might rival the costly exertions of Britain on the African coast and in the Pacific.

Slave Trade.—Until the early part of the 19th century, Great Britain permitted her colonies to retain slaves, but from the efforts of Wilberforce

Clarkson, and others, Britain then abolished slavery in her colonies, as had already been done in the British Islands. Until after the middle of the 19th century, the United States of America held in slavery about five millions of the African races and their descendants of mixed blood, but the slave law was then changed after a civil war in which great numbers of men were slain. During the 19th century, Britain made vast and costly efforts to suppress the slave trade from the west coast of Africa, but till 1884 it continues on the east side of Africa, principally carried on through Arabs and Hindu natives of India.

The Hindu races have been settled as traders on the east coast of Africa from the most ancient known times. When the Portuguese first doubled the Cape, they found Banya traders established at every great port, and it was from them that Vasco da Gama and his successors learned the secret of the easy approach to India by the aid of the monsoons. They have held in their hands the trade of the east coast of Africa, and are still to be found as far south as Delagoa Bay. All the trade between that coast and Europe, America, or Asia passes through the hands of some branch of the Banya community, purchasing goods wholesale from the European or American importer, and selling them in retail for the interior. They are of the Bhattia and Banya tribes of Hindus, and the traffic is shared by the Khojah and Borah Muhammadans; and in 1872, a merchant, Mathur Das Khetsi, writing in the Rast Guftar, stated that from 10,000 to 20,000 slaves passed yearly through Kelwi on their way to Suahili and Arabia. The E. African slave trade by that year had depopulated much of the sea-coast line. To the south of Pangani is the territory of the heathen Wasegua tribe, and the great centre of the traffic. The Arabs of Zanzibar come here, and for muskets, powder, and shot purchase the slaves from the Wasegua chiefs.

The Red Sea slave trade appears to be of an exceptionally revolting nature; nine-tenths of the unfortunate victims are obtained from the southern frontiers of Abyssinia, where an incessant series of border quarrels afford a plentiful harvest to the kidnapper. As a rule, only children are thought worth capturing in these forays, and as the free and independent spirit of the Galla race renders them unfit for domestic or menial service, the males are immediately emasculated and disposed of to the slave merchants. The slaves captured in the Western Galla countries are usually brought to Massowa by way of Matemina, where there is annually held a large 'rakik' or market, whilst Zaila is the principal emporium for those brought from the Eastern Gallas through Shoa, the Christian inhabitants of which country take an active part in the trade. At Massowa a large traffic in slaves goes on, and from Zaila and Tajura; these last situated opposite to the Galla and Shoa territory, on the south-west corner of the Gulf of Aden. In 1873 the governor of Massowa was Munzinger Bey, a Christian, who was not supposed to profit by or even countenance the revolting traffic. At Massowa, as at other places where this illicit traffic flourishes, legitimate trade is almost at a standstill.

The male black slave is in Arabia (and other eastern countries) treated with more consideration than the free servant. If discontented with his situation, he can legally compel his master to sell him. It has been frequently observed that the black slaves are generally greater fanatics than their Muslim masters, and that they are, as a rule, totally ignorant of the doctrines in the defence of which they are so zealous. Through the depopulation of the line of the coast the slave trade has extended farther and farther inland, till in 1870 slaves were being brought from the west of Lake Nyassa, on which the Arabs had dhows to carry their captives across, traversing a distance of 500 miles, a three months' journey, during which the sick are left behind to die, and any hesitation is met with instant death. The Manyema, a cannibal nation, are constantly attacked by the Arab slave-traders. The Manyema are honest, industrious cultivators. Their women do not partake of the cannibal feasts; many of them, far down Lualba, are very pretty, bathe three or four times a day, and are expert divers for oysters. The men are fine tall fellows, not like Negroes; they use long spears, and are only conquered by the Arab firearms.—*Butler's Travels, Assam*, pp. 228, 229; *Dalton's Ethnol. of Bengal*, p. 114; *Times of India; The Madras Mail*, 14th May 1873; *Tod's Rajasthan; Slavery, by Sir H. B. E. Frere, G.C.B., in Fortnightly Review*, March 1883; *Wilson's Glossary; Masson's Narrative; Dr. Livingstone; Mr. H. A. Fraser; Dr. Kraff; Col. Rigby; Mr. Allington; Rev. Horace Waller; Hon. C. Vivian, in the House of Commons Report*, 1872; *Sharpe; Vigne's Per. Nar.* p. 145; *Court's Palembang*, 124.

SLAVONIAN and Slavonic are terms applied to races and their languages now found in the east of Europe and all Turkestan eastwards to the China Sea. The Slavonian and Sarmatian dialects comprehend the languages of eastern Europe, Russian, Polish, Bohemian, and the dialects in the greater part of Europe subject to the Turkish empire. Of the Slavonic languages, properly so called, the eastern branch comprehends the Russian with various local dialects, the Bulgarian, and the Illyrian. It is one of the Aryan tongues.—*Muller's Lectures*, pp. 187, 188.

SLEEMAN, General Sir WILLIAM, an officer of the E. India Company's Bengal army, who discovered the practices of the Thugs, and was appointed by Lord William Bentinck to undertake their suppression. He was long Resident at Lucknow, having previously been Political Agent at Gwalior. He wrote Rambles and Recollections of an Indian Official.—*Dr. Buist.*

SLEEPING HOUSES for the unmarried young men and girls, the lads apart and the lasses apart, are in use among the Bor and Bor Abor and others of the races in Assam, Sirguja, and in the Eastern Archipelago. In Fiji there are two kinds: those in which the men sleep (Buri ni sa), and those dedicated to the gods (Bure kalow). The sleeping bure may aptly be compared to the European clubs. In buildings or bure like these, all the male population, married, sleeps. The boys, until they have come of age, erect a bure of their own, often built on raised stages over the water, and approachable only by a long narrow trunk of a tree. The women and girls sleep at home, and it is quite against Fijian etiquette for a husband to take his night's repose anywhere except at one of the public bure of his town or village, though he will go to his family soon after dawn.—*Galton's Vacation Tourists*, pp. 253, 254.

SLEINANACHD. GAELIC. The Muhammadans in India often cast lots, and in Sind is a practice similar to that of the mountaineers of Scotland, called Sleinanachd, or 'reading the speal-bone' or the blade-bone of a shoulder of mutton. The poet Drayton alludes to the practice of this 'divination strange' amongst the 'Dutch-made English' settled about Pembrokeshire, in his Polyalbion, Song 5. Camden notices the same superstition in Ireland.—*Burton's Sciude*, p. 404; *Tod's Rajasthan*, i. p. 71.

SLIPPERS.

Pantoufle, . . . FR.	Pai-posh, ... PERS.
Pantoffel, . . . GER.	Chinela, ... SP.
Juti, Jora, . . . HIND.	Papoos, Sapata, . TAM.
Pianella, ... IT.	

In Turkey, Egypt, amongst the Persians, and throughout British India, Muhammadans and Hindus take off their boots or slippers when they enter into a mosque or temple, or visit the shrine of their holy men, the Muhammadans giving as a reason that Moses was commanded by God to leave his slippers on approaching the burning bush, because he was treading on holy ground. In Persia, a native never enters a room in boots or slippers; and when a foreigner attempts any transgression of this usage, it is looked upon as the height of ill-breeding, if not quite a premeditated insult. In some cases, where it has been intimated, reasons of policy have compelled an apparent toleration of the objection, by providing the expedient of receiving such visitors in the open air, but the necessity is always remembered with repugnance to the exactors. The custom of leaving the outward covering of the feet at the door is of very ancient practice all over the east, and especially so when the place to be trod on is connected with any religious ideas. We find it recorded so far back as in the Book of Exodus (iii. 4, 5), at the account of Moses turning aside to observe the burning bush, where it is written, 'The Lord called to him, and said, Put off thy shoes from off thy feet; for the place whereon thou standest is holy ground.' And again, we read in the Book of Joshua, that when that great captain of Israel was encamped in the plain of Gilgal, the same Divine Being appeared to him, and said to him also, 'Loose thy shoe from off thy foot; for the place whereon thou standest is holy. And Joshua did so.' In British India, about A.D. 1850, the richer Hindus and Muhammadans who visited amongst Europeans, began to wear patent leather shoes or boots to obviate the necessity of taking off their slippers; but at native courts and at their places of worship the visitor enters either on his bare feet or on his stockings. It is a part of the customs of eastern races, from which they never deviate amongst themselves.

SLOKA, a Sanskrit word. A couplet from a Shastra; a stanza or verse of four lines. The Malays probably derived the term for their poetry styled 'Shair' from the Arabs, and that of 'Sloka' from the Hindus. The origin of the Malay word Pantun is not so easily decided from its name; one word used is Bar-beit, which is from the Arabic Bait, a couplet; but perhaps Pantun itself is a Malayan word.—*J. I. Arch.* v. No. 11.

SMALL-POX—Jadari, ARAB., Mata, Sitla, HIND., Amur, TAM., TEL.—is regarded by the Hindus as a manifestation of the Hindu goddess called Maria-tal, Mari-amma, Devi, Mata, or Sitla, who is supposed by them to be a form of Kali, the wife of Siva. In the south of the Peninsula, the person affected is removed to a separate room. A pot filled with water is placed in the room with the patient, covered over with a saffron-stained cloth and leaves of the nim tree, representing the goddess. These leaves are also sprinkled about the bed of the person infected, who uses the tender twigs of the same tree to relieve himself from the irritation occasioned by the pustules, which, when they become sore, are smeared over with a paste made from the leaves. No strangers or unclean persons are allowed to enter the room where the patient is, both being considered at the time sacred. No puja is allowed to be performed with the ringing of bells, so that the patient may not be disturbed. Oil is not allowed to be used by members of the family when ablutions are performed, it being considered a non-conductor of prurient matter; and any one who has been shaved is also prohibited entering the room. No diet is observed,—curds, butter-milk, curry, and rice, and any other articles of food which the patient may desire, are given. When the patient recovers, widows are invited, and fed and clothed; little images called sellay, in the form of horses, are made of clay or stone, and placed near the Iyenar or tutelary god's temple. The Sudras offer rams, fowls, and ragi, and ambali or kulu is distributed among the poor. When small-pox makes its appearance in a village, men and women give out that the goddess Maria-tal has come upon them. They then dress themselves out fantastically, generally in saffron-stained cloths, and carry on their heads a pot of water, with two or three smaller pots over it, one upon the other. These pots are ornamented with saffron and ochre, and garlands are suspended from them, amongst which several limes are fixed. The bearers of these pots carry in their hands a small drum (Ooduku), which they beat with their hands. Some also dance, and with wonderful skill retain the burden on their heads. As they pass through the streets they stand before each house, the residents of which come out and pour water on the feet of the bacchantes, and present them with money. In the Malayalam and some other districts, so soon as a person is attacked with the disease, he is taken out of the village to a distance of a mile or more, and left in a thatched building, to which food is sent by a miserable old man or woman; and so afraid are they of the ravages of the complaint, that no one else will approach the place. In Ceylon, amongst the avenging scourges sent direct from the gods, the Singhalese regard both the ravages of the leopard and the visitation of the small-pox. The latter they call 'maha ledda,' the great sickness; they look upon it as a special manifestation of devidosay, 'the displeasure of the gods.' In Ceylon, such is the awe inspired by this belief in connection with the small-pox, that a person afflicted with it is always approached as one in immediate communication with the deity; his attendants address him as 'my lord' and 'your lordship,' and exhaust on him the whole series of honorific epithets in which their language abounds for approaching personages of the most exalted rank. At evening and morning, a lamp is lighted before him, and invoked with prayers to protect his family from the dire

calamity which has befallen himself. And after his recovery, his former associates refrain from communication with him until a ceremony shall have been performed by the capwa, called awasara-pandema, or 'the offering of lights for permission,' the object of which is to entreat permission of the deity to regard him as freed from the divine displeasure, with liberty to his friends to renew their intercourse as before.

Sir J. E. Tennent says leopards are strongly attracted by the peculiar odour which accompanies small-pox. About the middle of the 19th century, the capwa, or demon priest of a 'dewale,' at Oggalbadda, a village near Caltura, when suffering under small-pox, was devoured by a cheeta, and his fate was regarded by those of an opposite faith as a special judgment from heaven.

Masson says (Narrative, pp. 307–319) that persons milking a camel ill with small-pox contract what is called the poto-shutar or camel small-pox, and become also inaccessible to variolous contagion equally with those who receive the analogous disease from the cow. He was assured that no fatal results were ever known to follow from either the vaccine or the cameline disease.—*Tennent's Ceylon*, p. 28; *Masson*, p. 307.

SMALTE.

Smalt, ... Fr.	Smaltino, ... It.
Schmalz, ... Ger.	Lasor, ... Rus.
Smalto azzurro, . . It.	Esmalte, Azul-azur, . Sp.

An oxide of cobalt, melted with silicious earth and potash. It is a sort of glass, of a beautiful deep blue colour; and, being ground very fine, is known by the name of azure or blue powder. It is in great demand for the painting of earthenware, in the colouring of paper, and for other purposes in the arts. Smalt is manufactured in Germany and Norway. The Chinese use it for painting on porcelain and glazed copper vessels. —*Morrison; M'Culloch.*

SMARTA BHATTACHARYA, author of the law book Vyavahara Tatwa.

SMARTTA, a sect of the Brahman race of India, followers of Sankaracharya. They adhere to Sankaracharya's doctrine of unity, according to the Vedanta philosophy, but they specially honour Siva. They hold a high place in Hindu society. Their chief establishment is at Srivagiri. The sect regard Brahma and Vishnu as manifestations of Siva, and Siva or Para-Brahma, the supreme, or rather the universal, spirit; they mark their forehead with three (sometimes only one) horizontal lines of pulverized sandal-wood, with a reddish or blackish round spot in the centre.

SMASAN or Smashanam. Sansk.

Rudra bhumi, San., Tel. | Shudukadu, . . . Tam.

The place of incremation of the Hindu dead, the place where bodies are burned; temples of Durga in some of her terrific forms are usually erected in or near it, and monuments of stone or brick are not unfrequently reared where the funeral pile has stood.—*Hind. Theat.* ii. p. 55.

SMILACINA is a pot-herb growing in Tibet, north of Kanchinjinga. It is a beautiful plant, from two to five feet high, and has plaited leaves and crowded panicles of white bell-shaped flowers, like those of its ally the lily of the valley, which it also resembles in its mucilaginous properties. It is called Choklibi, and its young flower-heads, sheathed in tender green leaves, form an excellent vegetable.—*Hooker's Himal. Journ.*

SMILAX, a genus of plants which gives its name to the natural order Smilaceæ. They extend south to Australia, and north to Japan, North America, and the S. of Europe. S. China has a tuberous root abounding in fecula; the Chinese esteem it invigorating, and ascribe to it other virtues. Two Indian species, which, like the Chinese species, have tuberous roots, are called in Sylhet, Hurina-Shook-China and Gootea-Shook-China. These are S. glabra and S. lanceæfolia, and their roots cannot be distinguished from Chob-Chini, the China root. A similar species is common in the southern parts of North America, and has been called S. pseudo-China. Among Indian species are—

S. elegans, Dehra Doon.
S. glabra, *Roxb.*, Garo Hills, Sylhet.
S. randifolia, *Linn.*, Konkans, Dekhan, Bengal.
S. grandis, *Wall.*, —?
S. lanceæfolia, *Roxb.*, Sylhet.
S. maculata, *Roxb.*, Nepal, Kumaon, Mussoori.
S. ovalifolia, *Roxb.*, Konkans, Bengal.
S. prolifera, *Roxb.*, Rajmahal, Bengal.
S. pseudo-China, *Linn.*, Virginia, Jamaica, Garo Hills.
S. retusa, *Roxb.*, Bengal.
S. Roxburghiana, *Wall.*, Garo and Khassya mountains.
S. villandia, Morung Hills.
S. Zeylanica, *Wight*, Ceylon.

S. Roxburghiana or 'Koomare-Shook-China,' and S. oxyphylla or 'Chotee or small Koomaree;' S. rigida and S. ferox are Nepalese species. There are two or more species of Smilax in the Tenasserim jungles, one of which is used as medicine, to supply the place of a species of sarsaparilla, whose dried roots are sold in the bazars.—*O'Sh.; Eng. Cyc.; Dr. Mason.*

SMILAX CHINENSIS. *Linn.* China root.

Smilax China, *Linn.*	Rasna, Sugandamula, San.
Shook-China, . . Beng.	China-alla, . . Singh.
Tsein-apho-ta-roup, Burm.	Poringay, ... Tam.
Tu-fu-ling, . . . Chin.	Gali chakka, . . . Tel.
Chob-Chini, . . Hind.	Pirangi chakka, . . ,,

Dr. Smith applies the above Burmese and Chinese names to the tuberous root of Pachyma cocos. S. Chinensis grows wild in China, from which it is exported to Burma and to India; and the root is one of the China roots of the bazars. It is largely imported into Calcutta from the eastward, and much employed by native practitioners. The China root which comes to Ajmir via Bombay, is taken as an aphrodisiac in milk; one tola is a dose; used also in mesalihs. Natives suppose that this is the root of the Hazari marigold, Tagetes erecta, after being in the ground three years.—*O'Sh.; Gen. Med. Top.; Smith.*

SMILAX GLABRA. *Roxb.* Gootea-Shook-China, Beng. A climber with a large tuberous rhizome, a native of Sylhet, the Garo Hills, and the adjacent country. The stem and branches are thornless; leaves lanceolate, pointed, pale-green beneath. The root is identical in appearance with the China root of commerce, and the natives use it in decoction for the cure of sores and syphilitic eruptions.—*O'Sh.*

SMILAX LANCEÆFOLIA, *Roxb.*, not S. lanceolata, *Wall. and Loureir.*, is Hurria-Shook-China of Bengal. The leaves are lance-shaped and three-nerved, umbels stalked. Its large tuberous roots are much used by the natives of India in medicine.—*O'Sh.*

SMILAX OVALIFOLIA. *Roxb.*

A plant of Bengal and the Konkans, used for tying bundles.—*Mason; Spry's Suggestions*, p. 68.

SMITH. George Smith, an oriental scholar, who died in the autumn of 1876. Nothing could surpass the effect his paper, which was read on 3d December 1872, on The Assyrian Account of the Deluge, had on English Assyriological inquiry. The scientific journals took it up as a triumph of philological research, and the Daily Telegraph offered to send him out to search for more material. Accordingly he left England in January 1873, and on 3d March he gained his first view of Nineveh. Full accounts of this and the succeeding expedition in 1874 and 1875 have been published. The importance of his inspection of the sites of the palaces of Sennacherib and Assur-Banipal, and the survey of the ruins of Nineveh, cannot be overvalued. He was the first excavator who was able to read the records which he uncovered. He discovered a small fragment of a tablet containing the legend of the creation of the cattle and insects. This led him to search among the tablets in the British Museum, and in March 1875 he announced to the world the discovery of the Chaldæan legends of the Creation. The remainder of the year was occupied in the copying and translation of these texts, and the result was given in his last and famous work, The Chaldæan Account of Genesis. This was the first English work on Assyriology that had been translated into any foreign language.

Lieut.-Gen. Sir Harry George Wakelyn Smith, Bart., G.C.B., born 1788, died 1860. He entered the British army in 1805, and served against Monte Video, Buenos Ayres, and Copenhagen. He was present in the battles of the Peninsular war and at Waterloo, and in 1835 against the Kafir tribes. In 1839-40 he was appointed Adjutant-General to the Forces in India, and was present at the battles of Gwalior and Maharajpore, for which he was nominated a K.C.B. In the Panjab campaign of 1845-46, he was in command of a division at Moodkee, and of the reserve at the battle of Ferozpur, where he supported Sir John Littler in his charge upon the guns of the enemy. A few days later, the Sikh forces crossed the river Sutlej, near Ludhiana, and took up their position at Aliwal, on which Lord Gough despatched Sir Harry Smith, with 7000 men and 24 guns, to relieve Ludhiana. On the 28th of January 1846, Sir Harry Smith led the main charge in the battle of Aliwal, carrying that village at the point of the bayonet, and capturing all the enemy's guns, to the number of 67, a success which enabled him to come to the assistance of the commander-in-chief, and to join in the final and crowning victory of Sobraon (February 10), which crushed the last hopes of the Sikh leaders and their troops, and secured the possession of the Panjab to the British forces. He received the thanks of the House of Lords, was presented with the freedom of the city of London, and the thanks of the Honourable East India Company; was created baronet, and advanced to the dignity of a G.C.B. In September 1847 he was nominated to the governorship of the Cape of Good Hope. He conducted the operations of the Kafir war of 1851-52, until succeeded by Sir George Cathcart.

Sir Lionel Smith in 1821 commanded an expedition against the pirate tribes in the Persian Gulf.

Colonel Richard Baird Smith, an officer first of the Madras and subsequently of the Bengal Engineers. He was born in the year 1818, at Lasswade near Edinburgh, on the banks of the Esk; in 1838 went to India in the Madras Engineers, from which in 1839 he was transferred to the Bengal corps. From 1840 he was employed in the canal department under Sir Proby Cautley, served with Sir Harry Smith at Buddiwal and Aliwal (1845 ?), and in 1848-49 under Sir Colin Campbell (Lord Clyde) at Ramnuggur, and afterwards at Sadullapur and Gujerat. In 1851 he went to Piedmont and Lombardy to study their system of irrigation. He was chief engineer at the siege of Dehli; died in the Madras roads in 1859. He established a Museum of Economic Geology for N.W. Provinces, Bl. As. Trans., 1831, x. p. 779. Author of Memoir on Indian Earthquakes, ibid., 1841 and 1843; and Edin. New Phil. Jl., 1842, xxxiv. p. 107. Wrote an Account of the Delta of the Ganges, Cal. Jl. Nat. Hist. iii.; and on the Irrigation of the N.W. Provinces, pamphlet, 8vo, 1849.

SMITHIA SENSITIVA. *Ait., Roxb.*

Kul kushanda, .	Beng.	Muyyaku ponna, .	Tel.

An annual with small yellow flowers, makes good hay.—*R. Brown.*

SMRITI, Sansk., is the body of the recorded or remembered Hindu law, the ceremonial and legal institutes of the Hindu traditions. Dowson describes it as inspiration as distinguished from Sruti or direct revelation. He says the term includes several religious works of the Hindus, the Vedangas, Sutras, Ramayana, Mahabharata, the Puranas, Dharma-Sastras, especially the works of Menu, Yajna-walkiya, and other inspired law-givers, and the Niti Sastras or ethics; but its ordinary application is to the Dharma-Sastras; as Menu says (ii. 10), by Sruti is meant the Veda, and by Smriti the Institutes of Law.—*Dowson.*

SMUT or Dust Brand, Uredo segetum, Siahi, Hindi, is a disease produced in wheat by a fungus, and is said to infect chaff, straw, seeds, and leaves.—*Hassal.*

SNAKE BIRD, Plotus melanogaster.

SNAKE-BITE. In British India, in the six years 1875-1880, 1,073,546 snakes were destroyed, over 103,000 persons died from snake-bite, and Rs. 6818 were given in rewards for killing above a million of snakes. For our knowledge of the nature and effects of snake-poisons we are indebted to Surgeon-General Shortt; to Sir Joseph Fayrer's work on the Thanatophidia; to a Report on Indian and Australian snake-poisoning by Drs. Ewart, Richards, and Mackenzie; to the investigations of Drs. Halford and Weir Mitchell in Australia and America; and to a volume by Dr. Wall of the Indian army.

Dr. Halford, of Melbourne, advanced the theory that in snake-poisoning germinal matter was thrown into the body, together with the virus,

which rapidly developed and multiplied, the process going on at the expense of the oxygen; and he described some cells in the blood which he believed were evidence of his proposition. These cells, however, were afterwards proved to be the ordinary white blood corpuscles. Sir Joseph Fayrer finding that the blood after death from the bite of the viper (daboia) remained fluid, while after the bite of the cobra it quickly coagulated, supposed that death is due to some important changes in the blood. Dr. Wall is unable to accept either of these theories, and, while admitting a serious change in the condition of the blood in viperine, but not in cobra, poisoning, he attributes the cause of death to disturbance of the nervous system,—in the case of cobra poisoning to paralysis of the respiratory function, and in viperine poisoning to convulsions due to the direct action of the poison on the nervous system, and not to carbonic acid poisoning from failure of the respiration.

Surgeon-General John Shortt, a medical officer of the Madras army, recommends liquor potassæ internally for the cure of persons wounded by poisonous snakes. Surgeon-General Sir Joseph Fayrer of the Bengal army recommends liquor ammoniæ. All stimulants are useful,—spirits, and the essential oils of cinnamon, peppermint, etc. Dr. Wall is urgent for the entire removal by the knife of all the poisoned structure before the venom can be absorbed into the system. This, however, requires the skilled eye and hand of the surgeon, and time is not given, because the whole blood of the body passes through the heart in three minutes. The virus of snakes does not owe its peculiar properties to germs, but it is a perfectly structureless plasma, whose physiological action is little influenced by such materials as carbolic acid, and it retains its poisonous properties after being heated for an hour to a temperature of 224·6° Fahr., a temperature which it is hardly probable organic germs could survive. On the other hand, the disinfectants, which act by destroying organic compounds, such as chlorine, sulphurous acid, and chloride of zinc, have a marked effect in weakening the activity of the virus; while the permanganate of potash—better known by the name of Condy's fluid—completely suspends it by parting with its oxygen and decomposing its albuminous constituents.

Dr. Wall found no benefit accrue from the injection of ammonia or the permanganate of potash into the blood, nor does he speak encouragingly of giving large quantities of alcohol to the extent of producing intoxication.

As about 90 per cent. of snake-bites occur on the arms and legs, great importance is attached to the immediate application of a ligature to the limb above the seat of the wound. Dr. Wall thinks that the common mode of tying a piece of string or calico round the limb often fails to stop the circulation, and recommends as a substitute a piece of india-rubber bandage, similar to Esmarch's, employed by surgeons for bloodless operations.

The mungoose is the natural enemy of the snake, and although it seems to be as tameable as the cat, its depredations on the poultry yard will always prevent it taking the place of the cat in the Indian household. Mothers also dread lest their sleeping children be attacked.

Aristotle tells us that serpents may be driven away from a house by the smell of rue. Pliny says that the root of the holm-oak is an enemy to scorpions, and that of the ash to serpents, which, moreover, will not retire under fern. Serpents may be driven away by the burning of hair or stag's horn, or the sawdust of the cedar, or a few drops of galbanum, green ivy, or juniper; and persons rubbed with juniper seeds are said to be secure from hurt by serpents. See Serpents.

SNAKE GOURD, Trichosanthes anguina, a curiously contorted gourd, peculiar to India, and in very general demand for vegetable curries. The plant is of easy culture on trellises around the doors of the native cabins, and the fruit often grows two feet long, beautifully striped, small, and tapering, so, that streaming down from the trellis, they immediately remind one of striped snakes suspended from the foliage of trees. The viper gourd is Tr. colubrina.—*Mason.*

SNAKE-HEADED FISHES, Ophiocephalidæ, breathe atmospheric air direct; so, when pollutions or poisonous substances find access to rivers, or mud is carried down in such quantities as to choke the gills of most fishes, the Ophiocephalidæ are almost unaffected.

SNAKE RACE, Naga or Takshak race, was one of the most extensive and earliest in High Asia, and celebrated in all its extent; but the traditions regarding them, and the notices in the Hindu writings, are so mixed with fable, that little can be understood as to their real position. The Ramayana relates that the sacrificial horse was stolen by a serpent (Takshak) assuming the form of Ananta. The Snake race of India were the foes of the Pandu. The Mahabharata records constant war from ancient times amongst the children of Surya (the sun), and the Tak or Takshak (Serpent) races, and mentions that the horse of the sun, liberated preparatory to sacrifice, by the father of Rama, was seized by the Takshak. The successor of Janmejaya carried war into the seats of this Tak or Serpent race, and is said to have sacrificed 20,000 of them in revenge; and he subsequently compelled them to sign tributary engagements (penameh). The Paratacæ (Mountain Tak) of Alexander were doubtless of this race, as was his ally Taxiles, which appellation was titular, as he was called Omphis till his father's death. Baber gives the position of the capital of this celebrated race, which he passed on his route of conquest. And there is an intermediate notice of it between Alexander and Baber, in the early history of the Yadu Bhatti, who came in conflict with the Tak on their expulsion from Zabulisthan and settlement in the Panjab.

SNAKE-STONE, Pambu kallu, TAM., is a term employed in tropical countries to various substances applied to snake-bites. Charred bone, bezoar, magnesian limestones, and chalk are used. The virtues of these depend on their absorbent qualities; and earth has been recommended. Dr. Davy's belief was that in Ceylon a piece of charred bone is filled with blood perhaps several times, and then carefully charred again, and he says the manufacture of them is a lucrative trade, carried on by the monks of Manilla, who supply the merchants of India. Thunberg was shown the snake-stone used by the Boers at the Cape in 1772, which was imported

for them from the Indies, especially from Malabar, at so high a price that few of the farmers could afford to possess themselves of it. He describes it as convex on one side, black, and so porous that when thrown into water it caused bubbles to rise; and hence, by its absorbent qualities, it served, if speedily applied, to extract the poison from the wound. Mr. Hardy furnished Sir J. E. Tennent with an account of the piedra ponsona, the snake-stone of Mexico: Take a piece of hartshorn of any convenient size and shape, cover it well round with grass or hay, enclose both in a thin piece of sheet copper well wrapped round them, and place the parcel in a charcoal fire till the bone is sufficiently charred. When cold, remove the calcined horn from its envelope, when it will be ready for immediate use. In this state it will resemble a solid black fibrous substance, of the same shape and size as before it was subjected to this treatment. The wound being slightly punctured, apply the bone to the opening, to which it will adhere firmly for the space of two minutes; and when it falls, it should be received into a basin of water. It should then be dried in a cloth, and again applied to the wound. But it will not adhere longer than about one minute. In like manner it may be applied a third time; but now it will fall almost immediately, and nothing will cause it to adhere any more. These are quite insufficient to obviate the effects of a bite by the more poisonous snakes.

SNANA, Sansk., from Sna, to purify; bathing, ablution, a ceremonial of the Hindus; the ceremony of bathing or washing an idol. In the full moon of the month Jyeshtha, images of Krishna, as Jaganath, are carried out and bathed. It is called the Snana-yatra, or in Orissa Ratha-yatra.

SNEEZE, Atas of the Arabs, Cheenk of Hindustan. Most nations salute an individual after his sneezing. A Muhammadan after a sneeze ejaculates, Al Hamd Illah, God be praised; on which any one present adds, Ya! Rahmat Allah, God have mercy on you. On a child in Great Britain sneezing, the mother or nurse ejaculates, Bless you, bless you, my darling.

SNIPE are birds belonging to the family Scolopacidæ, sub-families Scolopacinæ, Limosinæ, Numeninæ, Tringinæ, Phalaropinæ, and Totaninæ. The species of the Scolopacinæ which receive the name of snipes, may be thus shown:—

Fam. Scolopacidæ.

Sub-Fam. Scolopacinæ, Snipes.

Scolopax rusticola, *Linn.*, the woodcock, all India.
S. saturata, *Horsfield*, Java.
S. minor, *Gmelin*, America.
Gallinago nemoricola, *Hodg.*, wood snipe, solitary snipe, all India.
G. solitaria, *Hodg.*, Himalayan solitary snipe.
G. stenura, *Temm.*, pin-tailed snipe, all India.
G. scolopacinus, *Bonap.*, common snipe, all northern latitudes.
G. gallinula, *Linn.*, jack snipe, all northern latitudes.
Rhynchæa Bengalensis, *Linn.*, painted snipe.

Gallinago scolopacinus (Scolopax gallinago) is the common snipe of Europe, Asia, North Africa, and is very common in India.

Gallinago gallinula (Scolopax gallinula), the jack snipe of Europe, Asia, Barbary, is common in India.

Both these are migratory, coming over the Himalaya in October, but the Gallinago stenura snipe precedes them, though few sportsmen discriminate it from the common British snipe, which makes its appearance somewhat later. G. stenura is nevertheless a different bird, at once distinguished by having a set of curious pin-feathers on each side of its tail; whereas the British snipe, which is equally abundant in India, has a broad fan-shaped tail, as unlike that of the other as can well be. The pin-tailed is the common snipe of the Malay countries, and is unknown in Europe, excepting as an exceedingly rare straggler from its proper habitat, the east. The double snipe is the Gallinago major of Europe, distinct from the two species of large or solitary snipes of the Himalaya, G. solitaria and G. nemoricola. The solitary snipe is the Gallinago solitaria. It is found throughout India, northwards to the Himalaya, where, in the lonely glen, by the side of the mountain torrent, where the pine grows tall and dense, and the sun's rays seldom penetrate, may be found the great snipe Gallinago solitaria, from the lower to the upper ranges of the forest region.

There are two distinct species in the Himalaya commonly confounded under the name 'solitary snipe,' and both are very different from the Gallinago major of Europe and Northern Asia, which has not been observed in British India. Of the other Indian kinds, one (Gallinago solitaria of Hodgson) is peculiar to the Himalaya, and to this species the designation 'solitary snipe' should be restricted. It is readily known by its white belly and yellowish legs,—wings longer, straighter, and more acuminated than in the other, and the upper plumage more minutely speckled, with the pale linear markings on the back narrower, and the tail also longer. Average measurement, 12½ inches by 20 in expanse of wings; closed wing 6½ inches, and tail 3 inches. Weight, 5 to 6 oz., or even more.

The other (G. nemoricola of Hodgson) should be distinguished as the wood snipe, and is more of a woodcock in appearance and habit, though keeping to the outskirts of the jungle. Though principally a Himalayan species, it is not rare in the Neilgherries, and it has been met with in various parts of the country, and in the Calcutta provision bazar. This species has blue legs, and the under parts are uniformly barred throughout; the general colouring dark, and the markings bold; the wings more bowed and rounder than in the other, and the tail shorter. 'It is only found,' remarks Mr. Hodgson, 'in the haunts of the woodcock, with this difference in its manners, that it is averse to the interior of woods.' Length, 12½ inches by 18 in expanse of wings; closed wing 5½ inches, and tail 2¼ inches. Weight, 5¼ to 6½ oz. and upwards.

The grass snipe is also known as the pin-tailed snipe (G. stenura); it is distinguished by a duller plumage than the common British snipe, and especially by the curious series of pin-feathers on either side of its tail; whereas the other has a fan-shaped tail, altogether different in form. The pin-tailed is the common snipe of the Malay countries, but not of Australia, as has been stated; the Australian (G. Australis) being a much larger bird, with intermediate form of tail, as in the solitary and wood snipes of British India. In Bengal it is the more abundant species, early and

ıe season, as the common or British

be looked for on the sea-coast. Shore
should indeed be its popular name.

SNOW.

Talj, Tuluj,	Arab.	Neve,	It., Port.
Mo-bwing,	Burm.	Snyegh,	Rus.
Snee, Sneeuw,	Dan., Dut.	Nieve,	Sp.
Neige,	Fr.	Sno,	Sw.
Schnee,	Ger.	Khar?	Turk.

Snow is not known to fall in any part of British India south of the Himalaya. The snow-line of Kamaon was stated by Humboldt at 11,700 feet, but higher than this are flourishing agricultural villages and luxuriant vegetation. In every part of the Himalaya, and of Western Tibet, wherever the mountains attain a sufficient elevation to be covered with perpetual snow, glaciers are to be found. In the lofty chain of the Cis and Trans Sutlej Himalaya, and of the Kouen Lun, whose peaks rise to a very great height, and collect in winter enormous depths of snow, they are of great length. In the central parts of Tibet, which are often lower, and, even in their loftiest parts, are less snowy, than the bounding chains, the glaciers are of inferior dimensions, where the snow-bed is at once cut off abruptly in an ice cliff, which can hardly be said to be in motion, or rather whose motion must be almost entirely from above downwards. Moraines which, on the larger glaciers and among mountains of easily decaying rocks are of astonishing dimensions, form the margins of each glacier, and also occur longitudinally. The annual rising of the rivers Indus and Ganges depends to a great extent on the melting of snows on the mountains. The permanent flooding of the Euphrates is also caused by the melting of the snow in the mountains along the upper part of its course. This takes place about the beginning of March, and it increases gradually up to the time of barley harvest, or about the last days in May, when it is usually of its greatest height. In the report of the Proceedings of the Magnetic Survey, it is mentioned that the phenomenon of the illumination of snowclad mountains after sunset (analogous to the glowing of the Alpine snows) was seen several times in those nights when there was no moon. It was seen particularly well near Chibra, to the north of Kara-korum. Judging of it, as seen there, it was thought to be quite independent of a spontaneous development of light from snow, and evidently caused by an illumination of the snow-fields from the west-north-western parts of the sky. This illumination is only visible after a certain time after the sun has set, namely, when the projection of the earth's shade has reached an angular height exceeding that of the mountains, and when the atmospheric light has decreased so much that the atmosphere behind the mountains reflects less light than the snow-clad slopes of the mountains exposed to the west-north-west. The Lachen valley, says Dr. Hooker, remains almost level for several miles, the road running along the east bank of the Lachen. Shoots of stones descend from the ravines, all of a white, fine-grained granite, stained red with a minute conferva, which has been taken by Himalayan travellers for red snow, a phenomenon Dr. Hooker never saw in Sikkim. Red snow was never found in the antarctic regions during Sir James Ross' South Polar voyage; nor does Dr. Hooker know any authentic record of its having been seen in the Himalaya. — *Hooker's Himalayan Journal*, ii. p. 118; *Magnetic Survey of India*, p. 8.

SNUFF.

Barnuti, Saut, . .	Arab.	Tobacco da naso, . .	It.
Tabac en poudre, .	Fr.	Nosowoi tabak, .	Rus.
Schnupftaback, . .	Ger.	Tabaco de polvo, .	Sp.
Nas, ...	Hind.	Enfiyze, ...	Turk.

Snuff is tobacco in a powdered state, and in general use as an errhine. Other articles are sometimes added to vary its pungency, scent, etc. The snuff of Masulipatam was to be found throughout the Peninsula of India, where many Hindus and Muhammadans use it. Snuff is very little taken by the inhabitants of the Panjab plains, but the Baluchi and hill tribes of the Dehrajat use it more frequently. It is preserved in small egg-shaped boxes, with a little ivory stopper; some of them are very prettily carved out of the fruits of Feronia elephantum. Benares snuff is famous throughout India, and its manufacturers have made fortunes.—*Powell; Faulkner; M'C.*

SNUSSI, a society of darvesh of recent origin, but who have already obtained an influence in the region of Northern Africa corresponding to that exercised in Central Asia by the late Akhond of Swat. They are usually regarded as exceedingly fanatical.

SOAP.

The manufacture of soap has long been practised in India, but the identity of its names in very many regions shows that its manufacture was learned almost from one source. Soaps are slightly alkaline, feel soft and slippery, and are detergent. The watery solution is readily decomposed by acids, also by earthy and many metallic salts; hence, when water holds any of them in solution, instead of dissolving, the soap becomes decomposed. Such waters are called hard, while those which are comparatively pure are called soft waters. Castile soap is composed of 9 to 10·5 of soda, 75·2 to 76·5 of oleic and margaric acids, and 14·3 to 14·5 of water. Common soap is made of tallow and soda, and yellow soap of tallow, resin, and soda. Chinese use the native soda (Fan-kien), or the pods of the Acacia concinna (Fei-tsau-toh). Soap seems to have been introduced by the Muhammadans into India, though the Hindus have long used alkaline leys, obtained from the ashes of plants, for many of the purposes of soap; and they have a substitute for soap in several berries. Soap is made at Daeca, of fine shell lime, 10 maunds; saji mittee, impure carbonate of soda, 16 maunds; common salt, 15 maunds; sesamum oil, 12 maunds; goats' suet, 15 seers. It is made of good quality at Saharunpur. The soap of Tranquebar was formerly an export to Mauritius, Penang, Sumatra, and the islands of the Indian Archipelago. In Oudh, a soap is made from cow's fat and the reh which effloresces on barren land. It sells at 8 seers the rupee. Soft soap, used in the arts, is made with caustic potash and fish-oil and tallow; is semi-transparent, of the consistence of honey, brownish-coloured, and nauseous.

SOAP-STONE, Pot-stone, Steatite, Talc.

Hwah-shih, . . .	Chin.	Sunkjiri, Sunkjeeru,	Hind.
Hwah-shwiu, . .	,,	Bulpam, . .	Tam., Tel.

This mineral has a soft and greasy feel; is of a yellowish-white or greenish-grey colo times spotted or veined, with little transparency. It is composed of silica, oxide of iron, and water in various pr It occurs in many parts of India and Bu is constantly for sale in the bazars, be to write with on black boards, as Europ chalk.—*M. E. J. R.*

SOAP-WORTS. The soap tree o Sapindus Chinensis, is a large tree bearin berries, resembling the fruit of the mel tree is called by the Chinese Wa-hwan-Fei-chu-tsze. The berries are sometimes making rosaries, and when roasted are e the Chinese, notwithstanding their appare ity. In the form of tincture of the berri were used in skin diseases. The followe Taou faith employ sticks of this tree to demons. Soap-worts, soap-fruits, and so in tropical climates furnish substitutes fo of a more or less useful character, and t berries are to be found in almost ever being used throughout India for washing hair, or woollens and cloths of various The soap-berries of the W. Loupo Soarez de Albergaria, a rtuguese in India in the early part ury. He succeeded Albuquerque, luced Aden, took and burned Zeila, an attack on Jeddah. In 1517 he a on the Somali coast, made the bo tributary, and obtained permis- ling sovereign, Dharma Pra Krama . 1505–1527), to erect a fortified entrance of Colombo.

TI-NAGARA, the birthplace of the ka-muni, identified with Subhay-

a small village in Lahore district, W. bank of the Sutlej (Satlaj), in d long. 74° 54′ E. Opposite this east bank of the river, in the ct, lies the battlefield where Sir ds Lord) Gough gained his decisive February 1846, which brought to t Sikh war, and led to the occu- re by a British force. The Sikhs strong position on the east side of ecting the Hariki ford, while their rear rested upon the village of Sobraon. The battle took place on the Ferozpur side, where the Sikhs gallantly held their earthworks until almost their last man had fallen. Comparatively few made their way back across the river. — *Imp. Gaz.*

SOCOTRA lies between lat. 12° 19′ and 12° 42′ N., and long. 53° 20′ and 55° 2′ E., with an area of 1520 square miles. It was known to the ancients as Dioscorida, a name supposed to have been derived from the Sanskrit Dwipa Sakhadhara, *i.e.* island, the abode of bliss. The S.E. coast of Arabia is held by the Mahra tribe, in a narrow strip of land from Misenat to Ras Nus, lying between the sea and the mountains of Subhan, their sovereign being the sultan of Keshin, and the Mahra hold also Socotra. It was long occupied by Christians. It was temporarily occupied by the E. I. Company from 1834 to 1839. It has only three towns of any magnitude. The Bedouins, nomade shepherds, are the original inhabitants. They are tall men and well made, with open countenances, and peaceful. They dwell in caverns in the limestone rocks. Aloes and dragon's blood from Pterocarpus draco are the chief exports.

SOCRATES, B.C. 468-399, the Sokrat of the Arabs, a philosopher of Greece, born at Athens B.C. 468. His father was a sculptor and his mother a midwife. He served bravely as a soldier, but it is as a philosopher that he is famous. He does not seem to have written any book, but Plato digested his discourses, in the form of conversations. He was accused of treason, and was condemned to death by drinking hemlock juice.

SODA BIBORAS, Borax, Tincal.

Boorak, ...	ARAB.	Sohaga, ...	HIND.
Let-khya, . . .	BURM.	Catteri, Pijar, .	MALEAL.
P'ung-sha, . . .	CHIN.	Tankar, ...	PERS.
Yueh-shih, . . .	,,	Tincana, . . .	SANSK.
P'wan-shah, . . .	,,	Velligaram, . . .	TAM.

Borax is supposed to have been known to the Greeks and Romans, and to have been the chrysocolla of Pliny. The Hindus have long been acquainted with it; it is their sohaga, Sanskrit tincana, and one of the kinds of boorak of the Arabs. It is produced by spontaneous evaporation on the shores of some lakes in Tibet, and is brought across the Himalayan passes into India, and imported into other countries by the names of tincal and crude borax. It is also obtained by saturating the boracic acid of the lagoons of Tuscany with carbonate of soda. Crude borax is in pale-greenish pieces, covered with an earthy coating, and feels greasy to the touch. The natives of Tibet are said to cover it with some fatty matter, to prevent its destruction by efflorescence. It is purified by calcining, which destroys the fatty matter, or by washing with an alkaline ley, which converts it into a kind of soap, then dissolving and re-crystallizing. Sp. gr. 1·35. It is colourless, transparent, somewhat shining. It has an alkaline reaction on turmeric. The crystals, efflorescent slightly in the air, are soluble in 12 parts of cold and 2 of boiling water. When heated, they lose water, swell up into a porous substance called Borax usta v. calcinata, and at a red heat run into a transparent glass called glass of borax, much used as a flux. Another variety, more useful in the arts, crystallizes in octohedra, which are permanent in the air.—*Royle's Mat. Med.; Smith's Mat. Med.*

SODA, Carbonate of Soda.

Kan, Kien, . . . CHIN.	Choutoo munnoo, . TAM.
Kohlensaures natron, GER.	Karum, ... ,,

Khar, Sajji noon, . ,,	Savitimunnoo ooppoo, TEL.

The soda of commerce was formerly obtained from kelp or barilla, made by burning sea-weeds and species of salsola. It was known to the early Hindus, and is by them now called Sajji noon (*i.e.* Sajji salt or soda salt). Plants mostly of the natural family of Chenopodeæ, and chiefly of the genera Salsola, Salicornia, Suæda, and Chenopodium, are burned to obtain the ash. This is barilla, and contains 25 to 40 per cent. of carbonate of soda. Various saline plants of the Salsola tribe abound in the thals or deserts during the rainy season. The Indian article, though a natural product, could not compete with the manufactured in the market.

The mineral carbonate of soda, dhobi's earth, occurs abundantly in many parts of India, in a whitish soil over granitic rocks or over alluvium. The earth is collected and used by washermen instead of soap for washing cloth. There is from 5 up to 30 per cent. of dry carbonate of soda obtainable; but in the earth this is mixed with muriate of soda and other salts.

Kelp used to be prepared on the coasts of Europe by burning a great variety of algæ or sea-weeds. Kelp is in hard cellular masses, of a bluish-grey colour, and of a disagreeable alkaline taste, containing from 3 to 8·5 per cent. of carbonate of soda and other salts, as in the case of barilla, but also some potash and iodine.

SODA, Muriate of, Common Salt.

The common salt is obtained as rock-salt from the mines of the Salt Range, from the saline lakes and wells of many parts of Asia, in China and British India, from the sea water by evaporation, and from the saline soils by solution. Mineral salt or earth salt of very fair quality is made in Bangalore, Bellary, Hyderabad, Guntur, and Nellore districts, where it is almost invariably accompanied with gypsum, magnesian limestone, sandstone, sulphur, red and brown iron ores, and alum slate. Muriate and carbonate of soda is obtained from the Loonar lake in the Hyderabad territories.

SODA, Nitrate of.

Cubic nitre, . . . ENG.	Wurfelsalpetre, . GER.
Nitrate de soude, . FR.	

It consists of nitric acid and soda, and is similar in its properties to saltpetre, differing chiefly in being more pungent in taste, more soluble in cold water, more inclined to attract moisture from the atmosphere, and in crystallizing in a rhomboid form. It is highly esteemed as a manure for pastures, and for all other sorts of agricultural produce, except that grown in heavy wet soils. It is also applied to many of the purposes for which saltpetre is used. It answers well for some descriptions of fireworks, though, being more deliquescent than saltpetre, it is not adapted for the manufacture of gunpowder. This salt is found in immense quantities in deposits in South America, particularly in the districts of Atacama in Peru. It was exported from [illegible] tons in 1875. Indifferent samples [illegible] exhibited at the Madras Exhibition [illegible] Bellary and Hyderabad, where it [illegible] natural efflorescence.—*Waterston, M. E. J. R.*

endant of the Sikh Guru Govind. ted to infanticide.

ANSK. Called Sobhacritu in the y written Sodhyum. A constant bstracted in certain computations, to a particular epoch, being the epa.

N. A garment of leaves, which, hats, is fabricated by the agricultural labourers of Northern China, from the leaves of Chamærops excelsa, a palm indigenous in the northern and central parts of that country; but in the southern districts of China the So-e is made from the leaves of the bamboo and of other broad-leafed grasses.

SOENAIR. Colonel Tod relates that a Rajput ruler in the fulness of his pride had divine honours paid him in the rite Soenair. This distinction, which involves the most august ceremony, and is held as a virtual assumption of universal supremacy, had in all ages been attended with disaster. In the rite of Soenair, every office, down to the scullion of the Rusorah or banquet-hall, must be performed by royal personages.—*Tod's Rajasthan*, ii. p. 8.

SOFALA, a district on the African coast to which the ships of the Hebrews voyaged.

SOFARIDES, a dynasty who ruled in Khorasan and Seistan for thirty years, from A.D. 872 to 903. They displaced the Tahirides. Their founder, Yakub son of Leis, was a brazier (Soffar means a worker in copper) of Seistan, who first raised a revolt in his native province, and afterwards overran all Persia to the Oxus, and died while on his advance against the khalif in Baghdad. His brother Umar was defeated and made prisoner by the Samani, which put an end to the greatness of the family, though a younger member maintained himself in Seistan for a few years after the loss of their possessions (A.D. 903, A.H. 290).—*Elph.* p. 271.

SOFIAN, a little place which is within the lines of a dreadful battle fought [redacted] 1585, between the Turks and Persians, and which gave a signal overthrow to the former power by the arms of Hamzeh Mirza, who commanded the Persians. The distance from Sofian to Tabreez is 24 miles.—*Porter's Travels*, i. pp. 219, 220.

SOGDIA or Sogdiana, an ancient dominion. It comprised the mountainous part of Transoxiana (which may be described as the extreme western spurs of the Tian-Shan), with no definite frontier on the east, but bordering westward on Miyankal, southwards on Kesh, and northwards on Osrushna. The capital was Samarcand, undoubtedly the Maracanda of the Greeks, which they specify as the capital of Sogdia. Samarcand, throughout the history of Transoxiana, has been the rival of Bokhara. According to Bunsen (iii. p. 584), the separation of the Aryans was prior to their leaving Sogd. The Aryan emigration from Sogd to Bactria, after the separation, took place, he says, B.C. 5000, consequently before the time of Menes. Their immigration into the Indus country was, he says, about B.C. 4000; and Zoroaster's reform in Bactria about the time of Menes, or half a century later. Sogd is said to be the birthplace of Arsaces I. of the Arsacidæ. Sogdiana in Samarcand formed the first settlement of the Aryans. Sughda, afterwards spelled Sugdia, and commonly Sugdiana, is pre-eminently the country, as being the home of the fire-worshippers. It is described in the Vendidad as in the 38th degree of latitude, where Mara Kanda (Samarcand) is situated, a paradisiacal land, fertilized by the river Sogd, so that Sogd and Paradise are used synonymously by the later writers. The Vendidad (ii. verse 5) says it was created as the second best of the regions and countries.—*Vambery; Bunsen*, iii. 584, 586.

SOH and Wang. CHIN. The first and

fifteenth days of the month, kept as holidays by the Chinese.

SOHAG. HIND. Ornaments worn by married women while their husbands are alive. Sohagin, a married woman whose husband is alive.

SOHAGA. HIND. A clod-crusher, also called dah. A flat piece of heavy wood dragged over fields after ploughing and sowing, to smooth down the clods.

SOHAGIN or Sogheea, a sect of Muhammadan fakirs who assume women's clothes, and dress as women.

SOHAR, a town of Oman, on the E. coast of Arabia, with about 20,000 inhabitants.—*Findlay.*

SOHAWAL. This state was entered in the sunnud granted to raja Kishore Sing as a feudatory of Punnah. Separate sunnuds were granted to the chiefs of Koti and Oocheyra on the British occupation of Bundelkhand. The area of Sohawal is about 300 square miles, and the population about 50,000; the revenue is Rs. 30,000.—*Aitchison's Treaties*, p. 247.

SOHNA, a small town of 7507 inhabitants, with a sulphur spring, in the Gurgaon district of the Panjab, in lat. 28° 14′ N., and long. 77° 7′ E., at the foot of the Mewat Hills. The water has a temperature varying from 115° to 125° F., and it is considered a specific for the Dehli boils. A large bath has been constructed for the use of Europeans.—*Imp. Gaz.* viii.

SOIL. The gross revenue of British India in 1881 was £72,559,978, and the land revenue in that year was £21,112,995; so that alike for the agricultural rent-payers and for the Government receivers it is important to have the fullest acquaintance with the soils, seeing that, since 1872, the land revenue, being then £20,520,377, has but little risen, though agricultural farms and new products had been introduced, and more land brought under cultivation. The soils of British India are not multitudinous, though from the variety of languages the names are manifold.

Peninsula.—Throughout its entire extent, there are four markedly distinct kinds of soil in which cultivation is conducted. These may be briefly named as the red soil over the granitic, gneissic, and syenite tracts; the black soil or regur, also called cotton soil, over the rocks of volcanic origin; the alluvial soil; and the sandy soils along the coasts and in beds of rivers. There are patches of regur or black soil in various parts of the Ceded Districts and in Tinnevelly, and it is to be seen over all the great volcanic outburst in the Dekhan. The red soil tract lies over the granitic regions in eastern and southern parts of the Peninsula. The regur or black soil is very retentive of moisture, and very fertile, and all the country where it is found is well under cultivation. The field crops grown on it are cereals, pulses, and cottons. Dr. Heyne remarked (Tracts, p. 349) that red soil prevails where syenite forms the apparent ground rocks; and Mr. H. F. Blanford says the colour and appearance of the soil is an excellent indication of the presence of certain rocks throughout the districts.

The *plateau* of the Peninsula, from Central India southwards to the Godavery and Kistna rivers, is a great outburst of volcanic rocks, and the soil which is formed from their detritus is exceedingly fertile, when well combined, as it commonly is, with the salts and double salts formed by the union of the organic acids with bases of alkalis, earths, and oxid become soluble, and been brough from below by capillary attrac basaltic plateaux are often surm deposit of laterite, the detritus of promote fertility in the soil. Ther other deposit than this iron clay o the basaltic plateaux. The cent table-land of the Dekhan for around Beder is covered wit laterite, which occurs also nort Berar, also near Madras, along th and at Rangoon. Near Musery, o the Cauvery, black soil, with its calcareous strata of marl and tuff, rests on granite.

Ceylon.—The rocks of the interior of C granite, gneiss, and greenstone. The body of the island, and the soil cons disintegrated or decomposed materials felspar and quartz greatly preponderat in some parts by vegetable accretions.

Laterite, called Kabuk in Ceylon, several parts of the island, and the gr of felspar occurring in parts of the to the soil of those tracts a hard clay with a smooth and firm surface.

Owittes, Dutch or Singhalese? a only cultivable every three to seven

Wattocrawes, low, muddy ground reeds, only cultivated in dry season

Moelaries? high, steep ground, after rains.

Dedennies, sandy plains planted

Madras.—In the *Tamil* country uncultivated lands are classed as or capable of cultivation, and lying waste from time immemo cannot be profitably cultivated.

The greater part of the Madra covered with soils formed by the decom metamorphic rocks, gneiss, etc., and s inferior quality. Stretching across in a N.E. direction from Trichino a wide belt of rocks belonging to t formation, over which a very p rests.

The black cotton soil occurs s patches, in others extending over pl dreds of square miles.

The red soil of the Madras distr places covers extensive plains with a surface, in others it is open, friable, e and generally fertile. These parts with cotton and cereals; the gr varagoo, Panicum Italicum, and th with Penicillaria spicata and Sorgh

The soil of that part of the Ca nearest to the sea, is loam and mixed with marine remains, a formed from the debris of the gra mountains inland. The rocks of contain a very small proportion o seems to account for the want admixture of clay, and for the of iron. arese-speaking natives of Mysore dis-
ht different soils, viz.:—

ick cotton soil, quite free from stones.
e same but stony.
Kempu, red soil mixed with loam and
table mould.
Morallu or Molalu, sandy soil.
Kallu, Murbu, stony and gravelly soil.
Bila, Carlu, white stiff loam.
Maska, Masbu, Cabbou, garden soil.
Soudu, Choudu, salt ground.

The tops of the rising hummocks are usually very barren, producing nothing but a small jungle, chiefly composed of Dodonæa viscosa, Convolvulus cuneatus, Erythroxylon areolatum and a thorny species of Barleria. The soil of the valleys is a good and loamy mixture, in which rice and sugar-cane are grown, the latter demanding the best soil, while the rice requires an abundance of water. All other grains in Mysore are grown under the natural rains.

Salem.—Muriate of lime is found in the well water and the soil of the Bara Mahal or Salem district, also in Mysore and other parts of the Peninsula. The soil containing it rapidly absorbs moisture, is very fertile, and gardeners apply it to the roots of the egg plant. In Mysore it is found largely in the water from which salt is made.

The soda soils of the Bara Mahal or Salem district are in patches, seldom more than half a mile square, and generally resting on a bed of kankar. The soil is sandy, and incapable of supporting vegetation, only a scanty scrubby grass growing on them. The natives call the soil of these patches Chour mannu, and extract the soda to be used as a flux of quartz in bangle-making; and washermen dissolve it, add quicklime to it to make it caustic, and use it in washing clothes. The bangle-makers extract the impure soda by mixing the earth with water in a pot and allowing it to settle. The solution is [illegible] and evaporated by sprinkling [illegible] on the surface of granite [illegible] has become about half a [illegible] taken off and broken int[illegible] under the name of Chou[illegible] the rate of 17½ rupees th[illegible] per cent. of insoluble matter. [illegible] contain 15 per cent. of sulpha[illegible]

The soil in the wide plai[illegible] district is largely the black co[illegible]

The *Dekhan* soils, besi[illegible] as Lal-Barad, red [illegible] yellow soil; and Ma[illegible] Mattiari-Barad, clay[illegible] prevailing on the hig[illegible] heavy rich aluminous c[illegible] plains is principally a light and fertile loam, in either case of no great depth, and resting upon a rocky substratum. These two soils are derived from the wearing away of the surface rocks, the basalt going to form the stiff dark soils, whilst the amygdaloid greenstone disintegrates into a friable earth. The two mixing, form rich loamy lands. Such is the fertility of basaltic soils in general, that some are said to bear wheat cropping for thirty years in succession without a fallow.

The *Mahabaleshwar* Hills have a cellular ferruginous claystone as a surface rock, which disintegrates into a red clay. The soil consists of this red clay intermixed with the débris of trap-rock, and in many places with a considerable portion of decayed vegetable matter, forming a very productive brown mould.

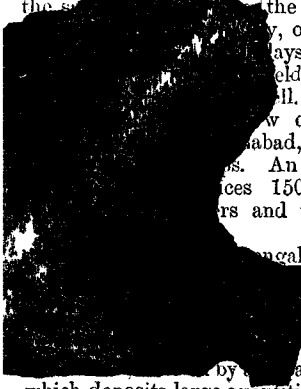
Gujerat is one extensive plain, with many different soils. The prevailing varieties are the black cotton soil, and the light gorat, a grain-

producing soil. On the eastern side of the gulf, the black soil is chiefly confined to the collectorate of Broach and the few parganas of Surat which lie north of the Tapti. The light soil prevails throughout the state of Baroda, the collectorate of Kaira, and some of the northern parganas of Ahmadabad, becoming more and more mixed with sand as we proceed northward from the Mhye. The western and southern parganas of Ahmadabad, lying to the westward of the gulf, abound in black soil, as do many of the numerous valleys of Kattyawar.

Gujerat, in the open districts, where the black soil abounds and cotton is most raised, has no boundary trees or hedges between the villages; the dividing line always consists of a strip of uncultivated land varying in width from 5 to 150 feet.

Bengal.—The general soil of Bengal is clay, with a considerable proportion of silicious sand, fertilized by various saline minerals, and by animal and vegetable products in a state of decay.

In all the Gangetic lowland, the upper layer of a well-raised tract always consists of alluvial mould, but the subsoil is sandy. The rivers which have had the longest course from the hills, deposit mud; the others leave behind them beds of sand; but the Ganges forms alternate layers of each. Hence a flood from the Gogra or the Sarju is injurious to the fields, while an inundation of the Ganges benefits the crops. Lands that are annually inundated or are thrown up by the action of rivers, are of various degrees of fertility, according as mould or sand predominates; where the [illegible] the mixed autumn crops, [illegible], or peas and grain, are [illegible]ays abound, as in the [illegible]elds are low-lying, the [illegible]ll. The tamarisk and [illegible]w on the alluvial lands [illegible]abad, often yield as good [illegible]s. An average acre of such [illegible]ces 150 bundles of sticks, [illegible]rs and the proprietor share



[illegible]ngal are good, and water [illegible]ajpur, four crops are

[illegible]il, formed from the [illegible] which bound it on [illegible] by [illegible]arak or Soorma river, which deposits large quantities of silt. Teelah, in Assam, and Cachar, are low ranges of hillocks covered with dense tree forest, intermatted with reeds, grasses, canes, and creepers.

In *East Oudh* and in the *Benares* districts, the loams are called doras or domat and kapsa doras. In Gorakhpur the doras is called bangar. The best is the doras. The kapsa doras contains more adhesive clay, and gives less produce. Both these soils take much manure, irrigation, and labour, but produce two crops, and of every variety.

Mattiyar is the prevailing name of the soil of Oudh, Jounpur, Azimgarh, Gorakhpur, and Basti. It embraces all good argillaceous earth, from the brown to the black humic or relmic deposit found in the beds of tanks, but the black soil of Bundelkhand is also known by this name. It is of a darker colour than doras, is more capable of absorbing and retaining moisture; is slippery when wet, very hard when dr[illegible] manured. It is the finest nati[illegible] yield is equal to the doras [illegible] together. Mattiyar is arranged [illegible] tiyar, this being again classed as [illegible] and kapsa kalar. It also includes [illegible] and bijar. Mattiyar karail is found [illegible] tanks and *jhils*. Mattiyar kapsa k[illegible] to mattiyar, but has orange-colour[illegible] hence called kahis and sandurya. Its [illegible] Mattiyar uparwar kapsa lies at a [illegible] and yields less.

Bijar is as hard as mattiyar, but [illegible] with very fine gravel. It resembles th[illegible] but usar produces reh or sajji in the [illegible] which bijar does not yield. Only diff[illegible] of rice are sown in it, and even these [illegible] the mattiyar is unusually abundant. S[illegible] the mattiyar retain moisture in Gora[illegible] indigo sowings go on in March and Ap[illegible] being commonly rolled in, keep in t[illegible] Mattiyar when irrigated is held to [illegible] productive of all soils; when unirriga[illegible] the worst.

Khalar soils of Oudh are low lands [illegible] moisture.

The *Saharunpur* district lands are [illegible] kach'ha, pahara, and tarai. The first [illegible] the two last. The Tarai soil is low [illegible] lying along the river banks.

Rotation.—It is a popular error to [illegible] double crop in the year is only obtai[illegible] best manured lands, called goind or go[illegible] fact is, wherever the water supply [illegible] outlying lands, two crops are take[illegible] N.W. Provinces, the agriculturist is [illegible] tent with one good heavy rabi or[illegible] from the inlying lands. The very l[illegible] last are reserved for wheat, sugar-can[illegible] Wheat may be grown two or three y[illegible] in such land, but natives are quite [illegible] value of rotation of crops, and a[illegible] change is wheat one year, to be foll[illegible] Cytisus cajan as a spring crop, but m[illegible] is also sown urd (Dolichos pilosus), [illegible] palum frumentaceum), or Sorghum v[illegible] autumn crop. These last grow quickly [illegible] before the Cytisus cajan has made mu[illegible] that is then weeded, and the plough [illegible] it, and left to mature in the spring. [illegible] rests the land much, as the leaf drop[illegible] supplement the usual manure.

Another rotation for wheat is (2) [illegible] crop of makra in the rains (always a[illegible] crop), and when that is cut, to put i[illegible] peas for the spring.

In the two crop lands proper, *i.e.* t[illegible] and low-lying lands near a swamp or ot[illegible] ant water supply, rice (dhan) is gr[illegible] rains, and so soon as that is cut, barley [illegible] are sown, as a mixed or separate crop at [illegible] they can be irrigated; or if they cannot [illegible] yet there still be sufficient moisture in [illegible] warrant the seed being sown, grain o[illegible] put in, and occasionally a sprinkling o[illegible] thrown in with them.

In *Sind* the soil near the banks of t[illegible] in many places of a loose sandy descri[illegible] where this does not form the principa[illegible] teristic, it consists of a fine loamy [illegible] exceedingly fertile. Large tracts of

however, impregnated with nitre, and are of course valueless for agricultural purposes. The hills in the back-ground are of sandstone and limestone, in which fossils occur.

In the *Panjab*, the classification of land is in two ways, viz. according to means of irrigation, and according to the nature of the soil. Even where terms descriptive of soil are employed, every class of land may also be described as chahi, if it be watered by wells; abi, if by ponds; or chalar, to be described hereafter; sailabi, if by flood and inundation of rivers; pani mar, if damaged by drainage floods; and barani, if dependent on rain.

The plain districts of the Panjab are subdivisions of doabs, *i.e.* tracts of country between two rivers. The names of the doabs are in all instances (excepting the first or Jalandhar Doab) the result of a rude attempt to join the names of the rivers on each side into one word. Thus, passing the Jalandhar Doab, between the Sutlej and the Beas, we come to the Bari Doab (Beas and Ravi). Then between the Ravi and Chenab, the Richnab Doab; between the Jhelum and Chenab is the Jach Doab. The last doab up to the Indus, takes its name from that river, and it is called Sind Sagar, the ocean of the Sind (Indus river). The Panjabi give the generic name Daman-i-koh or Kandi to the low hills that form the bases of the higher ranges, and in which such hill states as Kotahah and others are situate.

In the *hill districts*, including both hills and intramontane valleys, the best land is called bari; the second quality of land is called ekfasli; the third quality is distinguished by the name shand. This is allowed to lie fallow for two harvests, and is then cultivated only for the rabi. The fourth kind is math; it is a good quality of land, and is retentive of moisture, and will, if manured, yield two harvests in the year; the fifth kind is regi, that is, mixed with sand, or adjacent to the bed of a nullah or hill stream, shelah, which has washed down quantities of sand.

In the Panjab, deposits of moist alluvium extending along the bed of rivers, on which grow tamarisk (pilchi), sarkanda, and the munj (large grasses of the species Saccharum), are called bela. Land periodically inundated by the rise of the river is called bhet. It often has an efflorescence of reh or kalar (sulphate of soda), which renders it less productive.

Dushahi or dosahi is the same as rohi, except that it has some sand in it. Misi, again, has more sand, so that the soil is half and half sand and clay.

Shor is a kind of barren land, which swells after rain, and yields reh, an efflorescence which consists principally of sulphate of soda, and is fatal to the productiveness of any soil.

In the *Gujranwalla* district, the great subdivision of land is into high and low land, called utar, netar, the high lands being out of the reach of rivers, etc., the netar lands being on the banks, or otherwise subject to their influence. The netar lands are subdivided into bhet and dhaya, that is sailaba land subject to periodical inundation from the river, and land not so subject, respectively.

Rohi is the finest natural soil, a stiff loam which breaks up into large clods.

Doshahi is the dumat of Hindustan, a clayey soil, generally of good quality, manured by cattle being folded on it. When manured, it grows cotton, fine wheat, barley, jowar, makai, melons, etc.

Mera, a mixture of clay and sand, the rusli of Hindustan, has many varieties, some very good, and equal to the best doshahi.

Tibbah, nearly all sand, the bhur of the provinces, worth very little, and only grows the inferior crops of moth, mash, etc.

Cis-Sutlej States have divisions of the soil, to a certain extent corresponding to the netar and utar, viz. the low lands, called khadar; lands which have at one time been the beds of the rivers, or have been flooded; and bangar, high land requiring irrigation by wells. These great divisions are subdivided, as nyain, loamy land cultivated with manure and artificial irrigation; rusli, good loam; dakar, a low-lying stiff clay, productive of rice and gram; and bhur, an inferior land with a large proportion of sand. Land that is inundated and generally unproductive for want of drainage, is called choil. In some of the sandy districts the names vary considerably. In the Gugaira district, for instance, where the soil is very bare, there is but little scope for all the varieties of inundated, irrigated, and other lands; if land is cultivable at all it is fortunate, and there is but little variety to distinguish. The most generally recognised names of the descriptions of culturable soil are gusrah, sikand, and retli. In the Settlement Records, the name dakar, which is locally unknown, was introduced by the Hindustani amins employed on the measurements. The equivalent term is gusrah. Retli, as its name implies, is land with an excess of sand, and sikand is a stiff clay soil suited for rice; it is called in some parts pakk chikni.

The following names are known as names of soils and in husbandry in the various linguistic areas:—

Abi, in the Panjab, is an irrigation rate on land watered from tank or stream. In the N.W. Provinces it is applied to land watered from ponds, tanks, lakes, or water-courses, in distinction to that watered from wells, as the supply from the former is liable to fail in the hot season. Abi land is assessed at a lower rate, in some cases at less than a half of that watered from wells.

Agadi, of Coorg, a field in which seed is sown; a nursery.

Aghani, in Bengal, the great dhan or rice crop of the year, sown in Asarh (June—July), and cut in the latter half of Aghan (December).

Agor batai, in Bengal, a division of the crop between the landlord and the cultivator of it, after it has been cut, stored, and threshed.

Ahar, of Bengal, is an embankment raised to catch surface drainage for purposes of irrigation.

Ail, of Bengal, a bank or ridge of earth forming a division between fields.

Aima, of Bengal, a land grant by the Moghul government, either rent-free or subject to a small quit rent, to learned or religious persons of the Muhammadan faith. Aima baz-yaft are such grants subsequently assessed.

Aitho, of Sind, exhausted land lying fallow.

Ajjar, of Bengal, land not subject to diluvion.

Akasia, of Bombay, land dependent on the natural rains, or casually watered from tanks or rivers.

Aman, of Bengal, a rice crop sown on low wet ground about July or August, and reaped in December.

Aman are low lands yielding one crop a year.

Awal, duam, siam, charam, panjam, shasham, haftam, are Persian words signifying, as applied to land, soils of the first to the seventh rate qualities. In Gujerat, previous to the survey, this was a mode of classifying land; its distance from the village and facility for irrigation were taken into account in the classification.

Bad'h, in Bengal, high-lying rice fields, which yield scantily.

Bagh, of Northern India, a garden, an orchard. Baghayat, garden or spade culture, for such articles as betel, chillies, garlic, ginger, hemp, plantain, saffron, onions, sugar-cane, pepper, tobacco, and other vegetables; it is assessed at a higher rate than arable lands.

Baghelkhand, the prevailing classes of soil are mair, sengawan, domat, and bhata. Mair is a black soil which retains water and moisture well, and needs no irrigation.

Bailu, of Bombay, the first sort of rice land, producing in general two crops of rice and one of dry grain or vegetables, or sometimes three crops of rice in the year.

Bajal, of Bengal, a rice crop sown in May or June, and reaped in October.

Balla or Bullah, of Coimbatore, a dry land measure = 166,464 square feet, or 3·83 acres.

Balsundar or Balthaar, of Bengal, sandy soil.

Ban, of Surat and Broach, land covered by salt water at spring tides, a salt-water marsh.

Band or Bandh, in Urdu, a dam, an earthen embankment. Bandara is a masonry dam.

Bangar, in Bengal, a variety of soils, high grounds, uplands, stiff clay irretentive of moisture. In Gorakhpur, bangar is a silicious soil, and bhat a calcareous soil.

Banjar, waste land, fallow land. Adi banjar, immemorial waste land. Banjar jadid, recently waste. Banjar kadim, culturable land long left uncultivated.

Bankar, a red soil of Bundelkhand, a mixture of sand and clay, and yields 191 lbs. of cotton per acre, two-sevenths being the proportion of cleaned cotton.

Bar; high and somewhat sandy tracts in the centres of doabs, and equidistant from river influence on both sides, are almost universally called bar.

Barad or Burrud, of the Dekhan, stony and sandy inferior land. Lal-barad is red gravelly soil; pila-barad [illegible]w soil; [illegible]l-barad, stony soil.

Barani, of Sind, unirrigated lands cultivated by the natural rains. In Mysore, lands sown at the beginning of the rainy season, 27th April to 2d May, when various grains are sown.

Barar, of Bengal, alluvium.

Barattu, of Bombay, unculturable land.

Bard or Bardi, of Berar and Central Provinces, stony soil near hills, a light sandy soil.

Barike, of Coorg, low swampy land adjacent to or below the rice fields.

Basmati, of N. India, the best kind of rice, meaning odorous. There are about 200 varieties of rice.

Bat, of Bengal, fallow land.

Belo, of Sind, forest.

Bena, of Bombay, grass land on the borders of cultivated land.

Besur or Beysur, of Bombay, a good, productive soil, with the gorat and kali qualities, but is inferior to pure gorat.

Bett, Betta, Boru, Belt, or Bhat, of Bombay, high-lying land imperfectly irrigated, yielding but one crop a year, and of inferior grain.

Bhadai or Bhadui, of Bengal, rainy weather rice crop, sown about Bysakh, and cut in Bhadai (August—September), autumn crops.

Bhaiyachara, of Oudh and N.W. Provinces, a coparcenary estate held in severalty.

Bhal, of the Indus delta, a kind of rice cultivation.

Bhar is sand of a white or greyish-white colour.

Bhata soil, to the north of the Ganges, which retains its humidity for a long time, and contains a large quantity of nitre; it is not found west of the little Gandak river.

Bhatha, of Bombay, literally flood deposit, alluvial deposit, left in the bed of a river either by the water receding or the river changing its course. Being always moist, it is very productive, and all the more valuable agricultural products can be produced. It is of the Goradu class of soils.

Bhit or Bhiti, of Bengal, raised ground near a tank, for planting the piper betel on.

Bhumi, of N. India, land, earth, culturable land. Bilu-bhumi, of Bombay, is waste land, and in Dharwar is arranged in six classes, viz. :—

Gairan, free grazing ground.
Gaothan, the village site.
Khrab, uncultivated waste land.
Kuran, grazing land.
Hulabamu, grass land which is farmed.
Turmandi, a vacant space in the village where cattle stand.

Bhur, Bhud, Bhuda, unproductive soil, seven-tenths sand, rest clay, sandy soil, not retentive of moisture. Bhud-khaki and Bhud-parani are varieties of it.

Bhur, answering to maira, is a light sandy soil; the better kinds of it produce bajra, moth, mash, and jawar.

Biali, of Orissa, a rice crop sown about May or June, and reaped in October.

Bid, of Bombay, grass land.

Bijar soil of N. India is a stiff clay soil lying low, chiefly sown with rice only; sometimes grain is also grown; sometimes, as in Rai Baraili, this land fetches high rents. It is the land classed as mattiyar, and is generally inferior to domat.

Bijibur, of Berar, failure of crop sown, owing to seed not germinating.

Bindi, of Sind, sailab lands in the river.

Burki, of Bombay, a masonry structure for drawing water from rivers.

Chah, PERS., a well. Chahi, land irrigated from wells.

Chahal, HIND., is a strong soil ranking between rousli and dakura.

Chanch, of Bombay, the Jeela or Jeelun and the Pe-cottah of the Madras Presidency, a contrivance for raising water, upright stand supporting a transverse beam, with a waterpot at one end of the lever, balanced at the other by a stone or clay.

Charsa, of Panjab, a leathern bag for raising water for irrigation.

Chasa, of Bengal, a cultivator, a husbandman, a ploughman.

Chatar, of Bengal, a blight.

Chatali, of Bengal, a pulse crop, reaped in March or April.

Chatan, of Bengal, uncultivated land on the bank of a river.

Chau-masa, of Oudh, lands tilled during the four rainy months of the S.W. monsoon, June to September, set aside for the best crops.

Chaytra, the Bengal month, parts of March and April. Chet, of Sind, is the spring crop.

Ch'hut, of Sind, lands sown broadcast.

Choil. Low lands that receive the drainage of neighbouring uplands, and cannot carry it off, so that it lies, are called choil. They are unproductive for want of drainage. High tracts from which the water drains off quickly, are called magra and thalli.

Chuni, of Sind, a ploughshare.

Dania, of the Central Provinces, is the Kumari of S. India, and Jhum of Burma and Chittagong Hill Tracts, land cultivated by burning down the forest woods or brushwood, and sowing seed on the ashes.

Dakra, Dakara, or Dhakar, HIND., of the Upper Doab, is a stiff dark clay lying in natural dips and hollows, where water collects and lies during its rains; it dries into hard cakes.

Daman, of Sind, shallow soil.

Dang, of Bombay, forest or jungle land.

Dangar, of Bombay, rice crop raised as one of the kharif or monsoon crops. It is sown in kyari or black soil, at first in Darnvadi or small beds of the richest soil, and in July or August transplanted into beds which had previously undergone three or four ploughings while in a flooded state. The crop ripens in October. There are six varieties,—alaichi, karnod, pankhali, sathi or vari, and sutarsal; the first and last are the most common.

Darya, a river. Darya barāmadi, of Sind, land thrown up by a river. Darya burdi, land eroded suddenly in large masses. Darya khurdi is land gradually eroded by running water.

Dhan, URDU, a growing rice crop, also unhusked rice; in Malay padi, English paddy. In Bombay, the dhan crop is the main grain crop, consisting of bajra (Penicillaria spicata), banti, bavta, jowari (Sorghum vulgare), and kodra (Paspalum scrobic.).

The dhan crop is in contradistinction to the kathal or pulse crop. Dhan khet and dhan marri mean a rice field.

Dehar and Kalyar or Khalar, in Oudh, are low lands flooded during the rains. Dehir are lands flooded in autumn.

Dhasa, of Midnapur, high land close to a village, yielding two crops.

Dhekudi, of Bombay, a contrivance for drawing water from the beds of rivers. Dhekudiat is land so irrigated.

Dhenkli, of Bengal, a lever used for raising water for irrigation. See Chanch.

Dhulna, of Orissa, a rice crop grown on low marshy ground during the cold weather, and reaped about March or April.

Diarah or Diyara, of Bengal, Benares, Ghazipur, alluvial soil, an islet in a river bed.

Do-fasla or Do-fusli, of N. India, land producing two crops in a year.

Dol, URDU, a leathern bucket used for drawing water from a well.

Done, of Bengal, low rice land.

Doomuteea, in N. India, is of a light-brown colour, soon powders into fine dust, and requires much more outlay in manure and labour than the mattiyar soil.

Doras or Dores, of Bengal, land half sandy and half clay.

Doshahi is the dumat of Hindustan, a clayey soil, generally of good quality, manured by cattle being folded on it. When manured, it grows cotton, fine wheat, barley, jowar, makai, melons, etc.

Dumat, of N.W. Provinces, a soft loam, land of first quality, consisting of clay and sand.

Dunbi kali, cracked black soil; it absorbs moisture largely.

Eri bhumi, of Dharwar, is black soil, of which five kinds are recognised, viz. :—

Uttama eri, first class black soil, without stone or impurities.
Kurli eri, hard or gravelly black soil.
Hulaka eri, a kind of black soil in valleys.
Sona burali, black soil mixed with lime.
Gocha eri, a very black kind.

Eri, TAM., the bund of a tank, the bank built for retaining water in a reservoir.

Eru kanike, of Coorg, a plough tax levied as an educational cess at 3 or 4 annas a plough.

Eru, URDU, manure.

Fasl, in the N.W. Provinces, a crop, a harvest. Fasli, the harvest or revenue year. There are two principal harvests in the year, the rabi and the kharif. The rabi or spring harvest consists of grains and pulses, wheat, barley, peas, grain (Dolichos, *sp.*), oil-seeds, arhar (Cajanus Indicus), and other crops, which are sown in October and November, and are reaped in February, March, and April. The kharif or autumn crops are sown before or at the beginning of the rains in June and July, and reaped at their close in October, November, and December; generally, in Bengal, all crops reaped at the closing months of the year. The outlying fields, which are lightly cultivated, yielding one crop annually, are called palo, also ek-fardi, also ek-fasli. Do-fasli, also Jutiyan, are lands which bear two harvests a year.

Gadde, of Coorg, an irrigated field. In Bombay, wet or paddy lands fit for rice cultivation, or on which rice is grown.

Gairan, of Bombay, open pasture ground unsuited for cultivation.

Gharbai, of Oudh, irrigation done by hand.

Goera or Nyain is a term applied only to lands in the vicinity of wells and villages, which are abundantly irrigated and manured. Actual desert soil is called thul.

Gohani, Gorat, Bhumi, and Goind, land round a village.

Goind, manured land around a village.

Gojai, of Bengal and Oudh, a crop of wheat and barley grown together.

Gomala, of Mysore, land set apart for grazing pasture land.

Goradu, of Bombay, land of light colour, varying from almost mere sand to soil of the richest quality. Its fertility depends on proper culture and abundant manuring. It somewhat resembles the gorad land of the Jambusar district of Broach Zilla. Goradu kanetar is goradu irrigated either from wells, rivers, or tanks; Goradu kuvetar is dry goradu; Goradu padar is the poorest description. The kharif crops are mostly grown on it,—arad, bajra, banti, baota, bhinda, begen or rigna, chana or gram, chola, chillies, cotton, dhangar or dry rice in small quantities, erandi, garden products, govar, jowar, kang, math, mung, pan, sugar-cane, tobacco, tur, tal, and val.

Gorat, of Bombay, seems to be the same as goradu. It is a sandy soil of a light-brown colour, and varying from a reddish-yellow to brown, quite free from stones. It absorbs the rain rapidly, and never presents a broken surface in the dry season nor a muddy one in the wet. Fine water is found in almost every part of it at 30 or 35 feet from the surface. This soil is often watered and used as baghait or garden land. It is one of the richest descriptions of soil, and produces in rapid succession the most luxuriant crops; it abounds with fine trees, growing to the largest size, and having the most flourishing appearance. It requires to be well manured. From its great fertility the weeding is more troublesome and expensive than in other lands, the cost of cultivating it being altogether double that of the inferior black soil. The crops mostly produced are the kharif crops, and very little cotton or rawi jawar is grown on it. Dhan or grain and kathor or pulse are sown in it at the same time. The other principal articles are bajra, baota, kodra, javar (a little), kapas (a little), dhangar, dry rice in small quantities, math, tuwar, tal, erandi, val, mung, arad, chola, govar, banti, chana (gram), kang, bhinda, pau (indigo), tobacco, sugar-cane, begen or rigna, chillies, plantains.

Gorcharan, of Bombay, common pasture.

Gothan, of Bombay, ground set apart for cattle pasturage.

Gowria, of Oudh, a variety of paddy sown in June and October.

Har, of Oudh, a block or tract of land in a village, of the same quality.

Hari, of Bombay, the third crop, succeeding the kharif or monsoon crop, and the rabi or second crop. It consists generally of kang (Panicum Italicum) and chana (Cicer arietinum), and the poorer kinds of grain, brought forward during the hot season by irrigation.

Harte kunta, of Coorg, a clod-crusher.

Hemanta, of Bengal, the cold months; a rice crop ripening in December.

Jaihan, of Oudh, nursery rice.

Jaisan, of Bengal, a kind of rice.

Jal, of Bengal, water. Jali-dhan, a rice crop sown in marshy land about April, and reaped about July.

Jawaru, of Central Doab, as much land as can be ploughed by a pair (jora) of bullocks at Dehli in half a day.

Jeelun, of Bombay, the Pe-cottah of the Tamil country.

Jethi-dhan, in Oudh, a rice sown in April along the banks of rivers, or where water is still lying, and cut in Jeth. Jethi sawan (Panicum frumentaceum).

Jot, in Bengal and N.W. Provinces, the land held by a cultivator. Jotidar, the actual cultivator.

Kabar, a black soil of the N.W. Provinces of inferior quality to mar.

Kach'hi, of Oudh, garden lands.

Kacho, of Sind, alluvial land thrown up by the river Indus.

Kali, of the Mahratta, is arable land in general, but named from its black colour. It is a black soil or mould, and land of a superior quality; the underlying ground in the Dang receiving and retaining moisture during the cold season, and especially fit for wheat and other spring crops.

Kali bhui, of Bombay, regur or black cotton soil; it is the soil of the great volcanic district of the Dekhan north to Malwa, Ahmadabad, Broach Collectorate, Kaira, Kattyawar, and Surat. It is very retentive of moisture. The crops sown on it are jowar (Sorghum vulgare), kapas or cotton, gahun or wheat, dan-

gar or dry rice, chana, the Cicer arietinum, Bengal gram, castor-oil plant, rape seed (Rata tallar tall), mung (Phaseolus mungo), and tour.

Kali chunkari, black cotton soil overlying lime, which renders it very unproductive.

Kalr, of N.W. Provinces, barren land unculturable from reh efflorescence, salt, or other reason.

Kalr is a salt efflorescence which is observed in many places. Sometimes it extends over large tracts of land, rendering them almost entirely unproductive; they are called kalri zamin.

Kalrati, saline land.

Kanwai, HIND., clayey soil, in Puranya, in muddy hollows, which in the dry season is formed into detached nodules by the action of underground springs.

Kapale, of Mysore, apparatus for raising water for irrigating fields from a well or tank, worked by oxen on an inclined plane.

Kar or Karu, in the south of the Peninsula, the chief rice crop, watered in October, November, and December by the rains of the N.W. monsoon. In the northern districts it is the crop sown in April, and reaped in June or July.

Karas, of Berar, land at foot and top of hills.

Kashtgar, of Sind; Kashtkar, of Bengal, a cultivator.

Kashthar mirasi, a hereditary tenant.

Kashthar pahi, a non-resident tenant.

Kashtkar dehi, of Bengal, a resident cultivator.

Katta. In the Northern Circars, katta regur is a stiff loam, and katta sauda a black soil, from Katta, a clod of earth.

Kewaldas, MAHR., is a black soil.

Khadar or Khadir, HIND., low or alluvial lands easy of irrigation, and especially fit for rice cultivation; also rice beds or patches of ground surrounded by low banks, so as to confine the water and moisten the ground for rice cultivation. In some places, moist, alluvial ground, on which barley and wheat are grown.

Khajan, a salt marsh or meadow land; land near the sea-shore or inlets, and liable to be flooded.

Khaki is a soil or land that cannot be irrigated, and depends wholly on rain.

Khalati, MAHR., low rice grounds about a village. Low country on the upper part of the Malabar coast, descending from the Sahyadri mountains to the sea.

Khar, Kshar, or Karu, alkali, alkaline earth, soda, impure carbonate of potash or soda.

Kharif, the autumnal harvest, the crops of which were sown before or at the beginning of the rains, in June or July, and reaped at their close, in October, November, and December.

Kharpi, of Bombay, a trowel, a spade, a small hoe.

Kharril, resembling the mar of Bundelkhand, is a black earth common in the lowlands and in the plateau south of the Ganges. It produces a good spring crop without irrigation, but its character is much improved if sand is spread over the surface; otherwise it is liable to dry up into deeply-fissured masses of hardened clay.

Khed-waluyak, of Bombay, arable, fit for cultivation.

Khejar zamin, of Sind, bad land.

Khet, HIND., a field. Kheti or Kheti wari or Khet karn, agriculture, cultivation.

Kiari, of Bombay, a bed in a garden or field.

Kollai, TAM., dry soil, high ground not capable of artificial irrigation. Kollai payir, grain growing on high ground.

Kolpe, of Bombay, a hoe drawn by bullocks.

Korkul, of Bombay, land spoiled for cultivation by running water.

Kos, of Bombay, a leather bag for drawing water from a well; these are of two kinds, the Ramia kos and Sundia kos.

Kshetra, a field cultivation, crop.

Kyadee or Kyado, the bed prepared for rice growing, with or without artificial irrigation.

Kyne, of Burma, vegetable cultivation.

Ky-ne-myay. garden land near water, not cultivated during the rainy season.

Laterite soil is not very productive, and if not continuously cultivated the laterite rock becomes hard and bare, and checks all vegetation.

Lavani, of Bombay, agriculture, cultivation. Lavanidar, cultivator.

Lay, of Burma, a paddy field.

Lewa, of Bengal, rice field prepared for broadcast sowing.

Made bhumi, of Bombay, land in the bed of a tank or river.

Maduri, SANSK., land beyond the influence of the sea, free from any saline impregnation; in opposition to namaki or saline lands, or such as, having been washed by the tide, salt can be made from.

Magani, KARN., TEL., wet cultivation by artificial irrigation.

Majal, of Mysore, a second class of rice land, yielding one crop of rice and one of vegetables or dry grains.

Makha, of Mysore, rains falling between 14th and 27th August; tobacco and wheat are sown at this time.

Makki, culturable land covered with thick jungle; the worst kind of rice land.

Malai, MAHR., alluvial deposits.

Mal-zamin, MAHR., open country, barren or uncultivated plain; lands of inferior quality or on the sides of hills or on ridges, which, although they can be ploughed, cannot be irrigated, and produce only autumnal crops.

Manal, TAM., sand. Manalachari, soil mixed with sand. Manal taram, sandy soil.

Manavari, of the Tamils of Madras, rice crop depending solely on rain, not being irrigated.

Mani, of Coorg, unculturable fields on a high level, on which water will not remain.

Manjh, HIND., or manjha land is that lying between the land in the immediate proximity of a village and that on the boundaries of its lands. It is considered the second sort of land in point of fertility. In Oudh, marsh land bordering on lakes or rivers.

Mannu, TAM., soil. Four kinds of rice-field soils are reckoned in Coorg, viz.—

- Adimannu, low-lying soil, which is considered the best, because it receives the nourishment from all above it.
- Karimannu, black soil unfit for rice culture.
- Talemannu, top soil (*i.e.* best soil).
- Nadumannu, middle (moderately good) soil.

Other nine kinds of soil are recognised in Coorg—

- Arasinamannu, yellow earth.
- Eremannu, clayey soil.
- Usubumannu, sandy soil.
- Kalur mannu, unproductive soil.
- Kallu mannu, stony soil.
- Kempu mannu, red earth.
- Choulu mannu, unproductive saline soil.
- Jedimannu, clay, potters' earth.
- Bilimannu, white earth, white clay.

Mar or Maar, HIND., in the N.W. Provinces, a stiff clay or loamy soil, with some sand and vegetable mould; a variety of it is called kabar. In Bundelkhand it means a rich, black loam. See Purwa.

Marul, MAHR., soil of a light-black colour on the banks of rivers.

Marwa, GUJ., one of the two principal sorts of soil in Gujerat; a sandy soil of a light-brown colour, rapidly absorbing rain, and having water at no great depth. It requires manure, but, treated properly, yields the best crops both as to quality and quantity; valuable for wheat and cotton.

Mattiara, HIND., a rich, clayey soil, mixed with a small proportion of sand, one-tenth of silex, and the rest alluvial mould. Matyar is the equivalent Hindustani term of rohi, misar of misi, and dumat of doshahi.

Mera, a mixture of clay and sand, the rusli of Hindustan; has many varieties; some very good, and equal to the best doshahi.

Metta, TEL., high and dry land not capable of irrigation, but depending on the rain; unfit for rice.

Misan, HIND., a soil mixed of clay and sand, sometimes considered as the best kind of soil.

Mowat or Mawat, MAHR., soil of a mixed kind, of a light-black colour.

Mula, of Mysore, rains falling between 12th and 25th December. Cumin, coriander, tobacco, and other seeds are sown at this time.

Mungari, of Bombay, the early crop which is sown about the beginning of the rains, and reaped early in the cold weather; in Mysore, the rains of the S.W. monsoon.

My-ai, BURM., land. My-ai-loot, of Burma, waste land.

Myal, MALEAL., lands on which rice plants are sown thickly for the purpose of transplanting; land watered by rain.

Nachchu, TEL., waste land overrun with knot-grass.

Nijuri, in the Hyderabad assigned districts, land lying fallow from exhaustion of soil.

Nunjah, Nanjai, in Madras, irrigated land in distinction to Punjah dry land.

Obar land is of two kinds, todah and khil. Todah are those little hanging fields like steps rising one above another, and are built up at their lower edge with stones, and which are liable to destruction by being washed down when the rain is violent. If the land be good, it is called 'awal kism' or first class; if stony and bad, 'duyam kism' or second class. Khil land is that which is broken up with the hoe on the steep slopes of a hill; it is too steep to be ploughed. These kinds of soil are observable through many hill districts. In the hill districts bordering on the Ambala divisions, and Kotahah in the Ambala district, the land is divided into kulahu, land watered by kul (water-courses supplied from an artificial pond formed by damming up the hill streams), and obar, which is the same as barani, land dependent on rain for its irrigation.

Oosur soil appears to be formed by a superabundance of one or other of the salts or their bases, which are brought to the surface from the beds below, and not carried off or taken back into these beds. It is known that salts of ammonia are injurious to plants, unless combined with organic acids, supplied to the soil by decayed vegetable or animal matter. This matter is necessary to combine with, and fix, the ammonia in the soil, and give it out to the plants as they require it. It is possible that nitrates may superabound in the soil from the oxidizement of the nitrogen of a superfluity of ammonia. The natives say that all land may become oosur from neglect; and, when oosur, can never be made to bear crops, after it has been left long fallow, till it has been flooded with rain-water for two or three seasons, by means of artificial embankments, and then well watered, manured, and ploughed. When well tilled in this way, all but the very worst kinds of oosur are said to bear tolerable crops. In the midst of a plain of barren oosur land, which has hardly a tree, shrub, or blade of grass, are seen small oases, or patches of low land, in which accumulated rain-water lies for several months every year, covered with stout grasses of different kinds, a sure indication of ability to bear good crops under good tillage. From very bad oosur lands, common salt or saltpetre, or both, are obtained by digging out and washing the earth, and then removing the water by evaporation. The clods in the mattiyar soil not only retain moisture, and give it out slowly as required by the crops, but they give shelter and coolness to the young and tender shoots of grain and pulse. Trees, shrubs, and plants of all kinds everywhere derive carbonic acid gas and ammonia from the atmosphere, and decompose them for their own use in the same manner.

Pada, Padusara, Padakara, Uttarapada, Padit, and Padya are Mahrati terms for fallow or uncultivated lands.

Paiwast, in N.W. Provinces and Bengal, alluvial accretions.

Pallamu, TEL., low-lying ground.

Parampa or Paramba, MALEAL., garden land, a private estate.

Parampoku, in Mysore, uncultivable land.

Parti, in N.W. Provinces, fallow land.

Pasama or Pasama kur, of the Malealam country, from Pasa, paste or glue, is the best quality of soil; it is adhesive and tenacious.

Patla, TEL., is rice land yielding an intermediate crop between the first and second crops, being under water during the wet season.

Pilota is a poor, friable, yellow or dark-red coloured soil, which does not retain moisture.

Podu, TEL., land cleared recently from thicket and prepared for cultivation.

Punchanilam, TAM., also Punchppattam, MALEAL., wet land, or land capable of irrigation and of bearing rice crops.

Punja, properly Punshey, TAM., land not admitting of complete irrigation, and unfit for rice crops, but bearing dry crops. It is the converse of nanjai.

Pur, of Oudh, a large leather bucket for drawing water from wells, by bullocks or by hand.

Purua, of Bombay, a spud.

Purvabhadia, in Mysore, a rain commencing between the 2d and 14th March. Purvashadha, a rain between 26th December and 7th January. Cumin, coriander, tobacco, and other seeds are then sown. Pushia, a rain between 17th and 30th July, when grain is sown.

Purwa is a reddish soil in Bundelkhand, a mixture of sand and clay, yielding 191 lbs. of cotton per acre, two-sevenths being the proportion of cleaned cotton.

Mar or Maura, black marl of Bundelkhand, of the first quality, is the most productive soil in the country for cotton, and yields on an average 286 lbs. of cotton per acre, one-third being the produce of clean cotton to the raw produce. See Mar.

Rabi. See Kharif.

Rakar is the poorest of all the soils, and is only productive when the rains are abundant. It has a large mixture of kankar in it.

Rakh or Rakhai, URDU, a grazing and timber preserve.

Ramp or Rampadi, of Bombay, a weeding plough or hoe. The Ramph or Kalpi, Hathia, Rampdi, and Danda are of different sizes.

Ranwa, waste or woody ground in the vicinity of a town or village.

Rasi, MALEAL., is a mixed soil, consisting of sand and clay. Rasi kur, poor light soil. Rasi pasama kur, middling sort soil.

Rausli is a light loam, producing all crops except rice. It is soft and easily worked, consisting of clay and sand; it is mostly like, though superior to, the doshahi in the Panjab series.

Reg, PERS., also Ret, HIND., sand.

Regur, also Kali bhumi, HIND., Regati, CAN., and Regada, Regatti, TEL., the cotton soil and black cotton soil of Europeans, is a black soil, the wonder of all who have seen it. David Boswell Reid says (Edin. Phil. Journ., 1829) it consists of silica in a minute state of division, with portions of lime, alumina, and oxide of iron. The proportion of vegetable and animal débris appears to be very small; minute portions of the roots of vegetables are seen with the naked eye. It fuses readily before the blow-pipe into a dry, black slag. Dr. Voysey fused it into a thick glass. In composition it nearly resembles that of basalt. It is spread over the great volcanic outburst of the Dekhan, varying in depth from 2 to 30 feet. It is the larger part of the soil of Western Gujerat, occurs largely in Malwa, through Berar, over all the Western Dekhan, in the valleys of the Hyderabad territories. It is observed in the Southern Mahratta country, and in large tracts of the Ceded Districts. It is less common in Mysore, but farther south is again seen in continuous sheets from 6 to 20 feet thick below the Salem break, covering the lower plain of Coimbatore, Madura, Salem, Trichinopoly, Tanjore, Ramnad, and Tinnevelly, to the vicinity of Cape Comorin. The purest regur is of a deep bluish-black colour, or greenish or dark-greyish black, shining; when placed in water, it crumbles slowly, with emission of air bubbles, and forms a tenacious paste. When moistened, it gives out an argillaceous odour. Before the blow-pipe it melts into a greenish glass or dark slag. Mr. Reid fused some of it in a large covered crucible placed in a furnace into a solid mass, on the surface of which a crust of oxide of iron formed. Dr. M'Leod found it composed of

Silex,	48·2	Oxide of iron,	1·0
Alumina,	20·3	Water and extractive,	4·3
Carbonate of lime,	16·0		
Carbonate of magnesia,	10·2		100·0

The muriate and carbonate of soda are frequently accidental ingredients in the composition of the regur. They render it sterile when in large quantities. Captain Allardyce informed Captain Newbold that the regur of Trichinopoly does not

fuse, and contains imbedded crystals of pure mineral carbon, which are converted before the blow-pipe into a white ash. The best kinds of this soil are rarely suffered to lie fallow, except by accident, and never receive manure, which is even supposed to lessen its fertility. It has yielded annually, crop after crop, for upwards of 2000 years (usually in triennial rotation), of cotton, sorghum, and wheat, or bajri (Penicillaria), without receiving any aid from the hand of man, except an annual scratching with a small plough, and a decennial, or still more seldom, clearing of nuth grass by means of the large plough. It is irrigated solely by the dews and rains of heaven. It is remarkably retentive of moisture. Dr. Turnbull Christie thoroughly dried a portion of it by a heat nearly sufficient to char paper. He then exposed to the atmosphere of a moderately damp apartment 2615·6 grains of it, and found after a few days it had gained 147·1 grains. He now exposed it to an atmosphere saturated with moisture, and found that the weight increased daily till the end of a few weeks, when it was found to weigh 2828·4 grains. The soil had therefore gained 212·8 grains, or about 8 per cent. In wet weather the surface is converted into a deep tenacious clay. During the dry season, when the crops are off the ground, the surface of regur exhibits a black, drear aspect. Contracting under the powerful heat of the sun, it is divided, like the surface of dried starch, by countless and deep fissures, into figures usually affecting the pentagon, hexagon, and rhomboid. While the upper part for a few inches in depth is dried to an impalpable powder, raised in clouds by the wind and darkening the air, the under portions, at the depth of 8 or 10 feet, retain their character of a hard black clay, approaching a rock, usually moist and cold, when the surface dust has a temperature of 130°. The purest beds of regur contain few rolled pebbles of any kind. Professor Orlebar informed Captain Newbold that in Gujerat it is distinctly stratified, and in the Beder district it is distinctly in layers, sometimes separated by thin layers of sand or gravel. Regur is undoubtedly the best soil of the Peninsula, and its absorbent quality bears out the result of Sir Humphrey Davy's experiments, which showed that the absorbent power of soils with respect to atmospheric moisture, is greatest in the most fertile soils. He dried 1000 parts of a celebrated soil from Ormiston in East Lothian by a heat amounting to 212° Fahr., and found that by one hour's exposure to air saturated with moisture at a temperature of 62°, it gained 18 grains.

Regur, in the Bellary district, produces two kinds of crops, called mungari and kingari. It covers one million of acres, from 1 to 12 feet deep. It has, mixed with it, decomposed felspar, gritty particles of quartz, and is often covered with angular quartzose pebbles; ferruginous quartz and jasper; water is rarely found in these black lands, except at great depths. In the Cuddapah district, the decomposition of the limestones, calcareous veins, clayslate, and sandstones imparts a lighter colour and a looser texture to the regur. Underneath it generally is a kankar deposit resembling white gravel.

The garden soil of Bellary generally consists of regur and mussub soil, mixed with manure of decayed animal and vegetable matter.

In breaking up black soil, the farmers use a heavy plough drawn by five to eight pairs of the strongest cattle, generally buffaloes, and plough it 15 inches deep. The labour and expense is enormous. The ploughshare is a heavy three-cornered block of hard wood; the bar is 12 feet long, and besides the ploughman, two or more drivers manage the bullocks.

Mussub or mixed soil in the Ceded Districts is double that of the regur. Red soil in Bellary district, 2¼ millions of acres.

In the neighbourhood of granitic elevations or protruding beds of gneiss and large pegmatitic veins of quartz and felspar, the débris of these rocks decomposes into a light red soil, termed mussub by the natives, which is only capable of producing the mungari crop. This soil is sometimes extensively deposited in low situations by the force of streams or torrents of rain, when it becomes a terrein de transports or alluvial soil.

Reh, saline inflorescence, salts of soda abounding in some soils, and rendering them unproductive. In the N.W. Provinces, the deterioration of land by reh first attracted serious attention in the villages along the Western Jumna Canal and its branches, about Dehli, Panipat, Rohtak, and Karnal. In 1857, Mr. Sherer, Joint Magistrate of Aligarh, went on deputation to examine the tracts of country deteriorated, and the picture presented by him of the suffering in some of the villages was truly deplorable. Out of 580 canal villages, 59, or nearly 10 per cent., had been injured in degrees ranging severely to partially, 6 per cent. being severely injured. The maximum appeared to be reached in Panipat, where 46 villages, or 19 per cent., were injured out of 242. The salt effloresces in several parts of the Panjab where there are no canals at all; in these places it appears in land irrigated from wells, where the water is very far from the surface. The salt itself consists of sulphate of soda, with a variable proportion of chloride of sodium (common salt). In some of the instances given by Dr. O'Shaughnessy, the percentage was high; at Jagu, in Panipat, it was 20 per cent., and this consisted of abundance of carbonate of soda with sulphate and chloride of sodium and lime. As far as experience goes, lands near canals, like the old Hosli, in the Lahore district, constructed at, but not below, the ordinary level of the watershed, are usually found to be free from reh efflorescence. Drainage is to a certain extent a palliative and a cure, but, generally speaking, the farmers assert that fully impregnated reh land is incurable and valueless. In gardens and small plots, it has been found useful to dig out the soil to the depth of two feet or so, entirely, and put in fresh. Dr. Brown, chemical examiner for the Panjab, has demonstrated that nitrate of lime would succeed.

Rohi is the finest natural soil, a stiff loam, which breaks up into large clods.

Sada or Sara, HIND., the surface of land long under water, and covered with smooth, decaying vegetation.

Sailabi, of N.W. Provinces, land watered by floods or inundations, and thoroughly soaked.

Sankhu, of Bombay, fallow land.

Seota is a rich loam or mould of varying fertility.

Seri, MAHR., arable land originally, for some cause, excluded from the village assessment; in Telingana, land cultivated by ryots for the state; also waste land or in dispute; also ploughed land.

Shola, of Neilgherry Hills, a grove, a copse.

Shor, of N.W. Provinces, barren land, saline, salt, brackish.

Singa, in Bengal, second-class rice lands, inferior to garha, and superior to bad'h.

Siwai, HIND., a mixture of clay and sand, suited for any soil except rice.

Suggi, of Coorg, harvest time, spring harvest.

Tadal, PANJ., TAM., high land, incapable of irrigation.

Tal, pl. Tallaon, HIND., low ground. Tal-chua, light land above clay, which soon becomes soft and spongy in wet weather.

Talayari, MALEAL., a chief, a headman.

Tarai, in N.W. Provinces, low, moist lands; moist, marshy ground along the banks of rivers or at the foot of the Himalayas, but especially the tract running along the foot of the first range of the Himalayas for several hundred miles, and two to fifteen miles broad.

Taram, of Southern India, different kinds of arable land.

Taw myay, of Burma, jungle land.

Thal, of the Panjab, grazing ground.

Tibbah, nearly all sand, the bhur of the provinces, worth very little, and only grows the inferior crops of moth, mash, etc.

Toung, of Burma, a hill. Toung gya, literally hill garden, kumari cutivation.

Udave, in the Nuggur and Hasan division of Mysore, a jungly tract, fit for coffee planting; jungle allotted to a village for pasture, etc.

Ugala, SANSK., land always saturated with moisture.
Uratiya, BENG., land unfit for cultivation.
Urava matti, HIND., free loose mould.
Utera, of Bengal, a supplementary crop grown amongst the principal crops; it is sown in rice after its transplanting.
Valara, GUJ., land on which the weeds have been burned previous to sowing.
Vasel or Vaselo, of Bombay, fallow; warkas, of Bombay, dry cultivation; the poorer grains, all except rice and pulse.
Vilai, TAM., high ground not supplied with water. Vilai-nilam, fertile arable ground.
Walras, GUJ., a spot of land in a jungle prepared for tillage by burning the bushes and brushwood, and leaving the ashes as manure.
Warkas, MAHR., is a common term for all the grains except rice and the varieties of pulse, and Warkas-zamin is soil suited for their cultivation. Warkas-zamin, also land suited for the dry cultivation.
Yerra-chakku, TEL., a red sort of soil, containing a small quantity of lime.
Zamin, Jamin, land, earth. Gamati jamin, in Bombay, is waste land in a Bhagdari village that has been taken up and cultivated after the settlement was made.

—*Newbold; Bradley, Report on Circar Dowlatabad; Dr. Turnbull Christie in Madras Journal, Lit. and Science*, October 1836; *Cal. Review; Dr. D. B. Reid; Heyne's Tracts; Carnegy; Ward, quoting Colebrooke*, iii. pp. 105, 115.

SOJA HISPIDA. *Mœnch., W. and A., Grah.*

S. Japonica, *Savi.* | Dolichos soja, *L., Roxb.*

Gari kulay, . . . BENG. | Soy bean, ... ENG.
Hwang-ta-tau, . CHIN. | Sahuca bean, . . ,,
Mau-tau, . . . ,, | Bhut, ... PANJ.

This plant is one of the natural order Leguminosæ. It grows in the N.W. Himalaya, in Nepal, at Taong Dong, in China, Japan, and the Moluccas. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 feet, and abundant in the Peninsula of India, though probably introduced there. The seeds resemble those of the haricot, French, or kidney bean, and are used by the Chinese to form a favourite dish, called 'ten-hu' or 'tan-hu,' which looks like curd, and which, though insipid in itself, yet with proper seasoning is agreeable and wholesome. The Japanese call the seeds 'miso,' and put them into soup, of which they sometimes partake three times a day. They likewise prepare with them the sauce termed 'sooja,' which has been corrupted into 'soy.' Soy is only sparingly used as a sauce in Great Britain. It has the character of being a useful stomachic, but not more so than any of the other condiments when used with moderation. It is the well-known Chinese bean, which constitutes such a large article of trade between the northern and southern parts of China. Of all vegetable substances, it is richer in nitrogenous or flesh-forming matter than any yet discovered. There are two varieties, a white and a black, of which the composition in 100 parts is as follows:—

White Variety.		Black Variety.	
Moisture,	8·04	Moisture,	10·40
Nitrogenous matter,	39·18	Nitrogenous matter,	41·54
Starchy,	30·31	Starchy,	30·82
Fatty or oily matter,	18·30	Fatty or oily matter,	12·31
Mineral constituents,	4·16	Mineral constituents,	4·93

In China the ripe ovoid yellow beans are made into bean curd, which is largely consumed by the Chinese when vegetables are scarce; it is the cheese of that race; they are also pressed to extract bean oil or pea oil.—*Eng. Cyc.; Powell, Indian Museum; Smith.*

SOJNA or Dawut. HIND. The science of exorcism.

SOKA. HIND. A blight from want of water, when the sugar-cane dies.

SOKHA, among the Ho of Kolhan, a witch-finder.

SOK-PA, a colony of pure Mongols, who have located themselves on the frontier of China and Tibet. The words in Tibetan mean people of the pasture. On the same frontier, likewise, are the Gyami, Gyarung, Takpa, Manyak, Thochu, Sok-pa, and Horpa.

SOLA. BENG., HIND.

Æschynomene aspera, *L.* | Hedysarum lagenarium, *R.*
Æ. lagenaria, *Lour.* | Sola, Phul sola, . HIND.

A plant of Bengal, Sylhet, Assam, Saharunpur, Southern India, common in moist places in the rainy season. The lower part of the stem is rough and scabrous, as well as the legumes. The plants are remarkable for their light and spongy texture, and seem indeed to be composed almost entirely of pith. The thicker stemmed plants are collected in the dry months of April and May, and the light pith substance applied to making some kinds of toys, the floats of fishermen's nets, and cut into thin slices and pasted together, for making hats, which, being light and having broad brims, are well suited for protecting the head from the influence of the powerful Indian sun, especially if a handkerchief be put loosely into the crown of the hat. This substance has also been employed for lining drawers of natural history, and in its texture very much resembles the substance called rice-paper, which is the pith or stem of a malvaceous plant cut into thin slices. The larger plants are particularly light, white, and spongy.—*Roxb.; Voigt.; M. E. J. R.*

SOLANACEÆ. *Lindl.* The nightshade tribe of plants. The following are grown in Southern and Eastern Asia:—

Lycium Chinense, *Milt.*, Cochin-China, Canton.
Capsicum annuum, *L., Roxb.*, South America.
C. baccatum, *L.*, Tropical America, Guinea, India.
C. chamæcerasus, *Nees*, Moluccas.
C. fastigiatum, *Blain*, South America.
C. frutescens, *L.*, East Indies.
C. grossum, *Willde.*, Nepal.
C. Sinense, *Jacq.*, China.
Solanum Æthiopicum, *L.*, Ethiopia, China, Japan.
S. macrodon, *Wall.*, Khassya mountains.
S. crassipetalum, *Wall.*, Nepal.
S. denticulatum, *Blain.*, Sylhet.
S. giganteum, *Jacq.*, Neilgherries.
S. auriculatum, *Ait.*, Madagascar, Bourbon, Mauritius.
S. decemdentatum, *Roxb.*, Singapore, China.
S. ferox, *L.*, South Konkan, Coromandel, Bengal, Penang, Singapore.
S. incertum, *Dun.*, Bengal, Sylhet.
S. Indicum, *L.*, all British India.
S. Jacquini, *Willde.*, all British India.
S. macrocarpon, *L.*, Peru.
S. melongena, *L.*, Palestine.
S. nigrum, *L.*, Europe.
S. nodiflorum, *Jacq.*, Brazil, Guinea, Mauritius.
S. pentapetaloides, *Roxb.*, Brazil.
S. pseudocapsicum, *L.*, Madeira.
Lycopersicum cerasiforme, *Dun.*, Peru.
L. esculentum, *Mill.*, America.
L. Humboldtii, *Dun.*, South America.
Physalis Peruviana, *Linn.*
P. stramonifolia, *Wall.*, Gosainthan.
P. tuberosum, *L.*, W. coast of S. America
P. verbascifolium, *L.*, all India.
P. rubrum, *Mill.*, British India.
P. spirale, *Roxb.*, Sylhet, Assam.
P. torvum, *Swz.*, Bengal.
P. alkekengi, *Linn.*, Europe, Persia.

P. angulata, *L.*, East and West Indies.
P. minima, *L.*, all East Indies, Archipelago, Nepal, New Holland.
P. Peruviana, *L.*, Peru, East Indies.
P. pubescens, *L.*, America, India.
P. somnifera, *Nees*, Coromandel, Konkans, Gujerat.
Nicandra physaloides, *Gærtn.*, Peru, Chili, North America.
Datura alba, *Rumph.*, all India.
D. ferox, *L.*, Himalaya, Nepal, Cochin-China, China.
D. inermis, *Jacq.*, Abyssinia.
D. metel, *L.*, Canaries, Africa.
D. stramonium, *L.*, South America, Europe, North Africa, North Asia.
D. suaveolens, *Willde.*, Peru, Chili, Mexico.
D. tatula, *Linn.*, America.
Nicotiana Bonariensis, *Lehm.*, Buenos Ayres.
N. cerinthoides, *Hornem*, —?
N. fruticosa, *L.*, —?
N. glutinosa, *L.*, Peru, South America.
N. paniculata, *L.*, Peru.
N. plumbaginifolia, *Viv.*, Rio Grande.
N. quadrivalvis, *Pursh.*, North America.
N. rustica, *L.*, Europe, Asia, Africa, America.
N. tabacum, *L.*, all the world.
Petunia nyctaginiflora, *Juss.*, South America.
Hysociamus albus, *L.*, Europe, Tauria.
H. Canariensis, *Ker.*, Canaries.
H. muticus, *L.*, Arabia, Egypt.
H. niger, *Linn.*, Europe, Caucasus, North India.
Atropa belladonna, *Linn.*, N. Europe, Kanawar.
Mandragora officinarum.

Some of this family are deleterious, some have narcotic qualities. The tubers of such as produce them are amylaceous and nutritive. The leaves are generally narcotic, but lose that quality by boiling. The fruits which are red or yellow are acid and eatable, as the alkakengi, tomato, and capsicum; those which are black or purple are deleterious, as the mandrake, belladonna, thorn-apple, henbane, cestrum, etc. Atropa belladonna, *L.*, the suchi of the Sutlej, is found wild in Kanawar at 8500 feet. It is stated to be burned in order to kill fleas.

A Chinese plant called Tso-na-ts'au, one of the Solanaceæ, with an appended account of a similar drug called Yah-puh-lu, from the country of the Hun or Uigur, is described in the Pen-Ts'au as a plant producing profound anæsthesia, during which operations may be performed with perfect freedom from pain. The effects are said to last for three days, and to resemble those from the Atropa mandragora.—*Stewart; Voigt; Smith.*

SOLANKI or Chalukya. The history of this branch of the four Agnicula Rajputs cannot be traced to such periods of antiquity as the Pramara or Chauhan. The tradition of the bard makes the Solanki important as princes of Suru on the Ganges, before the Rahtor obtained Kanouj. Their capital was to India what Venice was to Europe, the entrepot of the products of both the eastern and western hemispheres. It fully recovered the shock given by Mahmud and the desultory wars of his successors; and Sid Rae Jye Singh, the seventh from the founder, was at the head of the richest, if not the most warlike, kingdom of India. The lieutenants of Shahab-ud-Din disturbed the close of Komarpal's reign; and his successor, Ballo Muldeo, closed this dynasty in S. 1284 (A.D. 1228), when a new dynasty, called the Baghela (descendants of Sid Rae) under Beesildeo, succeeded. Though the stem of the Solanki was thus uprooted, many of its branches (Sachæ) had fixed themselves in other soils. The most conspicuous of these is the Baghela family, which gave its name to an entire division of Hindustan; and Baghelcund has now been ruled for many centuries by the descendants of Sid Rae. Besides Bandugurh, there are minor chieftainships still in Gujerat of the Baghela tribe. Of these, Pitapur and Theraud are the most conspicuous. One of the chieftains of the second class in Mewar is a Solanki, and traces his line immediately from Sid Rae; this is the chief of Rupnagurh, whose stronghold commands one of the passes leading to Marwar, and whose family annals would furnish a fine picture of the state of border feuds. The Solanki is divided into sixteen branches. The name of the Baghela subdivision is from Bhag Rao, the son of Sid Rae, though the bards have another tradition for its origin. Tod (Rajasthan, pp. 80 and 97) styles the Anhalwara family Solanki and Chalukya.

SOLANUM, a genus of the natural order Solanaceæ. Upwards of 400 species of plants belonging to this genus have been enumerated, including many with apparently very opposite properties. The tomato, the egg-plant, and the potato, with the various species of poisonous nightshades, are found united so closely by botanical characters, that it is impossible generally to separate them. The properties of these plants, however, do not differ in kind but in degree; and the berries and leaves, and even the tubers when uncooked, of the potato, possess in a mild degree the narcotic properties of the poisonous nightshades. Many of them have also very handsome flowers. S. Jacquini is considered by the native practitioners of India as an expectorant. S. Æthiopicum, *Willde.*, is a native of Ethiopia, China, and Japan. Two varieties are recorded,—one, the S. violaceum, is a native of China, and the fruit is frequently eaten in that country as a dessert. It has a large spheroid oval berry of a red colour. The other variety is the S. æsculentum, having a prickly stem, and small yellow berries of the size of peas. —*Eng. Cyc.; Roxb.; Mason; Voigt.*

SOLANUM DULCAMARA.

Shuh-yang-ts'iuen, CHIN. | Ruba-barik, . . HIND.
Ku-kia, ... ,, |

This is a native of Europe, Asia, and North America, in hedges and amongst bushes. It is plentiful in Great Britain, and it or a variety of it is found on the Chur mountain, and in the Panjab Himalaya, at 7000 to 7500 feet. Its leaves, etc. (or those of S. nigrum), are officinal under the above name. It has purple flowers, and scarlet, oval, bitter, and juicy berries. These are acrid narcotics, and poisonous in moderately large quantities.—*Eng. Cyc.; Royle; O'Sh.; Stewart.*

SOLANUM FEROX. *Linn.*

S. involucratum, *Bl.* | S. hirsutum, *Roxb.*
S. lasiocarpum, *Dun.* | S. mammosum, *Lour.*
Ram began, . . BENG. | Ana chunda, MALE., TAM.
Vatarajakulo, . . CAN. |

A scarce shrub, but found on the coast line of Southern India, Bengal, Cochin-China, Penang, Singapore.—*Voigt.*

SOLANUM INCERTUM. *Dun.*

Ruba-barik, . . . HIND. | Mannuttha-kalee, . TAM.

Cultivated by the natives of India. The leaves are used as a pot-herb; the fruit and leaves in the preparation of chatnis. It contains a peculiar alkaloid, solanine, and acts as a diaphoretic, diuretic, and alterative, especially in skin diseases as lepra.—*Jaffrey's Hints; Powell.*

SOLANUM INDICUM. *L.* Indian Nightshade.

Several varieties of this are everywhere cultivated in the E. Indies, Persia, and Arabia. The fruits large, ovoid, firm, innocent, and insipid. It is one of the most useful of Indian vegetables, and is used in culinary purposes in various ways. The large Cape varieties are the best; require good soil and abundance of water. Flowers purple, and bears large, smooth, shining berries, which are the shape and size of a small hen's egg. S. ovigerum has the stem, calyx, and leaves without thorns; and in S. esculentum, these parts are more or less covered with thorns. Several sub-varieties of both these vary in the shape and colour of the fruit. The berries are white, yellow, red, purple, and black. The fruit of this plant, the oval-shaped white, the globular-shaped white, and the purple or violet coloured of both forms, are used in stews and soups. The natives of the Panjab regard this vegetable as hot and dry; it is said to prevent sleep and produce unpleasant dreams, owing to vitiated bile. Leaves are said to be narcotic.—*Roxb.; Eng. Cyc.; O'Sh.; Gen. Med. Top.; Jaffrey; Riddell; Powell.*

SOLANUM NIGRUM. *Linn.* Nightshade.

Mako, Mackoe, . . HIND. | Canchie pandu, . . TEL.

Solanum nigrum grows in waste places. Throughout Europe it is a weed in cultivated ground, and is found in Africa and Asia. It has white flowers, producing small berries of a black colour, and is employed as a narcotic by the hakims of India. The fruits are very dangerous, and act in the same manner as those of the belladonna and mandrake. It is considered by natives cool and moist, and is used in fever, diarrhœa, and ulcers, also in disorders of the eyesight, and in hydrophobia, both externally and internally. It contains a small amount of solanine in the juice of the stem and berries, but it may be eaten as food, as in France.—*O'Sh.; Ainslie; Eng. Cyc.; Powell; Voigt.*

Gorkhi, ... BENG. | Kachi; Erra and Nalla
Gaju chettu, . . TEL. | kamanchi, . . . TEL.
Kamanchi chettu, . ,,

The gorkhi is the red-seeded variety; both have small white flowers. They grow throughout the E. Indies and E. Archipelago.—*Roxb.; Voigt.*

SOLANUM SANCTUM. *Linn.* Lot's lemon.

Leimun lut, . . . ARAB. | Bari mauhari, . . HIND.
Palestine egg-plant, ENG. | Mahori, Tingi, . . ,,
Maraghune, . . . HIND.

Grows in Palestine, west of the Indus, and in the Salt Range. Supposed by Dr. Wilson to be the vine of Deuteronomy xxxii. 32. Stem shrubby, tomentose; leaves ovate-repand, oblique at the base, clothed with hoary tomentum on both surfaces. Berries nearly globose. In some places the fruit is eaten fresh and in pickle.—*Panjab Plants*, p. 160.

SOLANUM SODOMEUM. *Linn.* Sodom egg-plant, apple of Sodom, is a native of the north of Africa, the S. of Europe, N. Holland, and Brazil. Fruit white, and about the size of a walnut. It is very subject to the attacks of an insect, which deposits its eggs within the germen, and, as the fruit enlarges, the larvæ of the insect destroy and pulverize the whole of the interior, whilst the rind is left unchanged and entire. When the fruit is gathered under these circumstances, it is crushed to pieces by the hand; or if conveyed to the lips, the mouth becomes filled with an ash-like powder, exceedingly bitter to the taste. To these berries remarkable properties have been assigned by Josephus, Tacitus, and others. Mandeville, an old English writer, says, speaking of the Dead Sea, 'And there besyden grown trees that baren fulle faire apples and faire of colour to beholden, butte whosoe breaketh them or cuttethe them in two, he shall find within them coles and cyndres.' Milton alludes to this fruit in the lines:

'Greedily they pluck'd
The fruitage fair to sight, like that which grew
Near that bituminous lake where Sodom flamed.
This more delusive, not to touch but taste
Deceived; they, fondly thinking to allay
Their appetite with gust, instead of fruit
Chewed bitter ashes.'

It seems to be quoted in Deuteronomy xxxii. 32, 33, and in Isaiah, who says of the future Israelites, their vine is from the vine of Sodom, and from the fields of Gomorrah.—*Harris' N. H. of Bible*, p. 187; *Voigt; Hogg.*

SOLANUM TORVUM. *Swz.*

Goto-begoon, . . BENG.	Wusta-kaia, . . . TEL.
Sunday-kai, . . . TAM.	

A weed used as a vegetable by the natives. It has several synonyms.—*Voigt.*

SOLANUM TRILOBATUM. *L., Roxb., W. Ic.*

S. acetosæfolium, *Lam.*

Achudah? Alarkah, SANSK.	Uchinta kura, . . TEL.
Tuda valle, . . . TAM.	Tella uste, Uchchinta, ,,
Mulla muste-uste, . TEL.	

Root-leaves and tendril shoots used medicinally. The fruit, Toovullay kai, TAM., Moondlamoostekaia, TEL., is round and small, being not much larger than a marrow fat pea. It has a somewhat bitter taste, not unlike that of its congener the choonday kai, and is commonly eaten fried, having been previously sprinkled with a little salt and water.—*Roxburgh; Ainslie; Useful Plants; Voigt.*

SOLANUM TUBEROSUM. *Linn.* Potato.

Alu, . . . DUKH., HIND.	Rata-inula, . . SINGH.
Ubi, Kantang, . MALAY.	Alu gaddalu, . . TEL.

The potato is found native in the greatest abundance on the western coast of South America. Like most plants which are much cultivated, an abundance of varieties have been produced from the original plant; and in the leaves, colour of the flowers, shape, size, and colour of the tubers, it has a great tendency to depart from its normal character. The potato is a useful esculent, contains a large amount of starch, and when dried it is used as a substitute for salep. It is cultivated throughout British India as a cold-weather crop, in Burma, and in the Himalaya up to 9000 feet, where it is cooked and eaten with buckwheat. Two other species, namely, S. Valenzuela and S. montanum, produce edible tubers, but they are little used. The most formidable potato disease of the 19th century, from the Peronospora infestans, seems to have originated from guano. From potatoes is made British gum, an altered condition of potato starch, used for postage-stamps; starch, or English arrow-root, etc.—*Roxburgh* ii. p. 216; *English Cyclop.; Mason; Powell; Panjab Plants; Voigt.*

SOLANUM VERBASCIFOLIUM. *Linn.*

S. pubescens, *Roxb.*

Ola, . . . BEAS, RAVI.	Mullum chande, . . TAM.
Urus, ... BENG.	Rusa gadda manu, . TEL.
Tiari, . . . CHENAB.	Karawune, . TR.-INDUS.
Kala mewa, . . HIND.	

This is a native of Asia, America, and the tropical parts of Australia. Grows in the Siwalik tract up to 4000 feet, and west of the Indus. It is frequently cultivated. Every part is covered with a powdery white tomentum. The flowers are white, and the berries are of the size of small cherries, and used in curries.—*Roxb.; Useful Plants; Panjab Plants; Hogg; Voigt.*

SOLANUM VIRIDE. *Br.*

S. anthropophagorum, *Seeman.*

One of the plants of the Fiji Islands and New Zealand, the tubers of which were used when eating human beings.

SOLANUM XANTHOCARPUM. *Willde.*

Var. S. Jacquini, *Willde.*

Kandari, ... BEAS.	Kharian maragheone,
Mamoli, Pilak, . . ,,	HIND.
Unt-katara, . . . HIND.	Chhoti mauhari, . RAVI.
Chat-khatai, . . ,,	Mahori, ... ,,
Warumba, . . . ,,	Harnauli, . . SUTLEJ.

Grows common throughout the Panjab plains, and occasionally to 5000 feet in the outer hills. The seeds are eaten, they are applied for bruises and earache, and the fruit, Katela, Bat-kateya, HIND., is bruised and applied for pain. Considered an expectorant useful in coughs, asthma, and consumption.—*Roxb.; Powell; Panjab Plants.*

SOLAR RACE. In the northern part of British India, there were, in times long prior to the Christian era, two dynasties who strove for mastery, viz. the Solar dynasty, descended from Rama, which entered India B.C. 2300; and the Lunar dynasty, descended from Yadu, which entered India about B.C. 1300. The Solar dynasties at present remaining in India are three, viz.:—

Grahilote or Gehlote or Geholote, with 24 saca or branches, of which the Sisodia is the most distinguished. The rana of Udaipur or Mewar is a Grahilote, descended from Loh, Rama's eldest son.

Rahtor, said to be descended from Rama by Kusa, his second son. It has 24 branches, and the maharaja of Jodhpur or Marwar belongs to this tribe.

Kachwaha also sprang from Kusa. The raja of Jeypore is of this tribe. It has 12 kotri or houses.

The Lunar dynasty is sprung from the moon, through Yadu or Jadu, and is called Yadu or Jadu. It has eight branches, of which the Jhareja and Bhatti in Cutch and Jeysulmir are the most powerful.

The Agnicula, a third race, have four tribes and eighty-seven branches, viz.:—

Pramara with 35 branches.	Chalukya with 16 branches.
Parihara ,, 12 ,,	Chauhan ,, 24 ,,

The following list names the thirty-six royal races of Rajasthan:—

Ikshwaku, Cacoostha, or Soorya.
Unwye, Indu, Som, or Chandra.
Grahilote sacæ, . 24
Yadu, ... 4
5. Tuar, ... 17
Rahtore, . . . 13
Cushwaha or Cutchwaha.
Pramara, . . . 35
Chahuman or Chauhan, ... 26
10. Chalook or Solanki, 16
Purihara, ... 12
Chawura, single.
Tak, Tauk, or Takshak.
Jet or Gete.
15. Hun or Hoon.
Catti.
Balla.
Jhala.
Jaitwa or Camari.
20. Gohil.
Sarweya.
Silar.
Dabi.
Gor.
25. Doda or Dor.
Gerhwal.
Birgoojur, . . .
Sengar, single.
Sikerwal, ,,
30. Byce, ,,
Dahia.
Johya.
Mohil.
Nicoompa.
Rajpali.
36. Dahima, single.
Extra,
Hool,
Dahirya.

In the thirty-six royal tribes, there are some, the origin of which is not known, such as—

Chaura or Chawara.	Sarwaya or Sariaspa.	Sengar.
Tak or Takshak.	Jetwa.	Sikharwal.
Jit or Jat of Panjab.	Kamari.	Bais.
Jumna & Ganges.	Dabi.	Dahia.
Hun.	Gor.	Johya.
Katti.	Doda.	Mohil.
Batta.	Garhwal.	Nikumba.
Jhalamakwahana	Chandela.	Rajpati.
Gohil.	Bundela.	Dahirya.
	Bir-gujar.	Dahima.

Rama had two sons, Loh and Cush; from the former the family of the rana of Mewar claim descent. He is stated to have built Lahore, the ancient Loh-kote; and the branch from which the princes of Mewar are descended, resided there until Keneksen emigrated to Dwarica. The difficulty of tracing these races through a long period of years is greatly increased by the custom of changing the appellation of the tribe, from conquest, locality, or personal celebrity. Sen, an army, seems to have been the martial termination for many generations; this was followed by Dit, or Aditya, a term for the sun. The first change in the name of the tribe was on their expulsion from Saurashtra, when, for the generic term of Suryavansi, was substituted the particular appellation of Gehlote. This title was maintained till another event dispersed the family; and when they settled in Ahar, Aharya became the appellative of the branch. This continued till loss of territory and new acquisitions once more transferred the dynasty to Sisodia, a temporary capital in the western mountains. The title of Ranawut, borne by all descendants of the blood-royal since the eventful change which removed the seat of government from Chitore to Udaipur, might in time have superseded that of Sisodia, if continued warfare had not checked the increase of population; but the Gehlote branch of the Suryavansa still retain the name of Sisodia.

Most of the cula or races are divided into numerous branches or saca, and these saca are subdivided into immediate clans or gotra. A few of the cula never ramied; these are termed eka or single, and nearly one-third are eka. Ikshwaku was the first king in the Solar line, and, according to Hindu mythology, reigned at the commencement of the Tretu-yug. He was the son of the 7th Menu or patriarch, the offspring of the sun. His posterity was called, in consequence, the dynasty of the Solar princes, in the same manner as Budha was reputed the head of the Lunar line. Modern commentators bring the time of his accession down to the year B.C. 1320. A passage in the Agni Purana indicates that the line of Surya, of which Ikshwaku was the head, was the first colony which entered India from Central Asia. But the patriarch Budha was his contemporary, he being stated to have come from a distant region, and to have married Ella, the sister (or daughter) of Ikshwaku. Amongst the Aryan Hindus, the Kshatriya was a warrior branch taking social rank after the Hindu Brahmans. Menu, writing of their duties, says, to defend the people, to give alms, to sacrifice, to read the Vedas, to shun the allurements of sexual gratification, are in a few words the duties of a Kshatriya. How this soldier branch broke up is extremely obscure, but it is generally supposed that none of the races now in India can trace their lineage to that tribe of Aryans, though most of the Rajput families doubtless belong to them. Their quarrels amongst themselves seem to have led to their own destruction. These martial Kshatriya do not appear to have adopted Brahmanism readily, and the Brahmans to overcome them, consecrated by fire, on Mount Abu, a warrior body who still remain, and are known as the four Agnicula Rajput tribes.

Vyasa gives but fifty-seven princes of the Solar line, from Vaivaswata Menu to Rama; and no list which had come under Colonel Tod's observation exhibits for the same period more than fifty-eight of the Lunar race.

Ikshwaku was the first who moved to the eastward and founded Ayodhya.

Budha (Mercury) founded the Lunar line, but we are not told who established their first capital, Poorag, though we are authorized to infer that it was founded by Pooru, the sixth in descent from Budha.

A succession of fifty-seven princes occupied Ayodhya from Ikshwaku to Rama.

From Yayat's sons the Lunar races descend in unequal lengths.

The lines from Yadu, concluding with Krishna and his cousin Kansa, exhibit fifty-seven and fifty-nine descents from Yayat, while Yudishtra, Sul, Jarasandha, and Vahoorita, all contemporaries of Krishna and Kansa, are fifty-one, forty-six, and forty-seven generations respectively, from the common ancestor Yayat. The author, after the invocation to the mother protectress, Om! sacombari mata! says, 'I write the name of the thirty-six royal tribes.' The bard Chund says, 'Of the thirty-six races, the four Agnicula are the greatest: the rest are born of woman, but these from fire.'

Rama of the Ramayana is described as the son of Ikshwaku and grandson of Menu. His original abode is described as the mountains of the west. He was the first of the dynasties of Oudh. And the Solar dynasty held sway in Ayodhya, the modern Oudh, till the result of the great war, the Mahabharata, when they were forced to give way by their cousins of the Lunar line.

The Rajput race was at an early period divided into the two great Solar and Lunar dynasties, the former having its seat of empire in Oudh, and the latter in Dehli. Struggles for the pre-eminence were carried on with sanguinary obstinacy between these tribes. To fight, was the duty of the Kshatriya, as Krishna told the hero Arjuna, smitten with sorrow at the idea of slaughtering his own kinsmen in battle. 'O Krishna,' said the hero, 'I seek not victory nor a kingdom. I will not fight! What shall we do with a kingdom, or with life itself, when we have slain all these?' Krishna had no such qualms. 'You belong,' he replied, 'to the military class, and your duty is to fight.' And Arjuna fought.

The dynasties which succeeded the great beacons of the Solar and Lunar races, are three in number,—1st. the Suryavansa, descendants of Rama; 2d. the Induvansa, descendants of Pandu through Yudishtra; 3d. the Induvansa, descendants of Jarasandha, monarch of Rajgraha. The Bhagavat and Agni Puranas are the authorities for the lines from Rama and Jarasandha; while that of Pandu is from the Raj-Taringini and Rajaoli. The existing Rajput tribes of the Solar race claim descent from Lava and Cush, the two elder sons of Rama; and Colonel Tod does not believe that any existing tribes trace their ancestry to his other children, or to his brothers. From the eldest son Lava, the rana rulers of Mewar claim descent; so do the Bir-gujar tribe, formerly powerful within the confines of the present Amber, whose representative now dwells at Anupshahr on the Ganges. From Cush descended the Cushwaha princes of Nirwar and Amber, and their numerous clans. Amber, though the

first in power, is but a scion of Nirwar, transplanted about the 9th century, whose chief, the representative of the celebrated prince Nala, enjoys but a small district of all his ancient possessions. The house of Marwar also claims descent from this stem, which appears to originate in an error of the genealogists confounding the race of Cush with the Causika of Kanouj and Causambi. Nor do the Solar genealogists admit this assumed pedigree. The Amber prince in his genealogies traces the descent of the Mewar family from Rama to Sumitra through Lava, the eldest brother, and not through Cush, as in some copies of the Puranas, and in that whence Sir William Jones had his lists. Whatever dignity attaches to the pedigree claimed by the Amber prince, every prince and every Hindu of learning admits the claims of the princes of Mewar as heir to the chair of Rama; and a degree of reverence has consequently attached, not only to his person, but to the seat of his power. When Madhaji Sindia was called by the rana to reduce a traitorous noble in Chitore, such was the reverence which actuated that (in other respects) little scrupulous chieftain, that he could not be prevailed on to point his cannon on the walls within which consent established the throne of Rama. The rana himself, then a youth, had to begin the attack, and fired a cannon against his own ancient abode. In the very early periods, the princes of the Solar line, like the Egyptians and Romans, combined the offices of the priesthood with kingly power, and this whether Brahmanical or Buddhist. Many of the royal line, before and subsequent to Rama, passed great part of their lives as ascetics; and in ancient sculpture and drawings, the head is as often adorned with the braided lock of the ascetic, as with the diadem of royalty. Ferishta, also translating from ancient authorities, says to the same effect, that 'in the reign of Mahraj, king of Kanouj, a Brahman came from Persia, who introduced magic, idolatry, and the worship of the stars;' so that there is no want of authority for the introduction of new tenets of faith. Even now the rana of Mewar mingles spiritual duties with those of royalty, and when he attends the temple of the tutelary deity of his race, he performs himself all the offices of the high-priest for the day. In this point a strong resemblance exists to many of the races of antiquity. There seems to be no doubt that amongst the Aryans, whilst they were approaching India, and whilst the worship of nature under the Vedic system of religion prevailed, the householder was his own priest, and performed all the religious duties in sacrifices and worship. The head of the house was, in fact, his own household priest, and to the present day every head of a Hindu house performs all the religious sacrifices of his household. — *Wilson's Glossary; Tod's Rajasthan*, i. p. 215.

SOLE. The Plagusia of Tenasserim is a small fish of the sole family, that grows to nine inches or a foot long. It has no pectoral fins, and the dorsal, caudal, and ventral fins are united. The natives think that two of them always swim together, with their flat, uncoloured sides united. —*Mason.*

SOLEGNATHUS BLOCKII. *Bleeker.* The sea-needle of Block, a long, spindle-shaped fish, with round, needle-shaped body.

SOLENOCARPUS INDICA. *W. A.* This tree, when in blossom, is a perfect mass of white flowers. It grows on the Animallays (2600 feet elevation), also on the Tinnevelly ghats. When in leaf only, it much resembles the Spondias mangifera.—*Beddome, Fl. Sylv.*

SOLENOSTEMMA ARGEL, Arghel of Egypt, a native of Syria. The leaves are purgative, and are employed in Egypt to adulterate senna.—*Hogg*, p. 5; *Simmonds.*

SOLFATARA, the Hwang-kung of the Chinese. There are three of these in the north end of Formosa. There are also solfataras in the Japanese island of Kiu-siu, and at the south end of Satsuma is the burning sulphur island of Ivoo-sima. See Sulphur.

SOLOMON, properly Sulaiman or Suliman, the son of David, was king over the Judah and Benjamin tribes of the Hebrews or Israelites. He is famed in history for building the temple of Jerusalem, for his great wisdom and great wealth. He began to build the temple B.C. 1014. He founded Hamath, in the country of Galilee, and fortified Tadmor or Palmyra in the wilderness, and many other cities of store (1 Kings ix. 18; 2 Chronicles viii. 4), or emporia, for the commerce of India, and Tyre, Sidon, and all the surrounding nations. His father had introduced the custom of a vast polygamy, which Solomon continued. His commercial transactions extended down the Red Sea and the Euphrates valley, to India and the Aurea Chersonesus.

A port of departure and arrival was Ezion-geber (1 Kings ix. 26) on the banks of the Euphrates, the Hasn Jabir of the Arabs, also called Kalat Jabir or Castle Jabir, of which the vast ruins still exist not far from the ancient Roman town of Beles. Catafago says the translation ought to be, 'And king Solomon made a navy of ships in Ezion-geber, besides that of Eloth.' The modern Arab name of Tadmor or Palmyra is Sulaymaniyah. Solomon is fabled to have been king not only of men, but of the angels, genii, elements, beasts, and birds, and they have many traditions as to the queen of Sheba. Solomon's pools are three large reservoirs built on the slope of a hill about 7 miles S. from Jerusalem. Solomon's temple in Jerusalem was dedicated to Baal, and all the idolaters of that day seem to have held to the grosser tenets of modern Hinduism—

> 'Peor his other name, when he enticed
> Israel in Sittim, on their march from Nile.'

Solomon's temple, of Kashmir, stands on the summit of a hill to the east of Srinuggur city. Its height is 6263 feet above the level of the sea.—*Arrian, Periplus*, p. 152; *Pennant's Hindustan*, i. p. 4; *Tod's Rajasthan*, i. p. 76; *Paradise Lost*, Book I.

SOLOMON ISLANDS, discovered by Dampier, 1699, form an extensive chain which stretches to the N.W. from the E. point of San Christoval Island, in lat. 10½° S. and long. 162° 27′ E., to the N. point of Banka Island, in lat. 5° S. and long. 154° 38′ E. They are part of the extensive chain which, commencing to the N. of New Hebrides, extends in a N.W. direction towards New Ireland, and thence along the N. side of New Guinea. San Christoval or Arsacides is the most south-easterly. The people are cannibals. They murdered Lieutenant Bower and his crew, and massacred the native assistants of Mr. Brown,

the missionary, but Mr. Walter Powell lived amongst them.

SOLOR is an island lying to the east of Flores, and to the north of Timor, under which presidency of Netherland India it is placed. The inhabitants of the coast are Muhammadans in name, but they are hard arrack drinkers. They are hardy mariners and fishers. The village which most applies itself to the whale fishery is Lamakera, on the north-east part of the island of Solor, and lying within the Strait. They are remarkable for their skill in managing their prahu and canoes, and are the most expert fishermen in these seas, frequently capturing the black-fish, which no other fishermen in these seas will venture to attack. The blubber or fat obtained from them is used as food, and also as an article of barter with the inland inhabitants; and the oil and spermaceti is sometimes disposed off to the Bughi and Macassar traders, who prefer it to cocoanut oil for burning in their prahus.—*Journ. Ind. Arch.*, December 1850.

SOLPUGA ARANEOIDES and S. intrepida are two species of Phalange of the Kirghiz steppe, of a yellowish or reddish-brown colour, with long hair. The bite is said to cause death. When walking, it seems as large as two fists. They live in the sand.

SOLTYKOFF, PRINCE, a Russian noble who travelled in India in 1841, and wrote Voyage dans l'Indie.

SOMA was an ancient Aryan rite, a sacrifice to Indra (Zeus) of an intoxicating potion, consisting of fermented juice of plants mixed with milk. Soma juice and its effects are repeatedly mentioned in the Vedas (i. pp. 21, 139, ii. pp. 169, 233, 260, iii. p. 470). The Soma sacrifice now-a-days is not made with any spirituous fluid, but in Vedic times it seems to have been a distilled alcoholic fluid, and was offered to their deities,—

'The gods themselves with pleasure feel
King Soma's influence o'er them steal;
And Indra once, as bards have told,
Thus sang in merry mood of old:—
This Soma is a god; he cures
The sharpest ills that man endures:
He heals the sick, the sad he cheers,
He nerves the weak, dispels their fears,
The faint with martial ardour fires,
With lofty thoughts the bard inspires,
The soul from earth to heaven he lifts,
So great and wondrous are his gifts:
Men feel the god within their veins,
And cry in loud exulting strains,—
"We've quaffed the Soma bright,
And are immortal grown;
We've entered into light,
And all the gods have known.
What mortal now can harm,
Or foeman vex us more?
Through thee beyond alarm,
Immortal god, we soar."'

The Rig Veda, ix. says, 'The purifying Soma, e the sea rolling its waves, has poured forth gs, and hymns, and thoughts.' Thus perified, the Soma god bears a certain analogy the Greek Dionysus or Bacchus. The two ses above are a nearly literal translation of Veda, viii. 48, 3. The Soma plant of the las is the Sarcostemma viminale, a leafless lepiad, with white flowers in terminal umbels, ich appear during the rains in the Dekhan. It was gathered by moonlight, hence its name, from Soma, SANSK., the moon, and carried to their homes on carts drawn by rams, and a fermented liquor was prepared by mixing its juice, strained through a sieve of goat's hair, with barley and clarified butter or ghi. This beer or wine was used at all their religious festivals, and was used by the rishis at their meals.

Indra, according to Bunsen (iii. p. 587, 8, iv. p. 459), is the prototype of Zeus, and was a personification of ether. The Soma juice is the oblation or libation of the Vedic worship, and the Homa of the Parsee; and Prof. H. H. Wilson (Introduction to the Rig Veda, p. 36) says, 'Almost the whole of the Soma Veda is devoted to its eulogy, and this is no doubt little more than a repetition of the Soma Mandala of the Rig Veda.' The veneration of the Soma plant does not appear to have proceeded from any worship of the moon or planets, which are not, like the sun, objects of special adoration in the Veda. The Soma is mentioned in Menu, iii. pp. 85, 158, 180, 197, 257, v. p. 96, vii. p. 7, ix. p. 129, x. p. 88, xi. pp. 7, 12. All the ancestors of the Brahmans are styled Soma-pa, 'moon-plant drinkers;' and the Soma sacrificial priests, the Soma Yaji and Soma Devi.

Haug says the Homa was a nasty drink. Windischmann suggests that the Soma plant may be identical with the gogard tree, which enlightened the eyes, and Ampelus, the vine of Bacchus, is also mentioned.—*Bunsen's Egypt; Rig Veda; Williams' Nala*, p. 247.

SOMA, in Hindu mythology, is the son of the Rishi Atri by his wife Anasuya, but also said to be son of Dharma and Prabhakara. He married 27 daughters of Daksha (which are the 27 lunar asterisms). He carried off Tara, wife of Brihaspati (Jupiter), who bore a son, and named him Budha, the parent of the Lunar race. Soma, also Chandra, the moon, is chiefly celebrated in the Vedas in connection with the Soma plant, but in the Mahabharata is the mythical progenitor of the great Lunar race of Bharata. These heavenly bodies entered into the elemental worship of the Vedic times.—*Dowson.*

SOMA DEVA BHATTA, of Kashmir, collected the popular stories current in his time, and published them towards the beginning of the 12th century, under the title of Katha-sarit-sagara, the Ocean of the Rivers of Stories.

SOMAJH. From the religious scepticism which is the most remarkable result of western education in British India, has sprung several sects among the more thoughtful and earnest of the Hindus. The Brahmo society resembles in its organization of preachers, members, and hearers, the various sects of Christians. They eschew idolatry in every form, build chapels on the model of a Christian church, and, except that the Bible is seldom referred to, and Christ is only treated as a great and good man, would seem to be an Indian form of theism. They have fixed, paid ministers, lay itinerating agents, who receive no salary for their labour of love, and have adopted the missionary agency of the European churches, and send out trained missionaries for the propagation of theism. The census of 1881 showed their numbers in British India to be 1147, energetic, well-informed, and respected of their countrymen, amongst them men of social position and wealth.

SOMAL or Beer-us-Somal, the country of the Somali, to the south of Cape Guardafui, between the equator and lat. 11° N.; on the west is separated from the Galla nations by the Jub, a large and fertilizing stream which rises in the mountains of Southern Abyssinia, and debouches in the Indian Ocean. Capt. Speke states that the Somali are the descendants of a band of Muhammadans who were driven from Mecca in A.D. 1413, and crossed over to their present site, from which the Galla and Abyssinians were subsequently dispossessed. The Somali in their own land are pastoral nomades, but have settled villages on the coast line, with a patriarchal government. When the mother perishes in child-birth, the parents claim a certain sum from the man that killed their daughter. Twins, here called Wapacha, and by the Arabs of Zanzibar Shukul, are usually sold or exposed in the jungle, as amongst the Ibos of West Africa. A mother, when carrying her offspring, bears in her hand a kirangozi, a guide or guardian, in the form of two sticks a few inches in length, bound with bands of parti-coloured beads. This article, made by the Mganga or medicine-man, is placed at night under the child's head, and is carried about till it has passed the first stage of life. They trade at Berbera and other places on their coast, or sail to Aden during the N.E. monsoon, bringing gum, myrrh, ostrich feathers, ivory, etc. They are a good-tempered, though indolent race; but easily excited to anger. In Aden they are inveterate thieves and gamblers. They are handsome, active, and long-limbed, with woolly hair, capable of undergoing great privation and fatigue. In 1827, a British vessel trading at Berbera was plundered by the Habr Owul tribe of Somali. Berbera is a port to the east of Zaila and Tajowra, and nearly opposite to Aden. In consequence of unhealthy winds, it is deserted for six months every year. During the rest of the year it is visited by caravans of different tribes from the interior of Africa. A vessel of war was sent to punish the tribe for the outrage which they had committed. On 6th February 1827, a treaty of peace and commerce was signed by the elders of the tribe. An expedition was sent in 1854 to explore the country between Berbera and Zanzibar, but on the 18th April 1855 the party were suddenly attacked by Somali of the El Moosa tribe; two British officers were wounded, one was killed, and the entire property of the expedition was carried off. The murderers were not delivered up, but a treaty was entered into. In 1855, the elders of the Habr Gerhagi and the Habr Taljala tribes of Somali entered into an engagement with the Political Resident at Aden to prohibit the slave trade. — *Aitcheson's Treaties,* vii. p. 319.

SOMENDILLA. TAM., MALEAL. The Berrya ammonilla tree, yielding the most useful wood in Ceylon for naval purposes. It is commonly called Halmilile and Hameniel by the Dutch and Portuguese. It grows straight, from 20 to 40 feet high, and from 12 to 30 inches in diameter. Superior to any wood for capstan bars, cross and trussel-trees, cask-staves, battens for yards, fishes for masts, boat-building, etc. At Madras it is highly valued for coach-work, from the toughness and fineness of its grain. It is the Trincomalee wood of commerce.—*Edye, Ceylon.*

SOMESWARA or Somnath, lord of the moon, a title of Siva; also applied to Surya, the sun-god. —*Tod's Tr.* p. 508.

SOMNATH or Somanath is an ancient town situated in lat. 27° 7′ N., and long. 71° 34′ E., at the eastern extremity of a bay on the south coast of the peninsula of Kattyawar, in the Bombay Presidency. The western headland of the same bay is occupied by the port of Virawal, which gives to the locality its more common name of Virawal Pattan, also known as Deo Pattan, Pattan Somanath, Somnath Pattan, Prabhas Pattan. On the west, the plain is covered with Muhammadan tombs; on the east are numerous Hindu shrines and monuments.

The country near Somnath is full of memorials of Krishna, and at a spot to the east of the city, near the union of three beautiful streams, the body of the hero is said to have been burned. Before its capture by Mahmud of Ghazni, A.D. 1024-1026, little is known of the history of Somnath.

The country of Soreth, a province of the peninsula of Gujerat, now more generally known under the name of Kattyawar, is celebrated in the Puranas for containing five inestimable blessings. First, the river Gumti; second, beautiful women; third, good horses; fourth, Somnath; and fifth, Dwarka. Among the many places in Soreth that are held sacred by the Hindus, Somnath Pattan has always been one of the most remarkable. It stands one or two miles from the sea, at the junction of three rivers, the Hurna, Kupula, and Sersutty, at a distance of three miles to the east of the port of Belawul. Somanatha or Someswara is a name of the type of Siva, and the worship of Siva under this type prevailed throughout India at least as early as the 5th or 6th century. The Somanath idol, in fact, was one of the twelve great lingams then set up in various parts of India, several of which were destroyed by the early Muhammadan conquerors; and it has been mentioned that Somnath temple was the counterpart of Baalbek; and the idol is related to have been brought to India from the Kaba, on the advent of Mahomed. Brahmanical records, however, refer it to the time of Krishna. Somanath is the title of Swayam-nath, or self-existing, and the religion was, of old, common to Arabia and India; and there is reason for believing, what the early Muhammadan authorities assert, viz. that the Lat, worshipped by the idolaters of Mecca, was a similar deity to the Swayam-nath of the Hindus. The idol itself, Somnath, is stated to be one of the twelve symbols of Siva, which are said by Hindus to have descended from heaven to the earth. The temple of the idol was supported by 56 pillars in rows, the idol was of polished stone, about five cubits high, of proportionate thickness, and two cubits were below ground. General Cunningham says the Pattan Somnath temple of Siva enshrined a figure of the god, bearing a crescent on his head, as Somnath or the lord of the moon. This appellation w[illegible] therefore the proper name of the temple, and n[illegible] of the city, which he concludes must have b[illegible] Elapura or Erawal, the modern Virawal.

The image was, according to Muhammad[illegible] authors, destroyed by Mahmud; but in late ye[illegible] Ahalia Bhai, the widow of a prince of the Mahr[illegible] family of Holkar, erected a new temple on the ex[illegible] site of that which was demolished. A symbol[illegible] Siva Mahadeo has been placed in this temp[illegible]

SON or Sugun, in Sind, is a kind of divination by means of the position of birds and beasts, their cry, the direction of their flight, and other such particulars.

SONAI. HIND. Water in which the jute plants have been steeped.

SONAR, HIND., from Sona, gold, a worker in gold and silver. One of the five artisan castes of the Hindus, the other four being the blacksmith, coppersmith, stone-mason, and carpenter. The Sonar, or goldsmith, is a caste or hereditary avocation. He is not a jeweller, but an artisan, and works entirely by weight, charging from one anna to one rupee per rupee of the out-turned manufactured article, the rate varying according to his skill or the art required, the standard of intrinsic value being that of payment. The Sonar usually has the gold or silver with which he is to work delivered to him, and he must return in the ornament the same quality and quantity he received. He cannot work with much alloy, which is the best security against fraud, and his best work is with the purest gold and silver, and in these the metal is treated with quicksilver again and again, until it has become soft and perfectly ductile. The Kanari 'Panchala' and the Kokanasth 'Sonar' claim to be Brahmans. They wear the sacred cord, and have the Vedas read to them by their own priests. The Sonar of the south of India all claim to be of higher birth than the Brahmans. In Benares they claim to derive their origin from the Kshatriyas.

SONARGAON, in the Dacca district, the ancient Muhammadan capital of Eastern Bengal, but now an insignificant village called Páinam, situated about two miles from the Brahmaputra, in lat. 23° 39' 45" N., and long. 90° 38' 20" E. It was here that Azm. Shah, the son of Sikandar, proclaimed his independence, and invited the poet Hafiz to his court. The town gave its name to one of the three great sarkárs or provinces.—*Imp. Gaz.*

SONARI, a little village situated on a low spur of a sandstone hill between the Betwa and Besali rivers, 6 miles to the S.W. of Sanchi, 21 miles N.E. of Bhopal. It contains numerous Buddhist topes. See Bhilsa.

SONCHUS CILIATUS. *Lam.* Sow thistle.

Sonchus oleraceus, *Roxb.*, *Wight Icones.*

Dodak, ...	HIND.	Etrinta, ...	TEL.
Ka't mulingi kiri, .	TAM.	Adavi mullangi, . .	,,

A native of Europe, up to 8500 feet, of the Panjab, also of Peninsular India. It yields a milky juice on incision. Cattle are fond of it. Used in the Neilgherries as a pot-herb by the natives. Also the Kashmir people are said to use it as a vegetable; and it is probably the dwarf sow thistle, the shoots of which the Ladakhi use in a similar way, according to Moorcroft, though this may be the Tragopogon.

Sonchus Orixensis.

Bhangra, ...	HIND.	Dughdika, . . .	HIND.
Kala bhangra, . .	,,	Sahadevi, . . .	,,

Bari (H.) Jangli-tamaku. Similar to Lactuca in its properties.—*Powell; Jaffrey; Stewart, M.D.*

SONDIA. The principal among the illegitimate Rajputs in Central India, of mixed caste, are the Sondia, who have spread from Sondwarra in Malwa (a country to which they give the name) to many adjoining districts. This tribe is divided into many families, which take their name from Rajput ancestors; but all intermarry. Second marriages among their women are very common, and from the strict usages of the Rajputs upon this point, there is none on which they deem the Sondia to have so degraded the race from which they are descended. The Sondia have been either cultivators or plunderers, according to the strength or weakness of the government over them; but they have always had a predatory tendency, and have cherished its habits even when obliged to subsist by agriculture. Their dress is nearly the same as that of the other inhabitants, though they imitate in some degree the Rajputs in the shape of their turbands. They are, in general, robust and active, but rude and ignorant to a degree. No race can be more despised and dreaded than the Sondia are by the other inhabitants of the country. A considerable number occupy the districts of Dig Puch-pabar and Gungrar or Chowmela. They are Hindus, but abstaining from the flesh of kine is their only feature. They drink, use opium, and are of vicious habits; their women are bold and immoral; widows remarry. During the rebellion of 1857–58, they gave considerable trouble. Another tribe, the Bhilalah, who have sprung from Rajputs of the Bhil tribe, derive their name from associating with the Bhils, among whom, from the superior rank of their sires, they obtain respect and consequence. The chiefs of the Bhils in the Vindhya mountains are almost all Bhilalah. This class combine with the pride and pretensions of the Rajputs the cunning and roguery of the Bhils; and appear to be, almost without exception, a debauched and ignorant race, often courageous from constant exposure to danger, but invariably marked by an equal want of honour and of shame. The Bhilalah and Sondia chiefs were the only robbers in Malwa, whom under no circumstances travellers could trust. There are oaths of a sacred but obscure kind among those that are Rajputs, or who boast their blood, which are almost a disgrace to take, but which, it is asserted, the basest was never known to break, before Mundroop Singh, a Bhilalah, and some of his associates, plunderers on the Nerbadda, showed the example.—*Malcolm's Central India*, ii. pp. 15, 153.

SONDRI BRERI or Sondi Breri, an ebbing and flowing spring near the Berengi river in Kashmir. It appears about the vernal equinox. It seems to be an underground continuation of the Berengi river.

SONE. The fishermen settled along the coast from Gheriah to the north, near Surat, and at Colaba, in Bombay, are Koli of the Sone tribe; a few of them are mariners, but the vessels must be manned by natives, the Sone fearing to lose caste, which would take place did they sail with Europeans. The chief Patel of this tribe resides at Angria; he is looked on as a legislator, being endowed with power to adjust the affairs of the Sone Koli, settle their disputes, etc. The women of the Sone Koli wear choli or jackets, and have a number of glass bangles on their left hand; they are frequently seen in Bombay assisting their husbands in fishing and carrying fish to market. When they marry, the ornaments which were intended to adorn their right wrists are consecrated, and thrown into the sea as an offering to the deity who presides over that element, and an invocation to defend her husband from the dangers of the ocean. Not a caste meeting of the Sone

SOMAL or Beer-us-Somal, the country of the Somali, to the south of Cape Guardafui, between the equator and lat. 11° N.; on the west is separated from the Galla nations by the Jub, a large and fertilizing stream which rises in the mountains of Southern Abyssinia, and debouches in the Indian Ocean. Capt. Speke states that the Somali are the descendants of a band of Muhammadans who were driven from Mecca in A.D. 1413, and crossed over to their present site, from which the Galla and Abyssinians were subsequently dispossessed. The Somali in their own land are pastoral nomades, but have settled villages on the coast line, with a patriarchal government. When the mother perishes in child-birth, the parents claim a certain sum from the man that killed their daughter. Twins, here called Wapacha, and by the Arabs of Zanzibar Shukul, are usually sold or exposed in the jungle, as amongst the Ibos of West Africa. A mother, when carrying her offspring, bears in her hand a kirangozi, a guide or guardian, in the form of two sticks a few inches in length, bound with bands of parti-coloured beads. This article, made by the Mganga or medicine-man, is placed at night under the child's head, and is carried about till it has passed the first stage of life. They trade at Berbera and other places on their coast, or sail to Aden during the N.E. monsoon, bringing gum, myrrh, ostrich feathers, ivory, etc. They are a good-tempered, though indolent race, but easily excited to anger. In Aden they are inveterate thieves and gamblers. They are handsome, active, and long-limbed, with woolly hair, capable of undergoing great privation and fatigue. In 1827, a British vessel trading at Berbera was plundered by the Habr Owul tribe of Somali. Berbera is a port to the east of Zaila and Tajowra, and nearly opposite to Aden. In consequence of unhealthy winds, it is deserted for six months every year. During the rest of the year it is visited by caravans of different tribes from the interior of Africa. A vessel of war was sent to punish the tribe for the outrage which they had committed. On 6th February 1827, a treaty of peace and commerce was signed by the elders of the tribe. An expedition was sent in 1854 to explore the country between Berbera and Zanzibar, but on the 18th April 1855 the party were suddenly attacked by Somali of the El Moosa tribe; two British officers were wounded, one was killed, and the entire property of the expedition was carried off. The murderers were not delivered up, but a treaty was entered into. In 1855, the elders of the Habr Gerhagi and the Habr Taljala tribes of Somali entered into an engagement with the Political Resident at Aden to prohibit the slave trade. — *Aitcheson's Treaties,* vii. p. 319.

SOMENDILLA. TAM., MALEAL. The Berrya ammonilla tree, yielding the most useful wood in Ceylon for naval purposes. It is commonly called Halmilile and Hameniel by the Dutch and Portuguese. It grows straight, from 20 to 40 feet high, and from 12 to 30 inches in diameter. Superior to any wood for capstan bars, cross and trussel-trees, cask-staves, battens for yards, fishes for masts, boat-building, etc. At Madras it is highly valued for coach-work, from the toughness and fineness of its grain. It is the Trincomalee wood of commerce.—*Edye, Ceylon.*

SOMESWARA or Somnath, lord of the moon, a title of Siva; also applied to Surya, the sun-god. —*Tod's Tr.* p. 508.

SOMNATH or Somanath is an ancient town situated in lat. 27° 7′ N., and long. 71° 34′ E., at the eastern extremity of a bay on the south coast of the peninsula of Kattyawar, in the Bombay Presidency. The western headland of the same bay is occupied by the port of Virawal, which gives to the locality its more common name of Virawal Pattan, also known as Deo Pattan, Pattan Somanath, Somnath Pattan, Prabhas Pattan. On the west, the plain is covered with Muhammadan tombs; on the east are numerous Hindu shrines and monuments.

The country near Somnath is full of memorials of Krishna, and at a spot to the east of the city, near the union of three beautiful streams, the body of the hero is said to have been burned. Before its capture by Mahmud of Ghazni, A.D. 1024-1026, little is known of the history of Somnath.

The country of Soreth, a province of the peninsula of Gujerat, now more generally known under the name of Kattyawar, is celebrated in the Puranas for containing five inestimable blessings. First, the river Gumti; second, beautiful women; third, good horses; fourth, Somnath; and fifth, Dwarka. Among the many places in Soreth that are held sacred by the Hindus, Somnath Pattan has always been one of the most remarkable. It stands one or two miles from the sea, at the junction of three rivers, the Hurna, Kupula, and Sersutty, at a distance of three miles to the east of the port of Belawul. Somanatha or Someswara is a name of the type of Siva, and the worship of Siva under this type prevailed throughout India at least as early as the 5th or 6th century. The Somanath idol, in fact, was one of the twelve great lingams then set up in various parts of India, several of which were destroyed by the early Muhammadan conquerors; and it has been mentioned that Somnath temple was the counterpart of Baalbek; and the idol is related to have been brought to India from the Kaba, on the advent of Mahomed. Brahmanical records, however, refer it to the time of Krishna. Somanath is the title of Swayam-nath, or self-existing, and the religion was, of old, common to Arabia and India; and there is reason for believing, what the early Muhammadan authorities assert, viz. that the Lat, worshipped by the idolaters of Mecca, was a similar deity to the Swayam-nath of the Hindus. The idol itself, Somnath, is stated to be one of the twelve symbols of Siva, which are said by Hindus to have descended from heaven to the earth. The temple of the idol was supported by 56 pillars in rows, the idol was of polished stone, about five cubits high, of proportionate thickness, and two cubits were below ground. General Cunningham says the Pattan Somnath temple of Siva enshrined a figure of the god bearing a crescent on his head, as Somnath or the lord of the moon. This appellation w therefore the proper name of the temple, and n of the city, which he concludes must have b Elapura or Erawal, the modern Virawal.

The image was, according to Muhammac authors, destroyed by Mahmud; but in late ye Ahalia Bhai, the widow of a prince of the Mahr family of Holkar, erected a new temple on the ex site of that which was demolished. A symbol Siva Mahadeo has been placed in this temp

which is deemed peculiarly propitious to those who desire offspring. Not far from this, the Hindu pilgrim is shown a solitary pipal tree, on the bank of the Saraswati river, which he is assured stands on the exact spot where the Sri Krishen received the mortal wound from an arrow, that terminated his incarnation.

About a century after their expulsion from Balabhi, about A.D. 758, Bappa or Vappaka founded a new kingdom at Chitore, and his son Guhila or Guhaditya gave to his tribe the new name of Gubilawat or Gahilot, by which they are still known. About the same time a chief of the Chaura tribe, named Ban raja, or the jungle lord, founded a city on the bank of the Saraswati, about 70 miles to the south-west of Mount Abu, called Anhalwara Pattan, which soon became the most famous place in Western India. Somewhat earlier, or about A.D. 720, Krishna, the Pahlava prince of the Peninsula, built the fort of Elapura, the beauty of which, according to the inscription, astonished the immortals. In it he established an image of Siva adorned with the crescent. Following this clue, General Cunningham inclines to identify Elapura with the famous city of Somnath, which, as the capital of the Peninsula, was usually called Pattan Somnath. General Cunningham takes it to be the same as Elapura or Elawar, which, by a transposition that is very common in India, would become Erawal. Thus Nar-sinh has become Ran-si, and Ranod is used indifferently with Narod, and the ancient Verul is the modern Elur or Ellora.

There is nothing in the Vedas, Puranas, and other Brahmanical books to illustrate the origin and history of the Somnath temple. The earliest notice is contained in the brief account of the successful campaign of Mahmud of Ghazni. According to Ferishta, the fortified city of Somnath was situated on a narrow peninsula, washed on three sides by the sea. It was the residence of the raja, and Naharwala (a transposition of Anhalwara) was then only a frontier city of Gujerat. This agrees with the native histories, which place the close of the Saura or Chaura dynasty of Anhalwara in S. 998, or A.D. 941, when the sovereignty passed into the hands of the Chalukya-prince, Mula raja, who became the paramount ruler of Somnath and Anhalwara. When the Somnath temple was plundered by Mahmud of Ghazni in A.D. 1024, Byram Deo (Brahma Deva) of Gujerat was deposed. Mahmud left Ghazni, on his expedition against Somnath, in September A.D. 1024; his numerous army was accompanied by crowds of volunteers, the flower of the south of Turkestan. Ajmir and Anhalwara fell before him. Advancing against Somnath, for two days his most devoted followers were beaten headlong back by the valour of the Rajputs fighting for hearth and altar. On the third day, Mahmud led a furious charge in person, 5000 Hindus lay dead, and the day was won. When he entered the shrine of Someswara, he beheld a superb edifice of hewn stone, its lofty roof supported by pillars curiously carved and set with precious stones. In the adytum, to which no external light penetrated, and which was illuminated only by a lamp suspended from the centre by a golden chain, appeared the symbol of Someswara, a stone cylinder which rose 9 feet in height above the floor of the temple, and penetrated 6 feet below it. Two fragments of this object of idolatrous worship were, at the king's order, taken off, that one might be thrown at the threshold of the public mosque, and the other at the court gate of his own palace of Ghazni. Other fragments were reserved to grace the holy cities of Mecca and Medina. The tradition says that while Mahmud was thus employed, a crowd of Brahmans offered an enormous ransom if the king would desist from further mutilation. Mahmud hesitated, but, after a moment's pause, he exclaimed that he would be known by posterity not as the idol-seller, but as the destroyer. The work of destruction then continued, and was rewarded by the discovery in the vaults below the adytum of untold treasures. Thus fell Somnath. But this traditional story is quite unworthy of credence; the linga is never hollow. Its gates were taken to the mosque of Ghazni, from which they were removed when the British troops returned from the occupation of that country in 1842.

After the time of Mahmud, Somnath would appear to have been abandoned by its rulers in favour of Anhalwara, which is mentioned as the capital of Gujerat in the time of Muhammad Ghori and his successor Aibeq. It was still the capital of the kingdom in A.H. 697, or A.D. 1297, when the country was invaded by the army of Ala-ud-Din, Muhammad Khilji, which occupied Anhalwara, and annexed the province to the empire of Dehli.—*Postan's Western India; Bird's Hist. of Gujerat; Cunningham's Geog. of India; Prinsep; History of Persia; Wilson; Town. Outram and Havelock; Imp. Gaz.*

SOMNATHPUR, a village in Mysore State celebrated for its temple of Prasanna Ch[illegible] Kesava. An inscription at the entr[illegible]ance shows that it was completed in 1270 by [illegible] prince of the Ballala dynasty. The whole [illegible] is most elaborately ornamented, and the [illegible] structure is completed by three simānas [illegible] or pyramidal towers surmounting the triple shrine. Round the exterior base are portrayed the leading incidents in the Ramayana, Mahabharata, and Bhagavata, carved in relief in potstone, the termination of each chapter and section being indicated respectively by a closed and half-closed door. The number of separate sculptured images is 74. The workmanship is attributed to Jackanachari, the famous sculptor and architect of the Ballala kings, under whom Hindu art in Mysore reached its culminating point. There is also at Somnathpur a large temple to Siva in ruins.—*Imp. Gaz.*

SON. To have a son, a male child, is the great desire of the married Hindu; and if a son be not born, he may adopt one. The Sanskrit word meaning a son is said to mean deliverer from hell, since the son delivers his father from hell (Menu, ix. p. 138). This accounts for the extreme desire entertained by the Hindus for male offspring. Thus Bhima, like Dasaratha in the Ramayana, and many others, performed the holiest acts for the sake of obtaining a son. The son alone by the offering of the funeral libation (Srad'ha) is supposed to procure rest for the departed spirit of the father. The Hindu law recognised 12 kinds of sons. A son may be born of a wife or adopted. The Dattaka putra, or adopted son, properly renounces all claim to direct inheritance from his natural father and paternal relations, except through any affinity he may have acquired through his adopted father.—*Williams' Nala*, p. 178.

SON or Sugun, in Sind, is a kind of divination by means of the position of birds and beasts, their cry, the direction of their flight, and other such particulars.

SONAI. HIND. Water in which the jute plants have been steeped.

SONAR, HIND., from Sona, gold, a worker in gold and silver. One of the five artisan castes of the Hindus, the other four being the blacksmith, coppersmith, stone-mason, and carpenter. The Sonar, or goldsmith, is a caste or hereditary avocation. He is not a jeweller, but an artisan, and works entirely by weight, charging from one anna to one rupee per rupee of the out-turned manufactured article, the rate varying according to his skill or the art required, the standard of intrinsic value being that of payment. The Sonar usually has the gold or silver with which he is to work delivered to him, and he must return in the ornament the same quality and quantity he received. He cannot work with much alloy, which is the best security against fraud, and his best work is with the purest gold and silver, and in these the metal is treated with quicksilver again and again, until it has become soft and perfectly ductile. The Kanari 'Panchala' and the Kokanasth 'Sonar' claim to be Brahmans. They wear the sacred cord, and have the Vedas read to them by their own priests. The Sonar of the south of India all claim to be of higher birth than the Brahmans. In Benares they claim to derive their origin from the Kshatriyas.

SONARGAON, in the Dacca district, the ancient Muhammadan capital of Eastern Bengal, but now an insignificant village called Painam, situated about two miles from the Brahmaputra, in lat. 23° 39′ 45″ N., and long. 90° 38′ 20″ E. It was here that AZIM Shah, the son of Sikandar, proclaimed his independence, and invited the poet Hafiz to his court. The town gave its name to one of the three great sarkars or provinces.—*Imp. Gaz.*

SONARI, a little village situated on a low spur of a sandstone hill between the Betwa and Besali rivers, 6 miles to the S.W. of Sanchi, 21 miles N.E. of Bhopal. It contains numerous Buddhist topes. See Bhilsa.

SONCHUS CILIATUS. *Lam.* Sow thistle.

Sonchus oleraceus, *Roxb.*, *Wight Icones.*

Dodak, ...	HIND.	Etrinta, ...	TEL.
Ka't mulingi kiri, .	TAM.	Adavi mullangi, . .	,,

A native of Europe, up to 8500 feet, of the Panjab, also of Peninsular India. It yields a milky juice on incision. Cattle are fond of it. Used in the Neilgherries as a pot-herb by the natives. Also the Kashmir people are said to use it as a vegetable; and it is probably the dwarf sow thistle, the shoots of which the Ladakhi use in a similar way, according to Moorcroft, though this may be the Tragopogon.

SONDIA. The principal among the illegitimate Rajputs in Central India, of mixed caste, are the Sondia, who have spread from Sondwarra in Malwa (a country to which they give the name) to many adjoining districts. This tribe is divided into many families, which take their name from Rajput ancestors; but all intermarry. Second marriages among their women are very common, and from the strict usages of the Rajputs upon this point, there is none on which they deem the Sondia to have so degraded the race from which they are descended. The Sondia have been either cultivators or plunderers, according to the strength or weakness of the government over them; but they have always had a predatory tendency, and have cherished its habits even when obliged to subsist by agriculture. Their dress is nearly the same as that of the other inhabitants, though they imitate in some degree the Rajputs in the shape of their turbands. They are, in general, robust and active, but rude and ignorant to a degree. No race can be more despised and dreaded than the Sondia are by the other inhabitants of the country. A considerable number occupy the districts of Dig Puch-pabar and Gungrar or Chowmela. They are Hindus, but abstaining from the flesh of kine is their only feature. They drink, use opium, and are of vicious habits; their women are bold and immoral; widows remarry. During the rebellion of 1857–58, they gave considerable trouble. Another tribe, the Bhilalah, who have sprung from Rajputs of the Bhil tribe, derive their name from associating with the Bhils, among whom, from the superior rank of their sires, they obtain respect and consequence. The chiefs of the Bhils in the Vindhya mountains are almost all Bhilalah. This class combine with the pride and pretensions of the Rajputs the cunning and roguery of the Bhils; and appear to be, almost without exception, a debauched and ignorant race, often courageous from constant exposure to danger, but invariably marked by an equal want of honour and of shame. The Bhilalah and Sondia chiefs were the only robbers in Malwa, whom under no circumstances travellers could trust. There are oaths of a sacred but obscure kind among those that are Rajputs, or who boast their blood, which are almost a disgrace to take, but which, it is asserted, the basest was never known to break, before Mundroop Singh, a Bhilalah, and some of his associates, plunderers on the Nerbadda, showed the example.—*Malcolm's Central India*, ii. pp. 15, 153.

SONDRI BRERI or Sondi Breri, an ebbing and flowing spring near the Berengi river in Kashmir. It appears about the vernal equinox. It seems to be an underground continuation of the Berengi river.

SONE. The fishermen settled along the coast from Gheriah to the north, near Surat, and at Colaba, in Bombay, are Koli of the Sone tribe; a few of them are mariners, but the vessels must be manned by natives, the Sone fearing to lose caste, which would take place did they sail with Europeans. The chief Patel of this tribe resides at Angria; he is looked on as a legislator, being endowed with power to adjust the affairs of the Sone Koli, settle their disputes, etc. The women of the Sone Koli wear choli or jackets, and have a number of glass bangles on their left hand; they are frequently seen in Bombay assisting their husbands in fishing and carrying fish to market. When they marry, the ornaments which were intended to adorn their right wrists are consecrated, and thrown into the sea as an offering to the deity who presides over that element, and an invocation to defend her husband from the dangers of the ocean. Not a caste meeting of the Sone

Koli can take place without large potations of mahwa flower arrack being imbibed; and they frequently give any quantity of fish for half a tumbler of raw brandy. The chief tribes of Koli are the Raj, Solesy, Tonkry, the Dhour, Dungry, the Bhil, Mullar, the Ahir, Murvy, and the Sone Koli, with a few others. In Bombay, Tannah, Bhewndi, Kallian, Bassein, Daman, etc., are a number of Christian Koli, said to have been of the Sone section, and to have been forcibly converted by the Portuguese, but, terrified by the cholera in 1820-21, a portion reverted to paganism.

SONE, a tributary to the Ganges. It rises on the Amarkantak table-land, in lat. 22° 41′ N., and long. 82° 7′ E., 3500 feet above the sea. Length, 465 miles; receives the Koel, 140; Kunher, 130; Johila, 100 miles. Including the Phalgu and other rivers falling into the Ganges above Rajmahal, 42,000 square miles drained. The navigation of the river is not considered available. It is the chief tributary of the Ganges on its right bank. The Amarkantak table-land also supplies the sources of the Nerbadda and the Mahanadi, and is included in a tract of wild country transferred to the state of Rewah. In the rainy season native boats of large tonnage occasionally proceed for a short distance up stream; but navigation is even then rendered dangerous by the extraordinary violence of the stream, and during the rest of the year becomes impossible, owing to the small depth of water. There is one characteristic common to the Baghel of Rewah, the Bundela of Bundelkhand, and the Rajput of Gwalior and Malwa, a dislike to labour or service away from their homes; they generally leave tilling of the soil to the servile classes, and are regarded as the heads of the local society. Many of the Rajputs in the states of Central India give themselves up to sloth and the immoderate use of opium. In Malwa, Bhopal, Ujjain, Mundipur, Rutlam, Dhar, Jowra, Augur, Nemuch, Shoojawulpur, and Bhilsa are the principal marts. It is the Hyranyabhya of the ancient Magadha and Prachii, and the Erranaboas of Strabo, Arrian, and Pliny. Palibothra was situated, as stated by Megasthenes, at the junction of the Ganges and Erranaboas, and it is believed to be the modern Patna, the same as the Pataliputra of the Chinese pilgrim Hiwen Thsang.—*Tr. of Hind.* i. p. 225.

Sir, ... HEB.	Sur, Gata, . . . SANSK.
Geet, ... HIND.	

Out of the 64 sciences of the Hindus, five, Nos. 22 to 26, belong to music, viz. the modulation of sounds, art of playing on stringed instruments, of playing on wind instruments, of beating the tambourine, and of beating the cymbals. The musical notation extensively used by Curwen resembles the Hindu system. Sir William Jones' Essay on the Musical Notes of the Hindus was published in the third volume of the Asiatic Researches, p. 55, and J. D. Patterson on the Gramal, or Musical Scales of the Hindus, ibid. ix. p. 445; and the chief points established in these essays are thus given in the fourth volume of Lassen's Indische Alterthumskunde, §§ 832, 833. The native musical literature is tolerably copious, and the Indians are acquainted with four systems, whose founders, as usual with them, are mythical personages. The first system is ascribed to Devarshi Narada, who in the epic poetry appears as well skilled in stories, and goes about between the gods and men, to recite tales to them. From him Iswara or Siva received this system. The author of the second system is Bharata, the mythic inventor of the dramatic art; the author of the third is the divine ape Hanuman; and that of the fourth Kapila, the founder of the Sankhya philosophy. These assertions, of course, only mean that the Hindus attached a high value to the practice of music, and this view is confirmed by the circumstance that in the epic mythology the Gandharvas appear as musicians in Indra's heaven. For the antiquity of song amongst the Hindus, it is important to observe that the Udgatar, *i.e.* the priest who sings the saman, belongs to the Vedic period. As to later times, we may refer to the fact that, in the Mrich' chakatika, Rebhila is praised as a renowned singer. The Hindus are acquainted with the European scale of seven tones, and denote them by letters (sa, ri, ga, ma, pa, dha, ni). They admit, moreover, six raga or modes, and the musical treatises contain minute directions as to the employment of them in the six seasons into which the year is divided. The Hindus have also mythologized these ideas, and regard the six raga as god-like beings, whose consorts are called Ragini, and are eight in number. These couples produce 48 sons, called Ragaputra, by whom the various mixtures of the chief modes are denoted. This view furnishes a very striking example of the boundlessness of Hindu imagination, as it is impossible really to distinguish so many modes from one another. In some MSS. are found portraits of these two and 60 male and female genii. The people of India generally take no advantage of the wonderful power, range, flexibility, and sweetness of the musical sounds producible by the human larynx, especially in the female sex. Singing amongst the Muhammadans of India is never indulged in by any but professional men and public women; no woman of the Muhammadans sings even to her infant child. Individuals of some Hindu sects, particularly the Jain, are occasionally heard singing, but it is confined to the Hindu women of the temples of their deities, and to the singing bands of the Muhammadan women and Burmese. With the uncultivated aboriginal races, the efforts at singing is a mere howling.

SONG BIRDS. The European visitor to the E. Indies is much struck with the prevailing silence of the jungle, and the paucity of small birds even in the cold season, so different from the woods and gardens and hedgerows of Britain, teeming with small feathered inhabitants, among which are so many pleasing songsters of all degrees and merit. The chief families amongst whom the faculty of song is found are Merulidæ, Saxicolinæ, Sylviadæ, larks, some finches, a few shrikes and fly-catchers, and some starlings.

SONG-FAI, a money of account of Siam, the half of a fuang, and worth about 1½d.—*Simmonds.*

SONMEANEE, in lat. 24° 27′ N., and long. 66° 39′ E., a small fishing village, as its name Meanee implies. It is in Baluchistan, on a low shore at the mouth of the Poorali river. It is supposed to be the site of the place named by Nearchus the Port of Alexander. In the early part of the 19th century it contained about 250 huts. It is completely defenceless, and, on the side towards Bela, is overlooked by hillocks of sand. The bar at the

mouth of the river has only two fathoms on it at low water, but boats lie close to the village in six and seven. In the early part of the 19th century the inhabitants generally subsisted by fishing, and, with the exception of a few Hindus, were wretchedly poor.—*Pottinger's Travels*, p. 11; *Findlay.*

SONNERAT, a French naturalist and good draughtsman, who settled at Pondicherry, and made immense botanical collections, which seem to have been transmitted to France. These have not been described in any regular form, but such specimens as were presented to Lamarck were introduced into his Encyclopedie Methodique, a work from which much information is obtainable, although its alphabetical arrangement renders it very difficult of consultation, particularly in those genera which have been much subdivided of late years. Sonnerat wrote Voyage à la Nouvelle Guinee, and Voyages aux Indes Orientales et à la Chine, and he made known many new plants.

SONNERATIA ACIDA. *Willde., Linn.*

Rhizophora caseolaris, *Lin.*	Mangium caseolare, *Rump.*
Orchaka, . . . BENG.	Blatti, MALEAL. of Rheede.
Polai, Plye . of BORNEO.	Tewar, ... SIND.
Ta bu, Ta mu, . . BURM.	Gedde killala-gass, SINGH.
La-moo, ... ,,	Paga-pate of SONNERAT.

This tree grows 40 feet high. It grows near the tidal creeks and littoral forests of the region from the Indus to New Guinea, and has an acid eatable fruit. In British Burma it abounds in the mangrove swamps and on the banks of almost every stream on the coast as far as tide-waters reach. The natives use it for various economical purposes. It is said to be a better substitute for coal in steamers than any other kind of wood. In Ceylon it grows to a large handsome tree along the marshy banks of the large rivers. Spindle-shaped excrescences, called Kirilimow in Singhalese, rise from the surface of its roots, four or five feet above the surface of the ground. They are of a firm and close texture, nearly devoid of fibrous structure, and take a moderate polish, some of the transverse cuttings being two feet long and two to three inches wide. The finest pin passes in with ease, and the thin slices are invaluable for linings of insect boxes. The roots of S. acida, S. alba, and S. Griffithii spread far and wide through the soft mud of the marshy banks on which they grow, and at various distances send up, like the avicennia, extraordinarily long spindle-shaped excrescences.—*Roxb.; Hooker; W. and A.; Voigt; Mason; Thw.*

SONNERATIA ALBA. *Sm.* A tree of the Andamans. S. Griffithii, *Kurz*, the Tapyu of the Burmese, grows in Burma.

SONNERATIA APETALA. *Buch.*

Khoura, Keora, . BENG.	Thaum-nia, . . . BURM.
Kam-ba-la, . . . BURM.	Myouk-guo, . . . ,,
Kan-pa-la, . . . ,,	

A pretty large and elegant tree, which grows in the western side of India, in the delta of the Ganges, and under the parallel of Rangoon. It flowers in the hot season. It yields a strong, hard wood of coarse grain. It is the timber of a red colour of which boxes for packing beer and wine are made in Calcutta; is strong, and adapted for house-building. It grows in the low wet lands near the mouths of some of the Tenasserim rivers, bears a strong resemblance to the weeping willow, and is one of the most graceful trees in the country. The casuarina has been removed from the coast to compounds in India, and the sonneratia is quite as deserving.—*Roxb.; Voigt; M'Cl.; W. and A.; Mason.*

SON OF HEAVEN, a title of the emperor of China.

SONO KLING, of the Malaya, a tree of Java; the colour of its wood is a deep brown, inclining to black; used for furniture. Sono kombang of Java, used for furniture, which has some resemblance to the lingoa wood of the Moluccas.

SONPAT, a town in lat. 28° 59′ 30″ N., and long. 77° 3′ 30″ E., 25 miles N.W. of Dehli city. Population (1868), 12,176. It is of great antiquity, and is said to have been founded by the earliest Aryan settlers. Popular tradition identifies it with one of the five 'pat' demanded by Yudishtra, in the Mahabharata, from Duryodhana as the price of peace, and it has derived its name from Raja Soni, the son of Bhopat, who reigned B.C. 920. A little image was here turned up in December 1864 when sinking a well. It is of clay, baked and polished like chunar pottery. The figure is sitting cross-legged with a club in each hand. Below the left knee is a very short inscription in a very old Nagari character. General Cunningham has read this inscription, and supposes the idol to be an aditya or image of the sun. The age of it he thinks to be at least 1200 years. This agrees with the period of the seventh century, when the Hindu Puranic theology had assumed a hundred heads and forms to contend with Buddhism. There were then followers of Brahma, Indra, Ganesha, Surya, Chandra, and a host of gods, all of whom succumbed to the powerful Saivites and Vaishnavites. The only trace of the worship of Surya found in the 19th century, in Northern India, is in Benares, where, in the corner of the quadrangle of the temple of Anna Purna, is a small shrine dedicated to the sun. The idol representing that luminary, however, is seated in a chariot drawn by seven horses, with a glory round his head, a representation of the old Sol of Homer.—*Tr. of Hind.* ii. p. 384.

SONPUR was formerly a chiefship subordinate to Patna, but was constituted a separate state by Raja Madhukar Sa of Sumbulpur about the year A.D. 1560. Since then it has been counted among the cluster of 18 Garhjat states. It is now attached to the Sumbulpur district, and is situated between lat. 20° 41′ and 21° 10′ N., and long. 83° 20′ and 84° 18′ E. It is bounded on the north by Sumbulpur proper and a portion of Rairakhol, on the south and south-east by Bod, on the east by Rairakhol, and on the west by Patna. The non-agricultural castes are Brahman, Mahanti, Rajput; and the agricultural castes are Tassa, Kolta, Agharia, and Gond.

SONTA or Asa. HIND. A club carried by Muhammadan devotees. Sonta-bardar, a mace-bearer.

SONTHAL, Mundah, Bhumij, and Ho speak languages nearly identical. They occupy most of the British districts of Chutia Nagpur, Singbhum, Manbhum, and the hilly part of Bhagulpur, now known as the Sonthal Parganas; also parts of West Bardwan, Midnapur, and Cuttack,—an extensive country west of Calcutta. The Sontha[illegible] are a simple, industrious people, honest and truthful, and free from caste prejudices. Their country is healthy, their numbers are increasing, and the[illegible] are much prized as labourers by the Bengal indig[illegible]

planters, in the Assam tea plantations, and on the railways and other works of Western Bengal. The tribes live apart in detached houses or isolated hamlets. The Sonthal are a branch of the Mundah Kol. They seem to have separated from the Mundah, and fell back on Chutia Nagpur from the Damuda river, which the Sonthal call their sea, and they preserve the ashes of their dead until an opportunity occurs of throwing them into that stream or burying them on its banks. The Sonthal are now most numerous in the Sonthal Parganas, but there are many in Mohurbhunj, and there are several colonies of them in the Singbhum district. In 1881, the total in British India was 210,661. They are an erratic race, but Lieutenant-Colonel Dalton thinks that they left their chief settlements on the Damuda river from having been pressed by the Kurmi. The Sonthal, Bhumij, and Mundah tribes have long been known to be intimately connected, and they have affinities with the wild clan of the Korewah of Sirguja and Jushpur, with the Kheriah tribe of Chutia Nagpur, and the Juanga of the Cuttack Tributary Mahals. Since the beginning of the 19th century they have intruded themselves into some of the Rajmahal districts, which therefore now contain two populations, allied to each other, but speaking languages said to be mutually unintelligible. The close relationship of the Kur and Sonthal, and their separation from the Dravidian, may be illustrated by a few examples :—

English.	Kuri.	Sonthal or Kol.	Gond dialects.	Tamil.

Three.	Apkor.	Apia.	Mund.	Mundru.

The Sonthal and Bhumij races have suffered in esteem in consequence of the human sacrifices offered at the shrine of Kali as Runkini, but these races personally do not much care for this goddess, at whose shrine the establishment and ritual are essentially Brahmanical. The Sonthal and Rajmahali are markedly different in habits, appearance, manners, and national characteristics, and on the Chutia Nagpur plateau these differences are very marked. The Sonthal are a very ugly race, with flat, broad-nosed features. They are a more simple, mild, industrious race than the Rajmahali, Gond, or Khond. Though the Sonthal are geographically near the plains, they seem to be more shy and more socially isolated than the Mundah, Bhumij, and Ho. They have kept much to themselves, preferring locations surrounded by jungle and segregated from the world, and cultivating the lower lands of their country, but they have latterly taken to labour for hire.

SOOBI, a religious sect in Turkish Arabia. At a village not far from the junction of the Tigris and Euphrates, forming the Shat-ul-Arab, in 1872, lived the Sabæan chief priest. He had ancient books which he asserted to be inspired, and a ritual which he refused to divulge. His followers, numbering 500 or 600, are scattered about over the province, and call themselves Soobi, but are popularly styled 'Christians of St. John,' or 'Baptists.'

SOOMURUN or Gujta. HIND. Bracelets made of coloured thread, worn at the Maharram, and of flowers worn on other occasions.

SOONDA, a district in the south of the Bombay Presidency, bordering on North Canara. It contained large forests, but by A.D. 1850 the timber had greatly decreased in amount. In the transfer of Canara to Bombay, this district was re-transferred along with it.—*Gibson's Bombay For. Reps.*, 1849.

SOPHAGESENUS, the name given to Asoka by the Greeks. Evidence exists that Antiochus the Great was slain by an Indo-Scythian prince, called by the Greek writers Sophagesenus. See Kābul.

SOPHIST of India, a term applied to the Brahmans by Arrian (lib. vi. chap. xvi.) and Strabo. The religious ascetics are spoken of as Brachmanes, Germanes or Sarmanes (Sramana), and Sophists. Onesicritus was sent by Alexander to converse with a body of ascetics, in consequence of their refusing to come to him. (Strabo, lib xv.). He found fifteen persons two miles from the city, naked, and exposed to a burning sun; some sitting, some standing, and some lying, but all remained immoveable from morning till evening in the attitudes they had adopted. He found Calanus lying on stones, and to him he first addressed himself. Calanus received him with an affectation of independence, and told him, if he [illegible] verse, to throw off his clothes and sit [illegible] on the stones. But Mandanis, the oldest [illegible] party, reproved Calanus, and offered to instruct in the Indian philosophy as far as the means of intercommunication admitted. Alexander failed to prevail on Mandanis to accompany him; Calanus, however, did so, but, falling sick in Persia, and refusing to observe the regimen prescribed to him, he determined to burn himself alive. Alexander in vain opposed this intention, and he was carried to the pile, with a garland on his head, singing hymns. When he had ascended the heap, he ordered it to be set on fire, and met his fate with a serenity which made a great impression on the Greeks. A similar instance of self-immolation is related by Strabo (lib. xv.) of Zarmanochegus, an Indian of Bargoza, who had accompanied an embassy from his own country to Augustus, and burned himself alive at Athens.—*Elphin.* p. 238.

SOPHORA, a genus of plants belonging to the natural order Leguminosæ, said to be so named from an Arabic name (Sophera) of one of the species. Some species are ornamental shrubs and trees, found in Central and Tropical Asia, also in the warm parts of North America and the equinoctial and sub-tropical parts of South America. The species best known in England are S. Japonica and S. Chinensis. It has been proposed to engraft the Nepal S. velutina on the Japonica. Being handsome trees, with both leaves and trees differing much from European trees, they are well adapted for standing singly in lawns. They are raised from layers, but also from seeds, and require a little protection when young. Wight gives Sophora glauca, heptaphylla, and robusta. S. glauca, *Lesch.*, the smooth-leaved Sophora, is a Neilgherry plant, with middle-sized white flowers, tinged with rose colour. S. tetraptera, one of the few leguminous trees of New Zealand, is

variable in habit. S. mollis, the Arghawan of the Afghans, is a handsome, yellow-flowered shrub of the Panjab and N.W. Himalaya.—*R. Brown; Hogg; W. Ic.; Voigt; Gamble.*

SOPHORA JAPONICA. *Linn.* Hwi-shu, CHIN. This is an ornamental tree common in Japan and Central and Northern China, and about Pekin. Its leaves could be substituted for senna. The pods are used in China in preparing a yellow dye; the greenish-yellow, unopened flower-buds are used in dyeing cloth of a yellow colour, or in rendering blue cloth green. The wood was formerly used in China for making fire-frictors. An extract is made from the leaves to adulterate prepared opium.—*Smith; Von Mueller.*

SOPHORA TOMENTOSA. *Linn.*

S. occidentalis, *Linn.* | Downy-leaved Sophora.

A shrub (Hwang-ki, CHIN.), native of Southern Asia, with pretty yellow flowers. In China all parts of this plant are used in medicine as a tonic, pectoral, and diuretic.—*Smith.*

SOPHYTES, or Sophites, or Sopeithes, an ancient king of the Western Panjab, including the Salt Range of mountains.

SORAB, a village in the Shimoga district of Mysore, in lat. 14° 22′ 45″ N., and long. 75° 7′ 55″ E., on the right bank of the Dandavati river, 46 miles north-west of Shimoga town, where boxes, caskets, and cabinets are made by the Gudigar, and which they cover with minute and complicated reliefs. The native designs consist of vege[illegible] and scroll [illegible] work, interspersed wi[illegible]n the Hindu Pantheon; but any [illegible] pattern can be copied to order. The wo[illegible]ship is considered finer than that of Bombay or Canton, and commands a high price.—*Imp. Gaz.*

SORANI, a ferocious tribe, who call themselves Yezedi, after a khalif of Damascus of that name. They inhabit the mountains of Sindjar, a country to the north-west of Bilbos. They are the greatest robbers of all the Kurdish tribes.—*Porter's Tr.* ii.

SORECIDÆ, the family of shrews, comprising the genera Sorex, Soriculus, Crossopus, and Corsira.

Sorex cærulescens, *Shaw, Blyth.*

Sorex Indicus. | S. Sonnerati, *Geoff.*
S. giganteus. | S. myosurus, *Gray.*

All India.

Sorex murinus, *Linn., Blyth.*

S. Swinhæi, *Blyth.* | S. myosurus, *Pallas.*
S. viridescens, *Blyth.* | Mouse-coloured shrew.

Sorex nemorivagus, *Hodgson.*

S. murinus, *Horsf.* | Nepal wood shrew, . ENG.

Nepal, Sikkim.

Sorex Griffithii, *Horsf.*, Khassya Hills.

Sorex serpentarius, *Is. Geoff.*

S. kandianus, *Kelaart.* | Rufescent shrew.

Ceylon, S. India, Burma, Tenasserim.

Sorex heterodon, *Blyth*, Khassya Hills.

Sorex saturatior, *Hodg.*, Darjiling.

Sorex Tytleri, *Blyth*, the Dehra shrew.

Sorex soccatus, *Blyth, Hodgson*, hairy-footed shrew, Nepal, Sikkim, Mussoori.

Sorex niger, *Ell., Horsf.*, Neilgherry wood shrew, Neilgherry Hills.

Sorex leucops, *Hodgs.*, long-tailed shrew, Nepal.

Sorex Hodgsonii, *Blyth*, Nepal pigmy shrew, Nepal.

Sorex Perroteti, *Duvernoy*, Neilgherry pigmy shrew, Mysore, Neilgherries, Dekhan.

Sorex micronyx, *Blyth*, small-clawed pigmy shrew of Western Himalaya.

Sorex melanodon, *Blyth*, black-toothed pigmy shrew of Calcutta.

Sorex Sikkimensis, *Hodg.*; S. homourus, *Hodg.*; S. oligurus, *Hodg.*; S. macrurus, *Hodg.*; S. holosericeus, *Hodg.*; and S. tenuicaudus, *Hodg.*, all of Darjiling.

Sorex ferrugineus, *Kel.*; S. montanus, *Kel.*; S. Kelaarti, *Kel.*; S. purpurascens, *Temp.*; S. Horsfieldii, *Tomes*, all of Ceylon.

Sorex fuliginosus, *Blyth*, and S. nudipes, *Blyth*, Tenasserim.

Sorex atratus, *Blyth*, Khassya.

Sorex albinus, *Blyth*, China.

Sorex pulchellus, *Licht.*, Central Asia.

Soriculus nigrescens, *Jerd.*

Corsira, *Gray, Blyth.* | S. soccatus, *Hodg.*
S. aterrimus, *Blyth.* | S. Sikkimensis, *Horsf.*
Ting-Zhing, . . . BHOT. | Tang-Zhing, . . LEPCH.

Mouse-tailed shrew of Sikkim, Nepal.

Crossopus Himalaicus, *Gray.*
Choopitsi, ... BHOT. Jong-la-gniyu, . . LEPCH.

The Himalayan wat[illegible]-shrew of Sik[illegible]kim.

Corsira alpina, *Jerdon.*
Sorex caudatus, *Hodg., Bl.* | Alpine shrew, . . . ENG.

Europe, Sikki[illegible].

Corsira Nwera-elia, *Kel.*, of Ceylon.

Feroculus macropus, *Kel.*
Sorex macropus, *Blyth.*

Ceylon.

Snakes are said to avoid the neighbourhood of the shrew. In Jeypore the body of a small mu[illegible] of the is regarded as a powerful talisman. It is dr[illegible]sk-rat enclosed in a case of brass, silver, or gold, acc[illegible]ed, is ing to the means of the individual, and is s[illegible]ord-around the neck, or tied to the arm, to rend[illegible]lung individual proof against all evil, not exce[illegible]r the sword and other cut, musket shot, etc.—*Lubbock, Origin of Civil.* p. 167; *Jerdon; Blyth; Hodgson.*

SORGHUM BICOLOR. *Willde.*

Holcus bicolor, *Linn.* | Andropogon bicolor, *Roxb.*

Cultivated in India (Kalo-deb-dhan, BENG.) grain much used as food.—*Voigt.*

SORGHUM CERNUUM. *Willde.*

S. halepense, *Pers.* | Andropogon cernuus, *Roxb.*
Holcus cernuus, *Willde.* | A. laxus, *Roxb.*
Koonkie, . . . E. BENG. | Soondia . . of BROACH.

Cultivated by the natives of Munipore and other mountainous districts immediately east of Bengal. It is one of the Guinea corns, and reaches a height of 15 feet, with leaves 3 feet long. The grain is white, and forms an article of food of the races N. of Bengal.—*Von Mueller.*

SORGHUM SACCHARATUM. *Pers.*

Andropogon saccharatus, *Roxb.?* | Holcus saccharatus, *Linn.* Broom corn? of America?
A. caffrorum, *Kunth.?*
Deo-dhan, . . . BENG. | Sorgho-sucre, . . . FR.

Chinese northern sugar-cane, ... ,, | Jonna, ... ,,

This is a plant of Northern China. About the year 1855 it was introduced into the south of France and England, and since then into the United States. It was introduced into the Madras Presidency by the Editor in the year 1859. Dr.

Birdwood, however, says it is simply the Shaloo of the Dekhan and the Deo-dhan of Bengal. But Roxburgh (i. p. 271) doubts if his A. saccharatus or Deo-dhan is the H. saccharatia of Linnæus, and describes it as having oval seed, and Voigt calls it Sada deo-dhan, white; whilst the plant which the Editor introduced in 1859 has a black grain different from that of the Imphee and the Sorgho, which the Editor also introduced from the Cape of Good Hope, all of which were yellowish-white. In China, the black seeds are sown in April, but the plant is largely propagated by cuttings. It grows to the height of 12 to 18 feet, with an ample inflorescence, consisting of eight or ten separate stems, which group together to form the tuft of the plant. The large leaves, which make excellent green food or dry fodder for cattle, spring from the nodes of the gradually tapering stems. The seeds, at first green, become brown, and finally of a purplish-black colour, being produced only on the head of the plant. They are very nutrient, and the colouring matter has been used in China to tint wine of a deep colour. Since the efforts made in Madras, the Sorghum saccharatum has been grown for making syrup in almost every part of the United States. The usual machinery, consisting of three rollers, either vertical or horizontal, and driven by steam or horse power. It is believed that cane in a high latitude will degenerate if grown continuously from its own seed. The Minnesota early amber variety is said to combine the characteristics of the Chinese Sorgho and the Imphee or white Liberian, and its kindred African varieties. Its early ripening and the bright amber colour of its syrup give its name. It is very rich in saccharine matter, the flavour very similar to that of pure honey. The syrup granulates readily, and yields sugar equal to the best ribbon-cane of Louisiana. Chinese Sorgho is also known as Chinese cane, also sumac cane, as its seed heads resemble a head of sumac. The stalk of the white Liberian or white Imphee curves at the top, leaving the head pendent, hence its name Goose Neck. The seed heads are shorter, more compact, and of lighter colour than the early amber. The Honduras cane grows about one-half taller than the early amber, Chinese, or Liberian varieties. Its seed top is of reddish-brown and spreading, hence the synonym 'sprangle top.' It is also called Maslodon and honey-cane.—*Letter of the Commissioner of Agriculture, Washington*, 8th April 1880.

SORGHUM VULGARE. *Pers.* Great millet.

Sorghum vulgare grows on light sandy soils, and requires little moisture. It is grown in Egypt, and in all the countries of the south and east of Asia, its grain being used as food for man, in the form of cakes and porridge, also for horned cattle, and its stalks, the karbi of India, as fodder for horned cattle and horses. It is grown in all the table-lands of India, is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6000 feet, but in the N.W. Himalaya only in the valleys. It is also grown by the Karen and Burmese. It grows on a reedy stem to the height of 8 or 10 feet, and bears irregularly-shaped clusters of innumerable round grains about twice as big as mustard seed. It is common all over the Levant, under the name of durra (or dourrah); also in Greece, where it is called kalamboki; there is likewise a coarse sort in Italy, called Melica rossa, or Sorgo rosso.

In China, the seeds of the red variety are made into wine in Hu-peh, and the exhausted grains are a favourite food for pigs. When grown for cattle in Madras, 10,000 lbs. weight of green fodder may be taken off an acre of ground every three months. If the plot be irrigated, one-fourth more may be obtained, and the crop be cut every two months. That is, an acre of irrigated ground will produce about 70,000 lbs. weight of green and nourishing fodder in one year.

Major-General Sir J. B. Hearsey, K.C.B., sent from Barrackpur, on the 5th March 1858, the seed gathered from one plant, which came up accidentally during the early rainy season of 1857, and grew to nearly 11 feet in height. He had it supported by a strong bamboo. It spread out four shoots from the stem close to the ground, and these stems also threw down roots. The head from the principal shoot was very large; the side shoots also headed, but these were small. The number of seeds received from this one plant was 12,700. In the Chitteldroog and Nu[illegible]r divisions of Mysore, it is sown during showers between the end of April [illegible]ay, and the crop is reaped in September and October. The great defect in this grain is that it will not keep, being soon destroyed by insects; and the ryots have difficulty in preserving sufficient quantity of it for seed in the following year. The seed grain is mixed with ashes, and packed with paddy straw; in spite of which, however, insects obtain admittance; but the stems or straw of this grain, when well preserved from rain, will keep for about ten years, and are used as fodder. This is the millet designated in Ezekiel iv. 9.

—*Cleghorn's Report; Powell*, i. p. 383; *Indian Field*, 1858; *M. E. J. R. of* 1857; *Mason's Tenasserim; Macartney's Embassy.*

SORON, an ancient town in the Etah district, N.W. Provinces of India, originally known as Ukala-kshetra, but after the destruction of the demon Hiranyakasyapa by Vishnu in his boar avatar, the name was changed to Sukara-kshetra. The architectural features of the pillars of its temple resemble those of the Kutub at Dehli. Numerous inscriptions in the temple bear date from A.D. 1169 downward.—*Imp. Gaz.*

SORREL, Oxalis corniculata, *Linn.*, and also the Rumex acetosa, both used as spinach and salad. R. scutatus is a very delicate vegetable, of easy culture in light soil. It is grown by sowing the seed broadcast, and thinning the plants to the distance of 8 or 10 inches from one another. It may be sown at the commencement of the rains.—*Jaffrey; Riddell.*

SORWARNA. HIND. An offering of money

to a beloved friend or relative, to be distributed in alms.

SOSAN or Sosun. HIND. Iris Nepalensis, any of the lilies, species of Amaryllis. Sosanbar, ARAB., Thymus chamædrys. Sosni-rang, lilac colour of iris.

SOTER MEGAS, B.C. 70, a nameless great Bactrian king, who had coins with an Aryan legend, which James Prinsep and Professor Lassen ascribed to Azes. On all is a peculiar monogram with three prongs. The same monogram was continued to coins of Kadphises and of the Kanerki, but it is not found in those of the Hercules type derived from Hermæus. Mr. H. T. Prinsep considers him to have been contemporary, but not identified, with Vikramaditya, and that he assumed the title of Soter Megas, which was continued down by the Kadphises kings. He considers that the nameless kings, with those on whose coins are the words Kodes or Hyrkodes, although mere local chiefs, such as now rule at Kulm, Kunduz, and Balkh, preceded the conquest of the Panjab by Vikramaditya, B.C. 56.

SOUARI NUTS, the fruit of Caryocar nuciferum, *L.*, C. tomentosum, *Willd.*, etc. The kernel is said to be the most delicious of the nut kind. It contains an excellent sweet oil, used in South America. The timber of C. tomentosum is valuable for ship-building. These might be introduced into India.

SOU[redacted]AIHA, an Arab tribe in the Lahej dis[redacted]en, who have been termed the gypsies of Ara[redacted]

SOUJIE. HIND. The hard inner part of the grains of wheat, obtained by sifting the coarsely-ground wheat. In making bread of wheat, one process is first thoroughly to clean the wheat, and for this one woman will clean 430 lbs. in a day, and in the evening the cleaned wheat is placed on a table and thoroughly wetted, and the water left to drain from it during the night. The next morning the still moist grain is ground in hand-mills by women, a woman grinding 40 lbs. in a day. It is then sifted, and as much fine flour and soujie as can be obtained are laid aside. The remainder, then termed Naka, is subjected to a more powerful mill, and an inferior kind of soujie and a second sort of flour obtained from it. The residue is then ground in a large mill, and yields a coarse flour and bran.

Bran is what remains of wheat after the flour and soujie are extracted.

Soujie is the heart of the wheat, and is obtained by coarsely sifting the coarsely-ground wheat with sieves and soopas, by which all the small particles of the bran are separated from it. One woman can clean 50 lbs. a day.

Flour.—The first sort of flour is produced by finer sifting from the first grinding of the wheat. Second sort flour is sifted from the first grinding of the wheat. Second sort flour is sifted from the first grinding after the fine is extracted, and also from the second grinding.

Bread.—The materials for bread are 60 lbs. of first sort soujie, 20 lbs. of second sort or naka soujie, and 20 lbs. of first sort flour; 100 lbs. of these ingredients produce about 128 lbs. of bread.

Biscuit is made from second sort soujie and flour mixed in the proportion of 75 lbs. of naka soujie and 85 lbs. of second sort flour. This produces only about 85 lbs. of biscuit, which, after being well baked, is dried for two days in a kiln.

Barm or *Yeast* sufficient for 800 loaves 1 lb. each, is made of brown sugar 2 lbs., potatoes 1½ lbs., hops ½ oz., with half a gallon of water. Boil and mash the potatoes, boil the hops until none appear on the surface of the water, strain and dissolve the sugar in the liquid. The potatoes are then added, and the whole is strained into a jar or small tub. This quantity produces about 3½ pints, and is generally ready for use in 12 hours. The addition of a small portion of the old barm hastens fermentation. Bombay wheat is whiter and heavier compared with that from Kattyawar, and produces a greater quantity of soujie and flour. That of Kattyawar is smaller and darker, and produces good flour, though smaller in quantity, with less soujie.

SOUL. According to the Greeks, the psyche was the life, the perceptive principle. The pneuma was the spiritual nature. The leyp-bya of the Burmese is the psyche of the Greeks. In Burmese everyday philosophy, the life of man resides in the leyp-bya or butterfly spirit, and dies when it disappears. Man, at the point of death, opens the mouth, and the butterfly escapes from the body, but only to die at the same time. The leyp-bya is the cause of dreams. It is not necessary for the butterfly to remain constantly in the body; when the man is asleep, it leaves the body, and roams about far and wide, but only to known places, lest it lose its way, and, unable to return, both would die. Or it may be gulped up by a beloo, evil spirit, or kept in durance by a ta-seht, or by a sohn, wizard.

Burmese unwillingly wake a sleeping man, as his leyp-bya may be at a distance. An assistant-commissioner rides up to a small townlet, and calls for the headman, but he is asleep. 'Well, then, wake him;' but old Mah flatly refuses; on which the Englishman gallops off, raving at the dreadful impertinence of the people, and Mah Gyee tells all her neighbours how the young Englishman actually wished to imperil her husband's life.

The Greenlander believes that after death the soul travels to Torngarsuk, where reigns perpetual summer and sunshine, and no night; where there is good water, endless seals, birds, and reindeer.

The soul of the Arabs was the tayf or al tayf al khafi, a mysterious or invisible spirit, the ether.

From the passage in the Koran, xlix. 43, the Sufi hold that the soul can leave its body and visit different scenes while the body lies entranced. This, they say, happens to a certain extent every time a man sleeps. Jalal-ud-Din says—

> 'When deepest slumber doth the sense enfold,
> Into the regions of the Infinite
> Men's spirits wander free and uncontrolled.'

Soul or spirit, according to the Hindu philosophers, is eternal, separate from, but may be bound up with, the body.

Soul and animal life are believed by the Jains to be the same, and to be one in gods, men, and brutes.

The Stiens of Cambodia believe that animals also have souls which wander about after their death; thus, when they have killed one, fearing lest its soul should come and torment them, they ask pardon for the evil they have done to it, and offer sacrifices proportioned to the strength and size of the animal. See Spirit-Worship.

SOURA, Sowrah, or Saur is a term, identical with Sairea, given to populations occupying the fastnesses of the Eastern Ghats, along with the Khand and Kol. The Sowrah are wholly within Telingana, and extend from the Godavery to the southern frontier of the Khand, a large district and dependency of Bustar, in Central India, is surrounded by the Teling in the south, Khand and Mari Gond on the east, and Hindus to the north; situated between lat. 18° 30′ and 19° 30′ N., and long. 83° 30′ and 84° 30′ E. In the ancient Namalingāna Shāsanam of Amara, descriptive of the races inhabiting the Indian Peninsula, the Sowrah (Shabarah) are described as people who dress in leaves, and they are placed in a sub-family with the Kiratah, who dress in peacocks' feathers, etc., and the Pulindah, who only know one language. The Sowrah sub-family is described as a variety of the Chandala. They have become divided into two clans,—(1st) the Kapu Sowrah, who are dispersed over those hills of Purlah Kimedy and Palkonda which are in the more open country, and who, from frequent intercourse with the Telinga and Uriya people, have picked up their language and some of their civilisation. Many Kapu Sowrah now live in villages in the plains, and at the foot of the hills, and lead an industrious life. (2dly) The Konda Sowrah or hill Sowrah inhabit the dense forest of the hills to the north of Purlah Kimedy. A large portion of the Konda are nominally under the control of the Bissoyi or hill chiefs of Goomah and Gibau, Soringhee, Ryagudda, Wogayagudda, Jeringhee, and Coipuram. But the greater number go by the name of the Omaniyah Sowrah, and are independent. They are bounded on the north by the country of the Khand, another hill tribe, on the east by the zamindaris of Pedda Kimedy and Chinna Kimedy, on the south by Purlah Kimedy, and on the west by Gunipuram, a taluk of the Jeypore country. As viewed from the summit of Mahendragiri, a lofty mountain on its confines, this country appears as a continuous mass of hills which rise behind one another, range after range. Cultivation of dry grains is carried on, on the slopes of the hills, often at an angle of 45 degrees with the plain, while here and there crops of paddy are raised on the small level patches between the hills, advantage being taken of the numerous springs and hill streams. Besides the forts or places of residence of the Bissoyi, there are a few villages of tolerable dimensions among the hills, but the Sowrah generally live in huts perched singly or [illegible] groups of four or five on the hill-sides. [illegible] sing a song which they call Kellangiya. [illegible]t snakes, white ants, mice, monkeys, birds, [illegible]egetables, and grain, but, like the Khand, [illegible]bject to the use of milk in any form. The [illegible]men's dress consists of a coarse cloth kilt [illegible]tened round their waists, and reaching to their [illegible]ees, and nude above the waist. The men [illegible]nerely wear a langooty, passing between their [illegible]legs. Their ornaments consist of nose-rings and ear-rings, bangles, etc., made of brass or bell metal, and as many strings of coloured glass beads worn round their necks as they can accumulate. On festivals, the men decorate their hair with peacock and other feathers. The Sowrah, up to the year 1855, were in the habit of making incursions into the plains of Kimedy and Gunipuram, in small parties of five or ten, and waylaying travellers to rob them of their cloths; and as they were utterly reckless of life, several murders occurred annually. Every individual Sowrah fixes a stone in the ground a span upwards, and calls it by the name of mountain god. He lays a little of each crop before the stone, then sacrifices a fowl, gets some toddy, and, after dedicating to the god, he mixes them all together, and eats them with his friends and relatives. When a child is born, they assign to it the name of the day on which it was born, or that of the presiding demon, the latter being determined by a priest, called by them Vejju. A stimulant prepared of roots and bark is administered to the mother immediately after the birth, and on the fourth day she resumes her ordinary occupations. A young man having selected a bride, messages are sent to her parents, and finally the young man himself goes, bearing a pot of toddy or other present. Three posts are fixed in the ground, between which the bride and bridegroom with their respective friends assemble, and a drunken feast is commenced. The bride and bridegroom sit together while turmeric water is poured on their heads. Presents of cloth, beads, rings, etc., are exchanged. Fowls, and, if procurable, sheep are sacrificed, and the flesh is cooked, made up into balls with some sort of grain, and distributed among the party. They all join in a dance, hopping from one leg to the other, at each movement snapping their fingers and uttering an ejaculation, while at intervals the whole of the dancers bump together and again separate. If the parents of the bride refuse to consent to the marriage, the friends of the bridegroom watch their opportunity and carry her off. The relatives of the girl pursue and attack the opposite party, but even though successful in retaking her, they are prohibited by their customs from giving her in marriage to any one else.

The Sowrah burn their dead, and the following day bury the ashes on the same spot, over which they erect a rude pandal. On the fifth day the priest makes an offering of toddy, sacrificing at the same time fowls or animals, according to their means, to the spirit of the deceased, placing round a pot of toddy a number of leaves to represent the ancestors of the deceased; upon each leaf the priest sprinkles a little toddy, while pronouncing the name of the person represented, after which the toddy is divided among the party. At the end of the first and fourth years, there is feasting on food articles, which are first dedicated to the spirit of the deceased. The Sowrah race is far more wild and savage than the Khand, but they had no share in the Meriah sacrifices performed by the latter. Their bamboo bow is about a yard in length, the string being made of a thin slip of the outer coating of the bamboo, firmly bound on at each end with sinews. The arrows are of light reeds, feathered, with a head of flat beaten iron, having two or three pairs of barbs. They generally aim at the stomach or thigh of their victims, and the wounds are consequently dangerous and very often fatal. Some of them carry rude iron knives and a hatchet called tungi. The Muli Sowrah work in iron, making arrow-heads, knives, etc.; others, called Medari Sowrah, make bamboo mats; and the Arasi Sowrah weave their coarse cloths. They do not know how to tell a lie. They are not sufficiently civilised to be

able to invent. An insurrection occurred in 1858.

SOURABAYA or Soerabaja, in lat. 7° 13′ S., long. 112° 46¾′ E., is a town of Java, situated on the mainland on the shores of a narrow strait, which divides it from the large island of Madura. It is the only perfectly secure harbour on the north coast of Java. It gives its name to a district with a population of 1,722,626, the bulk of whom are Javanese, with 13,185 Chinese, and 1955 Arabs. The town is 1½ miles from the sea, is divided by a river 30 yards wide, which is navigable by boats 100 miles from the sea, and is sufficiently deep at the entrance to admit vessels of 250 tons. Grissik, a seaport town about 5 miles distant, may almost be termed an Arab colony. There are fish-ponds, extensive tanks of salt water, in which sea-fish are fattened for the table. These are highly prized by the Chinese, who spare no expense to procure them.—*Mr. Earl*, pp. 47 to 78.

SOUSSI. HIND. A striped cotton cloth. A kind of soussi is produced in France, blue striped, closer in texture than the Indian, perhaps, but belonging to the same class or category, and another called grivas, in particular, near Vichy, both excellent and fast-coloured fabrics, and both used for trousers and blouses. The Indian soussi are always striped or checked, woven in narrow patterns with coloured yarns, blue and white, black and blue, red and blue, yellow, white, and blue, green and chocolate; and they are worn, fine and coarse, literally by millions of the Hindu people of the middle and lower classes. Soussi is manufactured in Tanjore, Trichinopoly, St. Thomé, or Mylapore. Those of Tanjore and Trichinopoly are made of silk, and mixed with cotton of various colours and sorts, but Mylapore weavers work only in cotton. They are 7 yards by 1; the silk pieces are sold at from 8 to 20 rupees, those of cotton at 2 to 7 rupees each. These are used for undergowns or lungas by the Muhammadan women, and as trousers by men. The colours and patterns differ very little anywhere within the confines of India, whereas sarees, dhotis, and loongis, to suit, differ in particular localities.

SOUTH CANARA. This is a coast district between the sea and the high plateau of the Dekhan, in which most of its rivers consequently take their rise. South Canara has a seaboard of 120 miles, besides about 404 miles of estuaries. In Canara, fish are almost the sole meat food of the people. Hindu mythology says that the whole of South Canara was formerly under the ocean, the boundary of which was the edge of the Mysore plateau, and that the sea was dried up by a flaming arrow of the god Parasu Rama. More modern science robs the fable of its poetry, but leaves it its groundwork of truth, by ascribing the existence of Canara to volcanic action. There are also extensive littoral upheavings. Canara and its boundary hills are the first land that meets and receives the full force of the south-west monsoon, and the annual rainfall on the coast is 130 inches.

SOUTHERN INDIA is a term applied sometimes to all the Peninsula of India south of the Nerbadda river, sometimes to that portion of it lying south of the Kistna river. In the latter restricted sense, it is occupied by the Canarese, part of the Telugu, Tamil, Malealam, and Tulu-speaking races, and comprises part of the Circars, the kingdoms of Mysore, Cochin, and Travancore, and the British provinces of Nellore, Guntur, the Ceded Districts, Chingleput, N. and S. Arcot, Salem, Tanjore, Tinnevelly, and Coimbatore, all largely cultivated.

The architecture and ornamentation of the temples of Southern India have been made known by the representations and descriptions of Bijapur, Dharwar, Ahmadabad, and other cities, by Mr. Fergusson and Col. Taylor, and they are by far the most interesting and complete memorials of the sacerdotal and regal grandeur of Southern India which are in existence, and give a striking impression of the former splendour of those empires. The Dharwar sculptures are the records of Chalukya, Hoi Sala, Bellal, and other local dynasties; some of the figures are clothed with defensive armour, and there is no trace of a sewn garment. All the men's figures have short waist-cloths or dhotis, like kilts, with an end in some cases cast over the shoulder. The women are in the same costume, but both in the earlier memorial stones and on some of the profuse sculpture on the temple at Hallabid, in Mysore (Dhara Samudra, tenth to twelfth century A.D.), they wear bodices, tied in front, as Hindu women wear them at present. Many temples in the south and west of India, as also in Gujerat and Orissa etc., are known to belong to periods as early as A.D. 500. Groups of figures on them are numerous beyond description; the men wear head-dresses in the form of conical crowns, richly covered with ornaments, their bodies are naked, and their breasts and arms show necklaces and armlets of very ornate patterns. From the loins to the knee, or middle of the thigh, they have in most instances kilts, as it were, also composed of ornaments; and many are altogether naked, both male and female, with a girdle of ornamental pattern round the loins. These figures abound among the sculptures of Ellora, and upon the Hindu temples of Dharwar and Mysore of the eighth to the thirteenth century; also upon the Chola temples at Conjeveram and elsewhere, probably of the same era. In the Jain sculpture the male and female figures are invariably naked, but ornamented in general with necklaces, bracelets, armlets, and zones of exceedingly intricate and beautiful patterns, in imitation, probably, of the chased gold work of the period.

SOUTHERN MAHRATTA COUNTRY constitutes the British zillah of Dharwar, and likewise, geographically speaking, to include small province of Sunda. The general bou[nd]ary are the rivers Kistna and Bhima on the no[rth] north-east, the Tumbudra river on the sout[h] Hyderabad territory on the east, and the Syh[adri] range of mountains or Western Ghats on the west. This tract affords a great variety of elev[ation] tion and of geological structure. The wester[n] portion abounds with lofty forest trees, festooned by enormous perennial creepers. The bamboo forms a thick and luxuriant underwood in some places, while others are entirely open; and the banks of many clear and rapid streams flowing through it abound with the black pepper plant, the wild cinnamon, and other odoriferous shrubs. Portions of this forest are often left entirely untouched by the axe or knife. These are called

kans, and are favourite resorts of wild animals. To the east of the regular forest lies a tract called the Mulnad or rain country. The bushes consist chiefly of the karunda, the pallas, etc. It abounds in tanks and artificial reservoirs for purposes of irrigation. East of the Mulnad is a great extent of alluvial plain, producing fine crops of wheat, cotton, maize, millet, Sorghum vulgare, Panicum Italicum, Cicer arietinum, etc. And on the Hyderabad frontier is a succession of low, dry hills, with tabular summits, often rising in abrupt scarped precipices, and intersecting and traversing the plains in various directions. The first or mountainous division consists chiefly of micaceous clay and other schists, which to the northward are succeeded by basaltic or trap formation. The Mulnad is composed of undulating clayslate hills, which become covered with basalt to the north. This trap formation extends in a slanting direction from S.W. to N.E., nearly coinciding with a line drawn from Sadasheghur on the coast to Bijapur and Sholapur, and is almost coincident with that marking the separation of the two great tribes of the population using totally distinct languages, the Mahratta and Canarese. The hills to the N.E. and E. are all of sandstone, sometimes resting on schists, sometimes immediately on granite, which latter is the rock nearest the surface in the central and eastern plains. A well-defined range of hills to the S.W., called the Kupputgode, is basaltic. The extensive plains lying between these different lines of hills and eminences are composed of the rich black mould called regur or cotton ground, resulting from decomposed basaltic rocks. To the N.E. a considerable tract of limestone is found, resting on the sandstone, about Bagalcote, Badami, Hungund, Mulbihal, etc.

SOUTHERN-WOOD, Artemisia abrotanum.

Downah, ... HIND.	Dawanum, . . . TEL.
Marikolundu, . . TAM.	

The Tamil people sometimes mix the fine powder of it with gingelly oil, and anoint themselves with it after bathing; and it is one of the many sweet-smelling shrubs that are strewed before the Hindu gods at religious ceremonies. The Muhammadans prize it for its fragrance as a scent.—*Ains. Mat. Med.* p. 44.

SOUTH MAHRATTA JAGIRS comprise a group of native states; population, 610,000. They are Sangli, Jamkhandi, Miraj (senior and junior branch), Kurandwar (senior and junior branch), Mudhol, and Ramdrug. The first four belong to Brahman chiefs of the Patwardhan family.

SOUTHWELLIA BALANGHAS, China chestnut; seeds when roasted highly palatable.

SOWA, also Shuta-pooshpa. HIND. Anethum sowa, *Roxb.*, Indian dill. The seeds are in every bazar. They form an ingredient in curries, are employed as a carminative, and are bruised and applied externally in rheumatic and other swellings of the joints.

SOW-YEW. BURM. The egg tree of the Karen-nee, chisel-handle tree of the English in Burma, is stated by Dr. Mason to be a species of Dalbergia. Its maximum girth 2¼ cubits, and maximum length 10 feet. Found scattered all over the Amherst, Tavoy, and Mergui forests, inland, in undulating ground only, not near water. When seasoned, it floats on water. It is used by Burmese in preference to any other for handles of chisels and tools, also for helves of axes and hatchets. It is a very hard, fine-grained wood, unequalled for such tools as chisels which are struck with a hammer or mallet. This wood is of a yellowish-white in colour, with patches of black interspersed. It is always procurable in the markets.—*Captain Dance.*

SOY. Tsiang-yu, CHIN.; Soya, JAP. A well-known sauce made from the Soja hispida, which grows in China and Japan. In Java it is procured from the Phaseolus radiatus, the green gram, haree moong, or putchay payroo of India. The beans are boiled soft with equal quantities of wheat or barley, and left for three months to ferment; salt and water are then added, when the liquor is pressed and strained. Its price is about 6s. per gallon in the London market. Genuine soy is well flavoured, thick, brown, and clear, and when shaken in a glass, it should have a coat on the surface of a bright yellowish-brown colour. The best is exported from Japan. The flavour and ingredients of soy vary considerably, even among the people who make it, and much of that exported is supposed to be more or less adulterated. Chinese use the Soja hispida pulse when ripe for the manufacture of an oil, and give the remnant of the grain, together with stalks and leaves of the plant, as a food for cattle. Its cultivation has become general in Syria, Dalmatia, and Hungary. In the two former countries, the grain, after being allowed to ripen, is threshed out and roasted, and then employed for making coffee. In China, the grains are soaked till they swell and become soft, and then cooked like the small sort of beans. In other places, the seeds are set in a very damp, watery soil, and kept in darkness till they sprout up into a long white stalk, 4 or 5 inches high, which is then cut and served up after the manner of a salad. A sort of cheese, consumed in quantities by the poorer people both in China and Japan, is made from Soja hispida.

SOYMIDA FEBRIFUGA. *Ad. de Juss.*

Swietenia febrifuga, *Roxb.*	S. rubra, *Rottler.*
Swamy, ... CAN.	Patranga, . . . SANSK.
Bastard cedar, . . ENG.	Shem, ... TAM.
Rohuna, Rohitaka, HIND.	Sumi, Somi, Somida, TEL.
Rohuni, Rheyn, . MAHR.	

This large forest tree is a native of all the central and southern parts of India. The wood is red-coloured, light, and easily worked, is reckoned durable and strong, and good for indoor or cabinet purposes, but not adapted to those requiring exposure to sun and weather. Captain Beddome says it never rots underground. The bark is useful in intermittent fevers, where astringent tonics are applicable, but of very questionable efficacy as a true antiperiodic for mild ague, in which, doubtless, like all other astringent tonics, it will often succeed; it should be given in the form of extract. Mr. Broughton says that the substance to which the bark owes its bitter taste has the properties of a resin. It is of a yellowish-white colour when pure, is sparingly soluble in water, but is insoluble if the water contain acids; it is soluble in alcohol, ether, and benzol, but these liquids do not completely separate it from foreign substances.

SOZNI, a bed-cover quilted or embroidered in a pattern; the word literally means lily pattern, from Susan, a lily.

SPAIN, Espana, the ancient Hispania, a country in Europe, part of which was long held by Arabs. In the East Indies Spain holds the Philippine Islands. In 1519 the Spaniards laid claim to the Banda (United), or five (really ten) Nutmeg Islands, and the Moluccas, or five Clove Islands, as falling within the line of their sovereignty laid down by the Pope in 1493. From 1505 the Court of Spain had earnestly engaged in the project of finding a way to the Spice Islands from the west, and in 1508 Pinzon and De Solis sailed in search of them, and explored the coasts of South America to the 40th degree of south latitude. It was not, however, until 1515 that the Pacific was discovered, when Nunez de Balboa, who in 1510 had been placed in command of the Spanish colony of Santa Maria on the Gulf of Darien, having gone on an expedition into the Sierra de Quarequa, suddenly from one of its peaks beheld a boundless sea outstretched below him. From the narrow isthmus on which he stood, it extended east, and west, and south, until it was lost in space. This was the true discovery of America, that it was not, as Columbus believed to his dying day, the easternmost coast of Asia, or the West Indies, but a separate continent; and as this new world, with the vast waste of ocean beyond it, swam into his eyes, and all its moral significance flashed upon his mind, kneeling down upon the scarped summit from which he gazed, Balboa raised his hands to heaven in silent wonder and gratitude at the immensity of the revelation which had been made to him. Then, descending with all his men to the shore of the great South Sea, and wading up to his waist in its waters with his drawn sword, he claimed possession of the infinite expanse in the proud names of Aragon and Castile. In October 1515, De Solis was again sent out to discover the Spice Islands from the west, and in January 1516 entered the Rio de la Plata, originally named Rio de Solis; its present name not having been given to the river until 1525, when Diego Garcia found some plates of silver, probably from the mines of Potosi, in the hands of the wild Indians on its banks. De Solis, having anchored in the mouth of the river, went on shore to explore the country inland, when he and eight of his men were set upon and massacred by the natives, and roasted and devoured by them in sight of his ships; whereupon the disheartened expedition returned to Spain. In 1517, Ferdinand Magellan, who, according to De Barros, had been present at the capture of Malacca, proceeded to Valladolid, and gave it as his opinion that the Spice Islands fell within the Spanish boundary, and undertook to take a fleet thither by the south of the American continent. Accordingly, in 1519, Charles v. gave him five ships for the purpose. Every one of them was accompanied by a Portuguese pilot; and the *Santiago* was commanded by Joao Serrao, an old Portuguese, on whose knowledge of the east, and especially of the Moluccas, of which they were in search, Magellan placed great reliance. On the 21st of October 1520, St. Ursula's day, he reached the cape, which he called Cabo de las Virgines, at the entrance of the strait now called after Magellan, but which he named San Vittoria, in affectionate honour of his own flagship. From many fires having been seen on the land south of the strait, he named it Tierra del Fuego. On the 27th of November he emerged from the strait into the open Pacific Ocean, and the cape which terminated the strait on his left (on Terra del Fuego) he named Cabo Deseedo (the Desired), now called Cape Pillar. On the 6th of March 1521 he discovered the beautiful islands to which, from the thievish propensities of their inhabitants, he gave the name of the Ladrones (Thieves); and on the 16th, the islands he called the Archipelago de San Lazaro, a name afterwards changed by Villalobos, in honour of Philip II. of Spain, to that of the Philippines. On one of these islands Magellan was slain in a skirmish with the natives, brought on by his proselytizing zeal, whereon Joao Serrao and Duarte (Odoardo) Barbosa were elected joint commanders of the expedition. (On Serrao's death, Caraballo was elected commander-in-chief.) On the 8th July 1521 they anchored before the city of Borneo; and on Wednesday, 6th November 1521, they at last descried the long-sought-for Molucca Islands, the object for the discovery of which, by a western route, their daring adventure was undertaken. On the 8th they anchored at Tidore. In the following December, of the two remaining ships of the expedition, it was resolved to send the *Trinidad* back to Spain by Panama and the Strait of Magellan, and to take the *Vittoria* home, under Sebastian del Cano, by the Cape of Good Hope. In order to escape the observation of the Portuguese, her course was steered so far south as the 42d parallel of latitude, but, with all their caution, they approached within five leagues of the Cape on the 6th of May 1522. On the 9th of July, when they reached the Cape de Verd Islands, they were obliged to put in at Santiago, where, to prevent the suspicions of the Portuguese being roused, they said that they had come across from America. It was here they discovered that in sailing round the world they had lost a day, for while by the *Vittoria's* log it was Wednesday the 9th of July, at Santiago it was Thursday the 10th. On the 6th of September the *Vittoria* arrived at San Lucar, the only survivor of the noble fleet which had sailed from the same port on the 20th of September 1519. The circumnavigation of the world, which had originated in the dispute between Spain and Portugal about the possession of the Moluccas, was completed, and the sphericity of the earth demonstrated, against the authority of Cosmas Indicopleustes, which had ruled geographers for nearly a thousand years. Charles v. received Del Cano with the highest distinction, and conferred on him a life pension and a coat of arms, which bore branches of clove, cinnamon, and nutmeg, with a globe for the crest, and the motto, 'Primus circumdedisti me.' In regard to the dispute as to the respective rights of Portugal and Spain to the Spice Islands, the king of Spain was confirmed in the possession of the Philippine Islands, but the Moluccas were finally surrendered to the king of Portugal, under the agreement that the king of Portugal lent the king of Spain 350,000 ducats in respect of any claims which the latter might have on the Moluccas, in the possession of which the king of Portugal was not to be disturbed until the money was repaid, which was never done. By a decree of the Cortes, dated 19th October 1868, the monetary system is as follows:—100 centimes = 1 peseta = 9½d. Gold coins—100, 50, 25, 20, 10, and 5 pesetas. Silver coins—1, 2, 5 pesetas, and 20 and 25 centimes. Bronze coins—1, 2, 5,

and 10 centimes. 100 pesetas = £3, 19s. 2d.; 10 pesetas = 7s. 11d.; and the other coins in proportion. A 25 peseta gold piece is nearly equal to a sovereign.—*W. A. Browne, The Merchant's Handbook; Sir George Birdwood's Researches; Marsden's History of Sumatra*, p. 9.

SPANIEL. King Charles' breed of spaniels is supposed to have been brought from Japan by Captain Saris in 1613. Dogs always form a part of the Japanese royal gift.

SPARROWS. There are several species of this bird, of the genera Passer, Petronia, Pyrgita, of the family Fringillidæ. They are not used as food by any of the races of their native countries, though there is not much difference of flavour in a 'sparrow pie' between Petronia stulta and Gymnoris flavicollis. Homely Passer domesticus is every bit as good as an ortolan. Very much depends on the cooking. Sparrows in China are let loose as an act of merit.

SPARTO GRASS, Lygæum spartum, *Loefft.*, has been introduced into India. The grass sells in London at £5 the ton. In 1868 England imported 95,000 tons from Spain. It is the alfa of Algiers.

SPARUS, a genus of fishes in the Keeling Islands which graze in shoals, with their strong bony jaws, on the tops of the coral branches.—*Darwin, Res.* p. 553.

SPATHIUM CHINENSE. *Lour.*

Aponogeton monostachys, *Linn., Rh.*

Gotti gaddi, Kottika, TEL. | Namma dumpa, . . TEL.

The roots are much prized as food by the Yanadi. In Tenasserim one or two species of Spathium grow in the water, one of which, found on the banks of the Irawadi, has roots nearly as good as potatoes.—*Mason; Voigt.*

SPATHODEA ADENOPHYLLA. *Thw.* Heterophragma aden, *Seem.* Palol, SINGH. A small tree occasionally found in Ceylon gardens. It was introduced into the agri-horticultural gardens at Madras.—*Thw.; Gamble.*

SPATHODEA ARCUATA. *Wight Icon.*

Dolichandrone arcuata, *Hooker.*

Mer-singi, . . . MAHR. | Ran-palai maram, . TEL.

A small or middle-sized tree common in the Walliar forests of Coimbatore, and in the forests on the Bombay coast. It furnishes a strong wood, used by the turner.—*Wight; Gibson; Gamble.*

SPATHODEA FALCATA. *Wall., List.*

Bignonia spathacea, *Roxb.* | Dolichandrone falc., *Seem.*

A small or middling-sized tree, Wodi, TEL., common in most of the forests in the Madras Presidency, in Mysore, in Chanda and Bombay, but not found in Ceylon or Burma. The timber is light-coloured, strong, and serviceable, and much used by the natives for agricultural purposes, building, etc.—*Beddome, Fl. Sylv.; Gamble.*

SPATHODEA RHEEDII. *Spreng.*

Dolichandrone Rheedii, *Seem.*

Mer-singi, . . BOMBAY. | Kanpillay maram, TAM. ?
Tha-khoot-ma, . . BURM. | Vodi, Udi, Wodi, . TEL.
Nir pongilam, . MALEAL. | Ganora karra, . . ,,
Deya danga-gass, SINGH.

This small thin tree is a native of the west of Ceylon, the Peninsula of India, the forests of the Northern Circars, of the Godavery, and British Burma. The trunk is very irregular. In a full-grown tree the average length of the trunk to the first branch is 30 feet, girth 7 feet. A cubic foot weighs 23 to 35 lbs. It is strong, of a whitish colour, and in Burma, where it sells at 8 annas the cubic foot, it is used for yokes and cart-poles.—*Beddome; Dr. Birdwood; Gamble.*

SPATHODEA ROXBURGHII. *Spreng.*

Bignonia quadrilocularis, *Roxb.* | Heterophragma Roxburghii, *D.C.*

A large tree, with a straight trunk, and of considerable height. It is a native of the Northern Circars, flowers in the hot season, with spreading branches and large rose-coloured and delightfully fragrant flowers, and is remarkable for its leaves. Roxburgh says its wood is used for many purposes by the natives, but other accounts describe it as worthless. Buffaloes are very fond of the leaves.—*Roxb.; Voigt; Beddome; Gamble.*

SPATHODEA STIPULATA. *Wall.*

Bignonia stipulata, *Roxb.* | Dolichandrone stipulata.
Bet-than, Paet-than, BURM. | Palol, ... SINGH.

A large tree of British Burma; wood used for bows and spear handles, also for paddles and oars. Weight, 48 lbs. Length of the trunk, 20 feet; girth measured 4 feet.—*Roxb.; Dr. Brandis; Gamble.*

SPATHOLOBUS ROXBURGHII. *Bentham.* A gigantic creeper of the Sub-Himalayan region and of Burma. Its fruit and its red kino-like gum are used. It is one of the Leguminosæ.

SPAWN OF FISH. In Canara, men search in the rivers for hillocks wherein spawn has been left, gather the ova, and make it into cakes, which are considered a delicacy. The eggs of the kari and kalmuri are highly prized.

SPEKE, JOHN HANNING, discovered the source of the Nile. He was a captain in the Bengal army. Born 4th May 1827, at Orleigh Court, near Bideford, in the west of England; died near Bath, on the 16th September 1864, at the age of 37, from a shot from a fowling-piece. As a subaltern officer in the Indian army, he had made the campaign of the Panjab under Lord Gough, and in the four successive battles of Ramnuggur, Saddelapur, Chillianwalla, and Gujerat, acting throughout this terrible time with Sir Colin Campbell's division. He used to make hunting and exploring expeditions over the Himalayas, and in the untrodden parts of Tibet. A botanist, a geologist, and especially a lover of natural history, he toiled to collect specimens of every animal, every plant, and every mineral to be found in those wilds; shooting, collecting, and mapping the country as he went, he taught himself the knowledge required to enable a traveller to appreciate and utilize all he sees. In one journey to Africa he served under Captain Burton. The latter fell sick, and Speke went on and struck upon the great lake which is the fountain of the Nile, reaching it from the north, and proving what was at first but a sagacious conjecture, by tracking the river upwards to this same lake from the south. Speke began his march into Africa in the end of 1854. He named the inland sea the Victoria Nyanza. A column has been erected to his memory in Kensington Park, London.

SPERMACETI.

King-yu, ... CHIN. | Wallrath, . . . GER.
Blanc de Baleine, . FR. | Spermazet, . . . RUS.
Sperme de Baleine, ,, | Esperma de Ballena, SP.

The produce of a species of whale, Physeter

macrocephalus, found chiefly in the Pacific and Indian Seas. Spermaceti is found combined with oil in several cetacea, but it is most abundant in the sperm whale, and this is the commercial article. The head of the sperm whale has in front of the skull a solid mass of soft, yellow, and oily fat, based on the upper jaw, and forming the front and lower part of the snout. In a whale of large size this part weighs between two to three tons. The cavity called the case lies beneath and to the right of the spouting canal, and corresponds to nearly the entire length of that tube. It has a white fibrous lining, and is filled with a very delicate web of cellular tissue, containing in large cells a limpid and oily fluid, which is liberated by the slightest force, and has yielded up to 14 barrels, or 500 gallons. It is chiefly spermaceti. When newly obtained from the case of the whale, it is fluid, transparent, nearly colourless, without odour, and has a bland and creamy taste, not unlike that of very fresh butter. At the ordinary temperature of the tropics at sea (77° to 80°), it does not concrete, but in low temperatures, or when cast into cold water, it assumes a dull white hue and the consistence of lard.—*F. D. Bennett, Whal. Voyage*, ii. pp. 160, 223–26.

SPERMACOCE HISPIDA. *Linn., W. and A.*

Spermacoce hirta, *Rottl.*	Spermacoce scabra, *Willde.*
Shaggy button weed, ENG.	Nutti churi, ... TAM.

Gurak moondi, . . ,,	

This is common in Bengal and the Peninsula of India, near water-banks, at Ajmir, and in the Eastern and Central Panjab. Has a round pink blossom, considered heating, cleanses the blood; aphrodisiac; also opens the bowels; the flower and seed capsules are used. The roots, small oblong seeds, and receptacles are reckoned by the Vyteans amongst their anthelmintics, and are prescribed in powder. In the Panjab the officinal flowers are highly esteemed as alterative, depurative, cooling, and tonic.—*Gen. Med. Top.; Ains.; Powell; Stewart; W. Ic.*

SPHÆROCOCCUS, a genus of plants belonging to the natural order Algæ. A great number of species have been described, including amongst them some of the most useful of the sea-weed tribe. These species have been distributed by later botanists into the genera Rhodomenia, Gigartina, Chondrus, Gelidium, and Phyllophora; and the genus Sphærococcus has as species the S. coronopifolius, S. cartilaginaceus, and S. lichenoides. The genus Chondrus affords the Carrageen moss, which is so much used as an article of diet. Some assert it is a species of Gelidium with which the swallows build their nests in the Eastern Archipelago, and which are so highly valued as articles of food by the Chinese. The gelatinous substance of which the nests are composed, however, seems really to be a natural secretion from the swallow itself.—*Eng. Cyc.* See Sea-weed; Thallogen.

Sphærococcus cartilaginaceus, *var.* setaceus. Shih-hwa-tsai, CHIN. It is met with in the Chinese market, and resembles the Carrageen or Irish moss.

Sphærococcus lichenoides, *Agardh*, Ceylon moss, occurs in the coast of the S. Andaman, Termooklee Island, and is met with in China, being frequently cast up by the sea. It may be very well substituted for the Gracillaria lichenoides, *Greville*.

SPICES.

Spice is the term applied to all pleasant or pungent aromatic vegetable substances, used for flavouring food and condiments, and largely employed by the people of India. They are obtained from the barks, the dried seeds, the fruit, flower-buds, and root-stocks of different plants. The chiefly aromatic barks are the cinnamon and Cassia lignea; the seeds and fruits include pepper, cardamoms, coriander, cummin seed, star anise, chillies, mustard, nutmegs, mace, pimento, etc. The flower-buds of some furnish cloves and cassia buds, and the roots supply ginger and turmeric.

SPIDERS comprise the genera Clubiona, Theridion, Pholcus, and Epeira. But in common language the Mygale are called crab spiders and mason spiders, also trap-door spiders. Scorpion spiders are of the genus Galeodes; Tarantula spiders belonging to the genus Lycosa of Latreille. L. tarantula, *Latr.*, inhabits Southern Italy, and L. melanogastra Southern France. A spider, remarkable for the bright yellow colour of its web, a species of Epeira, was found by Captain Sherwill 1000 feet high on the summit of Maruk, south of Monghir. Some of the webs, including the guy-ropes, were from 10 to 12 feet in diameter, the reticulated portions being about 5 feet, in the centre of which the spider, of a formidable size and very active, sits waiting for prey. In one web was found entangled a bird about the size of a field lark, and eight young spiders feeding on the body. It was near the centre of the web, and its wings had been completely pinioned by the entwined web. The old spider sat about a foot above the bird. It was six inches across the legs, and had a formidable pair of mandibles. Walckenaer described a spider of large size under the name of Olios Taprobanius, which is very common in Ceylon, and conspicuous from the fiery hue of the under-surface, the remainder being covered with grey hair so short and fine that the body seems almost denuded. It spins a moderate-sized web, hung vertically between two sets of strong lines stretched one above the other athwart the pathways. Some of the threads thus carried horizontally from tree to tree at a considerable height from the ground, are so strong as to cause a painful check across the face when moving quickly against them, and more than once in riding Sir J. E. Tennent had his hat lifted off his head by one of these cords. The webs of spiders are strong enough to entangle and hold the small birds on which they are said occasionally to feed. Small house lizards will also be seized and devoured by these spiders.—*Blyth, Soc. Jour.*, 1850; *Gosse; Tennent.*

Ceylon, p. 469. See Aranea; Epeira; Galeodes; Latrodectes; Mygale.

SPIKENARD.

[illegible]bul, ... Arab.	Nardum, ... Lat.
[illegible] Beng., Hind.	Nardin, Narawastu, Mal.
[illegible]hyan, . Chin.	Shad-a-mangie, . Tam.
[illegible]ardos, . . Gr.	Jettamassie, . . Tel.
Chebur, Guj.	

[illegible]dostachys jattamansi of the Himalayas [illegible]ntains of High Asia is now generally [illegible]d to be the spikenard of the ancients. [illegible] is of a blackish colour, and resembles [illegible]y tail of the ermine. Its odour is strong [illegible]grant, and is much esteemed by all eastern [illegible]. Spikenard has enjoyed celebrity from [illegible]earliest period of the world's history. It was [illegible]teemed by the Greeks and Romans, and is mentioned in the Bible, the Nard of Scripture being supposed to be the same substance as the Nardos of the ancients. It contains about 9 per cent. of balsamic resin, and a small proportion of essential oil. It is valued in hysteria, and is a perfect substitute for valerian. See Sunbul.

SPILANTHES ACMELLA, *Linn.*, Hin-ka-la, Burm., is planted by the natives of Tenasserim for its medicinal properties.—*Mason; Voigt.*

SPILANTHES OLERACEA, *Jacq.*, Akarkarha and Pokarmul, Hind., is a powerful stimulant and sialagogue, useful in headache, paralysis of the tongue, affections of the gums and throat, and for toothache, also in fever, cough, and special diseases.—*Powell; Voigt.*

SPILSBURY, Dr., a Bengal medical officer who [illegible] an account of fossil bones on the Nerbadda [illegible] As. Trans.; also Geological Notes on the [illegible] of the Nerbadda, ibid., 1833, 1834, 1839.—*[illegible]uist.*

[illegible]NACIA, a genus of plants belonging to the [illegible] order Chenopodiaceæ.

[illegible]nacia oleracea, *Wight.*, spinach.

[illegible]aj, . Arab., Pers.	Isfanaj, Isfanak, . Hind.
[illegible]aluk, Paluk, Hind.	Vusayley-keeray, Tam.

[illegible]uch used as a vegetable in India, and the [illegible]ople consider it to be cooling. It grows in [illegible]ich soil, requires plenty of water, should be [illegible]own thinly in drills or broadcast every month [illegible]r six weeks; may be had during the hot months [illegible]n sheltered situations, with attention to water.—*Powell; Jaffrey.*

Spinacia tetrandra, *Roxb.*, spinach.

Choolai, . . . Hind.	Dumpa bachchali, . Tel.
Isfanaj, ... Pers.	Mattu bachchali, . ,,

The Hindustani name is indifferently given to Spinacia tetrandra, used in curries, and Amarantus polygamus. The former is a common sort of native greens, and, when boiled, resembles spinach; it is procurable nearly all the year round. The latter is much cultivated, is sown broadcast in beds from June to March. The leaves are sold in the bazar at one pie the seer.

New Zealand spinach is a hardy annual, with fleshy leaves and numerous branches, and as a spinach it is as valuable as the orache. If watered, grows freely, and produces leaves in the hottest weather.—*Riddell; Jaffrey.*

SPINIFEX SQUARROSA. *Spreng., Rh.*

Sea pink, Water pink, Eng.	Ravana suruni misalu, Tel.

This curious dioecious grass grows abundantly on the Coromandel coast. When the seed is ripe, the spherical head of the plant is detached and blown before the wind. See Isaiah xvii. 13, and Psalm lxxxiii. 13. Its great seed-balls are known to the Singhalese as Maha-Rawana-ræwula, the great beard of Rawana or Rama. See Sand-binding Plants.

SPIRÆA, a genus of plants of the natural order Rosaceæ. S. hypoleuca, S. cullosa, and S. canescens, *Don*, occur in the N.W. Himalaya. S. Kamtschatka is used in Kamtschatka to make an alcoholic spirit.

SPIRÆA SORBIFOLIA. *Linn.*

A shrub with fine white flowers, the handsomest and one of the commonest of the Himalaya, from 4000 to 10,500 feet, up to and beyond the Indus. It resembles the English meadow-sweet, especially S. Kamtschatka.—*Stewart.*

SPIRIT-WORSHIP prevails throughout all the south-east of Asia, amongst the Hindus, the Buddhists, the Chinese Taoists, and followers of Confucius, in Japan with the disciples of the Sintu faith, and in all these regions among all the uncultivated aboriginal races. It is the one general cult of all these regions. When Thales taught that the whole universe is pervaded by spirits, he was proclaiming both the primitive and the existing faith of all India and China. In India worship is performed to the Bhuta, Vetala, Pisacha, Preta, Yaksha, Vidyadhara or sylphs, and in Burma to the Nat and to Rakshasa or demons.

Ancestor-worship is a recognition of the existence of spirits freed from the body. This faith was exhibited from early times by the Egyptians; it was as a faith deeply seated, also, in Greece and Rome; it has always been and still is the popular religion of the Chinese, and it forms the belief of all the aboriginal races, and of most of the Brahmanical Hindu religionists of India. The Egyptian belief in the transmigration of the human soul into other bodies, and into the bodies of animals, was connected with it. Animal-worship dates from the earliest times in Egypt, and soon after the time of Menes (B.C. 3400) it became the established religion throughout the empire. This form of faith had evidently its origin in their belief in the identity of the principle of life in all living beings, and in the identity of the soul with life; grounded on a consciousness of moral responsibility and a belief in the personal indestructibility of the human soul. They believed that at the point of death, the deeds of this life are examined, judged, and rewarded or punished; in the latter case condemned to be degraded from human to animal life, and one regulated by brutal instincts.

In China, the spirits of deceased ancestors are periodically worshipped, and on weighty occasions are consulted. In their marriage processions, the titles of the ancestors are carried along with other displayed articles, and they are invoked to bless a newly-wedded couple. Their tombs are kept in repair. Spirits are summoned to attend to their worshippers. According to the Brahmanical Hindus, two things are indispensably necessary to the sacrificer in performing a religious ceremony,—several lighted lamps, and a bell, and the bell is sounded when the deity or spirit is supposed to be summoned.

SPIRIT-WORSHIP.

The Kyoung-tha of Chittagong are Buddhists. Their village temples contain a small stand of bells, and an image of Buddha, which the villagers generally worship morning and evening, first ringing the bells to let him know that they are there. The Sintu temples of the sun goddess in Japan also contain a bell, intended to arouse the goddess, and to awaken her attention to the prayers of her worshippers.

Among the Tiperah of Chittagong, if a man die away from home, his relatives stretch a thread over all the intermediate streams, so that the spirit of the dead man may return to his own village; it being supposed that without assistance spirits are unable to cross running water, as Burns in his Tam-o-Shanter says, 'a running stream they daurna cross;' the streams are therefore bridged. A somewhat similar idea existed in Europe, and it occurs also in the Fiji Islands, and among the Kol of Nagpur. All diseases in men and in cattle are attributed to one or two causes,—the wrath of some evil spirit who has to be appeased, or the spell of some witch or sorcerer. The Circassians and some of the Chinese have also the same belief. Hence it is that insane people are in many countries regarded with so much reverence, since they are looked on as the special abode of some deity.

Hindus, in the Srad'ha ceremonial, make offerings to the spirits of their ancestors. After death, the spirit of the Hindu is conveyed by the messenger of Yama, through the air, to the place of judgment. After receiving sentence, it wanders about the earth for twelve months, as an aerial being or ghost, and then takes a body suited to its future condition, whether it ascend to the gods, or suffer in a new body, or be hurled into some hell. This is the doctrine of several Puranas; others maintain that immediately after death and judgment, the person suffers the pains of hell, and removes his sin by suffering, and then returns to the earth in some bodily form.

In the Srad'ha or funeral ceremonies of the Hindu of Gujerat, the son repeats before an image many incantations, to the following purport: Before thee, O Brahma, I perform my father's Srad'ha. He next offers to his deceased parent, on a plantain-trunk dish, seven blades of kusha, and seven of durva grass, flowers, dry rice, cloth, red paint, and a brass lamp. He next cleanses the place before him with his hands, and, scattering upon it a few blades of kusha grass, presents other offerings to his deceased father, repeating many incantations, which contain the names of the offerings, and an invitation to the deceased father to partake of them. From what remains of these offerings, the son makes two balls, the smallest of which is offered in the name of those of the family who have not received the benefits of the Srad'ha, and the other he presents to his deceased father, and then lays it on some kusha grass as before, and worships it, presenting flowers, water, etc. He now places both hands open against a lamp which is burning, as though he were warming himself; after which he prostrates himself to the sun, and presents a fee of from one rupee to five to the officiating Brahman, salutes all the Brahmans present, and makes prostrations to the saligram, which he afterwards sends into the house. All the offerings are sent to the houses of Brahmans. The family now return home, where an entertainment is provided, both for Brahmans and others, consisting principally of sweetmeats, milk, curds, sugar, ca[illegible] etc. The Brahmans eat in an enclosed [illegible] uninvited Brahmans near the house, and [illegible] in the street or road. At the close of t[illegible] tainment, if the person making the S[illegible] rich, he gives presents to all those wh[illegible] guests, whether Brahmans or the poor, [illegible] dismisses them. The next morning he [illegible] the learned Brahmans with presents; to [illegible] learned he gives five rupees perhaps, and [illegible] less learned one. The Brahmans who were [illegible] are also dismissed with presents. Abou[illegible] o'clock a feast is provided for the relations, wh[illegible] are dismissed the next morning with presents of money, cloth, etc., and on this day another dinner is provided for nearer relations. At the close of the Srad'ha a number of mendicant musicians play on certain instruments of music, and sing verses celebrating the revels of Krishna; they are often dismissed with large presen's. The next day the family return to their accustomed diet; but the sons, for twelve months after the decease of the father, must refuse every gratification, and cook with their own hands, or eat what has been prepared by a wife or some near relation dwelling in the house. Gunga Govindu Singhu, a person of the writer caste, head-servant to Mr. Warren Hastings, expended, it is said, 12,00,000 rupees at his mother's Srad'ha; and Raja Nuvu Krishna of Calcutta, nearly as m[illegible] in the Srad'ha for his mother. This expens[illegible] principally incurred in presents to the Bral[illegible] such as bedsteads, at two or three hundred r[illegible] each; water pitchers of silver and gold [illegible] worth a thousand, and others .two th[illegible] rupees; dishes of silver and gold, valued a[illegible] to five hundred rupees. At the time of bat[illegible] the person who will perform the Srad'ha pu[illegible] himself by putting water, seeds, fruits, etc[illegible] parts of the trunks of four plantain trees, repea[illegible] ing incantations. He sends some of this wate[illegible] home to purify the family.

The monthly Srad'ha for the first year after the death of the parent, is upon a very small scale, and the expense is from ten rupees to twelve annas. Besides these, there are other Srad'has for deceased ancestors, as in every month at the total wane of the moon; on the last fifteen, or ten, or five days of the moon in the month Bhadra; once during the first fifteen days of the moon in Ugruhayunu; and again in the same month, in Poushu and Maghu, on the eighth of the wane of the moon; in Voishakhu and Shravunu, on any of the first fifteen days of the moon. At some of these times all Hindus perform this ceremony; at other times only a few persons. The expense is trifling, as scarcely any persons are entertained at them. In this Srad'ha the flesh of cows was formerly offered in sacrifice. In the Kali-yogu this is forbidden, and that of deer or goats is substituted; herbs, bread, and barley are used, as also fresh rain water.

Mr. Forbes in the Rasmala (p. 378) says, The Bhut and Pret are said to reside, at the place where funeral piles are erected, in trees which are not used for sacrificial purposes, such as the tamarind and the acacia, in desert places, at the spot where a death has occurred, or at cross-

roads, for which reason people set at these places food for the use of the Bhut. He is most at a loss for water to drink. The pipe of his throat is, it is said, the size of the eye of a needle, and he is continually thirsty enough to drink twelve gallons of water. The watchmen of Wuroon Dev, however, are stationed wherever there is water, to prevent the Bhut from drinking, and their thirst is therefore as continual as it is intense. The Bhut feed upon all kinds of refuse. The goblin of the best class, he, that is to say, whose funeral ceremonies have been duly performed, but who has been debarred from liberation by his own intense affection for earthly objects, is called a Poorwuj Dev, and resides in his own house or in a sacred fig tree. The Poorwuj Dev, like the Etruscan Lar, or the Grecian hero, is regarded as hovering about his former abode, averting dangers from the inhabitants, and bestowing blessings upon them. He frequently appears in the character of a serpent, and is then treated with great respect by the inmates of the house near which he resides. It is a common belief in Gujerat that serpents are always to be found wherever a hoard is buried, and that these are the Bhuts of the deceased owners who have remained upon earth from affection to their wealth. The Arabian Jin also frequents cross-roads, and the fairies of the Scottish Lowlands carry bows made of the ribs of a man buried where three lairds' lands meet, as in 'A Midsummer Night's Dream' (Act. iii. Sc. 2):—

'Damned spirits all,
That in cross-ways and floods have burial.'

Desert places, in Gujerat, correspond exactly with the dry places (*ανυδρων τοπων*) assigned to the evil spirits in Matthew xii. 43, Luke xi. 24. And all eastern races believe them to be the resort of evil spirits. In Gujerat the Bhut and Pret can take possession of a corpse, and speak through its mouth; they exhibit themselves in the form which they possessed when living; they enter into a living man, and cause him to speak as they please; sometimes they afflict him with fever, or various other diseases; sometimes they assume the forms of animals, and frighten people by suddenly vanishing in a flash of fire; sometimes, remaining invisible, they speak in whispers. A Bhut has been known to come to fisticuffs with a man, and to carry a man off and set him down in a distant place. It is even said that women are sometimes found with child by Bhuts.

The Jain Shastras teach a different doctrine in regard to spirits from that which is taught by the Hindu Puranas. They assert that there are eight kinds of Vyuntur Dev, and eight of Wan-Vyuntur Dev, who reside below the earth. Each of these has two Indra, or sovereigns, ruling respectively the northern and southern regions, and who are in colour black, white, or blue. The Vyuntur and Wan-Vyuntur Dev appear upon earth, where they possess the bodies of men, exhibit themselves in various shapes, and perform many strange feats, whence their common name of Kutohulee (or surprising) Dev. Below them reside the Bhuwunputi Dev, who also sometimes appear on earth. Below them again are the Narkina or infernal spirits. Above this earth, in the atmosphere, five kinds of Dev of splendour reside,—the sun, moon, stars, and others. Above them, in twelve Dev-Loka, the Dev who ride in chariots dwell; these, sometimes drawn by their own desire, or compelled by charms, appear in the world, but they do harm to no one. Above them are nine classes of Grivek, and five of Unootur Vimani. They are of great power, and never visit the earth. Men who have lived a life of austerity and righteousness are born again in these classes of upper or lower Dev, but the sinner is not born in them. In olden times, a man who had performed the rite of Uthum by fasting for three days, acquired the power of calling the Dev to him, but now, it is said, these Dev never visit the earth at any one's call.

In Gujerat, when people wish to prevent the removal of a jungle tree, they paint a trident upon it with vermilion, or, if that be inconvenient, they collect a number of stones and throw them down at the root of the tree. Whoever, after this, passes by, is sure to add a stone or two to the heap, believing the place to be the residence of a Bhut. If the place be one where stones are not easily procurable, a bit of old rag is thrown so as to adhere to the tree, and every one who passes by follows the example once set. They call the spot the 'Rag-uncle's.' In places where trees are scarce, these uncles are very common, and people are much annoyed with the dread of touching them. The name uncle is given to the Bhut by women as a term of respect. Men are less superstitious. Similarly, whenever in any place there is a hillock or mound upon which a few stones have been piled one above the other, every passer-by considers himself bound to add a stone to the heap, considering that the spot is the residence of some Dev and that if any one raise a little temple there, his house will flourish. Such monuments are also set up in places where a person has been slain or wounded. Cairns of this kind are frequently connected with the dead,—

'Many a cairn's grey pyramid,
Where urns of mighty chiefs lie hid.'

The Bhut-bali of the Hindus is an offering to evil spirits, ghosts. On the 14th of the dark half of the month Aswin, the Bhuta Chaturdasi offerings are made to evil spirits, and the Bhuta devata is a spirit worshipped as a deity.

As an instance of the Hindu belief in the powers of demons, Col. Tod tells us that Udi Singh died thirteen years after his inauguration on the cushion of Joda, and thirty-three years after the death of Maldeo. About A.D. 1645, when he was returning home from court, he beheld a girl whom he determined to have. But she was the daughter of a Brahman, an Aya-Punti, or votary of Aya-Mata, whose shrine is at Bai-Bhilara. These sectarians of Maru, he says, are very different from the abstinent Brahmans of Bengal, eat flesh, drink wine, and share in all the common enjoyments of life with the martial spirits around them. And as there was no other course by which the father could save her from pollution but by her death, on that he resolved. He dug a sacrificial pit, and, having slain his daughter, cut her into fragments, and mingling therewith pieces of flesh from his own person, made the homa or burnt sacrifice to Aya-Mata, and as the smoke and flames ascended, he pronounced an imprecation on the raja: 'Let peace be a stranger to him! and in three pahar,

three days and three years, let me have revenge!' Then exclaiming, 'My future dwelling is the Dabi Baori!' sprang into the flaming pit. The horrid tale was related to the raja, whose imagination was haunted by the shade of the Brahman, and he expired at the assigned period, a prey to unceasing remorse.

Up to the close of the 15th century, it was customary in England to place food for demons. In the dialogue of Dives and Pauper, printed by Richard Pynson in 1493, among the superstitions then in use at the beginning of the year, the following is mentioned:—'Alle that take hede to dysmal dayes, or use nyce observances in the newe moone, or in the new yeere, as setting of mete or drynke by night on the benche to fede alholde or gobelyn.' So in British India to the present day, with Hindus, Chitapinda or funeral cakes are offered at the pile, at the time of burning the body. On the fourth day after decease, Chaturtha-pinda, funeral cakes, are again offered. On the 13th day after decease, the pret, or newly-embodied spirit, is compelled by the emissaries of Hades to set forth on his journey towards Yampur. Its attendants aggravate the miseries of the wicked soul by their threats and upbraidings. They cry to the pret, 'Come quick, evil one! We will carry you to Yama's door; we will cast you into Kumbheepak, or some other hell!'

In the south of India, spirits of the air are numerous: celestial vestals, which frequent cool shades and limpid streams, help the sick, succour women in travail, guide the benighted traveller who has lost his way, shower blessings and flowers on happily married couples. The village Kannimar, or virgins, as they are styled in ordinary country parlance, are patrons of the village lassie afflicted with the tender passion, and watch with a motherly interest the progress of stedfast honourable loves. There is nothing which they hate so intensely as the violation of matrimonial vows, or the infringement of maidenly honour. Rude statues of potter's work representing these champions of virtue, may be seen invariably under some pleasant shade, by the side of a rippling rivulet or the placid surface of the village tank. When the sun is at its greatest height, and man and beast seek some friendly shelter, these fair celestials, screened from profane mortal sight, quietly perform their ablutions in the tank or brook close by, divesting themselves of their flowing ethereal robes. Their appearance to mortals in bodily form always portends something extremely good or evil; but as they are naturally inclined to acts of kindness and mercy, such interviews prove, in the majority of cases, harbingers of prosperity and conjugal felicity. Instances are not wanting of these sylvan beauties, through forgetfulness to bind the wood with their magic spell, allowing themselves to be surprised by the strolling cowherd ere they have risen from their midday bath. Every year, as the husbandman sows his grain after the precursory showers of the rainy season, he vows to set apart so much, a kalam (12 marcals), as a thank-offering, if the out-turn should prove as abundant as he prayed for. True to a farthing, the sale-proceeds of the virgins' share is religiously laid by, to be made use of a month or two after the harvest, when the ryot, now at leisure, thinks of redeeming his vow at the shrine of the celestial fair one. At the appointed time, generally at night, the whole village wends in solemn procession to the sacred grove, with banners flying and drums beating, and with all the paraphernalia of eastern worship. Rice is boiled, sheep are slain, amateur theatricals improvised, and the light hearts of the multitude rendered still lighter by potions of arrack.

Closely allied to the virgins are sundry village deities, mostly shrineless, the most important of whom are Mariammen, Bhagavati, Chakkammal, Muttaramman, and Dhwarapati.

The principal demons employed by wizards and necromancers are Karuppan, Maden, Patchee, and Irulappen. These assume any shape or colour, according to their masters' orders; and, most frequently, are carried from one place to another, attached to a magical ring, a tuft of hair, or to a baby's scull secreted in the wizard's bag. Sometimes they scour the country at night in quest of their victim, who is generally a rival magician, or one who has by word or deed incurred their master's displeasure. The demon is now a tiger, tearing the entrails of the hated victim; now an incendiary, setting houses on fire; and very rarely does it appear in monstrous human shape to kill or frighten or perform any other mischief. But if the pursued man possess a mightier demon, and the assailants be defeated, the latter vent their baffled rage and fury on their master himself. A few demons are so voracious that they snatch up with avidity balls of rice and curry thrown into the air; some so lascivious as to have human mistresses and concubines, and even to outrage the modesty of their occasional fair worshippers. At Bodinaikenur, in the Madura district, a Chetty bought of a magician a Malabar demon for Rs. 90, it is said; but ere a day had passed since the transfer, the undutiful spirit fell in love with his master's wife, and succeeded in its nefarious purpose.

The European will-o'-the-wisp is the Tamil Kollevai Pai. Modern science calls them phosphorated hydrogen gas rising from dead animal matter in different stages of putrefaction, but the Hindu persists in calling them devils of a most malignant type. The explosive nature of the gas, before it has time to ascend higher than one's knees, gives it the appearance of jumping. In the middle of rice-fields, by the side of stagnant pools, and especially in burial-grounds, do these spirits sing and dance and engage in their midnight orgies, to the no small terror and consternation of the simple village folks.

There are many more classes of demons, more or less violent, such as Khattarie, Bhudam, Pesasam, Mohinee or sirens, Jadamuni, and Etchilpai. Of the last two, the former occupies perhaps the highest, and the latter the lowest stratum of spirit life in the unseen world. The Jadamuni, as their name indicates, are the spirits of human sages, who, by dint of extraordinary penance, were enrolled as an inferior set of gods. At midnight, when not a sound of man, beast, or bird disturbs the calm, still air, these assume their human shape. With their crests touching the skies, and their feet a few feet above the ground, they present a sufficiently hideous aspect, rendered still more horrible by long tresses of hair floating like serpents, tongues dripping with gore, and

yes like glaring orbs, darting forth the intensest atred and revenge towards the poor, hapless vayfarer who may hap; en to cross their custom- ry beat. The Etchilpai are hungry as wolves, nd yet without the power of obtaining food; hey pick up the stray grains of boiled rice in Hindu kitchens, or snatch off morsels of food rom people's heads, if they happen to carry it at ight.

In the south of the Madras Presidency, local- zed demons have exercised a mysterious power or centuries. A man dies under the slightest xceptional circumstances,—and lo! his spirit goes broad! It lurks in yonder hut, it crouches nder yonder banyan tree. It must be propitiated vith plantains or fruit, rice, or sweet toddy. here is an English ghost in Tinnevelly. It is he ghost of a Captain Pole, who died in the torming of the Travancore lines early in the ineteenth century. Mortally wounded, and re- reating to the northward, he was left behind y his servants, and he breathed his last near a illage in which, latterly, a mission of the C.M.S. as been established, and which is called Gospel own, Suviseshapuram. After his death, he was leified by the simple instincts of the neighbouring Shanars. He has a rude hut to his honour; and he offerings which appease him are brandy and heroots. He may be invoked. His opinion may e elicited. ●

[redacted]tle Frere accidentally found an order in [redacted]at Government House, Dapurie, handed [redacted] non-commissioned officers, for the native [redacted]n guard to present arms if a cat or dog, [redacted]r goat, entered or left the house or crossed [redacted]s beat during certain hours of the night, it was the ghost of a former governor [redacted]s still remembered as one of the best and [redacted]f men. The raja of Wanparty, one of [redacted]di race who have founded small princi- [redacted]along the banks of the Kistna river, died [redacted]t Hyderabad. He had led a turbulent [redacted] retained to the last much of the spirit of [redacted]th. At the close of that year, an outbreak [redacted]lera occurred in that neighbourhood, which people attributed to the spirit of Wanparty, and they made a clay image of him, riding on an elephant, and placed near him the figure of a Bin- arni, and worshipped all with the great Mahabala sacrifice.

The superstitious fears of the Hindus extend o innumerable objects: they dread the wrath of he following invisible beings,—the messengers of Yama, bhuts, prets, pisacha, dakinee, yoginee, hakinee, yukhshu, rakshasa, shunkinee, gooma, brumhu-doitya, aluya, etc. They also fear the cries of the following animals, at particular times, and in certain situations, viz. jackals, owls, crows, cats, asses, vultures, dogs, lizards, etc. They also dread different sights in the air, and many kinds of dreams.

King James I. in the preface to his Demonology, says, 'They (magicians) can suddenly cause to be brought unto them all kinds of dainty dishes by their familiar spirit, since as a thief he delights to steal, and as a spirit he can subtilely and suddenly enough transport the same.' To obtain such a spirit for a familiar, the two following receipts were presented by a Hindu of the Penin- sula as having been tried and found efficacious:—

In the dense darkness, at the time of new moon, let the person who would obtain a devil, walk naked into a lake, and, standing in the water up to his middle, repeat the mantra (a charm pre- viously taught him by some proficient) the appointed number of times, taking care of his reckoning by casting into the water a pebble, a jasmine flower, or a pepper-corn, from a collection which he has previously counted and brought with him. At every repetition of the mantra, let him give himself a stroke with a rattan. The charm is to be repeated boldly, and without mistake, or the devil will certainly kill the charmer.

Or, go to the temple sacred to the demon whose services are required. Having closed all avenues by which so subtle a subject may escape, stand on the threshold of the temple, and boldly conquer the demon by a powerful mantra. Then you must raise the pedestal on which the image of the demon is placed, and take from under it the money placed there when the image was inaugur- ated. Instead of this money place there a copper plate, on which you have engraved a kolam (magical inscription). From that day the demon becomes your slave, and will perform for you any service, or bring you whatever you may require. Some say the spirit must, when caught, be con- fined in a little golden box, called a Simil. Exami- nation of a manuscript book of spells, kolam, and cabalistic figures, collected by a Tamil man of low caste, shows that very [redacted] cantations commence with the Om! or the mantra 'Nama Sivayam,' to Siva. The invocation is never addressed to either Brahma or Vishnu. The following is a specimen of a charm given by Mr. Murdoch:—

'Om! Adoration to the supreme power,
Kali ratri, black night!
To whom the bloody flesh of man is dear;
Whose very form is fate and death;
Seize, seize on the life of such a one.
Drink blood! drink blood!
Devour flesh! devour flesh!
Make lifeless! make lifeless.
Hum! Phut!'

The highest Brahman authorities have taught that the case of the devils themselves is not al- together hopeless. There is a well-known aphorism in the Sankhya, which is illustrated by the story of a devil (Pisacha), who was enlightened and ob- tained felicity by overhearing the religious dis- course between Krishna and Arjuna. Burns, it will be remembered, expresses a like hope for the 'puir deil'—

'But fare ye well, Auld Nickie ben!
O wad ye tak' a thought and men'!
Ye aiblins might—I dinna ken—
Still ha'e a stake;
I'm wae to think upon your den,
Ev'n for your sake.'

With the Burmese, the six lower heavens are occupied by Nat or Dewa, where good kings and virtuous people reside, and the Tha gyah min, or king of the Nat, visits the earth for three days at the beginning of the Burman year, 9th to 12th April. Perfectly distinct from these are the Nats of the house, the water, the air, and the forest. The Nats are everywhere worshipped, but this is denounced by devout Buddhists. With the Karen all nature is filled with Nats; and the Ka-Chin provide the Nat with pipes of spirit, sacrificed animals, hatchets, spears, bows and arrows, which

the Nats may use at their pleasure. In all Burma, especially among the Talaing or Mon (Mohn), and in the neighbourhood of the Geniolatric tribes, at the extremity of every village, the Yua-sohn, there is a Nat-sin, a shrine of every dimension, for the Nats of the neighbourhood, at which lamps, water-pots, and food are offered, with figures of Shway Pyin-gyi, Shway Pyin-nge, the Nyi-daw, etc.

The Koh soung Nats, twelve in number, six good and six bad, six male and six female, provide a genius for each person. Min mahgyi is the guardian Nat of the house, and usually takes up his abode on the top of a house post, a pot of water being kept in the verandah for his use. Each village also has a guardian Nat. None of the lower class of Talaing would think of eating a morsel without first holding up his platter in the air and praying to the village Nat.

The spirit Moung Iwn Gyi is greatly feared. He lives in water, and causes death. They believe that persons who are executed, or have met with a violent death, become Nats, and haunt the places where they were killed. Every district has a Nat thoo-nge or spirit woman, called Nat-mehmma, who is consulted, and who dances at the Nat feasts.

With the Burmese, on the foundation of a new capital, there are always a certain number of people buried alive. They are supposed to become Nat-thehn, that their spirits haunt the place where they were put to death, and attack [redacted]aching with malevolent intention when the foundations of Man[redacted] were laid, fifty-two persons were entombed, three under each of the twelve city gates, one under each of the palace gates and at the corners of the timber stockade, and four under the throne itself. By 1880 the virtue had largely evaporated, and it was resolved to replace them by six hundred victims; but the outcry in Europe restrained the king, and only a small number were sacrificed.

The Muhammadans of the S.E. of Asia believe in spirits, and in the science of dawat or exorcism, to which they have recourse to command the presence of genii or demons who, when it is required of them, cause anything to take place. The genii spirits are believed to reside in the lowest firmament, and possess the power of rendering themselves visible to human beings in any form they please. The evil spirits are called shaitan. The spirits of all Muhammadans are supposed to rest in the graves till the resurrection; being laid in the grave, the two angels on Nakir and Mankir interrogate the departed as to his life. Dogs, women, and horses are not allowed inside their burial-grounds. Annually, oblations, called Ooroos, are offered in the name of Mahomed, or in the names of the Pir or spiritual guides, or in the names of the Wali or saint. Khajah Khizr, a Muhammadan saint, often appears to travellers in different guises, but generally as an old man. The people of Sind believe in the Rijal-ul-ghaib; in Jin or genii; in Bhut, ghosts or disembodied spirits; in Ghul, or demons of the wilderness; in Pari, fairies; and in Dev, Rakas, and Pap, powerful fiends, corresponding with the Arab 'Marid.' The Dakini is the same as the witch of Europe, usually an old woman, decrepit, poor, of humble family, and angry disposition. She has the power of turning men into beasts, killing cattle, flying to any distance on a tree by reciting a maud (magical formula), and mounting a hyæna. The Bandh and Mann are frightful beings, half-female, half-hellish. They live in the hills and jungles, where they frequently appear to travellers, are covered with hair like bears, have large pendent lips, and live on fruits and herbs. The Shir is a creature of Satanic nature. He, generally speaking, appears like a low-caste man, very dark, tall, and frightful; sometimes as a headless body. He lives in the makām or burial-ground, where he lights fires, and amuses himself by throwing the brands about, frightening folk by vociferating their proper names, or pursuing them in the form of some beast. Hence their fear of approaching a burial-ground by night. The shaitan of Sind is only seen by learned and religious men; to them he appears as a young man of white complexion and handsome form, which he can change at discretion. In Sind, popular superstition has created the Marhun Machhi (mermen and mermaids). The science of Osteomancy is the Ilm-el-Aktaf (knowledge of the shoulder-blades) of the pagan Arabs and some Bedouin tribes of the present day, the Ilm-i-Shaneh of the Persians and Afghans, and is known to the shepherd Sindi and Baluchi by the name of Phannia-jo-fannu. The instrument of divination is the scapula of a sheep divested of its muscles and integuments, the speal-bane of the Scotch. The Ilm-i-Kāf, or palmistry, is common among Muslims and Hindus, but better known i[redacted] than in Sind. The Sona-jo-Ilm, or know[redacted] omens, taken from the flight of birds, the [redacted] ance of beasts, and other similar phen[redacted] closely resembles the art of the Indian [redacted] The Baluchi are considered great adepts [redacted] branch of the occult sciences, and the[redacted] have a short treatise upon the subject [redacted] Sungun-namo.—*Rajasthan*, ii. p. 662; *Scinde; Ward's Hindoos*, ii. p. 140; *Forbe[redacted] mala*, ii. 378; *Lubbock's Civilisation; The L[redacted]*

SPITI is a subdivision of the Kangra [redacted] of the Panjab; area, 2100 square miles, c[redacted] of an outlying Tibetan valley among the [redacted] ranges of the Himalaya, between lat. 31° 4[redacted] 32° 58′ N., and long. 77° 21′ and 78° 32′ E.; its [redacted] lies at the point of convergence of the Kanzam ridge and the outer Himalayas, while the transverse ridge of Manirang, dividing the Kangra district from Bashahr State, forms its base. The higher peaks of the main chain rise 20,000 to 23,000 feet above sea-level; and even the villages stand at from 12,000 to 14,000 feet.

The population of Spiti in 1868 amounted to only 3024 persons, almost exclusively of Tibetan origin. The people belong to a kindred race with those of Lahoul. The language is almost identical, but the customs and religious institutions are not analogous. Spiti is approached from British territories and Kanawar by six different routes, and from Ladakh and Tartary by three routes, through the two chains of mountains. Many of the passes vary from 14,000 to 18,000 feet. The exports are wool, borax, salt, and blankets; and the imports are articles from the plains, and a great deal of iron. The resources of the land are locked up for more than six months in the rigorous winter. The inhabitants are obliged to repair during this inclement season to the lower and more genial latitudes in the valley of the Sutlej. The produce of the land in

Lahoul and Spiti does not suffice for the wants of the population. The people of Lahoul import grain from Kulu, and the valley of the Sutlej supplies the additional demands in Spiti. The barley of Spiti is hexagonal or six-sided, and the grain large and succulent. A liquor, called chang, is distilled in Spiti from barley, and sold at 30 puttahs for the rupee. A puttah is a liquid measure of 2 seers = ¾ of a pucka seer. They consume large quantities. Chang can be made from other grains besides barley; that made from rice is superior. The wealthier classes in Spiti, etc., use a weak spirit, called arrack, which is distilled from rice. When a person dies, the body is buried or burnt, or thrown into the river, or cut into small pieces and burnt; admonitions are made over the body to the departed spirit, such as, Do not trouble yourself, you cannot enter it (meaning the dead body); in summer it quickly becomes corrupt, in winter it freezes, and is too cold for you.—*Powell's Handbook; Gerrard's Kanawar*, p. 112; *Imp. Gaz.*

SPONDIACEÆ, the hog-plum tribe of plants, comprising species of the genera Spondias and Poupartia. They are natives of the East and West Indies, the Society Islands, and the Isle of Bourbon. The fruit of some of the species is eatable.

SPONDIAS ACUMINATA. *Roxb.* Ambut, DUKH. A most elegant middle-sized tree, with shining leaves. It grows on the western side of India, in all the coast and inland forests. The [illegible] its natural state is not of any value, [illegible]ld be creosoted with advantage.—*Roxb.*; [illegible]; *Riddell.*

[illegible]NDIAS DULCIS, *G. Foster*, of the South [illegible]ands, is a noble tree, growing to 60 feet in [illegible]. Its fruit, the 'rewa,' weighs over 1 lb., [illegible] delicious flavour.

This large tree grows in various parts of India, Ceylon, China, and Burma. The wood is soft, and of little use except for firewood. From wounds made into the bark, in the beginning of the hot season, very large quantities of a transparent juice issue, which soon hardens into a mild insipid gum, like gum-arabic. The fruit got its name from its resemblance to a mango, but it is harsh and little deserving of notice; on the Malabar coast, the root is considered as an emmenagogue; the bark is supposed to be of use in dysenteric affections, and a decoction of the wood serviceable in gonorrhœa. The Karens have a tradition that in those golden days when God dwelt with men, all nations came before him on a certain day, each with an offering from the fruits of their land, and the Karens selected the hog-plum for their oblation, which gave such offence, that God cursed the Karen nation, and placed it lowest among all the nations by whom they are surrounded. The fruit is eaten raw when ripe, and before ripe is pickled, put into curries, made into tarts, etc. The fruit when fully ripe is of a pale-yellow colour, of a pleasant flavour, but a little too acid. The sour leaves are used in chatnis. In China, juice of the fruit enters into several nostrums for the hair, the glory of the Chinese men and women.—*Roxb.*

There are several genera of sponge animals, which naturalists arrange under the class Porifera, as Spongia, Spongilla, Halichondria. There are many species both in fresh and in sea waters, but that used for economic purposes is from Spongia officinalis, *L.*, of the Mediterranean, known as Turkey sponge, and the W. India or Bahama sponge, from Spongia usta.

The substance used as sponge is traversed by many canals, the pores of which open out on the surface. The canals, in life, are lined with a soft gelatinous matter up to the opening of the pores, and the pores are kept open by numerous siliceous or calcareous spicula, needle-like bodies. Whilst the animal is alive, the water, entering into the sponge by the pores, circulates in the canals, and is finally expelled through the larger orifices.

The sponges used in Europe are known in commerce as the fine Syrian, fine Archipelago, fine hard or Grecian, white sponge, gelatine sponge, brown sponge of Barbary, also called Marseilles or Turkey sponge, the Spongia communis of naturalists, which is fished on the coast of Tunis, and used for cleaning rooms, and the sponge of Salonica.

Turkey sponge, the Spongia officinalis of Linnæus, of the natural order Spongiæ, is the peculiar skeleton, whole, and is produced in southern and eastern seas, though imported into Great Britain from Turkey. The imports are in cases, each containing about 500 sponges of various sizes, averaging in value about 35s. per pound. The finer kind, suitable for toilet use, is found in the Levant,—the best on the coast of Northern Syria, near Tripoli, and secondary qualities among the Greek isles. These are either globular or of a cup-like form, with fine pores, and are not easily torn. They are got by divers, who plunge from a boat many fathoms down, with a heavy stone tied to a rope for sinking; the man snatches the sponges, puts them into a net fastened to his waist, and is then hauled up. Some of the Greeks, instead of diving, throw short harpoons attached to a cord, having first spied their prey at the bottom through a tin tube with a glass bottom immersed below the surface waves.

The sponges of the coasts of Asia Minor and Syria are dived for by the people of Calymnos, Chali, Syme, and other islands near Rhodes, from May to October. In May a little fleet of caiques sets sail from Calymnos, manned by the greater part of the able-bodied of the male population, and they return in the autumn, and sell to their richer townsmen who trade in sponges, and these are despatched to Trieste, Syria, or Smyrna. A

diver can descend to 30 fathoms, and remain for three minutes. A caustic fluid at the root of the sponge is apt to cause ulcers. They are cleaned and dried in the fields, and then filled with sand to ensure equality of sales. Numerous species are known, with soft porous bodies, traversed by tortuous canals, but the officinal sponge is imported from the Mediterranean and Red Sea; some of the coarser kinds from the West Indies. Those of the British seas would probably answer equally well for burning. When collected, sponge contains numerous small fragments of corals and minute shells; from these it must be freed before it can be used. Sponge is composed of gelatine and coagulated albumen. When burnt, its ashes give carbon and some silex, carbonate and phosphate of lime, carbonate of soda, chloride and iodide of sodium, bromide of magnesia, with a little oxide of iron.

Coarse, soft, flat sponges, with large pores and great orifices in them, come from the Bahamas and Florida. A small schooner, towing several little boats, with two men in each, passes slowly over the sponge ground. One man sculls, the other squats, hanging over the boat's side, with his head in a bucket, the bottom of which is of glass. Through this he looks down into the deep, still water, and sees the sponges lying 20 or 30 feet below. Then, assisted by the other man, he aims a stroke with a three-pronged hooking-fork at the end of a long pole. The sponge is grappled and lifted into the boat. When the boats have loaded the vessel, the sponges lying on board, covered with a gelatinous mass, from which oozes a slime of disgusting odour, give forth a very disagreeable smell; but the animal soon dies. The sponges are laid out in the sand that this putrefying outer substance may rot off, after which they are roughly cleaned and scraped, pressed, and packed in bales. Much further washing is required, and a chemical process of bleaching. American sponges being so inferior to those of the Mediterranean, it has been sought to utilize them for the stuffing of cushions and mattresses, or for the felting of hats and winter coats, but with poor success.

Sponge is gathered from the rocks of Vizagapatam at about 12 feet below the sea.

Assistant-Surgeon Carter, of the Bombay army, described four species of fresh-water sponges in the tanks of Bombay. They are attached to floating bodies, or on the inclined and under surfaces of the rocks, never at the bottom, and sometimes so high up as to be covered with water only for three or four months.

In the Sea of Japan, a very remarkable sponge (the Hyalonema) is met with. It is a bundle of spicules, like threads of glass, which seem artificially tied together, and on the surface of which is invariably found a polyp of the genus Polythoa.

The remarkable hooked, branched, or star-like spiculæ in many sponges are believed to have the function chiefly of rendering them unpalatable to other creatures.

The sponge-making animal, like some other zoophytes, can be multiplied by cutting it in pieces, leaving each piece to live and grow by itself. It is stated by Dr. Oscar Schmidt, of the University of Gratz, that in three years, at a cost of £8, 8s., 4000 sponges can be raised, worth £16, which would seem to be a profitable industry.—*Phipson; Carter.* See Venus Glass Flower.

SPONIA ORIENTALIS. *Roxb.*

Papyrus sphærica, *Kœmpf.*	Celtis orientalis, *Roxb.*
Chicolee, . . . BENG.	Moralf chettu, . . TEL.
Jeebun, ... „	Budu manu, . . . „

A small erect tree of Ceylon, the Coromandel coast, common along the foot of the ghats, occurring in the Kenneri forests, Salsette, in Nepal, Bengal, Sylhet, and Assam. The under bark consists of numerous reticulated fibres, and forms a natural cloth used by the Garo race, and its leaves are used for polishing horn.—*Roxb.; Voigt; Flor. Andh.; Mr. W. Jacob.*

SPONIA POLITORIA. *Planch.* A plant of the Darjiling Terai, Sikkim, Oudh, Salt Range. Wood used for charcoal, leaves to polish wood and horn.

SPONIA WIGHTII. *Planch.*

Kanghi . . of AMBALA.	Mini, ... TAM.
Marni . . . of BEAS.	Gadda nelli, . . TEL.

This tree is common throughout the Presidency of Madras, and is occasionally planted by coffee planters for shade because of its rapid growth; it ascends the mountains to above 5000 feet elevation. The wood is soft and white, but makes about the best charcoal for gunpowder. This tree springs up in all places where heavy, moist forests are cleared away for coffee or other purposes, although there may not be a plant of it within miles. It occurs as a small tree very sparingly in the Siwalik tract up to the Beas, and occurs also in the Salt Range occasiona[lly] of the Jumna; in some parts of India, its [sin]gly harsh, rough leaves are employed t[o] wood and horn.—*Stewart; Powell; Bed. F[l.]*

SPOOKDIER, DUTCH, the ghost ani[mal] Menado, is provided with sharp-nailed t[oes] four legs for climbing in trees. It is ab[out] inches high, covered with greyish hair; ha[s] flabby ears, piercing eyes, and a long, thin t[ail] which the hair stands out at right angles.

SPRENGER, ALOYS, M.D., a medical [officer] of the Bengal army; a philologist; a nat[ive] the Tyrol, and born about the year 1813. [He] arrived in Calcutta in September 1843, a[nd] 1845 was appointed Principal of the Dehli Colle[ge]. He translated Masudi's Meadows of Gold, edited Abd-ur-Razaq's Dictionary of Sufi Terms, and superintended the translation into Urdu and printing of about thirty books of science and history. In 1848-49 he drew up a catalogue of the library of the king of Oudh, about 10,000 MSS. volumes of Arabic, Persian, Pushtu, and Hindustani. He wrote an incomplete life of Mahomed, 1851; a Dictionary of Arabic Technical Terms; Ibn Hajur's Biography of Persons who knew Mahomed; and other works.

SPRINGS. The Aryan Hindu and the non-Aryan tribes who occupy British India, continue to worship springs and fountains, and other natural objects. This has been a custom with many races. The fountain of Egeria, the Fontinalia Romana, the Aquæ ferentinæ, and the sacred wood where the Feriæ Latinæ were celebrated, were under the especial protection of some divinity. Pausanias says that at Phocis in Achaia, there was a fountain called Hama, consecrated to Hermes, near which thirty enormous straight stones had been erected at a very remote period, when, instead of images, the Greeks adored blocks of stone. Such was also the religion of pagan Ireland.

There are ten hot-water ponds within two miles of the old town of Ataran, with a temperature of 130° Fahrenheit. At the forks of the Tenasserim about four miles below Matah, are hot springs highly charged with sulphuretted hydrogen gas.

On the margin of the granite range east of Tavoy are many saline thermal springs, with temperature up to 196°.

A mineral spring is described in the Saugor taluk, Nuggur division of Mysore.

Around Hazaribagh, for about 130 miles in every direction, many places are literally teeming with hot springs.

Other springs, several of them sulphurous, others thermal, occur in the Salt Range; at the base of the Himalaya; in Northern and Western Sind; in Gujerat; in the valley of the Nerbadda, and in the Konkan.

There is a sulphurous spring at Chaunch near the terminus of the Grand Trunk Road; and three miles off a much more abundant and hotter one, called Tantloie, on the banks of the Damuda; also hot springs at Lakarakunda and at Kisshun, Bun, Buklesir, and Sita Kund at Monghir.

The Zungsum mineral springs, beyond Kanawar, are impregnated with salt, alum, and iron.

The Koop or mud volcanoes of Rama Chandra are at Hinglaj, west of Kurachee, and others at Cheduba. There are hot springs at Pir Muggen, others at the Lukkee pass, and the Garm-ab is in the Bolan pass.

Chalybeate at Nagconda.

SPRUCE, DR., an eminent botanist, native of Welburn in Yorkshire, who aided Mr. Clements R. Markham, C.B., in introducing cinchona plants into British India, 1860–1865. The British Government in 1877 rewarded him with a pension of £50 a year.—*Markham.*

SPRY, HEN. H., a medical officer of the Bengal army, distinguished for his scientific attainments. Suggestions for extending the Cultivation and Introduction of Useful and Ornamental Plants, with a view to the Improvement of the Agricultural and Commercial Resources of India, Calcutta 1841.

SQUALIDÆ, a family of fishes of the section Chondropterygii, which includes the various species of sharks. The shark's body is elongated, tapering gradually from the head to the tail, or but little dilated in the middle. The male sharks are smaller, and differ externally from the females in possessing two elongated appendages, one of which is attached to the hinder edge of each of the ventral fins, the uses of which are not known. Some species of sharks bring forth their young alive, whilst others are enclosed in oblong semi-transparent horny cases, at each extremity of which are two long tendrils. These cases are frequently found on the sea-shore, and are called sea-purses, mermaids' purses, etc. They are deposited by the parent shark near the shore in the winter months. The convoluted tendrils, hanging to sea-weed or other fixed bodies, prevent the cases being washed away into deep water. Two elongated fissures, one at each end, allow the admission of sea-water; and the young fish ultimately escapes by an opening at the end near which the head is situated. For a short time the young shark continues to be nourished by the vitelline fluid contained in the capsule attached.

to its body by the connecting pedicle, till, having acquired the power of taking food by the mouth, the remains of the ovum are taken up within the abdomen, as in birds and some other animals. See Sharks.

SQUILL, Urginea maritima, Sea Onion.

Ansul, ... ARAB.	Kanda, . . . HIND.
Pen-lay-pa-dein, BURM.	Scilla, . . . POR., LAT.

Meerzwiebel, . . . GER.	

Squill is a perennial bulbous-rooted plant found on the shores of Spain, Portugal, north of Africa, the Levant; and one species occurs on the coasts of India. The bulbs are pear-shaped, and vary in size from that of the fist to the compass of a child's head. The root is very nauseous, intensely bitter, acrimonious, and causing inflammation when rubbed on the skin. It is one of the most useful remedies in the Materia Medica.—*M'C.; Faulkner.*

SQUILL, COUNTRY. Scilla Indica, *Roxb.*

Ansul, Iskeel, . . ARAB.	Nurri vangayum, . TAM.
Kanda, Junglie piaz, HIND.	Nurri vunjayum, . ,,
Peyaz-i-dhashtia, . PERS.	Addivi-tella gadda, TEL.
Nurriala, . . . SINGH.	

The Indian squill resembles the true squill in medicinal virtues. Farriers are in the habit of using it, in conjunction with other articles, for horses, in cases of strangury and fever. It grows in abundance in waste, sandy soils.—*Ains.*

SQUIRRELS belong to the genus Sciurus. The E. Indian species are—Malabaricus, maximus, Elphinstonei, macrouroides, macrourus, lokriah, barbei, Europæus, laticaudatus, lokriodes, palmarum, tristriatus, Layardi, sublineatus, M'Clellandi, ephippium. Sc. Layardi eats the coffee berries; it is common in Ceylon; the pulp alone is digestible, and the coffee-beans are dropped on logs of wood and on the ground. Sc. Tennentii is peculiar to Ceylon. Its dimensions are large, measuring upwards of two feet from head to tail. It is distinguished from the Sc. macrourus by the predominant black colour of the upper surface of the body, with the exception of a rusty spot at the base of the ears.

Sciurus maximus is the Malabar squirrel. Its upper parts and external surface of the limbs are of a bright chocolate-brown colour. Length about 33 inches, of which the tail measures rather more than one-half. This richly-coloured species is the largest of the true squirrels. It haunts among palm trees, and is stated to be very fond of the milky juice of the cocoanut, as well as of the solid part of the nut. In captivity, it is tame and familiar; but it tries its teeth upon most substances that come within its power, and should be guarded against accordingly.

Sciurus macrouroides, *Hodgs.*, a gigantic squirrel, abounds throughout the Burmese countries and Malayan Peninsula, and northward to the Assam Hills and those of Sikkim and Nepal. It has a pale variety in the Malay Peninsula.

Sciurus macrourus, *Forster*, the common large squirrel of the western districts of Ceylon, also met with in Travancore and other neighbouring districts of continental India, becomes extremely tame, chiefly perhaps remarkable for its singularly loud and harsh voice. Indeed, the voice would seem to be an excellent criterion of specificial distinction among the Sciuridæ. This animal carries its tail in the same peculiar manner, curled round on one side, as is observable in Sc. purpureus and Sc. bicolor, and doubtless all others of the same group.

Sc. Elphinstonei is the red squirrel of the Western Ghat. They soon become very tame. The palm squirrel, also, Sc. palmarum, soon becomes very tame.

One group of the squirrels, of large size and rich colours, is peculiar to S.E. Asia as far as Borneo, some of them wherever there are large and lofty forests.

Flying squirrels are species of the genera Pteromys and Sciuropterus—

Pt. magnificus, *Hodgson*, S.E. Himalaya.
Pt. inornatus, *Is. Geoff.*, N.W. Himalaya.
Pt. cineraceus, *Blyth*, Burma.
Pt. elegans, *S. Muller*, Java.
Pt. nitidus, *Geoff.*, Pen. Malacca.
Pt. petaurista, *Pallas*, Pen. India.
Pt. Philippensis, *Gray*, Philippines.
Sciuropterus alboniger, *Hodgson*, Nepal.
Sc. caniceps, *Gray*, Nepal, Sikkim.
Sc. fimbriatus, *Gray*, Himalaya.
Sc. fuscocapillus, *Jerdon*, Travancore.
Sc. villosus, *Blyth*, Sikkim, Bhutan.
Sc. spadiceus, *Blyth*, Arakan.
Sc. Phayrei, *Blyth*, Pegu.
Sc. genibarbis, *Horsf.*, Malayana.
Sc. Horsfieldii, *Waterhouse*, Malayana.
Sc. sagitta, *L.*, Malayana.

With the flying squirrels, the skin of the flank is extended between the fore and hind feet, forming, when expanded, a wide parachute. They have long, bony, or cartilaginous appendages to the feet, which serve to support the lateral membrane. Pt. petaurista lives principally on fruits; it and Pt. inornatus have been seen take a flight of sixty yards.—*Blyth; Jerdon; Tennent.* See Sciuridæ.

SRADDHA. SANSK. Faith. In Hindu mythology, daughter of the sage Daksha, wife of the god Dharma, and reputed mother of Kama deva, the god of love.

SRAD'DHA, as commonly understood, are obsequies paid by Hindus to the manes of deceased ancestors, to effect, by means of oblations, the re-embodying of the soul of the deceased after burning his corpse, and to raise his shade from this world (where it would else, according to the belief of the Hindus, continue to roam among demons and evil spirits) up to heaven, and then deify him, as it were, among the manes of departed ancestors. In the ceremony, food and water are offered to the deceased ancestors of the sacrificer, or to the Pitri or manes collectively. The *Preta* or *Dasa-pinda* Srad'dha is an offering of a ball of rice to a deceased person, by the next-of-kin, increased by one daily, for ten days. The *Adya* Srad'dha is the first obsequial ceremony after a person's decease. The obsequies performed monthly, on the day of the new moon, are called *Anwaharya* Srad'dha. The social or legal uncleanness of the Hindu is called Asauch, and occurs from the death of a relative or the like. The day preceding a Srad'dha is held as a fast-day, and called Ativasa. The Ekadasi Srad'dha is a presentation of offerings on the 11th day after demise. The Masika, or Anwaharya, is performed monthly for a year on the day of demise, and the Sapinda or Sapindi Karana on the first anniversary of a person's death. The Abhyu dayaka Srad'dha,

is an offering to deceased ancestors, or to the manes collectively, on some prosperous event, as the birth of a son or the like. The proper seasons for the worship of the manes collectively are the dark fortnight or period of the moon's wane, the days called Ashtakas, or the eighth lunations of the dark fortnight of the four months of the cold weather, the summer and winter solstices, and vernal and autumnal equinoxes. The idea involved is a belief in the prolonged separate existence after death of the body of the spirit or ghost that it may hover about its former dwelling, and be gratified by offerings of food. It consists of three distinct rites,—(1) the daily Srad'dha in propitiation of the ghosts of remote ancestors (pitri); (2) the monthly Srad'dha, for immediate paternal ancestors; (3) the funeral Srad'dha, for a near kinsman, within a certain period after death.—*Coleman*, p. 162; *Moor*, p. 75; *Wilson's Glossary*. See Hindu; Shraddha; Spirit-Worship.

SRAMA, the performance of asceticism. Sramana, a Buddhist monk, in Burma called Phoungye, in Siam a Talapoin. Sramana is the appellation of the Buddhist and Jaina ascetics, known to the later Greeks as Sarmanes, Sarmanæ, or Germanes. The ordinary application of the word Brahman means a theologist or divine, and [illegible] derived from Brahm, the divinity.—*Strabo*, [illegible] pp. 7-20.

SRAOSHA, in Parsee belief, an angel who appeared to Zoroaster.

SRAVAKA, a layman of the Jaina persuasion, [illegible] Savanga Dhamma laho hodu, or Sravaka Dharma labha bhavatu, as used by Jivasiddhi in [illegible] place, are the ordinary salutations a Jati or [illegible] Jain proffers to the laity.

SRAVANA. Sansk. The fourth month of the Hindu solar year, July—August, when the [illegible] in the sign Carcataca, answering to the [illegible] Audi; also the fifth month of the luni-[illegible] year, owing to that sort of year beginning [illegible] Chaitra. The fifth of Sravan is the Nagpan-[illegible] or day set apart for the propitiation of the [illegible] the reptile race, the Naga or serpent. On this festival at Udaipur, as well as throughout India, they strew particular plants about the threshold, to prevent the entrance of reptiles. Sravana, also the 22d lunar mansion.

SRAVANA-BELGOLA, a village in the Hasan district of Mysore, 35 miles from Chenraipatam, and 33 miles N. by W. from Seringapatam. Close to the village, on the summit of Chandrabetta, a syenite hill 500 feet high, is Gomateswara, a nude Jaina image 70 feet 3 inches high, which must have been cut from the solid rock; the arms and legs are ornamented with wreaths of flowers, the features are pleasing, the hair curled, unlike that of the natives of India. A pagoda has been built round the image. Even at the present day the Jains are numerously represented in the village of Sravan-belgola, which they are locally reported to have colonized during the reign of Chandragupta in the 3d century B.C. On the hill of Indrabetta in this neighbourhood are many ancient temples and inscriptions cut in the rock, with characters a foot long. The Ballala dynasty lasted from the 10th to the 14th century A.D. Their capital was Dwaravati-pura, the ruins of which are still to be seen scattered around the village of Hallabid. The earlier kings professed the Jain faith, but the finest temples were erected to Siva by the later monarchs of the line. While the Ballalas were at the zenith of their power, the whole of Southern India acknowledged their sway. In 1311, a Muhammadan army under Kafur, the general of Ala-ud-Din, sacked Dwaravati-pura, and returned to Dehli laden with spoils. The Ballala prince escaped to Tondanur in Mysore, and the dynasty continued to exist for sixty years more.

SRAVASTI, in Pali Sawatthi or Sewet, a city in ancient Oudh, now called Sahet-Mahet. It is on the Rapti, and is famous for Buddha's preaching. Its position, though one of the most celebrated places in the annals of Buddhism, long puzzled the best scholars. The ruined city of Sahet-Mahet is situated between Akaona and Balrampur, at 5 miles from the former and 12 miles from the latter, and at nearly equal distances from Bahraich and Gonda. Sravasti is said to have been built by Raja Sravasta, the son of Yuvanaswa of the Solar race, and the tenth in descent from Surya himself. Its foundation therefore reaches to the fabulous ages of Indian history long anterior to Rama.—*Cunningham's India*, p. 408.

SRI, a name of Lakshmi, the goddess of prosperity, the Ceres of the Latins, but is also very frequently used as an adjective, meaning illustrious. Sri is the Venus Aphroditus of the Indians, born like the Grecian Venus from the sea. Sri is often written Sree, Shri, and Shree. It is prefixed to the names of Hindu deities, Srimata, Sri-swami. All Hindu books are commenced with this word, written at the top of the first page, as an invocation to Ganesh, the god of learning, to favour the undertaking. It is similar to the Greek and Roman invocation of Jupiter, the alif initial at the top of the first page by the Muhammadans, the Laus Deo of the Christians. Sri is now a Hindu honorific appellation, answering to Lord when applied to deity, and Mr. when used for man. Sri Rangapatnam is the Hindu name of Seringapatam. In all letters to Hindus, Sri is prefixed as an honorary appellation; and if the writer wish to be very respectful, he will repeat the word two or three times, as Sri, Sri! Jayaram. According to the Hindus, every city has its own Sri, its own fortune or prosperity, which in former times seems to have been represented by an image with a temple of its own. The practice amongst the ancients of considering a city under the protection of a well-known divinity is more familiar to Europeans, but an analogous superstition with that of the Hindus also prevailed amongst the polytheists of Europe. Thus in the seven chiefs before Thebes, the Theban women seek their shrines of the gods who are the guardians of the city.—*Hind. Theat.* ii. p. 64. See Krishna; Lakshmi.

SRI-CHUND, a son of Nanuk, founder of one of the sects of the Sikh faith. See Sikh.

SRI-DAMA-CHARITRA, a modern drama in five acts, by Sama Raja Dikshita, on the sudden elevation to affluence of Sri Daman, a friend of Krishna.—*Dowson.*

SRI DANDI, author of the Kavya Darsa or Mirror of Poetry, a work on the Ars Poetica.

SRI DHARA SWAMI, author of commentaries on the Bhagavat Gita, Vishnu Purana, etc. —*Dowson.*

SRI-HARIKOTTA, an insulated jungle tract of alluvium and marine deposit, in the Nellore district of the Madras Presidency. It lies between the Pulicat lake and the sea, stretching from Coromandel to Durgarazpatnam; and it contained in 1871, 13,578 inhabitants. Its people, the Yanadi, are a wild race, and speak a dialect of Telugu. When they first came under the notice of the British authorities in 1835, they lived upon roots and jungle produce; but they have been partially reclaimed since then, and now maintain themselves by cutting firewood.—*Imp. Gaz.*

SRI HARSHA lived in the 11th or 12th century A.D. He was a sceptical philosopher, author of the Naga-Nandana, a drama in five acts, which has been translated by Boyd. He also wrote the Uttara Naishadha-Charita or Nai-Shadhya, a poem on the life of Nala, king of Nishadhiya; it is one of the six Maha-Kavya or great poems of the Hindus. Sri Harsha's Neshadha relates the marriage of Nala, king of Neshadha, with Damayanti, daughter of Bhima, king of Vidarbha. It is esteemed the most beautiful composition in the Sanskrit language. Nalodaya wrote a continuation of it. The adventures of the couple constitute an episode in the Mahabharata, and are the subject of a novel in prose and verse by Trivikrama Bhata, entitled Nala-Champu or Damayanti Kat'ha. The Nala and Damayanti was translated into English by Mr. Kindersley of Madras.—*Dowson; Ward*, iv. 386.

SRI-KANTA, a mountain peak in Garhwal State, N.W. Provinces, lying in lat. 30° 57′ N., and long. 78° 51′ E., enclosed by a great bend of the Bhagirathi river; it is a sharp and lofty peak, 20,296 feet above sea-level, visible from Saharanpur, a distance of 105 miles in a straight line.

SRI-KRISHNA is the 9th, and Sri-Rama the 7th, incarnations of Vishnu, as a Kshatriya and a Dwarf Brahman. The anniversaries of these incarnations are observed.

SRI-MAHADEVI, mother of Sankaracharya, expelled her caste for adultery.—*As. Res.* xvii.

SRINAGGUR, in lat. 34° 31′ N., long. 74° 51′ E., the capital of Kashmir, is 5276 feet above the sea, in the valley of the river Jhelum, which divides the city into two equal parts, that are connected by seven bridges. The average breadth of the river is about 887 yards, and its depth during the summer season is about 18 feet. The city is surrounded by low, swampy tracts, which render it unhealthy. The population numbers about 150,000,—20,000 being Hindus, and the remainder Muhammadans. There are many places of historical interest, made famous by Asiatic and European writers. It contains the tomb of the mother of Zain-ul-Abidin, who died in the 15th century; the shrine of Syed Ali Hamadani, and the Jama Masjid, capable of holding 60,000 persons. The Takht-i-Suliman Hill overlooks the city. On the top is a shrine called the Sankaracharya temple, originally Buddhist, built by Jaloka, son of Asoka, about B.C. 220. Hari Parbat, an isolated hill on the northern outskirts of the city, is about 250 feet high, and is crowned by the fort and surrounded by a wall 20 feet high, both built by Akbar about A.D. 1590, at a cost of a million sterling.

The Sher Garhi, within the city, contains the royal palace.

The Dal or lake of Kashmir, on the N.E. side of the city, is about 5 miles long, 2¼ miles broad with an average depth of about 10 feet.

The Shalimar Bagh was laid out by Jahangir; the Nasib Bagh, another picturesque pleasure-ground, is said to have been first planned by Akbar.—*Imp. Gaz.*

SRINAGGUR, the capital of Garhwal, in lat. 30° 14′ N., and long. 78° 37′ E., was built in the 16th century, formerly the residence of the rajas. It is on the south bank of the Alaknanda, about 20 miles above its junction with the Bhagmutty at Deo Prague, where a strip of level ground stretches along for three or four miles, forming the valley known by the same name as the town. The people of Garhwal are Bhot, dwelling in the passes and their neighbourhoods, at heights above 6000 feet. The pass-men state that ridges which, within the memory of man, were covered with forest and pasture lands, are now covered with snow, showing the extension of the snow zone. The Bhot, here as elsewhere, is an agriculturist, and is assisted by slaves, who live under the roofs of their masters.

SRINGAVERA, the modern Sungroor, a village on the north bank of the Ganges, in ancient times inhabited by Nishada wild tribes, of whom Guha was the chief, by whose assistance Rama, Lakshmana, and Sita were ferried over to the south bank of the Ganges, a day's march above its junction with the Jumna.—*Hind. Theat.* i. p. 300.

SRINGIRI (or Sringa-giri) is in the Kadur district of Mysore, on the edge of the Western Ghats, in lat. 13° 25′ 10″ N., and long. 75° 17′ 50″ E., on the left bank of the Tunga river. Population (1871), 1661. In the 8th century, Sankaracharya settled here, bringing, it is said, from Kashmir, the image of Saradamma or Saraswati. The spiritual throne which he founded has been handed down to the present day. The Magani of Sringiri, in the upper valley of the Tunga, forms an endowment of the math or monastery over which the guru presides, and a monthly grant of £100 is allowed in addition by the Mysore State. Several large festivals are held during the year, each attended by from 3000 to 10,000 people, who are fed at the expense of the math.—*Imp. Gaz.*

SRIPADA or Serapada, or holy footprint, the name given in Ceylon to the footstep of Buddha, on the mountain Sumanakuta or Adam's peak, in lat. 6° 51′ N., and long. 80° 35′ E.; top of peak, 7385 feet, or 7420 feet; source of Kalu Ganga, 4345; bungalow, foot of Sripada peak, 5114 feet; lower limit of rhododendrons, on the slopes of Sripada, is 6550 feet. The Sripada is noticed in that part of the Mahawanso written by Mahanaama prior to B.C. 301. Models of it are shown in the Alu Wihara at Cotta and at other temples of Ceylon. The Buddhists are the guardians of the Sripada, but devotees of all religions meet here freely around the object of their common adoration, for Christians, Muhammadans, and Hindus have reverence for the impressions of feet. It is a natural hollow artificially enlarged, said by Buddhists to be the impression of a foot of Buddha. It is, however, called by the Hindus, Sripada or Sripad, meaning the divine footstep, Vishnu having, they say, alighted on that spot in his avatara of Rama. Hindus make pilgrimages to the Sripada in Ceylon and in other places, where similar proofs of an avatar or descent have been discovered

Christians and Muhammadans ascribe the mark to Adam, and claim that footmark as of their religious relics.—*India in the 15th Century.*

SRI PARVATA means the same as Sri Saila, the mountain of Sri or Lakshmi, a place of sanctity in the Dekhan, near the Kistna river. It still retains its sanctity, but has lost the splendour it formerly seems to have possessed by the extensive remains of sculptures on the mountain, and great labour and cost bestowed on the causeways by which it is approached. It is described by Col. Mackenzie (Asiatic Res. v. and vi.), and was afterwards visited by Dr. Voysey. In this temple was one of the twelve great lingas, the worship of which seems to have flourished particularly up to the period of the first Muhammadan invasion. Prior to the same date, also, it seems to have been a place of great resort for Yogis or Saiva ascetics. —*Hind. Theat.* ii. pp. 18, 277.

SRIPERMATOOR, about 30 miles from Madras, famed for its great Vaishnava temples.

SRIPHAL, the fruit of Ægle marmelos, so called by Hindu poets, because it sprang, they say, from the milk of Sri, the goddess of abundance, who bestowed it on mankind at the request of Iswara. Anona reticulata is called Ramphal, or the fruit of Rama. Anona squamosa is named Sitaphal, after Sita.

SRI RANGAM, an island and small village six miles north of Trichinopoly, formed by the bifurcation of the river Cauvery and by the channel of the Colerun. A dyke or anicut has been raised on its eastern side to prevent the waters of the Cauvery entering into the Colerun. On it is a magnificent pagoda of the Vaishnava sect, composed of seven square enclosures, 350 feet distant from each other. Each enclosure has four gates with high towers, placed one in the centre of each side opposite to the four cardinal points. The outer wall of this temple is not less than four miles in circumference. The idol is named Ranganiyangar, and the accumulated wealth in gold, silver, gems, and precious stones is valued at 12 to 15 lakhs of rupees. The hall of 1000 columns measures 450 feet by 130 feet. The number of columns is 16 in front by 60 in depth, consequently are not more than 10 feet apart. The care of the shrine is under vestrymen, called Dharma-karta, who aided the Editor to form a civil hospital at the place. From 1751 to 1755, the island and its pagodas were the frequent objects of the contests between the French and the British. In those contests, several rocks, the Golden, Pine, French, and Sugar Loaf were the points of the battles.—*Orme; Imp. Gaz.*

SRI SAMPRADAYA, a Vaishnava sect founded about A.D. 1150, by Ramanujacharya. He was born at Perumbur, and studed at Kanchi or Conjeveram, and afterwards resided at Sri Ranga. He then visited various shrines, propagating his reformed views, and reclaiming the shrines for the worshippers of Vishnu, particularly the celebrated temple of Tripati. The sect worships Vishnu and Lakshmi and their several incarnations. They keep the salagrama fossil and tulsi plant in their temples and dwellings, and set up in their houses images of stone and silver, which are daily worshipped. The temples appropriated to Vishnu and his consort are resorted to, and pilgrimages are made to Lakshmi-Balaji, Ramnath, and Ranganath in the south of India, to Badrinath in the Himalaya, Jaganath in Orissa, and Dwaraka on the Malabar coast. This sect in general prepare their food individually and in private, and if a stranger's look fall on the food, the cooking is stopped and the food buried. They must not eat in cotton garments, but, having bathed, must put on woollen and silk. Their chief religious tenet is the assertion that Vishnu is Brahm, that he was before all worlds, and was the cause and creator of all. In opposition to the Vedanta doctrines, they deny that the deity is now of form or quality, but regard him as endowed with all good qualities and with a twofold form, viz. the supreme spirit Paramatma or cause, and the gross one, the effect, the universe or matter. Their doctrine is therefore called the Visishthadwaita, or doctrine of unity with attributes. In these assertions they are followed by most of the Vaishnava sects. They assert three predicates of the universe, comprehending the deity; it consists of Chit or spirit, Achit or matter, and Iswara or god, or the enjoyer, the thing enjoyed, and the ruler and controller of both. Besides his primary and secondary form as the creator and creation, the deity has assumed, at different times, particular forms and appearances, for the benefit of his creatures. He is, or has been, visibly present amongst men in five modifications,—in his Archa, objects or worship, as images, etc.; in the Vibahava or avatara, as the fish, the boar, etc.; in certain forms called Vyuha, of which four are enumerated, viz. Vasudeva or Krishna, Balarama, Pradyumna, and Amruddha; fourthly, in the Sukshma form, which, when perfect, comprises six qualities. Blood-offerings at the temples are prohibited by all Vaishnava. Their reward for good acts is laid down as the perpetual residence in Vaikunt'ha or Vishnu's heaven.—*Professor Wilson.* See Mantra.

SRI-VAISHNAVA, a Hindu sect, worshippers of Vishnu, in the form of the four-handed image Lakshmi-Narayana, holding the sankha shell, chakra discus, gada club, and lotus flower. The byragi ascetics of the sect wear pewar or ochre-coloured clothes, have a kanthi or sacred garland around their neck, also a rosary of the tulsi ocimum. They are one of the four Sampradaya or Vaishnava ascetic byragi. These are four in number,—the Ramanandi, Nimanuji, Madhava-charya, and Sri-Vaishnava. Some writers add the Valabhacharya, and others substitute it in place of the fourth. The Sri-Vaishnava are to the Vaishnava sect what the Sri-Saiva are to the Saiva. In the south of the Peninsula are two minor divisions, the Thengalay, whose monastery is at Tinnevelly, and the Vadagalay, whose chief temple is at Agobilam in the Cuddapah district.

SRI YEO, the divine spirit. See Arka.

SROTRIYA or Shrotriya, a Brahman well read in the Vedas, who teaches and expounds them.

SROTRIYAM. TAM. A village or village lands, held at a favourable rate by any subject as a reward for past services. A srotriyam grant gives no right over the lands, and the grantee cannot interfere with the cultivators so long as they pay their rents.

SRUGHNA, now Sugh, a famous ancient city on the old Jumna, near Jagadri.

SRUTA-BODHA, a work on Sanskrit metres, attributed to Kalidasa.—*Dowson.*

SRUTI. SANSK. In Sanskrit, literature revealed by a deity. It applies properly to the Mantra and Brahmana portions of the Veda, but later the Upanishads were included. See Sruta.

SRUVA. SANSK. The lustral spoon, figured as held in the hand of the god Brahma.

SSE-TCHOUEN, or the four valleys, also written Sze-chuen, is the largest province in China, and perhaps also the finest. Its temperature is moderate, both in winter and summer. The Yang-tze-kiang traverses the province from S.W. to N.E. Its fertility is such that it is said the produce of a single harvest could not be consumed in it in ten years. Numbers of textile and tinctorial plants are cultivated. On the hills are fine plantations of tea, of which all the best kinds are kept for the province, and the coarsest are sent to Tibet and Turkestan. Pharmacists from all the empire send their travellers to Sse-tchouen to lay in their stocks of medicinal plants. The worders of Sse-tchouen are the Yen-tsing and Ho-tsing, wells of salt and wells of fire. M. Imbert, for many years a missionary in this province, but subsequently appointed Vicar-Apostolic in Corea, where he was martyred in 1838, says there are dozens of salt wells in a tract of country of about ten leagues long by four or five broad. The water of these wells yields 20 to 25 per cent. of salt of very acrid quality, so much so as often to inflame the throat to a painful degree. The air that issues from these wells is highly inflammable. If when the tubeful of water is near the top you were to present a torch at the opening, a great flame, twenty or thirty feet in height, would be kindled. This does happen sometimes through the imprudence of workmen, or in some cases from a malicious desire to commit suicide in company. Wells from which fire only, and no salt, is obtained, are called Ho-tsing, fire wells. A little tube of bamboo closes the opening of the well, and conducts the inflammable air to where it is required; it is then kindled with a taper, and burns continually. The flame is of a bluish colour, three or four inches high, and one inch in diameter. Here the fire is not sufficient to boil the salt, but at about forty leagues off there are much larger fire wells. Showmen often fill bladders with it, and carry it about the country; they make a hole in the bladder with a needle, and kindle it with a taper, to amuse lookers-on. This is no doubt what the chemists call carburetted hydrogen. Sse-tchouen province counts nearly 100,000 Christians, zealous and faithful in the fulfilment of their duties.—*Huc's Chinese Empire*, i. pp. 288 to 303.

STAGMARIA VERNICIFLUA. *Jack.*

Arbor vernicis, *Rumph.* | Kaya rangas, . MALAY.
Black varnish tree, . ENG. |

A native of the Eastern Islands, but not very abundant in Sumatra, though occasionally found in the neighbourhood of rivers. The wood is of a fine dark colour towards the centre. The bark exudes a resin which is extremely acrid, causing excoriation and blisters when applied to the skin. In this, as well as in becoming black when exposed to the air, it resembles the Melanorrhæa, cashew-nut tree, poison oak, and others of the Terebinthaceæ. According to Rumphius, this tree yields the celebrated Japan lacquer or varnish, and he considers it the same with that of Siam and Tonquin. Loureiro, however, represents the latter to be the produce of another tree. Mr. Jack says the varnish of Siam and Cochin-China is probably the best, but that of Celebes and of Java, which is the produce of this tree, is also employed for the same purposes, and cannot be much inferior, as it bears an equally high price. Chinese and Tonquinese insert into the trunks two pieces of bamboo, sharpened at their points, in such a manner as to penetrate the bark in a somewhat oblique direction. This fluid resin is sold in Tonquin and Camboja for 33 to 60 dollars the pikul, but in many of the provinces of China for 200 or 300 dollars. The varnish is prepared for use by boiling it with an equal weight of the oil of Tang-yhu. The proportions are varied according to the purposes for which the varnish is required. Sometimes dry pigments are added for the sake of the red or other colours. The Japanese are the most skilful in preparing and ornamenting all kinds of work with this varnish, and their black lacquered works are conveyed to all parts of the world.—*Jack*, *Malayan Miscellany*, No. 3; *Eng. Cyc.*; *Jameson's Edin. Journal*, vi.

STALACTITES. Shih-chung-ju, CHINESE. Stalactitic carbonate of lime occurs chiefly in long masses suspended from the roofs of caverns in limestone rocks; stalagmites on the floor. Water containing carbonate of lime, held in solution by carbonic acid, trickling through crevices in the roofs of the caverns, gradually during its exposure to the air, loses its carbonic acid, and consequently deposits its carbonate of lime; the water passing over the portion first deposited gradually adds to it, and eventually gives the carbonate of lime its great length and stalactitic character. In China, the cave-like masses hanging from the roofs of caves are carved into all sorts of shapes by means of pieces of bamboo. They are bright and sparry on fracture, and are usually perforated all through.—*Smith.*

STALAGMITES. Shah-chwang, CHINESE. Deposits of lime on the floors of limestone caves in China and the Tenasserim Provinces. Much of the alabaster of which ornaments are made is stalagmite; but all the alabaster images of the Tenasserim coast are made of marble, and not of compact gypsum, which they much resemble. Stalagmites are formed on the floor of the caverns by the water there depositing that portion of its carbonate of lime which is not separated during the formation of the stalactite. Caverns are sometimes nearly filled with these deposits. All the Tenasserim limestone caves have stalactites hanging from their roofs, and stalagmites raised on their floors. The elephant caves near Rangoon are of prodigious size, and the stalactites and stalagmites are wonderful, and when illuminated with blue lights, the effect is magical. Throughout the plain there is scarcely a rock in which one is not to be found. They are tenanted by myriads of bats. Near Rangoon is a small cave which is curiously and fantastically adorned with innumerable figures of Gautama, of every size, from the colossal to the miniature, stuck against the side of the rock, and occupying every available ledge.

STANISLAS, JULIEN, a Sanskrit and Chinese scholar, who translated the Chinese Buddhist pilgrim Hiwen Thsang's book of travels, named Si-in-ki, or Descriptions of the Countries of the West.

STAPHYLEA EMODI. *Royle.* Serpent Stick.

Guldar,	Beas.	Mar-chob,	Pers.
Chual,	Chenab.	Thanari,	Ravi.
Ban-shagali,	,,	Nag-dan,	Sutlej.
Ban-bakhura,	,,	Kaghania,	,,
Chitra, Kurkni,	Jhelum.		

A small tree of the Himalaya, at an elevation of 6000 to 9000 feet, not uncommon in Murree and Hazara. Bark of branches speckled, whence, on the doctrine of signatures, arises the belief that a branch or stick of it kept by one will drive away snakes.

STAR-ANISE.

Hwai-hiang,	Chin.	Anise d'Etoile,	Fr.
Ta-hwai-hiang,	,,	Skimmi,	Jap.
Pak-koh-hwin-hiang,	,,	Badian-i-khatai,	Pers.
Anas-phool,	Dukh.	Anasi-pu,	Tam.

Star-anise is the fruit of the Illicium anisatum of Linnæus, a shrub or small tree which grows in several places in the south-eastern parts of Asia, in China, Japan, the Philippines, and the countries extending from China to Japan from lat. 23½° to 35° N. The name is given from the clustering star-like form assumed by the capsules or pods, five to twelve in number, joined together at one end, and diverging in rays generally fine. These are used all over the east as a condiment. They are prized for their aromatic taste. The barks have a more aromatic flavour than the seeds, but they are not so sweet. In China, their most common use is to season sweet dishes. In Japan they are placed on the tombs of friends, and presented as offerings in the temples. They are chiefly exported direct to India, England, and the north of Europe, at the average value of 8½ dollars per picul. In India they are much used in seasoning curries and flavouring native dishes, and large quantities are used in Europe in the preparation of liqueurs. It is from this fruit that the oil of anise is prepared, and it imparts the peculiar flavour of anisette de Bourdeaux. — *Burton's Lindl.; Morrison; Simm.; Hogg; Faulkner; O'Sh.*

STARCH.

[illegible]	Arab.	Amido,	It.
[illegible]	Burm.	Kanji, Garus,	Malay.
[illegible]	Chin.	Nishashta,	Pers.
[illegible]	Dan.	Gomma de trigo,	Port.
Amidon,	Fr., Sp.	Krkhmal,	Rus.
Amidan, Stärke,	Ger.	Starkelse,	Sw.
Ganji,	Hind.	Godambe mao,	Tam.

The starch of commerce is procured generally from wheat, rice, and potatoes. The best kind is white, soft, friable, and easily reduced to powder. It is insoluble in cold water and alcohol, but readily affords a gelatinous solution in warm water, which is largely employed for stiffening articles of wearing apparel, and for dressing some descriptions of goods after weaving. It is also much employed by calico printers and others. It can be obtained from a great variety of plants, and many of the most productive of it are natives of the tropical countries in the east. Starch is one of the constituent parts in all mealy farinaceous seeds, fruits, roots, and other parts of plants. The following are the chief fecula or starch-like substances of the east, and may be considered separately also under the heads Arrowroot, Food, and Maranta :—

Arrowroot, West Indian,	Maranta arundinacea.
Arrowroot, East Indian,	Maranta ramosissima, Curcuma angustifolia, and other sp. of Curcuma.
Arrowroot, Mergui,	Tacca pinnatifida.
Tapioca,	Jatropha manihot.
Cassava meal,	Do.
Plantain meal,	Musa paradisiaca.
Sago, Singapore,	Arenga saccharifera.
Sago, Malabar,	Caryota urens.
Sago meal,	Phœnix farinifera.
Sálep,	Habenaria, etc.
Nelumbium seeds,	Nelumbium speciosum.
Singhara seeds,	Trapa bispinosa.
Yams,	Dioscorea (*var. sp.*).
Telinga potato,	Amorphophallus campanulatus.
Sweet potato,	Batatas edulis.
Ceylon moss,	Plocaria candida.
Kotee kalangoo,	Aponogeton monostachyon
Farina of	Parkia biglobosa.
Chara kelangoo,	Plectranthus tuberosus.
Champoo,	Caladium nymphifolium.
Sago, Indian,	Cycas revoluta, C. circinalis, species of Sagus.

STARLINGS are birds of the sub-family Sturninæ and family Sturnidæ. The spotted-winged starling, Saraglossa spiloptera, is a native of the woods and jungles of the lower hills. Sturnus unicolor, *Marmora*, the Sardinian starling. The rose-coloured starling, Pastor roseus, *Linn.*, is a famous locust killer, but their flocks commit immense depredations on the white sorghum and the mulberry.

STAUNTON, Sir GEORGE THOMAS, Bart., ob. August 10, 1858, was born at Milford House, near Salisbury, in 1781, and succeeded his father, the first baronet, in 1810. He was chief supercargo for the E. I. Company, President of the Select Committee at Canton, [illegible] to Pekin in 1810 [illegible], the first [illegible] was secretary to [illegible]artney, a Governor of Madras, and received his title after the negotiation of the peace with Tipu Sultan in 1784. He was subsequently Secretary of Legation during Lord Macartney's embassy to China in 1792. With the embassy of Lord Amherst were present Sir George Staunton, who made a translation of the Chinese Penal Code; also Sir John Davis, author of The Chinese, and translator of several works; and also Dr. Morrison, author of Chinese Dictionary.

STAUNTONIA, a genus of plants belonging to the natural order Lardizabalaceæ, named after Sir George Staunton. This genus is common to China and the Himalayan mountains. The Himalayan species are found in Nepal and in lat. 30° N., at elevations of 5000 and 6000 feet. Stauntonia latifolia, *R. Br.* (Hollbollia latifolia, *Wall.*; Ramkela and Gophla, Hind.), is a twining shrub of Nepal and Kamaon, at elevations of 5000 and 6000 feet. The fruit has a sweetish pulp, and is eaten by the people. Stauntonia angustifolia, *R. Br.*; Hollbollia angustifolia, *Wall.*, is a plant of Nepal.—*Voigt.*

STAUROBATES opposed Semiramis, but was at first overcome by that queen, though he subsequently defeated her. Staurobates is supposed to be the same with Sthavarapati.—*As. Res.* iv. 371, vi. 529, xiii. 256.

STEARINE, the harder portion of animal fats, olein or elain being the softer ones. Stearine yields an acid, called stearic acid, having the form of brilliant, white, scaly crystals, which is largely employed in soap and candle making.—*Waterston.*

STEATITE, Soapstone, Potstone.

Hwah-shi,	Chin.	French chalk,	Eng.
Hwah-shwui,	,,	Balpam,	Hind.
Figure stone,	Eng.		

Steatite is a silicate of magnesia, a soft magnesian mineral, unctuous to the touch. It occurs in beds generally associated with talcose slate, common in Southern Asia, of all sorts and colours. At Vellore, Kurnool, and Salem, and near Mysore there are very fine and beautifully white soapstones, and near Chittur there is a valuable description, procurable in large blocks, and suitable for many statuary and decorative purposes. There is a quarry of excellent potstone at the Nagery Hills. The stone is of fine grain, easily worked with the chisel, and susceptible of a high polish; when oiled, this stone resembles in a great degree black marble. It is abundant in the rocks of the Irawadi towards Khamti, and the white variety is used all over Burma for writing with on their black paper books. Like potstone and serpentine, which it nearly resembles in composition, it becomes considerably harder by exposure to the air. When first raised it may be easily turned with chisels; the turned articles may be polished first with sand and water, and afterwards with tripoli and water, and, for the highest gloss, with rottenstone and oil, woollen cloths being used in each case. When the steatite has become hard, the methods employed for alabaster may be resorted to. Steatite is used as the material for idols and other figures, which form the household gods of the Chinese. It is also mixed with black lead in the manufacture of crucibles. It forms a polishing material for serpentine, alabaster, and glass, [illegible] from cloth. See

Steel is iron combined with a small quantity of carbon. It is hard, brittle, resists the file, cuts glass, affords sparks when struck on flint, and retains the magnetic virtue for any length of time. It loses its hardness by being heated and cooled very slowly. Steel is used for many small implements and important engineering and other works.

Konasamoondrum steel is made at several villages in the Circar of Elgundel, at Ibrahimpatnam, and at Konapur in the Karaolla pargana, and at Atmacore and Chintulpet in the Vellurla Taluka. Formerly it was prepared at several other places. Teepoor, the iron, is manufactured at Maytpilly, a village 12 miles south of the Godavery, from a ferruginous sand procured from gneiss by roasting, pounding, and washing.

The steel wire of Chinnapatam, in Mysore, has long been known. The ore from which wootz, an Indian steel, is made, is a magnetic oxide combined with quartz, generally in proportion of 48 parts of quartz to 52 of oxide of iron. It is made in many parts of the south of India, but Salem is the chief seat of the manufacture, and there the ore is prepared by stamping and separating the quartz either by washing or winnowing. The furnace is from three to five feet high from the surface of the ground, and the ground is hollowed out beneath it to the depth of eight inches or a foot. It is somewhat pear-shaped, being about two feet diameter at the ground, and tapering to about one foot diameter at the top; it is built entirely of clay. Two men can finish one in a few hours; it is fit for use the next day. The blast is furnished by a pair of bellows each being a goat skin with a bamboo nozzle; a semicircular opening about a foot and a half high and a foot in diameter at the bottom, is left in the furnace, and before each smelting it is stopped up with clay. The furnace is then filled up with charcoal, and kindled, a small quantity of ore, previously moistened, is laid on the top of the fuel, and charcoal is thrown over it to fill up the furnace; in this manner ore and fuel are added and the bellows plied for four hours or thereabouts, when the process is stopped, and the temporary wall in front of the furnace having been broken down, the bloom is removed by a pair of tongs from the bottom of the furnace, and is then beaten with a wooden mallet to separate as much of the vitrified oxide as possible; and, while still red-hot, it is cut half through with a hatchet, and in this state sold to the blacksmiths, who perform all the subsequent operations of forging it into bars, and making it into steel. The process of forging into bars is performed by sinking the blooms in a small charcoal furnace, and repeated heatings and hammerings to free it as much as possible from the vitrified and unreduced oxide of iron; it is thus formed into bars about a foot long, an inch and a half broad, and about half an inch thick. In this state it is full of cracks and exceedingly red short. These bars are cut into small pieces to enable them to pack in a crucible. A quantity amounting to a pound and a half to two pounds is put into a crucible along with a tenth part by weight of dried wood of the Cassia auriculata chopped small; these are covered with one or two green leaves of the Calotropis gigantea, the mudār plant, and the mouth of the crucible filled up with a handful of tempered clay, which is rammed so as to exclude the air perfectly. As soon as the clay is dry, twenty to twenty-four of the crucibles are built up in the form of an arch with their bottoms inwards, in a small furnace urged by two goat-skin bellows, charcoal is heaped up over them, and the blast kept up without intermission for about two hours and a half, when it is stopped, and the process is considered complete. The crucibles are removed from the furnace and allowed to cool; they are then broken, and the steel, which has been left to solidify, is taken out in a cake, having the form of the bottom of the crucible. When the fusion has been perfect, the top of the cake is covered with striæ, radiating from the centre, but without any holes or rough projections on it; when the fusion has been less perfect, the surface of the cake has a honeycombed appearance, caused probably by particles of scoriæ and unreduced oxide in the bar iron, and often contains projecting lumps of iron still in the malleable state. The natives prepare these cakes of steel for being drawn into bars by annealing them for several hours in a charcoal fire actuated by bellows, the current of air from which is made to play upon the cakes whilst turned over before it at a heat just short of that sufficient to melt them; by this means the excess of carbon is detached. The process of smelting iron differs according to circumstances in different parts. In some the ore is collected in the form of sand from the beds of rivers or ironstone is collected either from the surface or from mines.

Steel of Mysore made at Mudgiri is the best.

That made of kanekal ore from the Dhore Gudda Hill in the Chikkanaikenhalli taluk, is produced in a ruder manner, and is of an inferior quality. The kanekal is pounded to the size of small gravel and well cleaned. But the Mudgiri ore is reduced to an iron-sand by hard wooden mallets, and the earthy particles washed away, and is then filled into the small furnace with 15 times its bulk of charcoal, made of Ficus Indica, F. racemosa, and F. excelsa. The furnace is about 4 feet high, 2½ feet at bottom, and about 1½ feet at mouth, which is covered with an open earthen pot, pierced with holes at its bottom, like a colander; ten seers of charcoal are placed at the bottom, then one seer of the iron-sand, over which again five more seers of charcoal are placed (the furnace having been previously warmed). The materials are then ignited, and the fire kept up from below without intermission for three hours, by two men blowing two common blacksmith's hand-bellows, during which time the colander has been filled as the material sinks till seven more seers of iron-sand have been added, with their due proportion of charcoal. The whole eight seers are then considered to be in a proper state to take out, which is done by opening the hole at the bottom, when the semi-molten mass is withdrawn by large pincers to an indentation in the neighbouring rock, where it is beaten with the same wooden mallets into as shapely a mass as time will admit of. This is reheated in a forge and beaten into four rough bars, and again reheated and beaten into bars 7 to 11 inches long, and in this state they are fit for the crucibles, and called 'gatti murudu.' The furnace for converting them into steel is merely a hole in the ground, about two feet deep, lined with red clay, the greatest diameter being about two feet, and the least (which is about nine inches from the surface) about one foot, when it is gradually sloped out in the form of a skew-back to receive fourteen crucibles with their ends downwards, which are ranged round it in the form of a flat arch. Charcoal is put below and above, and when ready for igniting, the charcoal appears about six inches or so above the ground, and is prevented from spreading by a low wall, in the rear of which the bellows are blown. The charcoal is renewed from time to time, so as to keep the crucibles in the midst of a carefully-regulated heat, which is kept up by plying the bellows unremittingly for four hours, when the firing is complete.—*Major Cuth. Davidson, Assistant Resident; M. C. C. for Ex. of* 1851; *Rohde, MSS.; Mad. Lit. Journ.; M. E. J. R.; Heyne.*

STEFANO, HIERONIMO DI SANTO, a Genoese, visited India about 1474–99 as a merchant. At Cairo he laid in a stock of coral beads and other wares, and passed down the Nile to Cane (Keneh), from which he travelled by land through the Egyptian desert for seven days to Cosir (Cosseir) on the Red Sea, where he embarked on board a ship, which in 25 days carried him to Mazua (Massouah) off the country of Prester John; and in 25 days more, during which he saw plenty of boats fishing for pearls, to Adem (Aden); and in 35 days more to Calicut. 'We found that pepper and ginger grew here, . . . and the nut of India' (cocoanuts). From Calicut he sailed in another ship, and in 26 days reached Ceylon, 'in which grow cinnamon trees, . . . many precious stones, such as garnets, jacinths, cats'-eyes, and other gems, . . . and trees of the sort which bears the nut of India.' Departing thence after twelve days, he arrived at a port on the coast of Coromandel, where the red sandal-wood grows; and after a long stay, departing thence in another ship, after 27 days reached Pegu in Lower India. This country (Pegu) is distant 15 days' journey by land from another, called Ava, in which grow rubies and many other precious stones. From Pegu, where he suffered many and great troubles, he set sail to go to Malacca, and, after being at sea 25 days, one morning found himself in a port of Sumatra, where grows pepper in considerable quantities, silk, long pepper, benzoin, white sandal-wood, and many other articles. After further and greater troubles suffered here, he took ship to Cambay, where, after six months' detention among the Maldives, and subsequent shipwreck, he at length arrived, but stripped of all his goods. He notices that Cambay produced lac and indigo. In his destitution he was assisted by a Moorish merchant of Alexandria and Damascus, and after a time proceeded in the ship of a sheriff of Damascus as supercargo to Ormuz, in sailing from which place from Cambay he was [illegible]. From Ormuz, in company with [illegible] and Azami (Irak-Ajemi) merchants, by land to Shiraz, Ispahan, Kashan to Tauris; whence he went [illegible] which was plundered by [illegible] finally to Tripoli in [illegible]. *Purchas, Pilgrimage; Dr. Birdwood's Records.*

STEGODON GANESALIS. *Sw.* The broken masses of fossil bones are found in Sze-chuen, Shan-tung, and Shen-si in China, and are called Lung-kuli or dragon's bones. They are powdered and levigated, and used in spermatorrhœa. The fossil teeth of Stegodon Sinensis, *Owen*, also, are called Lung-chi or dragon's teeth.—*Smith.*

STELLARIA MEDIA. *Sm.* Kaaray munthakiray, TAM. One of the Alsinaceæ or chickweed tribe of plants. S. media grows on the Neilgherries, and S. triandra, *Wall.*, of Nepal, is used by the natives on the Neilgherries as a pot-herb, eaten alone and mixed with others; probably introduced.—*Jaffrey.*

STEMONOPORUS. *Thw.* A genus of Ceylon trees. The S. acuminatus is a large tree of Ceylon in the Ambagamwa, Badulla, and Mahamahanawera districts, at no great elevation. S. affinis is a large tree, growing in the Hunasgiria district, at an elevation of 4000 feet. S. canaliculatus, a moderate-sized tree, of the Hinidun and Reigam corles, at no great elevation. S. Gardneri, a great forest tree, near Adam's Peak, at an elevation of about 5000 feet. S. lanceolatus is a small tree near Ratnapura, at no great elevation. S. Moonii, near Maturatte. S. nitidus, at Pasdoon corle, a middle-sized tree, at no great elevation. Thwaites also mentions S. oblongifolius, S. petiolaris, S. reticulatus, S. rigidus, and S. Wightii, a great tree, the Vateria Ceylanica of Wight; and S. apicalis (the Urandra apicalis in Hooker's Kew Journal of Botany), is a great tree of the dam forests, at an elevation of 1000 to 2000 feet, Ooroo-kannoo gass of the Singhalese.—*Thw.* p. *Beddome, Fl. Sylv.* p. 99.

STENO MALAYANUS.

Dolphinus plumbeus, *Dussumier, Cuv.*
D. Malayanus, *Lesson apud Cuv.*

Inhabits the Malabar coast and coasts of Penang. It is numerous and rather heavy in movements, but is rarely captured, except by chance in the stake-nets. It eats small fishes, Clupea and Glyphisidon cœlestinus. Steno frontatus inhabits the Indian Ocean and the Pacific.—*Cuvier.*

STEPHEGYNE PARVIFOLIA. *Hooker f. et Bentham.* This is a large deciduous timber tree, one of the Rubiaceæ, the Nauclea parviflora of Roxburgh. Its wood is light, moderately hard, of a pinkish-brown colour. S. diversifolia, *H.*, is a tree of Burma, and S. tuberlosa, *H.*, a tree of Ceylon.

STERCULIACEÆ, an order of plants of the E. and W. Indies, S. America, Mexico, Madagascar, all Southern Asia, and New Holland. The order comprises 82 genera, and upwards of 100 species. They are trees or shrubs, sometimes climbing or twining plants, and are all remarkable for the abundance of their mucilage and the tenacity of their fibres.

STERCULIA, a genus of plants of the order Sterculiaceæ. One species, the Kun-nun-nu of the Burmese, an enormous tree, grows at Tavoy, as also does another species, called in Tavoy Thi-ka-doo. One species in Africa, and another in India, S. fœtida, yields a tragacanth-like gum. The seeds of Sterculia chicka are eaten by the Brazilians, as in India are those of S. balanghas, S. urens, and S. fœtida, after being roasted. A species called Kodalo in Telugu, not S. fœtida, is a tree of Ganjam and Gumsur; extreme height, 39 feet; circumference, 3 feet; and height from ground to the intersection of the first branch, 8 feet; gives a light wood, used for planks, doors, boxes, and scabbards; it is also used for firewood, being tolerably plentiful. Sterculia ramosa, S. fœtida, S. campanulata, S. piperifolia, are very plentiful throughout the Pegu province; they yield a gum which is known in the bazars of Bengal under the name of Kotheela. Other two species, S. balanghas and S. colorata, are not so plentiful. This gum is

probably analogous to the tragacanth, which Dr. Lindley states is obtained from a species of Sterculia at Sierra Leone.

STERCULIA ACUMINATA, the Kola acuminata, *R. Br.*, is the Kola nut or Gongo nut tree of W. Africa and the Soudan, Senegambia, Angola. In Fezzan they sell at a dollar for four seeds. They support the strength, allay inordinate appetite, assuage thirst, promote digestion, and render those who use them capable of prolonged fatigue. It should be introduced into India. Quantities of the nut are carried to the interior of Africa. Each nut of the Gongo variety sells for 100 cowries, and 2500 cowries at Rabba on the Kevorra value a dollar of 4s. 4d. Bitter Kola fruit is about the size of a peach, rose-coloured, and very pretty. The bitter Kola nut is intensely bitter, not astringent like common Kola, and is used for medicinal purposes.

STERCULIA ALATA. *Roxb.*

Bud'h's Cocoanut.	Pterygota Roxburghii, *Sch. and Endl.*
Shaw-nee, . . . BURM.	Dodelee mara, . . CAN.

Grows to an immense height in Canara and Sunda in deep ravines and sheltered places below the ghats, but is used there only as a support for [illegible]nes. The wood is said to be too spongy [illegible] for which its height and straightness [illegible]well fit it. It is a handsome tree in the [illegible]im Provinces, bearing a large fruit, whose [illegible]eeds are sometimes eaten by the natives.

[illegible]CULIA BALANGHAS. *Linn.* Pin[illegible]. A tall and straight tree of the hotter [illegible] Ceylon, common in the forests of the [illegible] coast. It may readily be distinguished [illegible]ain seasons by its large pink fruit. The [illegible]s of open grain. The seeds are described [illegible]mphius as being roasted and eaten by the [illegible]s of Amboyna, and the capsules burned for [illegible]paration of the kusumbha colouring matter.

[illegible]RCULIA COLORATA. *Roxb.*

[illegible] . . . . DUKH. | Karaka, . DUKH. ? TEL.

[illegible]ge tree of the Dekhan, which is deciduous [illegible]cold season, and flowers in March and [illegible]The wood is said to be useless. Carpels [illegible]ght red, somewhat resembling the broad [illegible] a pea opened, with the peas adhering. [illegible]e when covered with them has a strange [illegible]nce.

[illegible]RCULIA FŒTIDA. *Linn.*

[illegible]Badam, . HIND.	Kudrap-dukku, . TAM.
[illegible]naram, . TAM.	

[illegible] large tree is very common in the [illegible] Province of Ceylon, and grows in the [illegible]la of India generally, but chiefly on the [illegible] coast, in Malabar and Mysore. It is [illegible] on the hills and plains of British Burma. [illegible]on its wood is used for common house[illegible]g purposes. On the western coast and in [illegible], it is applied to a number of useful pur[illegible] and Dr. Gibson tells us that it is used as a [illegible]ute for the true poon spars in small country [illegible] It makes a good avenue tree. In the [illegible] this fruit there are contained certain [illegible]ernels which have a very pleasant taste, [illegible]arnem ossiculum locatur oblongo-rotundum [illegible]ucleum continens candidum amarodulcem. The [illegible]lower has a most offensive smell, and hence the [illegible]amil name. The fruit is used in the treatment [illegible]f gonorrhœa. The leaves are deemed aperient, [illegible]nd a decoction of the fruit mucilaginous and astringent. The seeds are oleaginous, but are deemed unwholesome. The semi-solid oil obtained by expression from the seeds of this large jungle tree is thick at all seasons of the year, appears to contain a large percentage of stearine, but it is doubtful if it can be obtained in large quantities. It was sent to the Great Exhibition of 1851 from Bombay.

STERCULIA GUTTATA. *Roxb.*

Kawillee of ANIMALLAY.	Pi maram, . . . TAM.
Goldar, ... DUKH.	Ramena pu maram, ,,
Kukar, ... MAHR.	

A large erect forest tree of Ceylon, Malabar, and all over Southern India. Carpels the size of a large apple, three or more growing together, of a reddish colour; seeds size of a chesnut, roasted and eaten by the natives. The bark of the younger parts of the tree abounds with very strong, white, flaxen fibres, of which the inhabitants of Wynad manufacture a kind of coarse cloth, which derives its name from the first process of its manufacture, viz. the chopping the bark into small pieces, from auragoonoo, to cut. It is not usual to make use of the bark until the tenth year. The tree is then felled, the branches lopped off, and the trunk cut into pieces of six feet long, a perpendicular incision made in each piece, the bark opened and taken off whole, chopped, washed, and dried in the sun; by these means, and without any further process, it is fit for the purposes of clothing.

STERCULIA MONOSPERMA. *Ventenat.* The S. nobilis of R. Brown, a middle-sized spread[illegible] tree of China. Its seed[illegible]d those of S. urceolata of the Moluccas, are roasted and eaten as chesnuts.

STERCULIA PARVIFLORA. *Roxb.* Ramjulparee, HIND. A middle-sized tree, a native of the hills east of Tiperah. It is abundant in the jungles of Ajmir.—*Roxb.; Gen. Med. Top.* p. 202.

STERCULIA PLATANIFOLIA. *Tung.* Wutung, CHIN. Ornamental, shady, large-leafed tree of China, frequent in the courtyards of houses and temples. The seeds are oily, and enter into the composition of the cakes eaten at the autumnal festival of the eighth month. The leaves and liber make a hair-wash and a soothing lotion.

STERCULIA URENS. *Roxb.*

Buli? . . . . . BENG.	Velle butalle, . . TAM.
Kur katila, Katira, HIND.	Vellay putalli, . . ,,
Kundol, Kavali, MAHR.	Thabsi, Kavali, . . ,,

This large tree is a native of Ceylon and of most parts of India. Its peculiar bark looks as if painted of a light colour. Wood soft, spongy, and loose-grained, only fit for the most common purposes. Its leaves and tender branches are used in certain cattle diseases. The leaves when soaked in water render it ropy and glutinous. The bark yields the Katila gond gum, resembling tragacanth. The carpel is covered with rigid bristly hairs, which puncture like the Mucuna pruriens. The seeds of the stinging pods are roasted and used by the natives as an article of diet, and also as a dainty. Bark, exceedingly astringent, tinges the spittle reddish. Its gum has been sent to London, but artists did not find it answer. It exudes spontaneously during the hot season, in large, light-brown or white, transparent tough masses. Immersed in water, these swell like a jelly, but do not dissolve unless by protracted boiling. Its uses are very limited. The solution is not adhesive. The want of adhesiveness renders it unsuitable for the arts, while its

difficult solubility renders it inferior to most other gums for medicinal purposes. A similar gum, called Kutira, is afforded by the Cochlosperum gossypium.

STERCULIA VILLOSA. *Roxb.*

Gul-kandar, Kuri, Chen.	Kurdula, ... Mahr.
Gul-bodla, . . Hazara.	Osha, God-gudala, Sutlej.
Oodhal, Oodial, . Hind.	Magsu, . Sutlej, Ravi.

A large tree of the Dekhan and in the mountainous countries to the eastward of Bengal, common in many places in the outer hills of the N.W. Himalaya to 3600 feet or more up to the Indus, and occurs in the Salt Range. It has a straight trunk, with a smooth bark, leaves palmated, five or seven lobed. The bark can be stripped off from the bottom to the top of the tree with the greatest facility, and fine pliable ropes may be made from the inner layers, whilst the outer yield coarser ropes. The rope is very strong and very lasting, wet doing it little injury. In Southern India elephant ropes, and in Bombay bagging, are made of it. In Dehra Doon good paper has been made from it.

STERCULIA WALLICHII.

Wulena, Ulan, Beas., Rav.	Kuri, ... Chenab.

A shrub of the Panjab, occasional to 3500 feet. —*Drs. Roxb., Ainslie, Brandis, Gibson, Mason, Riddell; Wight and Arnott; Cleghorn; Royle; M'Clelland; Stewart; W. Ic.; Captains Beddome, Drury, Macdonald; Thomson and Mendis; Rohde.*

STEREOSPERMUM CHELONOIDES. *W. Ic.*

[illegible]-koop-poo, . . Burm.	Vela-pathri, . . Tam.
Padri, ... Hind.	Kala-goru, . . . Tel.
Padul, ... Mahr.	Moka-yapa, ... ,,
Lumu-madala, . . Singh.	

This, though not a large, is a very handsome tree, with very fragrant, beautiful pinkish flowers. It is very common in almost all the forests of the Madras Presidency up to an elevation of about 3000 feet, also in Ceylon, Mysore, Bombay, Bengal, and Burma. The wood is of a beautiful orange-yellow colour, close and even grained, elastic and durable, easily worked, and gives a smooth glossy surface. A cubic foot weighs 57 to 60 pounds unseasoned, and 40 pounds when seasoned; and its specific gravity is ·768. The sapwood is rather coarse-grained, of a brownish-white colour, and not durable. The wood is much used in house-building, and for a variety of purposes by the natives. The roots, leaves, and flowers are used medicinally. The wood of S. fimbriatum, *D.C.*, is of similar structure. —*Wight; Gibson; Brandis; Beddome; Gamble.*

STEREOSPERMUM SUAVEOLENS. *W. Ic.* Bignonia suaveolens, *Roxb.* A middle-sized tree, with pinnatic leaves and panicled inflorescence, frequent in the Walliar jungles. It abounds in the Sunda forests in Southern India, is very rare in other Bombay forests, but is occasionally found in the Konkan, near temples, where it has evidently been planted for the sake of its beautiful flowers. The wood is dark-coloured, strong, and serviceable; is said by Dr. Wight to be elastic, and fitted for making bows. It grows in the south of Ceylon, in the neighbourhood of Buddhist temples. Its roots are much valued by the Singhalese as a tonic medicine, and they attribute the same properties and give the same name (Palol) to those of Spathodea adenophylla, which is occasionally found in gardens.—*Wight; Cleghorn; Gibson; M. E. J. R.; Thwaites.*

STEREOSPERMUM XYLOCARPUM. *Benth.* Bignonia xylocarpa, *Roxb.* A deciduous tree of the Dekhan; sap-wood large, grey; heart-wood brown-coloured, very hard.—*Gamble.*

STERNINÆ, a sub-family of web-footed, long-winged birds, known as sea swallows and terns.

Kivi, ... Gond.	Mach-louka (fish snatcher), . . . Hind.
Tehari, ... Hind.	Ramadasu, . . . Tel.

STERNOCERA CHRYSIS. Its elytra a[illegible] in India in embroidering muslin.

STEVENSON, Reverend J., D.D., cha[illegible] St. Andrew's Church, Bombay, who w[illegible] the Anti-Brahmanical Worship of the [illegible] in Lond. As. Trans. vi. p. 239, viii. p. 3[illegible] the Mahrati Language, ibid. vii. p. 84; Modern Deities worshipped in the Dekha[illegible] p. 105; on the Buddha-Vaishnavas [illegible] Dekhan, ibid. p. 64; on the Intermix[illegible] Buddhism with Brahmanism in the Relig[illegible] the Hindus of the Dekhan, ibid. p. 1; A[illegible] of the Ganesa Purna, ibid. xiii. p. 319; R[illegible] on the Relation between the Jain and B[illegible] ical Systems of Geography, Bom. As. Tran[illegible] ii. p. 411; on Specimens of Saurashtr[illegible] found near Junir, ibid. p. 377; on the Bra[illegible] ical Manner of Constructing their Image[illegible] p. 396; Translation of Buddha Inscriptio[illegible] Nasik, ibid. p. 452; Observations on the [illegible] matical Structure of the Vernacular Langu[illegible] India, ibid., 1849, i. p. 171, 1850, iv. p. 196. He gave some comparative lists of w[illegible] the Indian languages, tracing analogies [illegible] Mongolian, Celtic, and Hebrew tongues, and sai[illegible] there exists a great resemblance in the gram[illegible] matical structure of the chief modern language[illegible] in the north and in the south of India, proofs o[illegible] which he produced from the Hindi, Bengal[illegible]

jerati, Mahrati on the one side, and from lugu, Carnatica, Tamil, and Singhalese on the her. He thinks that there is more agreement n construction with the Turkish than with the Sanskrit, so that he believed it likely that the original language of India may be the connecting nk between what the Germans have called the do-Germanic family and the Turkish family of guages.—*Dr. Buist; Max Muller's Rep. Brit.* ., 1847, p. 331.

STEWART, CHARLES, author of History of gal to its Conquest by the English, London 3; also a Descriptive Catalogue of the Oriental rary of the late Tipu Sultan, with Memoirs of Hyder Ali.

STEWART, LIEUTENANT-GENERAL D. M., K.C.B., Bart., served on the frontier in 1854–55, was Deputy Assistant Adjutant-General at the siege of Delhi, and Assistant Adjutant-General of the army at the siege and capture of Lucknow, and throughout the subsequent operations in Rohilkhand. He also commanded the Bengal Brigade in the expedition to Abyssinia in 1867–68, was afterwards (1872–73) Chief Commissioner at the Andaman Islands, commanded the Lahore division, and in command of the Kandahar column of erati ns in the late Afghan campaign. He was times mentioned in despatches, was created et of the United Kingdom, and appointed nder-in-Chief of India.

AIA. SANSK. Arid or dry land, which vernacular dialect becomes t'hul. It is verse of the Greek oasis, denoting tracts larly sterile. Each t'hul of the Indian has its distinct denomination, as the 't'hul vur,' the 't'hul of Goga,' etc. Maristhali, he Sanskrit Mri, to die, and St'hala, is a name desert of Rajputana. St'hali devata are s of the soil.

HAMBA or Lat, SANSK., is a monolithic usually erected in front of a Hindu temple, er Saiva, Vaishnava, Jaina, or Buddhist. re of all ages, from B.C. 250 down to the ecent times. The Buddhist st'hambas wheel representing Dharma or law or he Saiva bear a trisula; the Vaishnava a f Garuda; and the Jaina a Chaumuktra or Tirthankara. Some of the finest of t lats were erected by Asoka, and bear his r other inscriptions, but are not ap- y in connection with any temple or other re, or if so, these have long ago perished. *and Burg. Cave Temples of India*, p. 174.

HAMBA PUJA, worship of the temporary rected for a marriage.

HANA. SANSK. A place or station. St'han, t'hana, stan, istan, or estan, added to the f a thing, expresses the place wherein it s or is contained; as Gulistan, a flower- or bed of roses; Hindustan, the country Hindus; Negaristan, a cabinet or gallery ures. St'hana, SANSK., the firm, a name .—*Ouseley's Travels.*

HAVIRA, SANSK., or, in Pali, Thero, an f the Buddhist religion, a Buddhist priest.

I'NANAM. SANSK., TAM., TEL. Bathing Hindus as a religious rite of purification. St'hnanam abhiangana, amongst Hindus a ceremonial on the wedding day, when the bride and bridegroom are anointed with oil.

STHUNA-KARNA, in Hindu mythology, a Yaksha who is represented in the Mahabharata to have changed sexes for a while with Sikhandivi, daughter of Drupada.—*Dowson.*

ST'HUPA. SANSK. A Buddhist tumulus or tope, a mound, burrow, or funeral pile, a hemispherical shrine, or a tumulus erected over any of the sacred relics of Buddha, or on spots consecrated as the scenes of his acts. The st'hupa in Pali becomes stupo, and in Anglo-Indian phraseology tope. We thus hear constantly of the Bhilsa topes, and the Sarnath and the Sanchi topes. The word is from a Sanskrit root to heap, to erect. The st'hupa or dagoba or topes of India are monumental shrines or receptacles for the relics of Buddha, or for those of the Sthavira or patriarchs of the sect, or to commemorate some historical event or legend. They consist of a cylindrical base supporting a hemispherical dome called the garbha. On the top of this was placed the Tee, a square stone box, usually solid, covered by a series of thin slabs, each projecting over the one below it, and with an umbrella raised over the whole. General Cunningham says the Pali form is Thupo, also Thupa or Thuva, in the early Aryan inscriptions from the Panjab. The term now used is Thup for a tolerably perfect building, and Thupi for a ruined mound. The great st'hupa or Buddhist monument of Manikyala was first made known by the journey of the Honourable Mountstuart Elphinstone, and has since been explored by Generals Ventura and Court. The name is said to have been derived from Raja Man or Manik, who is said to have erected it. The pilgrim Fa Hian states that at two days' journey to the east of Taxila is the spot where Buddha gave his body to feed a starving tiger. But Sung-yun fixes the scene of this exploit at eight days' journey to the south-east of the capital of Gandhara, which is a very exact description of the bearing and distance of Manikyala, either from Peshawur or from Hashtnagar. General Cunningham has identified the great st'hupa of the 'body-offering' with the monument that was opened by General Court, which, according to the inscription found inside, was built in the year 20, during the reign of the great Indo-Scythian prince Kanishka, shortly before the beginning of the Christian era. Manikyala was therefore one of the most famous places in the Panjab at a very early period; but he thinks that it must have been the site of a number of large religious establishments rather than that of a great city. The people are unanimous in their statements that the city was destroyed by fire; and this belief, whether based on tradition or conviction, is corroborated by the quantities of charcoal and ashes which are found amongst all the ruined buildings. It was also amply confirmed by the excavations which he made in the great monastery to the north of General Court's tope. He found the plaster of the walls blackened by fire, and the wrought blocks of kankar limestone turned into quicklime. The pine timbers of the roofs also were easily recognised by their charred fragments and ashes. General Cunningham discovered nothing during his researches that offered any clue to the probable period of the destruction of these buildings; but as this part of the country had fallen into the power of the Kashmirian kings even before the time of Hiwen Thsang, he was inclined to

attribute their destruction rather to Brahmanical malignity than to Muhammadan intolerance. Vaisali is supposed by General Cunningham to lie to the east of the Gandak, where we find the village of Besarh, with an old ruined fort which is still called Raja-Bisal-ka-garh, or the fort of Raja Visala, who was the reputed founder of the ancient Vaisali. The ruined fort of Besarh thus presents such a perfect coincidence of name, position, and dimensions with the ancient city of Vaisali, that there can be no reasonable doubt of their identity. In one of the Buddhist legends quoted by Burnouf, Buddha proceeds with Ananda to the Chapala st'hupa, and, seating himself under a tree, thus addresses his disciple: 'How beautiful, O Ananda, is the city of Vaisali, the land of the Vriji,' etc.—*Ferg. and Burg.* p. 18.

The Tallow.

Kim-yu, Mu-yu, . CHIN. | Peh-yu, Hiueh-yu, CHIN.

It receives its Chinese name from the fondness of the cow for its leaves. It grows nearly all over China and Formosa, and has been introduced into India. Its aspen-like yellow foliage becomes of a brilliant red colour in autumn and winter. The three-seeded berries dehisce when ripe, disclosing the kernels enveloped with the coat of vegetable fat, which renders the tree so valuable. The leaves yield a black dye with sulphate of iron. This fatty tallow substance is of a whitish colour, hard, and tasteless. The ripe nuts are bruised, and the pericarp separated by sifting. They are then steamed in wooden cylinders, with numerous holes in the bottoms, which fit upon kettles or boilers. The tallow is softened by this process, and is separated from the albumen of the seeds by gently beating them with stone mallets, after which the tallow is effectually removed by sifting the mass through hot sieves. The tallow still contains the brown testa of the seeds, which is separated by pouring it into a cylinder made up of straw rings laid one on top of the other, in which it is put into a rude press, and the tallow is squeezed through in a pure state. A pikul of seeds (133⅓ lbs.) yields from 20 to 30 catties of tallow, besides the oil which is obtained from the albumen by grinding, steaming, and pressing it subsequently. The vegetable tallow melts at 104°, and is composed mainly of tripalmitine. To make candles, it is mixed with white insect wax in the proportion of three mace of wax to ten catties of the tallow. The candles are largely used in Buddhist ceremonies. In China the average price is about eight Mexican dollars per pikul. Cases of poisoning in China are generally treated with the tallow or the oil of the albumen, but the latter generally comes up. The tallow is also used in ointments, and the candle refuse as suppositories. The refuse of the husks and seeds is used as manure for the tobacco fields.—*Smith, Mat. Med. Chin.*

STINKING-WOOD, ENG., Chee neb, BURM., is abundant in Tavoy and Mergui. The flowers have an intolerably fetid, sickening smell; hence its name. It is used by the Burmese for boxes, tables, etc., and is a long-fibred, tough wo[od] when new, but rots readily. The stink tree [of] Ceylon was called by the Dutch Strunt-hout, an[d] by the Singhalese Urenne, on account of its dis[a]gusting odour, especially in the thick stem an[d] the larger branches, resembling that of huma[n] ordure. Thunberg says the tree was neither th[e] Anagyris fœtida nor the Sterculia fœtida.—*Ca[ll] Dance; Thunberg's Tr.* iv. p. 234.

STIPA, a genus of grasses belonging to [the] tribe Stipaceæ. Stipa tenacissima, the esparto [of] the Spaniards, the halfa of Northern Africa, [is] used in the manufacture of paper, yields a s[ure] crop, independent of the weather, and exem[pt] from the attacks of locusts.

STIZOLOBIUM ALTISSIMUM. Assam bean; Kalee seem, DUKH. This bean is grown like most others, and may be first sown at the commencement of the rains, and continued during the cold season.—*Riddell.*

STOCKS, an officer of the Bombay Medical Service, an eminent botanist. His extremely valuable collections from Sind and Baluchistan amounted to about 1500 species. He was Conservator of Forests in Sind, and distinguished himself by his researches in the flora of that region. He died at Cottingham on th[e] August 1857, aged 34.—*H. et T.; Bom. As.* ii. p. 390; *Dr. Buist.*

STOCQUELER, J. H., author of [the] Montens' Pilgrimage through Untrodden T[ar]tary, Kurdistan and Persia, 1831-32.—*Dr. Buist.*

Stones of every kind, suitable for archite[c]ture, sculpture, or ornament, are obtainable in di[f]ferent parts of India, as the red sandstone in the [n]eighbourhood of Dehli; the slates, limestones, and mar[bles] of the Nerbadda, and of the valleys of the G[o]davery and Kistna; basalt and basaltic greenstone [are] used in the Hindu temples; and the ma[r]ble of Burma is largely sculptured for the fig[ures] of Gautama; the Hubba Hills, near Bhoo[j], yield a stone which is employed as a substitute for soapstone is found in many parts of British Burma, and China, and is carved into nu[me]rous figures; the sandstones of the Kymore ra[nge] are used as flagstones, and for ornamental pu[r]poses; the millstones of Chynepore, Sasseram, Tilo[thu] and Akbarpur, are famous; the Sone ca[nal] and the Koylwan railway bridge, are [of] the dense sandstone of Sasseram; little q[uar]tz are found in the higher portions of the [hills] towards Rohtas; but the best stone, whil[e] workable, is almost as hard as granite, and [is] had of any colour, viz. white, crystallin[e] grey, and all shades to a dark red.

Stone implements have been largely fo[und] in India. Chipped flints, agates, jaspers, and c[ores] donies have been found by Lieut. Swene[y] Jubbulpur. Others of flint were found [at] Blanford near Nagpur and near Lingoosagoor. Flint (chert), agate, and chalcedony knives re[-] sembling those of Mexico, arrow-heads, etc., were found by Surgeon Primrose. Stones have bee[n] used for recording edicts, laws, and moral codes

loses wrote on stone tablets the Ten Commandments. In the Confucian temple at Pekin are ten ones shaped like drums, on each of which are ngraved stanzas of poetry. These stone drums are said to have been in existence since the days of Yaou and Shun, who flourished, the former B.C. 2357, and the latter B.C. 2255. The king Asoka, who was a follower of Buddha, had his edicts engraved on rocks, where they are still to be seen.—*Gray*, p. 93. See Sculpture.

STONE-CUTTING. The seal-engraver's wheel consists of a light frame ballasted below to keep it firm, with two uprights about eighteen inches in length and eight inches between. Betwixt the two is a small spindle. This turns at the one end on a screw or pivot, sometimes of cornelian; the shoulder in its place by a neat iron clamp, it is steadied iece of rag wrapped round it, and enclosed ollar. The spindle is terminated by a small iron of about an inch long, ending in a cular saw or button, from a tenth up to inch in diameter. To this, powdered m mixed with oil is from time to time , while it is spun round with a bow. The r holds the seal up betwixt his fingers and and a sweep or two of the bow causes a n the seal. This is deepened and extended red, the larger discs being employed for raight strokes. The work turned out is by ns very fine, but the celerity of execution ssing. Diamond dust is very rarely used in corundum being the chief material employed shing gems, marbles, and metals. For ning swords or burnishing metal, it is lly used like a whetstone or burnisher; for g gems, it is either made up into a lap ac or into a paste with oil or grease. For ing marble or other stone it is used in two ; the first of these is a cake of about eight long, three across, and two deep. This is by an individual in the hand. For heavier es, a cake a foot square or so is employed, in a frame. Two men work at this, and the g process is very rapidly accomplished by , in fact, a file with a lac body and corunth. The diamonds seen amongst native are almost all cut in Europe, and the l gems cut in India are the lapis-lazuli, emeralds, opals, garnets, and siliceous The chief articles into which these are t are paper-weights, knife-handles, miniaed cups and saucers, tables for snuff-boxes, s, necklaces, bracelets, pins, buttons, and The polish of Cambay stones is not such as the eye of the British lapidary; yet they cheap that they might be expected to a considerable article of commerce. They e built up into mosaics for work-tables, ss-boards, and other elegant articles of e,—the chief part of the work being perhere, where labour is cheap, the final finish ven at home. The Cambay agates equal st Scotch pebbles in beauty; they generfeed them in size, and may be had for a mere n of the price.

king in stone, polishing the hardest surfaces, engraving the surfaces with imperishable records, and sculpturing stone into various forms, even excavating gigantic temples out of the solid mountains, are branches of sculpture, statuary, and engraving to which Hindus have paid attention from the earliest times; and their structures are conspicuous for the exquisite polish and glass-like appearance of some of the hardest rocks. They use a small steel chisel and an iron mallet. The chisel, in length, is not more than six inches, and it tapers to a round point like a pencil. The iron mallet does not weigh more than a few pounds. It has a head fixed on at right angles to the handle, with only one striking face, which is formed into a tolerably deep hollow, and lined with lead. With such simple instruments they formed, fashioned, and scooped the granite rock which forms the stupendous fortress of Dowlatabad, and excavated the wonderful caverns of Ellora and Ajunta. The traces of the pointed chisel are still visible on the rocks of Dowlatabad, as they are also on some of the works of Egypt. The stone having been brought to a smooth surface, it is next dressed with water in the usual way, and is then polished in the following manner:—A block of granite, of considerable size, is rudely fashioned into a shape like the end of a large pestle. The lower face of this is hollowed out into a cavity, and this is filled with a mass composed of pounded corundum stone, mixed with melted lac. This block is moved by means of two sticks, or pieces of bamboo, placed on each side of its neck, and bound together by cords, twisted and tightened by sticks. The weight of the whole is such as two workmen can easily manage. They seat themselves upon, or close to, the stone they are to polish, and by moving the block backwards and forwards between them, the polish is given by the friction of the mass of lac and corundum. The same materials are employed in polishing agate beads and bracelets, elegantly-shaped cups, or models of cannon. The agate stones are first fixed on a steel spike, and there roughly rounded with an iron hammer, and then polished with a composition of lac and corundum variously applied. The holes are bored with a steel drill, tipped with a small diamond. Cups and saucers, and similar hollow articles, are wrought, according to the required external shape, on the steel spike, and a rough polish given on the rough polishing-stones. The cavity is formed by the diamond-tipped drill to the depth of one-fourth of an inch all over the space, until it exhibits a honeycombed appearance; the prominent places round the holes are then chipped away, and this process is repeated until the depth and form desired are obtained. They are then polished upon prepared moulds of convex forms, and of the same composition as the polishing-plates which are attached to the turning-wheel.

STONE-WORSHIP. Stones have been objects of worship of all nations, and are largely so by the Hindus, generally smeared with red lead.

Amongst the earliest mention of this form of devotion will be found notices in several parts of the Hebrew Scriptures, under the appellations of images and groves, but these are very obscure. The Phœnicians worshipped a deity under the form of an unshaped stone. The Arabs, down to the time of Mahomed, worshipped a black stone, which is now let into the wall of the Kaba. There was a sacred stone in Jura, round which the people used to move deasil, *i.e.* sunwise. In some of the Hebrides the people attributed oracular power to a large black stone.

Baber in his Memoirs, p. 450, describes how, in the battle of Jam, at sunrise, the magicians set to work with their magic stone to create confusion amongst the Persians. In spite of three centuries of Muhammadan teaching, the magic stone still keeps up its reputation among the nomades of Central Asia. The sirdar (chief) of a razzia of Turkomans, or the leader of a Kirghiz baranti, to this day carries it carefully with him, and in case of the deadly bite of a viper or a scorpion, its efficiency is valued as highly as that of a fatiha prayer from the Koran.

Stonehenge is a circle of stones in England, of Buddhist architecture, and is own brother to the circle of upright stones at Amravati on the Kistna, and to many others in the south of India. The Stone of Destiny, on which the kings of Ireland were crowned, was afterwards taken to Scone, and thence carried to Westminster, and placed under the old coronation chair, where it still remains. Seating a king on a stone seems to have prevailed throughout Europe on inauguration. Monarchs of Sweden were seated upon a stone placed in the centre of twelve lesser ones, and the kings of Denmark were crowned in a similar kind of circle. The use of the Inaugural Stone is of Canaanitish origin. Abimelech was made king by the plain of the pillar of Shechem. Jehoash was anointed as he stood by the pillar, as the manner was. The Gael used the standing stone, which was traditionally considered a supernatural sacred witness [illegible]y solemn covenant, and especially of that between an elected king and his people. Jack Cade touched London stone, and exclaimed, 'Now is Mortimer lord of London city!' Amongst the Irish, the inauguration of a chief was celebrated at a stone with the impression of two feet, believed to be the size of the feet of the patriarch chieftain who first acquired the territory. Every great tribe had its installation stone and other specialities, such as sacred trees, and rath-hills or entrenched places of meeting, dedicated to the inaugural rite. Herodotus shows that the practice of carving the impression of the feet of mighty heroes on huge stones was older than his time, as he mentions that the Scythians showed the mark of the foot of Hercules upon a rock. Spenser, the poet, writes that some of the stones on which the chief lords or captains of the clan were placed had a foot engraven, which was regarded as the measure of their first captain's foot. On inauguration, the new chief stood thereon, and took oath to preserve all the former customs of the country inviolable. His feet were placed in the impression while the heads of law relating to the clan were read to him.

Stones from the beds of Indian rivers are the usual gramma devata or village deities of the Hindus, and also of the non-Aryan castes, who are not permitted to enter the Hindu temples. The salagrama, a fossil ammonite from the Gandak river, is worshipped by all Vaishnava Hindus.

Stone monoliths are erected as memorials by the Kol and Khassya races. In Kanawar villages in the Himalaya, a stone is set up as a pillar in the fields, its centre and top smeared with whitewash, and the top marked with five finger-marks of red ochre; on this flowers are offered for the prosperity of the field. In S. India, white lime-washed splinters of stone, tipped with red, are placed under the trees in a garden or field. The Asaga of Mysore worship a god called Bhuma Deva, literally earth-god, who is repr[illegible] sented by a shapeless stone. The worship [illegible] stones is spread over all parts of the distri[illegible] from Berar to the extreme east of Bustar, an[illegible] that not merely among the Hinduized aborigines[illegible] who have begun to honour Kandoba, etc., bu[illegible] among the rudest and most savage tribes. H[illegible] is generally adored in the form of an unshapely[illegible] stone covered with vermilion. Two rude slave[illegible] castes in Tulava, in Southern India, the Bakadara and Betadara, worship a benevolent deity named Buta, represented by a stone kept in every house. Indeed, in every part of Southern India, four or five stones may often be seen in the ryot's field, placed in a row and daubed with red paint, which they consider as guardians of the field, and call the five Pandu. Colonel Forbes Leslie su[illegible] that this red paint is intended to represen[illegible] The god of each Khond village is represe[illegible] three stones. Aerolites are worshipped by[illegible]

Stones are reverenced by the Karen[illegible] selection of them is fanciful. At Benkuna[illegible] Lampong country, there is a long stone, s[illegible] on a flat one, supposed by the people to [illegible] extraordinary power of virtue. It is rep[illegible] have been once thrown down into the wat[illegible] to have raised itself again into its original p[illegible] agitating the elements at the same time[illegible] prodigious storm. To approach it without [illegible] they believe to be the source of misfortun[illegible] offender.

The shape of the Polynesian stones, the[illegible] ence paid to them, their decoration, and the[illegible] expected from their worship, are quite in [illegible] ance with a widely-spread superstition. [illegible] had in his possession several smooth stone[illegible] the New Hebrides. He says that some of the[illegible] nesian stone gods were supposed to cause fecu[illegible] in pigs. Two large stones, lying at the bott[illegible] a moat, are said to have given birth to Deg[illegible] supreme god of Fiji. In all instances, an a[illegible] to objects already existing was expected fr[illegible] Fiji monoliths. A stone near Baw existed[illegible] whenever a lady of rank at the Fiji capi[illegible] confined, was fabled also to give birth t[illegible] stone.—*Galton's Vacation Tourists*, p. 27[illegible] *bery, Bokhara*, p. 299; *Lubbock's Origin* [illegible] pp. 207-210, 244.

STONING is regarded by Semitic race[illegible] most infamous of deaths. It is the rajn[illegible] Arabs, and their rajim is an execrating epi[illegible] the devil. One of the ceremonies of the[illegible] to cast stones towards Mount Arafat, an[illegible] pressive of their utter detestation of the d[illegible]

STORAX.

Mayah, ...	ARAB.	Styrax broom, .	
Su-hoh-hiang, . .	CHIN.	στυραξ, . . .	
Su-hoh-yu, . . .	,,	Storace, . . .	
Fung-hiang-chi, .	,,	Styrax, . . .	
Peh-kiau-hiang, .	,,	Azumbar, . .	

A gum-resin, the produce of Styrax o[illegible] growing in the south of Europe and the [illegible] It is usually met with in tears, which is p[illegible] in lumps or red storax, which is mixed wi[illegible] dust and other impurities. Storax has a f[illegible] odour, and a pleasant, sub-acidulous, [illegible] pungent, and aromatic taste; it is of a reddish-brown colour, and brittle.

The Chinese names refer to several resinous o[illegible] balsamic substances, used internally, and extern[illegible] ally in plasters.

STORAX, LIQUID, Rose malloes.

Mayah, Sailah, . ARAB. | Rasa-mala, . . . MALAY.
Sillarus, . . . HIND.? |

Liquid storax is obtained from the Liquidamber altingia. It is more or less opaque, of the consistence of birdlime, greyish colour, warm balsamic taste, and peculiar vanilla-like odour, if pure. Small quantities are imported annually into India from Suez and the Arabian Gulf in skins; it is re-exported to England and China under the designations of Rose malloes (Rasa-mala) and Sillarus, in barrels of about four imperial gallons' capacity each.—*Faulkner.*

STORKS. Naturalists arrange storks under the family Ciconidæ, tribe Cultirostres, and the genera Ciconia, Leptoptilos, and Mycteria.

The storks are more extensively distributed than the cranes, being represented in every part of the world, except in North America, where no member of the group occurs. They are more or less carnivorous in their habits, and are armed with a powerful beak, which attains its largest development in the adjutants and the Balæniceps. The [illegible] stork, Ciconia alba, is one of the most [illegible]rly known species of European birds, al[illegible] in England it has, from the changes [illegible]d by improved agriculture, become com[illegible]ely rare. It is widely distributed through[illegible]e Old World, being found in North Africa, [illegible] Asia as far as Bengal.

[illegible] species of the East Indies are as under:—

[illegible] alba, *Belon*, Europe, Africa, and Asia.
[illegible]ocephala, *Gmelin*, all India, Burma, and Archi[illegible]lago.
[illegible]a, *Linn.*, Northern India, Panjab, Dekhan.
[illegible]ptilos argala, *Linn.*, N. and N.E. India, Bengal, [illegible]nd Hyderabad.
[illegible]vanica, *Horsfield*, S. India, Bengal, Assam, Sylhet, [illegible]Burma.
[illegible]eria Australis, *Shaw*, all India, Malayana, Austra[illegible]a.

[illegible]rgala is the gigantic stork or adjutant bird [illegible]ropeans; L. Javanica, the small adjutant or [illegible]rested stork; M. Australis is the black-[illegible]l stork. Ciconia alba, C. leucocephala, and [illegible]a are the white, white-necked, and black [illegible]—*Jerdon.*

[illegible]RM-WAVES occur on some part or other [illegible]coasts of S. India every few years, sweep[illegible]r the land and destroying in great numbers [illegible]ople and their cattle; the western coast of [illegible]eninsula about the northern part of the [illegible]y Presidency, the eastern part about Ma[illegible]am, Vizagapatam, and Orissa, and the [illegible] of the Gangetic Delta, have been repeatedly [illegible]elmed.

[illegible]he 19th May 1787, the sea rose nearly 15 [illegible]nd inundated Coringa, when 20,000 people [illegible]0,000 cattle perished. Again, in 1789, [illegible]a was deluged by three enormous waves, [illegible]ng in slow succession, the third of them [illegible]ng everything before it. See Cyclone;

[illegible]ABO, an ancient geographer who lived [illegible]the beginning of the Christian era, and in [illegible]ne of the emperor Tiberius. He travelled [illegible]tween Armenia and Sardinia, and from the Black Sea to Ethiopia, and was the author of some historical works; but his Geography in seventeen volumes is alone extant. It treats on all the then known world; amongst other parts, of the south of Asia, Ceylon, and India, interspersed with many philosophical remarks, and short narratives relating to history and antiquities.

STRACHEY. Several civil and military officers of this name have added to our knowledge of British India.

Edward Strachey, Bengal Civil Service, editor of the Bija Ganita.

Lt.-Col. Henry Strachey, author of Narrative of a Journey to the lakes Cho-Lagan or Rakas Tal, and Cho-Mapan or Manasarowara, and the Valley of Pruang in Tibet in 1846, 8vo, Calcutta 1848; on the Frontier of Kamaon and Garhwal. He mentions that Manasarowara discharges its waters through a gravel bank into Rakas Tal, which again sends off a tributary to the Sutlej.

Sir John and General Richard Strachey wrote jointly on the Finances and Public Works of India for 1869 to 1881.

General Richard Strachey, an officer of the Bengal Engineers, wrote on the Physical Geography of the Provinces of Garhwal and Kamaon, in the Himalaya Mountains, in Lond. Geo. Trans., 1851, xxi. 57; on the Glaciers of the Pindur and Kuphinee Rivers, in the Kamaon Himalayas, Edin. New Phil. Jour., 1847-48, xliv. 108; A Trip to the Niti Pass, 1849, in Bl. As. Trans., 1850; on the Snow Line of the Himalayas, ibid., 1849, xviii. 287; Notes on Investigations near Kamaon, ibid., 240; Geography of Kamaon, ibid., 1851; Horary Barometrical Observations at 11,000 feet above the level of the sea; On the Tertia[illegible]tions of the Himalayas, Rep. Brit. As., 185[illegible] was appointed by the Indian Government to make a scientific survey of the province of Kamaon, and was occupied on the task about two years, during which time, in addition to the important investigations in physical science which occupied his attention, he thoroughly explored the flora of the province, carefully noting the range of each species. He was joined by Mr. Winterbottom in 1848, and they travelled together in Tibet. Their joint collections, amounting to 2000 species, were distributed in 1852-53 to the Hookerian Herbarium, the British Museum, the Linnæan Society, and some foreign museums.—*B. As. Soc. J.*, 1848; *Dr. Buist; British Museum.*

STRACHIA GEOMETRICA, a bug of a yellowish coffee colour, but marked with grey and orange on the upper side, found at Badulla in Ceylon. It feeds upon the juice of the young coffee berries, 3 per cent. or more of which were said to have suffered from it. It is allied to the green or fetid bug, but though it may occasionally cause destruction, there is no fear of it ever becoming a serious nuisance.

STRAIT OF JUBAL, at the entrance of the Gulf of Suez, 50 miles broad, extends from Ras Muhammad to Tur Harbour.—*Findlay.*

STRAIT OF SUNDA, one of the great portals of the Eastern Archipelago, is 63 miles wide between the south-western extremity of Sumatra and Java Head, but the main strait is narrowed to 51 miles by Princes Island. The most eastern rock is lat. 6° 44′ 13″ S., and long. 1° 36′ 20″ W.—*Findlay.*

STRAITS OF BANCA is rather more than 100 miles long, and in the narrowest part seven miles from shore to shore. The Straits of Banca, between that island and Sumatra, is the most frequented in the Indian Seas.

STRAITS SETTLEMENTS, on the northern boundary of the Straits of Malacca, include under one government, Penang, Province Wellesley, the Ding Dings, Malacca, and Singapore, and were incorporated in one Administration in 1826. These settlements ceased to be connected with India on 1st February 1867, when they became a Crown colony. The inhabitants in 1871 were returned—

Singapore, . . .	97,111	Penang and Province Wellesley, . .	133,230
Malacca, . . .	77,756		

The census taken in 1881 gives the total population of the Straits Settlements as 423,384, of which 1656 are resident Europeans and Americans, 174,327 Chinese, 238,066 Malays and other Asiatics, 316 Jews and Armenians, and 6904 Eurasians. A rapid increase is taking place in the actual numbers of Chinese, as well as in the proportion they bear to the whole population; and it is remarked that the numbers of Chinese women, though still only 127 in the 1000, has increased in the last ten years. In 1871 the proportion was 107 per 1000.

The inhabitants of Malacca and Province Wellesley consist chiefly of Malays and Chinese, with scarcely civilised tribes of Jakun, Binua, and Semang.

Penang is a beautifully-wooded island, situated at the north-western entrance of the Straits of Malacca, or in about lat. 5° 25′ N., and long. 100° 21′ E., and is about 13½ miles long, with an extreme breadth of 10 miles, containing an area of nearly [illegible] acres.

P[illegible] was obtained in 1786 by treaty from the king of Quedah; and fourteen years later, Province Wellesley was ceded by the same prince. In 1881, its population, with Province Wellesley, numbered 190,597, viz. Malays, 84,724; Chinese, 67,502; Tamils, 25,094; Europeans and Eurasians, 2271; Arabs, 574; Armenians and Jews, each 32.

Malacca has a sea frontage of forty-three miles, with a depth of ten to twenty-eight miles. The town is in lat. 2° 16′ N. Its population, 93,579. Amongst them, Malays, 67,488; Chinese, 19,741; Europeans, 40; Eurasians, 2213.

Malacca, conquered by Albuquerque for the Portuguese about 1515, fell into the hands of the Dutch in the beginning of the 17th century, but was taken by the British in 1795. They kept it until, in 1818, it was redelivered to the Dutch under the provisions of the treaty of Vienna, but it again reverted to the British by the treaty of 1824.

Singapore island is twenty-four miles long by fourteen broad, and contains an area of 206 square miles. The town is in lat. 1° 17′ N., and long. 103° 51′ E. Singapore has never changed European owners. In 1819, Sir Stamford Raffles, then governor of Fort Marlborough, or Bencoolen, in Sumatra, who had been long impressed with the importance of the position, took formal possession of the then nearly uninhabited island. Population, 139,208. Amongst others, Chinese, 86,766; Malays, 22,114; Europeans, with military, and Eurasians, 5862.

Province Wellesley is on the mainland of the peninsula, immediately opposite Penang, the water dividing them being about three miles broad at the narrowest point. It runs from north to south twenty-five miles, varying in breadth from four to eleven miles, and containing an area of 15,000 acres.

STRAMONIUM, Thorn apple.

Masil, Methel, . .	Arab.	Datura, ...	Hind.
Jouz masil, . . .	,,	Datura stramonium,	Lat.

These names are given to several species of Datura; all parts are poisonous. The leaves are used in asthma, for smoking.

STRANGE, Sir THOMAS, Judge of the High Courts of Madras and Bengal, and his son, Thomas Lumsden Strange, Judge of the Sadr Adawlat Court of Madras, authors of books on Hindu Law; that of the son, called a Digest of Hindu Laws, was compiled partly from the smaller work on the same subject by his father, and partly from other eminent authorities, but amplified and elucidated by his own investigations.

STRANGERS' HOME FOR ASIATICS was established in London in 1859. It offers to Indian sailors and other orientals, a comfortable and respectable lodging, with wholesome food, at a cost which shall render the institution self-supporting. Each lodger is to pay not less than 8s. per week, for which the lodger will be supplied with three meals a day, medical attendance, baths, washing, etc. Arrangements have been mad[illegible] take charge of their money and other pr[illegible] to make remittances to their families and f[illegible] to give them advice, and afford them inform[illegible] to protect them from imposition, to procu[illegible] employment in vessels.

STRAW.

Stroh, ...	Ger.	Stra, ...	
Pral, ...	Hind.	Sap, ...	

Straw is used for thatch, for the for[illegible] horned cattle, for veneering in Japan, an[illegible] straw-plait for the bonnets of the wome[illegible] Europe.

STRAWBERRY is the English name o[illegible] plant and fruit of species of Fragaria, of there are many,—

F. Bonariensis, *Juss.*, Buenos Ayres.
F. Chilensis, *Ehrh.*, South America.
F. collina, — ? Switzerland, Germany, hil[illegible] berry.
F. elatior, *Ehrh.*, America, hautboy.
F. grandiflora, *Ehrh.*, Surinam.
F. Indica, *Andr.*, mountains of India.
F. majaufea, — ? France.
F. monophylla, *Duchesne.*
F. nubicola, *Wall.*, Himalaya.
F. Roxburghii, *W. and A.*, Khassya, Assa[illegible]
F. vesca, *Linn.*, cultivated.
F. Virginiana, *Linn.*, North America.

Species occur in India both wild and cult[illegible] F. Chilensis, *Ehrh.*, the Chili strawber[illegible] brought from South America. F. collina an introduced plant. F. elatior, *Ehrh.*, hautboy strawberry from America; and F. flora and F. majaufea are also known, as Roxburghii, *W. and A.*, the F. Indica and of Roxburgh, which has also been classe[illegible] Duchesnea and Potentilla, growing in th[illegible] gherries, Dehra Doon, and Kamaon.

Fragaria vesca, *Linn.*

Paljor, . . .	Chenab.	Tash, ...	K[illegible]
Wild strawberry, .	Eng.	Fraga, ...	L.
Wood strawberry, .	,,	Bunun, also Musrini,	Ravi.
Kanzar, . . .	Jhelum.	Bana-phal, .	Sutlej.
Ingrach, Yan, .	Kangra.	Tawai, .	Trans-Indus.

This grows wild in most parts of the Panjab

Himalaya, from 4000 to 12,000 feet. The fruit is excellent when gathered dry, but is largely improved by cultivation. It is cultivated by Europeans and market gardeners, and in the Bombay Dekhan a bed of a few square yards brings in from £15 to £20 the season. In Bangalore, it is grown abundantly. The strawberry plant multiplies itself from runners and suckers; the old plant, after it has ceased bearing, throwing them out. In the Dekhan, as soon as the rains have set in, these runners may be removed into a nursery-bed, for their being more easily looked after, and should have the space of 9 or 10 inches allowed between them; they will throw out other runners, the whole of which may be separated and transplanted at the proper season. They thrive best in a light soil with good old stable and vegetable manure at first, and as soon as they show a disposition to flower, may have old goats' or sheep's manure added around each plant, a couple of double handfuls being sufficient. In no part of the Dekhan should the plants be put out for fruiting before the close of the rains, the part of September being quite early enough. s planted for experiment at the commence- f August, grew to a good size, and did for ten or twelve weeks but throw out , which were continually removed, but, , fruited badly. The finest and most prolific as got from suckers put out in the begin- October. Some strawberries were gathered ember from the plants put out in August, y were so few as in no way to induce a trial experiment again. Varieties can only be ed from seed; and to procure the seed, the finest ripe fruit, rub it on a sheet of and dry it. When the rains commence, the seed in water, reject all that float, the inder sow in baskets in a light loam, when will be fit to remove in about six weeks, and l be put in other baskets four or five inches and taken care of until ready to be trans- into the beds where they are to remain. se plants throw out suckers very fast, they e constantly looked after, and removed. ill commence bearing in six months from of sowing the seed. As soon as the rains ased, put the suckers that have rooted into beds, each not less than one foot apart, a row; this will give twenty-five in each s many as can be easily looked after and d without trampling on the bed, and injuring the plants. When the earth is of y consistence, Dr. Riddell has seen the rry cultivated on ridges. Some think this od plan, but he prefers the beds. It is nes necessary, in consequence of flooding s, to put tiles under the fruit to keep it ut it also attracts the notice of the birds. or grass be used, then the chances are ite ants destroy the plants. This it is that some persons prefer the ridge system of g, as they say the fruit is cleaner in con- e. Fine fruit may be grown either nd if on ridges, the same distance must be l between the plants as in beds, and even in the latter the plants may be put on raised cones of earth. The common vegetable manure is all that is required at first until near flowering, when a handful or two of goats' or sheep's dung should be put round the plant, opening the earth, and scraping it together. Water during the evening and very early in the morning.—*Drs. Birdwood, Cleghorn, Stewart, Riddell, Hooker, and Hogg.*

STRI-HARIKOTTAH MUTTAH, a small forest tract on the north of Madras.

STRIPERMATUR or Sri Perumbudur, lat. 12° 58′ N., and long. 79° 56′ E., in the Carnatic, 27 miles west of Madras; properly Sripermatur.

STRIVIGUNTUM, an anicut across the Tambrapurney river, in Tinnevelly, about 16 miles from the sea, provides irrigation for 32,000 acres. There are other seven anicuts across the bed of the river.

STROBILANTHES, a genus of plants of the order Acanthaceæ, which grow in the Khassya Hills, Nepal, Nagpur, and Ceylon. In Ceylon, species of Strobilanthes, the Nillu plant, are used as sticks to put in mud walls. Fourteen species of Strobilanthes grow abundantly in the mountain ranges of Ceylon. The golunda rats feed on the seeds, also the jungle-fowl, whose eyes are said to become affected from it.—*Tennent's Ceylon*, p. 30; *Fergusson.*

STROMBOSIA CEYLANICA. *Gardn.*

Sphærocarya leprosa, *Dalz.* | S. Javanica, *Thw.*

A large timber tree of Ceylon and the Canara Ghats. The wood is white and durable. S. Javanica, *Blume*, a closely-allied species.—*Beddome, Fl. Sylv.*

STRUTHIONIDÆ, the Ostrich family.

Naam, Naamah, .	ARAB.	Strutho-camelos, .	GER.
Thar-ud-jemmel, .	,,	Struzzo, Struzzulo, .	ITAL.
Autruche, ...	FR.	Struthio camelus, .	LAT.
Strausse, ...	GER.	Shutr-murgh, . .	PERS.

A family of birds of great size, which may be thus shown,—

Fam. I. Struthionidæ.

a. Struthioninæ.
Struthio camelus, Africa.
Rhea Americana, Rep. Argentine.
R. macrorhyncha, Rep. Argentine.
R. Darwini, Patagonia.

b. Casuariinæ.
Casuarius galeatus, Ceram.
C. bicarunculatus, Aru.
C. Kaupi, Salawatty, New Guinea.
C. uniappendiculatus, —?
C. Bennettii, New Britain.
C. Australis, New Holland.

Fam. II. Apterygidæ.
Apteryx Australis, New Zealand.
A. Mantelli, New Zealand.
A. Owenii, New Zealand.
A. maxima, New Zealand.

The distribution throughout the world of the struthious birds has this peculiarity, that each region which they inhabit has a separate form. The ostrich is found only in Africa, the three known species of rhea only in S. America, the emu only in Australasia, and the cassowaries only in the Moluccas and adjacent islands.

The common cassowary is Casuarius galeatus; Kaup's cassowary is Casuarius Kaupi. Cassowaries are usually wild and difficult to manage, and very rarely breed in captivity. The male takes sole charge of the duties of incubation.

The common cassowary is only found in Ceram, is replaced in the Aru Islands by another species (the Casuarius bicarunculatus), distinguished by having the caruncles on the throat widely separated, and in Northern Australia by a third species. Kaup's cassowary is peculiar to New Guinea, where

a second species of the genus, with only a single throat-wattle (C. uniappendiculatus), also occurs.

The southern apteryx is A. Australis, Mantell's apteryx is A. Mantelli, and Owen's apteryx, A. Owenii. See Ostrich.

STRYCHNOS, a genus of tropical plants. S. colubrina, *Linn.*, in the hot, drier parts of Ceylon; S. minor, *Blume*, at an elevation of 6000 feet, Ceylon; S. nux vomica. S. bicirrhosa, *Lesch.*, is a native of Tanjore; S. lucida, *R. Br.*, is from tropical New Holland; S. Madagascariensis, *Pet. Th.*, is of Madagascar; S. axillaris is of the Khassya Hills, and S. monogynus, *Roxb.*, in Sylhet. Στρυχνος was a name applied by Theophrastus and Dioscorides to a kind of nightshade, but adopted by Linnæus for this genus of the Apocynaceæ. One species is used in ordeals at Gaboon, in Africa, under the name of Cusa or Icaja, and at Cape Lopez it is called M'boundu. It grows in swampy places to the height of 4 to 6 feet. The active principle is contained in the red bark of the root, which is scraped off and steeped in about a quart of water, and when the water has acquired a reddish colour, the poison is ready. S. laurina, *Wall.*, grows at Galle, Kornegalle, and other of the warmer parts of Ceylon. S. cinnamomifolia, *Thw.*, Atta-kirindi-wel, SINGHALESE, a native of Ceylon, growing in the Hantani district, at an elevation of 3000 feet. S. Gaultheriana, of Cochin-China, is employed in cases of leprosy and hydrophobia.—*Eng. Cyc.*; *Thw. En. Pl.*; *Thw. Nature.*

STRYCHNOS COLUBRINA. *L.* Snake-wood.

Kuchila luta,	BENG.	Madira kaniram,	MALEAL.
Bois de couleuvre,	FR.	Pao-de-cobra,	PORT.
Lignum colubrinum,	LAT.	Naga musadi,	TEL.

A scandent plant with a stem often 8 to 12 inches in diameter, growing in the hot, drier parts of Ceylon, and in Malabar, Konkan, Coromandel, and Khassya. The wood is of a light-grey colour, hard, and intensely bitter. That of the root is deemed a remedy for the bite of the cobra capella; but several woods have, however, received the appellation of Bois de couleuvre (Lignum colubrinum), viz. the Ophyoxylon serpentinum in Amboyna, the Ophiorhiza mungos in Java, Polygala senega in North America, etc., all for their supposed virtues as antidotes to snake poison. A very large proportionate quantity of strychnine exists in the wood of this root.—*O'Sh.*; *Eng. Cyc.*; *Thw. Enum.*; *Roxb.*

STRYCHNOS LIGUSTRINA.

Caju-alar,	MALAY.	Caju-badaira pail or laut,	MALAY.
Caju-nassi,	,,		

A tree of the Eastern Archipelago, resembling the orange tree; berries globose, yellowish-green, two to eight seeded. This yields the Lignum colubrinum of Timor.—*O'Sh.* p. 443.

STRYCHNOS MINOR. *Blume.*

Var. a. S. parviflora, *Benth.* p. 341.

Grows in the warmer parts of the island of Ceylon, in the Central Province, up to an elevation of 6000 feet.—*Thw.*

STRYCHNOS NUX VOMICA. *Linn.*

Khanek-ul-kalb,	ARAB.	Lignum colubrinum,	LAT.

Snake-wood tree,	ENG.	Gada-kadooroo,	,,
Poison-nut,	,,	Yetti-cotay maram,	TAM.
Kuchila,	HIND.	Musadi, Mushti,	TEL.

A middling-sized tree, with a short, crooked trunk, which grows in the East Indies. The seed is inodorous, but its taste insupportably acrid and bitter. It is very difficult to reduce the seeds to powder; they must be first rasped, the raspings steeped in mucilage, then dried and powdered; or the raspings should be exposed to the steam of water for an hour, then stove-dried, and powdered in a covered mortar. The bark is of an ash-grey colour; is known to the European druggists under the name of the 'false angustura.' Dr. O'Shaughnessy found the bark commonly sold in Calcutta under the name of Rohun, and substituted for the harmless bark of the Soymida febrifuga. It acts as a powerful exciter of the spinal cord, and as a tonic. By Europeans it is principally used in paralysis and neuralgia, also in muscular tremors and incontinence of urine; and natives of India are now using strychnine as an excitatory agent. The pulp of the poisonous fruits are the favourite food of the Buceros Malabaricus hornbill, and other birds. The hard and durable wood is used for many purposes by the natives. It is exceedingly bitter, particularly that of the root, which is in intermitting fevers, and in cases of ve[ry] snake-bites, when that of Naga musini, S[.] brina, cannot be had. The seeds are empl[oyed] distillation of country spirits, to render the[m] intoxicating. Its timber is strong and grained, but never of large size; wood ha[s] of a white or ash colour, streaked with specific gravity, 0·706. A cubic foot we[ighs] lbs. It is used for ploughshares, cart wh[eels] Travancore for making cots, and is adapt[ed] fancy work and cabinet-making. It furnish[es] of the snake-woods of commerce. Iron to[ols] sharpened on blocks of this wood. Whit[e ants] will not touch it.—*O'Sh.*; *Royle*; *Roxb.*

STRYCHNOS POTATORUM. *Linn.*

Induga,	BENG.	Ingivi,	
Kha-boung,	BURM.	Tettan kotte maram	
Yæ-kyie,	,,	Tettan parel maram	
Chil-binj-ka-jhar,	DUKH.	Indupu chettu,	IND.
Clearing nut tree,	ENG.	Katakamu,	
Nirmul, Nirmuli,	HIND.	Chilla ginja chettu	
Kataka,	SANSK.	Kotoko,	

This tree grows in the drier parts of [India] is found in various parts of India, and gr[ows] larger size than the S. nux vomica, but [is] It has shining fruit, which is black when [ripe] attains a height of from 15 to 60 feet. T[he] lish name is derived from the property [of] seeds of purifying muddy water, bein[g] stantly used for that purpose by the nativ[es] rub the inside of their brass pots with the[m] impurities very soon fall to the botto[m]. nature of the action has not been clear[ly] tained. It probably depends on astring[ent] the fruit. The fruit is used medicinally [and] when ripe, eaten by the natives. Th[e] plant is destitute of the poisonous ingre[dient] the other species. This seed can often be [used] when alum cannot be procured. The nativ[es] drink clear well water if they can get [it] river water, which is always more or less [bad] —*Drs. Roxb.*, *Wight*, *Gibson*, *Cleghorn*; *Macdonald.*

STRYCHNOS SANCTI IGNATII. *Berg.*

Ignatia amara, *Linn.*

St. Ignatius' bean,	ENG.	Papeeta,	HIND.

A branching tree, a native of the Philippin[es]

Islands, with seeds an inch long, the size of a large olive. According to the analysis of Pelletier and Caventon, these beans contain igasurate (strychnate) of strychnia, wax, concrete oil, yellow colouring matter, green starch, bassorine, and vegetable fibre. The strychnine is present in three times the quantity of that in S. nux vomica nuts, but there is no brucine. Its activity is consequently very great, its uses the same as those of nux vomica. In small doses they are said to purge; they are an efficacious vermifuge. When given in over-doses, the symptoms are those of poisoning by strychnia, as vertigo, convulsions, etc., and the remedy used for these effects is lemonade in large quantities, which is said to afford relief speedily.—*Eng. Cyc.; OSh.*

STRYCHNOS TIEUTE. *Lesch.*

Ypo, ... CELEBES.	Tietti, Tiette, . . JAV.
Upas tjeute, Tshellik, JAV.	Antiar, ... ,,

Has elliptical, acuminate, 3-nerved, glabrous leaves, and simple tendrils, which are thickened opposite the solitary leaves. This plant is a ng shrub, a native of Java, and is said to true Upas tree of that country. It is tedly the most poisonous species of the and yields the greatest quantity of strych- The root is called Upas raja, but another ree of Java is the Antiaris toxicaria, and other plants are called Upas. The natives a prepare from this species one of the that are used for producing death by wounds.—*O'Sh.; Eng. Cyc.*

Bank myna, . . ENG.	Lali, ... SIND.
Ganga maina, . . HIND.	

Occurs from Afghanistan and the Himalaya southwards to the Nerbadda.

Acridotheres fuscus, *Wagler.*

A. griseus, *Blyth.*	Mama cristatelloides, *Hod.*
Pastor Mahrattensis, *Sykes.*	Gracula cristatella, *Sund.*
Jhont-salik, . . BENG.	Jhonti maina, . . HIND.
Pahari maina, . . HIND.	

Occurs in hilly and jungly districts throughout India, Nepal, Assam, and Burma.

Acridotheres cristatellus, — ? China.

Acridotheres Javanicus, *Cabanis*, Java.

Temenuchus pagodarum, *Gmelin.*

Pastor nigriceps, *Hodg.*	Turduspagodarum, *Gmel.*
Maina sylvestris, *Hodg.*	
Monghir pawi, . . BENG.	Bahmani maina, . HIND.
Pabiya pawi, . . ,,	Papata pariki, . . TAM.
Brahmany myna, . ENG.	Rawanati, . . . ,,
Popoya maina, . . HIND.	Papata gorruki, . TEL.

Occurs throughout all India. It is the black-headed myna.

Temenuchus Malabaricus, *Gmelin*, is the Pastor caniceps, and T. Blythii, *Hodgson*, the Pawi of Bengal.

Temenuchus Blythii, *Jerdon*, the white-headed myna of the Malabar forests, and other six species of Further India.

Saraglossa spiloptera, *Vigors*, of Western Himalaya.

Eulabes religiosa, *Linn.*, hill myna, of S. India, Coorg, Wynad, and Malabar.

Eulabes intermedia, *A. Hay*, the Nepal hill myna, of N. India.—*Blyth; Jerdon.* See Starlings.

STYLIDIUM BEGONIFOLIUM. *R. Br.*

S. Chinense, *Lour.* | Marlea begonifolia, *Roxb.*

Khassya Hills, extending northwards beyond 30° of N. lat.; middle-sized, white, with large

yellow anthers, from March and April to July and August. Timber employed by the natives in the construction of their houses.—*Voigt.*

STYLOCORYNE WEBERA. *A. Rich.*

Webera corymbosa, *Willd.*	Rondeletia Asiatica, *Linn.*
Canthium corymbosum, *Pers.*	Cupia corymbosa, *D. C.*
	Tarenna Zeylanica, *Gærtn.*
Kommi chettu, . . TEL.	Konda papata, . . TEL.
Bomma papata, . . ,,	

The wood of this small tree is small, but hard, prettily marked, and much esteemed by the natives. The tree is met with on the Godavery. Its leaves and fruit are used in medicine.—*Roxb.; Voigt.*

STYRACEÆ, a sub-order of plants, consisting of trees or shrubs, and comprising eight or nine genera; Symplocos, Styrax, Paralea, and Decadiathera. The E. Indian species are:—

Symplocos ferruginea, *Roxb.*, Khassya.
S. spicata, *Roxb.*, Khassya.
S. racemosa, *Roxb.*, Bardwan, Nepal, Kamaon.
S. sinica, *Kerr*, China.
S. pulcherrima, *Wall.*, Nepal.
Styrax benzoin, *Dryand.*, Sumatra.
S. serrulatus, *Roxb.*, Chittagong.

This order is chiefly remarkable, in an economical point of view, for furnishing the storax and benzoin of commerce, which contain a peculiar acid called the benzoic acid. Some of the species are used for dyeing yellow.

STYRAX BENZOIN. *Dryander.*

Lithocarpus benzoin, *Blume.*

Bakhur, Kunnuk, . ARAB.	Kominjan, . . MALAY.
[illegible]ood, Ood, DEKH.	Husse luban, . . PERS.
Gum-benjamin tree, ENG.	Husse-ul-jawi, . . ,,
Storax, ... ,,	Sambranee, . . . TAM.
Luban, ... HIND.	

This tree is a native of Sumatra, Siam, and Java, and yields the gum-benjamin of commerce, by making incisions into the tree in its seventh year. The juice hardens on exposure to the air, that which flows first being the purest and most fragrant. It is supposed that Styrax Finlaysonianum also yields it. It occurs in masses composed of white lumps, joined together by a brownish-red substance. It has an agreeable odour and taste. It contains a resin mixed with a considerable quantity of benzoic acid, which may be prepared from this drug. It is a very useful stimulant, expectorant, and diuretic, but is chiefly used as incense. It is principally used in chronic bronchitis and laryngitis, also in jaundice and disease of the bladder.—*Voigt; Birdwood; Powell.*

STYRAX OFFICINALE. *Linn.* A native of Asia Minor and Syria, common in Greece, and cultivated in the south of Europe. As this plant does not yield a balsamic exudation in all these situations, some storax has been thought to be yielded by Liquidamber orientale. See Storax.

STYRAX SERRULATUS. *Roxb.* Koom jameeva, BENG. A small tree, a native of Chittagong, where it blossoms in March, and the seed ripens in October.—*Roxb.*

SU, also Abar, a great Scythic horde who entered India B.C. 126, and gave their name to the province of Indo-Scythia.—*Elliot.*

SUAR or Surah, a wild, half-savage, forest tribe inhabiting the Eastern Ghats of the Peninsula of India. They are known to their settled neighbours as the Chenchu kulam, Chenchwar, and Chensuar. Wilson names them Chenchu-vadu (Vadu, TEL., a man). They dwell in the tract covering the westernmost range of the Eastern Ghat line, between the Pennar river and the Kistna, and known locally as the Nullamallay and the Lankamallay. They inhabit clearings in the forest, live in beehive-shaped huts, like the African, Nicobarian, and many of the ruder Asionesian tribes. These are of wicker-work, with walls about 3 feet high, and a conical straw roof, with a screen for a door. The men, almost nude, have in general only a rag for covering. The women dress like the wandering female basket-makers, whom they resemble in features. The features of the men are small, but the expression is animated, cheek-bones higher and more prominent than those of the Hindus in general, nose flatter, and nostrils more expanded; their eyes black and piercing. In stature they are somewhat shorter than their neighbours, and they are slightly, but well made, except about the knee and the leg, which is large. The colour of the skin is dark. Newbold characterizes them as between a Teling and a Jakun of the Malay Peninsula. They speak Telugu with a harsh and peculiar pronunciation. They have large dogs, and a few are employed as hill police pass from the Kuman to Badwail. They h images. They are polygamists; they bur dead, but sometimes burn, and they ca deceased's weapons to the grave. They spear, hatchet, the matchlock, or a bamb and reed arrow tipped with iron. They weaving and other manufacturing arts wi tempt. They are patient and docile. Mr. has suggested that the Chenchwar are a co tion of the wild forest Surah of the mount tracts farther north in the line of Eastern Vocabularies of the Kond, Savara, Gadaba, kala, and Chentsu are given in the Beng. A Journal of 1856.—*Newbold in Beng. As. Soc.* 1865; *Logan in Jour. Ind. Arch.*

SUBAH, a province, a government, som a smaller division, also the officer in charg subah. Subah under the Moghul rule was a subdivision of their dominions, such as Behar, Bengal. Each subah was divid a certain number of circars, and eac into parganas or mahals (which are equivalent expressions), and the pargana were aggregated into dustoor or districts; the parganas of the dustoor were always ous, the dustoor statement in old regi copied with any regard to correctness, means of the verification of doubtful Subah is an Arabic word, signifying a money or a granary. Circar is literally a supervisor; dustoor, besides signifying a also a minister, a moonshi. The title of dar, or lord of the subah, is long subseq Akbar's time. Sipahsalar was then t designation of the emperor's viceroy subah. A subahdar, in the British India is a native commissioned officer of native or cavalry.—*Elliot; Malcolm's Central In*

SUBAH. ARAB. The morning. S kazib, a false dawn, is a transient appea light on the horizon, which often appears a an hour before the subh-i-sadik, or real dawn o day. Subah-ul-kheir, good morning.

SU-BAHU. SANSK. Five-armed, a royal Hindu title.

SUBAKTAGIN, governor of Khorasan, declared himself independent at Ghazni in A.D. 975;

he afterwards carried his arms across the Indus, forcibly converting the natives to Islamism. These inroads were repeated, and in the last (A.D. 997) he was accompanied by his son, the celebrated Mahmud, who, after his succession to the throne of Ghazni, repeatedly invaded India. Mahmud subjugated the whole of the level district west of the Indus to the very foot of the Brahui mountains. His son Musaud extended these conquests still more westerly into Mekran. He adhered, however, to his father's plan of not ascending the lofty ranges.—*Hist. of Panjab*, i. 64.

SUBANSIRI, a river in the north-east of the province of Assam, which contributes to form the main stream of the Brahmaputra. It is supposed to rise far up among the mountains of Tibet. It enters the district of Lakhimpur from the Miri Hills, and, flowing south through North Lakhimpur, forms, together with the channel of the Lohit, the large island Majuli Char, and finally empties itself into the main stream of the Brahmaputra in Sibsagor district. In the plains it is navigable by steamers as far up as Patalipani, 16 miles from Lakhimpur town. Below this place it is [illegible]e fordable.—*Imp. Gaz.*

[illegible]ARNAREKHA, meaning the streak of [illegible] a river in Bengal, which rises 10 miles [illegible]est of Ranchi in Lohardaga district, and [illegible]owards the north-east, leaving the main [illegible] in a picturesque waterfall called Hun[illegible]rh.

[illegible]RNAREKHA, in lat. 21° 34′ 30″ N., and [illegible]° 22′ E., on the Orissa coast, was the site [illegible]first maritime English settlement in Bengal. [illegible]rt is unsafe during the south-west mon[illegible]ut within the bar the Subarnarekha pos[illegible]a magnificent deep channel.—*Imp. Gaz.*

[illegible]BATHU, a military cantonment and sana[illegible]n in the Simla district of the Panjab, in lat. [illegible]′ N., and long. 77° 2′ E. It occupies the [illegible]f a ridge on a table-land at the extremity of [illegible]la range, overlooking the Ghambar river, [illegible]s from Simla station. It is 4253 feet [illegible]he sea. It has been held as a military [illegible]ce the close of the Gurkha war in 1816, [illegible]acks exist for a whole regiment. Suba[illegible]9 miles from Kussowlee on the road to [illegible]the hills are bare of wood; the climate [illegible]rom that of Kussowlee in being hotter in [illegible] and colder in winter. It is altogether [illegible]y and sheltered, and has an advantage in [illegible]ldom visited by fogs. Subathu is noted [illegible]ummulitic strata.—*Imp. Gaz.* See Sana[illegible]

[illegible]HA, a Bedouin tribe on the right bank of [illegible]es below the Weldi. They are constantly [illegible]with the Shammar of Al Jazirah, and on [illegible]ount are protected by the Anazeh. They [illegible]ge flocks of sheep and camels, and have [illegible]rses. Some families grow grain.

[illegible]ADRA (Su, beautiful, Bhadra, good), [illegible]r of Vasudeva, sister of Krishna, and [illegible] Arjuna. Bala Rama, her elder brother, [illegible]to give her to Duryodhana, but, at [illegible]shna's suggestion, her marriage was by seizure [illegible]f the maiden by Arjuna, near the Raibuta mountain, where she had gone to perform religious ceremonies, and Bala Rama subsequently acquiesced in their union. She was the mother of Abhi Manyu. Her lamentation for her son after he was killed in battle was addressed to his spirit, and she prayed for its being associated with the holy and heroic in the heavenly sphere.—*Dowson; Mahabharata; Cal. Review.*

SUBHAGNA (of good fortune) was an only child, a maiden widow. It is related of her in a Hindu legend, that, having learned from her preceptor the solar incantation, incautiously repeating it, the sun appeared and embraced her, and she thence became pregnant. The affliction of her father was diminished when he discovered the parent. Nevertheless (as others might be less charitable), he sent her with a female attendant to Balabhipura, where she was delivered of twins, male and female. When grown up the boy was sent to school, but, being plagued about his birth, whence he received the nickname of Ghaibi (concealed), in a fit of irritation he one day threatened to kill his mother if she refused to disclose the author of his existence. At this moment the sun revealed himself; he gave the youth a pebble, with which it was sufficient to touch his companions in order to overcome them. Being carried before the Balhara prince, who menaced Ghaibi, the latter slew him with the pebble, and became himself sovereign of Saurashtra, taking the name of Silladitya (from Silla, a stone or pebble, and Aditya, the sun). His sister was married to the raja of Baroach. We are struck by the similarity of production of these Hindu Heliadæ, and that of the Tatar dynasty from which Chengiz-Khan was descended. The Nooranyon, or children of light, were from an amour of the sun with Elancua, from which Chengiz Khan was the ninth in descent. Authorities quoted by Petis de la Croix, in his life of this conqueror, and likewise by Marigny, in his history of the Saracens, affirm Chengiz Khan to be a descendant of Yezdejird, the last Sassanian prince. Chengiz was an idolater, and hated the very name of Muhammadan. A courtier telling Aurangzeb of his celestial ancestry, gravely quoting the affair of the mother of the race of Timur with the sun, the monarch replied, 'Mama caba bood.'—*Tod's Rajasthan*, i. p. 234.

SUBHAN. ARAB. Praising or glorifying God. Subhan Allah, May God be praised! a frequent solemn ejaculation of devout Muhammadans.

SU-BHANGI or Aghiri are wandering Hindu mendicants. They drink from human skulls water mixed with urine and sugar, and as if for purposes of nature squat before houses, extorting alms by the disgust they create. They likewise do the tricks of producing from their mouths, milk, liquor, etc. They are believed to engage in gang robberies.

SUBHAN RAI, author of Khulasat ut Tawarikh.

SUB-HIMALAYA is a term originated by Mr. B. Hodgson to distinguish all the mountains and their inhabitants below the snowy range. But the term is inappropriate, as it includes precipitous mountains 8000 and 10,000 feet high, and people dwelling in them, higher than the highest mountaineers of Europe. The Sub-Himalayas comprised in Bhutan, Sikkim, and Nepal are chiefly occupied by Tibetan or Bhotia tribes, and by tribes more akin to the Gangetic race. The first fossil remains of the colossal tortoise, Colossochelys atlas, were discovered in 1835 in the tertiary strata of the Siwalik Hills, or Sub-Himalaya skirting the southern foot of the great Hima-

laya chain. They were found associated with the remains of four extinct species of mastodon and elephant, species of rhinoceros, hippopotamus, horse, anoplotherium, camel, giraffe, sivatherium, and a vast number of other mammalia, including four or five species of quadrumana. The Siwalik fauna include also a great number of reptilian forms, such as crocodiles and land and fresh-water tortoises. Some of the crocodiles belong to extinct species, but others appear to be absolutely identical with species now living in the rivers of India, in particular to the Crocodilus longirostris, from the existing forms of which naturalists have been unable to detect any difference in heads dug out of the Siwalik Hills. The same result applies to the existing Emys tectum, now a common species found in all parts of India. A very perfect fossil specimen, presenting the greater part of the evidence of the dermal scutes, is undistinguishable from the living forms, not varying more from these than they do among each other. There are fair grounds for entertaining the belief as probable that the Colossochelys atlas may have lived down to an early period of the human epoch, and since become extinct,—1st, from the fact that other chelonian species and crocodiles, contemporaries of the colossochelys in the Siwalik fauna, have survived; 2d, from the indications of mythology in regard to a gigantic species of tortoise in India. —*Campbell*, p. 46; *Jour. As. Soc. Ben.*, No. 247 *of* 1855. See Siwalik.

SUBRAMANYA, among the Hindus of Southern India, a name of Kartikeya, the god of war. Subramanya is a favourite deity of the Tamil and Teling races.

SUBRAMUNI, below the ghats in the south of the Peninsula, is one of the principal seats of serpent-worship in India.

SUBRAON is in the neighbourhood of Ferozpur in the Panjab. It was the scene of a battle between the British and the Sikhs after the death of Ranjit Singh.

SUBSIDIARY FORCE, a term by which is designated a brigade of the British Indian army, about 5000 strong, lent to the Hyderabad Government, under treaty, and the expenses of which are met by the revenues of the Ceded Districts, now forming the revenue collectorates of Bellary, Cuddapah, and Kurnool. It was the Marquis of Wellesley who established the relations between the Nizam and the British on their present basis, and who initiated that political status of subsidiary alliances which has continued with but little alteration down to the present day. By this system a native sovereign receives a British Resident at his court, and receives and maintains a British subsidiary force within his dominions. This system was carried out with the Nizam of the Dekhan in 1798 and 1800. It was also tried on the sultan of Mysore, but Tipu flamed up at the idea of becoming a pensioned prince, and the result was his own overthrow and the establishment of a dependent raja in his room. Then it was tried on the Peshwa of the Mahrattas, and would also have been tried on Sindia and Holkar, had not Wellesley been recalled, and Cornwallis sent out in his room. This system was subsequently extended to the whole of the Native States, and belongs to the general history of India. By this arrangement Nizam Ali was compelled to give up his French force, and to become really dependent on the British power. He died in 1803, very shortly after the change.

SUCCOTH BENOTH, an Assyrian deity, whom the Jews worshipped under the name of Astarte or Ashtaroth, and it is said that this deity was of both sexes. This physiological or androgynic union of the sexes is attributed to a form of Siva, the right side being male and left side female, and his female energy or sakti is fabled to have assumed both appearances as circumstances required. The Babylonian goddess identical with Succoth Benoth was Mylitta, meaning mother, and the term Mat'ha or mother is applied to the wife of Siva. Amongst the Assyrians, the women, once in their lives, had to make a sacrifice of virtue to the goddess Succoth Benoth. Lemprière says that Succoth Benoth was a surname of Venus, in whose temples all the women were obliged to prostitute themselves to strangers. Amongst other names of the wife of Siva is Bali or Vali, under which appellation she assumed the form of a girl of twelve years of age. And in Madura, Balane, and other places, be[a] virgins used to go to the temple once in[a] lives to offer themselves in honour of the g[od]. It was the belief that a god had converse[d] them.—*Roberts*, p. 9.

SUD, Sudh, or Sudhan, in Chutia Na[gpur] term which includes all Hindu castes, Bra[hmans] Rajputs, Goalas, Kurmis, Kahars, etc. word means pure, and they designate origines Kol, meaning vile or impure, or robber. The Kol accepted the distinctive d[esignation] nation. Uniting in themselves a Dravidia[n] Kolarian element (the Oraon and Munda) were in want of a generic term to disti[nguish] them from the Sudhs, but to the latter the[y] apply the epithet Diku, a word of unc[ertain] meaning, but not intended to be complime[ntary] —*Dalton, Ethnol. of Bengal*, p. 309.

SUDANA or Sudatia, illustrious giv[er] title of the famous Buddhist prince Wess[antara] king of Sibi or Siwi, and son of Raja Sand[aka] is believed to have been one of the p[revious] incarnations of Buddha. His history and[,] his wife Phusati and two children, ar[e] sented in the sculptures on the north gat[e] great Bhilsa tope. He gave away wha[t] was asked for, even his kingdom, a[nd] dethroned by the people. His capital [Pushkarawati] is supposed to be the modern Shahbaz ga[rhi] a rock within its bounds is one of the rock tions of Asoka.

SUDDHODANA, father of Gautama Si[ddhartha] the Sakya Buddha. He was chief of a Sakya, whose country lay among the spu[rs] Himalaya, along the banks of the R[apti] modern Kohana. He was one of the las[t] sentatives of the pure Aryan or Solar d[ynasty] who held sway in Ayodhya, the moder[n] and were deposed by the Lunar dynastie[s] mixed Aryan and Turanian races, and re[duced] mere chieftains of tribes, who still main[tained] precarious independence under the prot[ection] shadows of the Himalaya. The Rohini (Kohan[a]) divided the Sakya rule from that of the Koliyan on its opposite bank, and in times of drought and famine the river was often the subject of fighting between them. But during the rule of Suddhodana there was peace between the clans on either

side of the Rohini, and Suddhodana had married two daughters of the Koliyan chief. Both continued childless, until, in her 45th year, the eldest sister presented her husband with a son, the prince Gautama Siddharta, who when 19 years old was married to his beautiful cousin Yasodhara, daughter of the Koliyân chief, who bore a child to her husband when he was in his 29th year.

SUDI. HIND. The bright or increasing half of a lunar month from new to full moon; a fortnight of the growing moon.

SUDIKKODUTTA NAYSSIYAR, a Tamil poetess, who is said to have been a foundling, who consecrated herself to Vishnu, as worshipped at Tirupati. 173 stanzas, called Tirupavai and Tirumoli, part of the Nalayira Pirapantam, are attributed to her.

SUDRA or Sudar is the caste appellation of the mass of the Hindu inhabitants of India. This word is of very rare occurrence in the Vedas. The Aryans commonly styled their native foes Dasya, but in several passages of the Atharvan, [illegible]or çudra is directly contrasted with arya. [illegible]recognises the name in that of the town [illegible] the Lower Indus, and especially in that [illegible]ations of the Sudroi in Northern Ara-[illegible]nd he supposes them to have been, with [illegible]ira and Nishada, a black long-haired race [illegible]gines, subdued by the Aryans. It cannot [illegible]te[illegible] that by the Aryans the term was [illegible]d in course of time to all who occupied or [illegible]luced to a dependent condition, whilst the [illegible]'hlecha continued to be the appellation [illegible] unsubdued un-Aryanized tribes. Lassen [illegible]ax Muller suppose that the whole of the [illegible] or primitive servile classes of Northern [illegible]belonged to a race different from their [illegible] conquerors; but Dr. Caldwell thinks it [illegible]le that a considerable portion of them [illegible]cd of the slaves, servants, dependents, or [illegible]s of the high caste Aryans, and, like the [illegible]belonged to the Aryan race. And the fact [illegible]e Brahman, Kshatriya, Vaisya, and Sudra [illegible]epresented as having sprung from Brahma's [illegible]ough from different parts of it, is in [illegible] the idea that the Sudra differ from the [illegible]rn Aryans in rank only, not in blood. [illegible]e farmers, gardeners, mechanics, artisans, [illegible]urers of every description. But in these [illegible]ocations will be found persons of the [illegible]nd third tribes, castes, or classes, but of [illegible] comparatively few. According to Menu, [illegible]ral duty of the Sudra is servitude. Many [illegible] and sub-castes of Sudra burn their dead [illegible]er Hindus. Others inter them decently [illegible]l in a horizontal position, while others, [illegible]ngaets, artisan goldsmith caste, etc., put [illegible]d in a sitting attitude. The Sudra have [illegible]s subdivisions in their castes, and the [illegible] of the Aryan Brahman races has been [illegible]nise as of the Sudra caste all the ab-[illegible]races who adopt Brahmanism. In the [illegible]a of India, the great Vallalar, Idiga, and [illegible]aces, the Balja, Pakinati, Mootati, Vella-[illegible]n with the titles of Rao, Naidoo, and Sitti, [illegible]ll the Kunbi, Kurmi, all the Hindu barber and [illegible]mutton butchers, claim to be of Sudra origin. [illegible]Part of the Sudra have by some authors been [illegible]believed of a Cushite or Caucasa race, who invaded [illegible]ndia anterior to the Aryan immigration. If other employments fail a Sudra, says Menu, he should subsist by writing.—*Oriental Linguistic Studies.*

SUDRA. The Parsees are invested with the sudra or sacred shirt, and the cord or kusti, at the age of six years and three months. This investiture is the initiation of the child into the religion of Zoroaster, the jubhla being then discontinued. The sudra is made of linen or gauze or net, while the kusti is a thin woollen cincture or cord of seventy-two threads, representing the seventy-two Has or chapters of the Izashne, one of the sacred books of the Parsees. The sudra and kusti are worn alike by men and women, but the latter likewise dress in the saree, generally of coloured silk, and the short-sleeved silk vest called the kanchri or choli.—*Parsees*, p. 70.

SUDRAKA, author of the drama Mrichchha Kati, or the Toy Cart.

SUEDA FRUTICOSA. *Moq.* The Lanee and Loonuk, a plant of the Chenopodiaceæ, growing abundantly in the Panjab and Sind. It is burned along with Salsola Indica, *Roxb.*, and Chenopodium, to obtain Sajji khar, crude carbonate of soda.—*J. A. Murray.*

SUEVI. Su, Tuisto (Mercury), and Ertha (the earth), were the chief divinities of the early German tribes. Tuisto was born of Ertha (Ella) and Manus (Menu). He is often confounded with Odin or Woden, the Budha of the eastern tribes, though they are the Mars and Mercury of these nations. The Suevi or Suiones, the most powerful Getic nation of Scandinavia, was divided into many tribes, [illegible] who[illegible] Su (Yu-chi or Jit), made human sacrifices in their consecrated groves to Ertha (Ella), whom all worshipped, and whose chariot was drawn by a cow. The Suevi worshipped Isis and Ceres (of Rajasthan), in whose rites the figure of a ship is introduced, 'symbolic,' observes Tacitus, 'of its foreign origin.' At Udaipur, the festival of Isa or Gowri, wife of Iswara, is performed on the lake, and appears to be exactly that of Isis and Osiris in Egypt, as described by Herodotus. The Getic race carried their veneration for the horse, symbolic of their chief deity the sun, into Scandinavia, equally so of all the early German tribes, the Su, Suevi, Catti, and Sucimbri Getes, in the forest of Germany and on the banks of the Elbe and Weser. The milk-white horse was supposed to be the organ of the gods, from whose neighing they calculated future events: notions possessed also by the Aswa, sons of Budha (Woden), on the Yamuna and Ganges, when the rocks of Scandinavia and the shores of the Baltic were yet untrod by man. It was this omen which gave Darius Hystaspes (Hysna, to neigh; Aspa, a horse) a crown. The bard Chund makes it the omen of death to his principal heroes. The steed of the Scandinavian god of battle was kept in the temple of Upsala, and always 'found foaming and sweating after battle.' 'Money,' says Tacitus, 'was only acceptable to the German when bearing the effigies of the horse.'—*Tacitus; Rajasthan*, i. p. 64.

SUEZ, the Es-Suweys of the Arabs, is at the northern end of the Gulf of Suez. It is supposed to be the Klysma mentioned by Lucian, and later on the Kolzum of the pilgrims, and the sites of these places are indicated by mounds on the backwater which formerly extended for miles inland. Prior to the construction of the Suez Canal, Suez

remained a small Arab village, with perhaps 1000 inhabitants, and although the population has considerably increased, the town presents to this day a decayed appearance, the stimulus given to it by the opening of the canal and docks having been transient.

SUEZ CANAL, connecting the Red Sea and the Mediterranean, was constructed in the middle of the 19th century, having been projected and its works superintended by Count Ferdinand de Lesseps, a native of France. Rameses the Great constructed a canal from the Nile at Bubastes, which reached to the neighbourhood of the lake Timsah. Upon this canal Rameses built his strong towns, Pithon and Rameses, and Israelites were employed in building these cities. This canal was constructed to prevent the passage of the horses of the Hyksos for the purpose of plundering Egyptian territory, and it was certainly completed in the 14th century B.C., and was in use at the time of Herodotus. Necho, a king of Egypt, who reigned about 600 years B.C., is said to have commanded some Phœnicians to sail from the Red Sea to the Mediterranean, round the Cape of Good Hope,—a voyage which they accomplished in two years. If the Phœnicians really did complete the voyage, they anticipated the discovery made by the Portuguese about 2000 years after. Necho entertained the idea of connecting the Mediterranean and Red Seas, and with this view he commenced extending the canal of Rameses, though he succeeded in his [illegible] only in extending it as far as the Bitter Lakes.

About 100 years later, Egypt fell under the kings of Persia, and Darius determined upon completing the projects of Sesostris and Necho by digging a canal between the Red Sea and the Nile; but, being assured by the engineers of the period that the Red Sea was higher than the Nile, and that its salt water would overflow and ruin the whole land of Egypt, he abandoned his purpose.

The next king of Egypt who gave his attention to the construction of a Suez Canal was Ptolemy Philadelphus, who reigned about 300 years B.C. He dug a canal from a branch of the Nile to Damietta, a port on the Mediterranean. This canal was 100 feet broad, 30 feet deep, and 10 or 12 leagues in length, extending, in fact, to the Bitter Wells. He meant to have continued it to the Red Sea, but desisted from fear that the Red Sea was three cubits higher than the land of Egypt. That this canal, though deeper than that of M. de Lesseps, did not succeed, is evident from the fact that in B.C. 277 Ptolemy Philadelphus changed the direction of Indian traffic. Alexandria was now made the port on the Mediterranean side, and merchandise from Europe was carried thence up the Nile to the city of Coptus (probably near Keneh), and conveyed across the desert from thence to the seaport of Myos-Hormos (probably near Cosseir) on the Red Sea. On account of the dangers attending this port, Philadelphus sent an army to construct the haven of Berenice, in which the ships engaged in Indian commerce took shelter. Trade increased enormously by the new route, and Alexandria became rich and famous. The father of Cleopatra received a prodigious revenue from customs alone. After the reduction of Egypt and Alexandria by the Romans, the trade increased still further. 120 ships were sent yearly from the Red Sea to India, sailing about the middle of July, and returning within the year. The returns on this Indian trade are said to have amounted to 'an hundred for one,' and through this increase of wealth the matrons and noble ladies of Alexandria were exceedingly profuse in decorating themselves with pearls and precious stones, and enhanced their personal charms by the use of musk and amber, and other rich perfumes.

Soon after this the mighty Roman Empire fell, and history itself is blotted out for a number of years. Not only the trade with India, but India itself, was completely lost to the western world. When, after some centuries, we find the Genoese engaging in commerce and navigation, a new trade route had been opened up between India and Europe.

The design, so long imagined, of connecting the Mediterranean and the Red Sea by a canal, remained unaccomplished, till M. de Lesseps brought his wonderful engineering skill and perseverance to bear upon the work, and the Suez Ca[illegible] opened for navigation 17th November 18[illegible]

The Suez Canal starts from Port Said, [illegible] east of the Damietta mouth of the Nile, a[illegible] across the isthmus, and through lakes M[illegible] El Ballah, and Timsah (on the shores o[illegible] latter stands the new town of Ismailia[illegible] through the Bitter Lakes to Suez. Its tota[illegible] is 92 miles. Its actual width (over the [illegible] part of its length) does not permit of two [illegible] passing or crossing each other in the canal[illegible] but there are numerous sidings, by which [illegible] are enabled to cross one another. Vessels mea[illegible] 430 feet in length, and drawing 25 feet 9 in[illegible] water, have safely passed through the canal[illegible] actual cost of the canal, according to a [illegible] of the year 1877, was £17,518,729. Th[illegible] receipts, from all sources, of the Suez Cana[illegible] pany in the year 1877 amounted to £1.3[illegible] and the expenditure to £1,169,549. T[illegible] year in which the receipts exceeded the e[illegible] was in 1872, when the surplus amou[illegible] £82,849. In 1870, 491 vessels of 436,[illegible] passed through; in 1877, 1651 vessels of 2[illegible] tons; in 1882, 3198 vessels of 7,122,1[illegible] and total receipts, 63,409,593 francs.

The isthmus has been ascertained to[illegible] of fresh-water formations, passing on t[illegible] side into marine deposits of the Red Sea[illegible] the north into those of the Mediterranea[illegible] whole of the service of the canal is supplie[illegible] one end to the other, by a fresh-wate[illegible] leaving the Nile near Cairo. For 70 m[illegible] ship canal is carried through lakes, its[illegible] being marked by buoys, and the botton[illegible] been dredged to the requisite depth; whi[illegible] miles it takes the form of a land ditch, th[illegible] way being cut partly through sand an[illegible] through clay. The prices of the canal sha[illegible] fluctuated. Their nominal value is 500 f[illegible] were quoted in 1861, 438 f. 75 c.; in 18[illegible] varied from 220 f. to 558 f.; in 1869, the [illegible] the opening of the canal, they rose to 633 f. 50 [illegible] in 1875 they were at 875 f.; in 1880 they went [illegible] from 715 f. to 1327 f. 50 c.; in June 1881 they [illegible] were quoted at 1700 f.; from that period they [illegible] rose even to 3500 f. In January 1884 they were [illegible] selling at 2015 f. per share. In 1875 the British [illegible]

Government bought 176,602 shares from the Khedive for £3,976,852.

SUFFUR, the 2d month of the Muhammadan year.

SUFI, by some authors, is derived from the Greek Sophos. Others point to the Arabic Suf, wool, in allusion to the woollen robes worn by the majority of the darvesh. The Sufi philosophy is called Tasawwuf, and is based on some mystic verses in the Koran and Hadis. Its main principle is that there is no real existence except that of God, and that all the phenomena of the material universe are but emanations from him, and tend ultimately to reabsorption in him. This form of doctrine is spoken of as a tariqat or path (to salvation), the disciple as a traveller (salik), and the manāzil are the various stages of spiritual development. It is a religion of the heart, as opposed to formalism and ritualism. Sufis talk of love to God, of union with God, of death to self, and life eternal in God; of the indwelling in man of the Spirit, of the nullity of works and ceremonies, of grace and spiritual illumination, and of

s.
d-Din says, in the Masnavi, 'In whatever set our foot, we are always, Lord, within t.' The Sufi creed is a philosophy, a n. The whole visible creation is the manifestation of the invisible Being irit is diffused everywhere through it. stage of a Sufi disciple is styled Sharyat n which he practises all the external rites monies of religion. Tariqat, from Tariq, a path, way, or direction, is the second which the disciple discards the outward religion, and devotes himself to the mental of the deity. The third stage is Haqiqat, aq, the All-Righteous. It means the state h, and is a condition accompanied by a atural knowledge or meditation, obtained evotee through a long meditation on God. th stage is the Marifat, from Arif, to know, tained by long and painful fasts, dwelling ry deserts, seeing only his teacher. Few he severities of this stage. But when it d, the soul, absorbed into the divine s again with God. But the purified Sufi ke of the nature of God, which is termed d signifies that mild and gentle beauty es to do good and hurts not. Or he toxicated with the wine of the divine absorbed in the contemplation of the onsuming glory of the deity; in which s full of wrath with the iniquities of the d if provoked to imprecations, they take effect. Or he may pass from one stage r, may at one time assert that God is in and then fall back into the condition of mortals, trusting that God will forgive ins and make his latter days righteous. spiritualist is often almost with views te to eastern pantheistic ideas, but with ost atheistic, a sort of esoteric doctrine. many sects, tracing their tenets to par- unders, whose views they are supposed o hold. Some of them have attained to the con- lition of the highest spiritual exaltation; but ome of the darvesh or fakirs are degraded beings, nd in British India are held in great disesteem. lso many of the educated classes in Persia accept ufi doctrines, adopting a mystical pantheism and spiritual love in secret, outwardly conforming to Muhammadanism.

Sufi spiritualism, though contrary to materialism, has in reality much in unison. Sufi doctrines are principally held amongst the partisans of Ali, and out of it grew the belief in the infusion of divinity in Ali. Evidences of its antiquity may be found in the annals of almost every ancient and civilised race. The Sufi were called by the Guebres (Gabr), Wahia-daran, Roushan-dil, etc.; by the Hindus, Gnaneshwar and Atma-gnani. Among the Greeks they became Platonists, and have continued up to the present time. The number of Muhammadan sects is considerable. As a broad distinction, they are generally classed as Shiah and as Sunni, but the six bodies of sectarians who oppose the Sunni are classed by them as Rafziah, Kharjiah, Jabriah, Kadriah, Jahmiah, and Marjiah, each of whom are broken up into smaller bodies. Before the end of the 1st century, the ascetic turn and the theosophy inseparable therefrom, a combination styled among the Arabs Sufi, had arisen. This made rapid strides; and in the end of the 3d century was already, itself, the subject of learned works, and the Muhammadan world has carried this system to the utmost extreme. Their Sufi outstrip in every point of view both the Hindu Jogi and the Christian monks. The asceticism of the Sufi is more systematic, their pantheistic teaching deeper and more consistent, and their vices more enormous, than those of any other people. Spinoza and Schelling are left far behind by Ibn Arabi.

Taüs Abu Abd-ur-Rahman died A.H. 102 (A.D. 720). He was the friend of Zain-ul-Abi grandson of Ali. He was a pupil of Abu Hurayr the most devout of Mahomed's friends, and Ibn Abbas, renowned alike for his profound learning and for his spotless life. Taüs was the founder of a school of disciples whom he trained in mortification, poverty, contempt of the world, and the various spiritual arts and devout practices of the contemplative life. It was he who first adopted the high cap of suf, woollen stuff, from which the term Sufi originated, and the Khirqa or long patched robe, which is their distinctive habit. Among his followers has been Ibn-us-Sammak, an eloquent preacher, who said, 'Fear God as though you had never obeyed him, and hope in him as though you had never sinned against him.'

Fazl Abu Ali Talikani, of Khorasan, lived in the 2d century of the Hijira. He commenced life as a robber, but while on the watch on one occasion, he overheard a verse of the Koran, which awed him so that he was instantly converted, and became widely celebrated for his sanctity and works. On one occasion he said to Harun-ur-Rashid, 'Oh, Khalifah, I have only detached myself from this little world, but you have detached yourself from the world which shall endure for ever.'

Fazl's successor as the head of the order was Bashr (Bishr), the barefooted, who was converted in Baghdad by a dream.

Zu un Nun, a native of Egypt, lived in the 3d century, and his tomb at Cairo still attracts pilgrims. He courageously rebuked wickedness in high places. He scourged himself; was in chains and bondage.

Husn-ul-Hillaj, who was martyred at Baghdad A.H. 303 (A.D. 915), founded a school, which subsequently attained to great influence.

In the 4th century also there lived the famed Abd-ul-Kadar Ghilani, the doctor Mohi-ud-Din-ibn-ul-Arabiya-ul-Maghrabi, and also Umar-ibn-ur-Ridh, author of a celebrated Dewan. He fasted for three or four days, and was subject to ecstasies or Wajd. He taught the freedom of the human will, and was put to death with circumstances of revolting cruelty, on the accusation of teaching Christianity in a covert manner.

Farid-ud-Din Attar, author of the Pind Nama, of the Lives of the Pirs, and the Mantiq-ut-Taer. He had a biographer in Daulat Shah of Samarcand. He was born A.H. 513; but one day he spoke harshly to a darvesh, who rebuked him so as to subdue Farid, who entered the monastery of Rukn-ud-Din Asaf, and attained a high degree of spirituality. He was martyred by the Moghul invaders under Chengiz Khan.

Jalal-ud-Din Rumi, commonly entitled Maulana, also Maulana Rumi. His father was Baha-ud-Din, a lineal descendant of Abubakr, successor of Mahomed. His mother was a princess of the royal house of Khorasan. He was born A.H. 603 (A.D. 1205). When Jalal-ud-Din was five years old, Baha-ud-Din left Balkh, after denouncing the innovations there in the religion. He went to Baghdad, where he rebuked the khalif; then on to Mecca, and finally settled in Qonya, the ancient Iconium, whose monarch he also rebuked; and he died A.H. 628. After his demise, Jalal-ud-Din studied in Aleppo and Damascus, particularly following the philosophy of Al Gazzali, his teacher being Shaikh Syed Burhan-ud-Din, a pupil of his father and an [illegible] of great renown, and from him Jalal [illegible] instructed in the mysteries of mute reality and [illegible]stasy, and the science spoken of in Koran xviii. 64. He afterwards assumed the rectorship of his father's college in Qonya, where he abode till his death. His son Baha-ud-Din survived him. At his funeral, mourners of all creeds and of various nations attended his remains to the grave. He died at sundown, Sunday, 5th Jamadi-ul-Akhir, A.H. 672 (16th December A.D. 1273), 68 years old. In the religious dances of the darvesh, he introduced instrumental music, the flute, the rebec, the drum, and the tambourine. He says—

'Learn what are the terms of the Musalman's creed,—
Fasting, pilgrimage, prayer, and alms.'

'Thus, when self-abased, man's spirit
From each earthly tie
Rises disenthralled to inherit
Immortality.'

Sad-ud-Din Mahmud, of Shahbistari, near Tabreez, lived in A.H. 717 (A.D. 1317). 15 questions were received from Amir Syed Husaini of Herat on the Sufi doctrines, and Sad-ud-Din was chosen by his sect to answer them. This he did in verse, and his book is called the Gulshan-i-Raz or Mystic Rose Garden. Little is known of the writer. In his answer to the 13th question he says—

'The spiritual world is infinite,
How can finite words attain to it?
How can the mysteries beheld in ecstatic vision
Be interpreted by spoken words?
When mystics treat of these mysteries,
They interpret them by types.'

On this point, however, the outside world will regard it, to say the least, as unfortunate that the Sufi should employ, in telling of their love of God, all the expressions usually adopted when describing the beauties of a mistress, the joys of sexual love, and pleasures of alcoholic stimulants.

The Sufi rest all their system of morality upon the practice of divine love, and the darvesh and fakirs are their expounders.

M. Dozy says the influence of Sufism is rather increasing than diminishing in Turkish provinces, and M. de Kremer considers it the preponderating element in Muhammadan civilisation.

In Constantinople they have 200 monasteries, and there are 32 distinct orders in Turkey. They are styled fakirs, and constitute thoroughly organized bodies, minutely discriminated from each other. Every school, every brotherhood, has its own distinctive teaching and technicalities, its peculiar practices and observances, its great men and founders, its saints and doctors. Within the 19th century, owing to Sufi efforts, Muhammadanism has had a revival in Turkey. A system of primary schools has been established, and the present generation has been taught to regard the ordinances with reverence. Sufi doctrines have been but little avowed in British India. Mullah Shah, a saint and poet, died at Lahore, A.H. 1072 (A.D. 1661–62), and Fatima, daughter of Shah Jahan, erected a tomb over him.—*Burton's* [illegible] p. 406; *Westminster Review*, 1869; *A* [illegible] *Persia*, ii. pp. 382-445; *Home and Foreign* [illegible] iv. p. 571; *W. S. Lilly in Cont. Rev.*, 1883; *Gulshan-i-Raz*. See Zikkir.

SUFI-SUFIYANA, fabric of silk an[illegible] mixed, lawful for Muhammadans to wear.

SUFOORA, Moses' wife Zipporah.

SUGAR.

Shakkar,	AR., GUJ., HIND.	Soola, Sakar,	.
Kyan,	BURM.	Gula,	.
Shih-mih-sha-t'ang,	CHIN.	Acucar,	.
Sukker,	DAN.	Sachar,	.
Suiker,	DUT.	Sarkara,	.
Sucre,	FR.	Azucar,	.
Zucker,	GER.	Socker,	.
Sakxar, Sakkari,	GR.	Sakkarai;	.
Zucchero,	IT.	Panchadara,	.
Saccharum,	LAT.		

The commercial sugars of Asia are ch[illegible] products of the Saccharum officinarum, S. [illegible] Phœnix sylvestris, Borassus flabelliformis [illegible] nucifera, Arenga saccharifera, Nipa f[illegible] and Sorghum saccharatum.

Coeval with the use of other vegetable [illegible] for domestic purposes in India, appears to l[illegible] the employment of the juice of the su[illegible] though it would not seem that the anci[illegible] sessed any knowledge of the process [illegible] this saccharine matter is converted into [illegible] lized substance. But Marco Polo, who [illegible] in the east in the year 1250, found abun[illegible] sugar produced in the province of Ben[illegible] from the almost universal growth of th[illegible] that province at the first occupation of th[illegible] by the British, there is good reason for [illegible] that its culture had rapidly extended [illegible] early period. From the earliest Europe[illegible] course with India, sugar, in a great v[illegible] forms, was met with in daily use. N[illegible] lives without it, either as crystallized or [illegible] called jagari. Upon the first possession of [illegible] by the E. I. Company, there was a flouris[illegible] port trade in sugar to the Indian coasts, some of [illegible] the Eastern Islands, and a few ports in Arabia and [illegible] Persia, to the extent of about 1500 tons; whilst [illegible] the local consumption of the article was enormous. [illegible] The quality of this sugar was, however, very in[illegible] ferior; and about the year 1776 some unsuccessfu[illegible]

attempts were made to introduce into India the Jamaica mode of growing the cane and manufacturing the sugar.

In China, from unknown times, the people have manufactured sugar both from the sugar-cane and from the sorgo-cane. In the reign of the emperor Tai-Tsung, of the Tang dynasty, the method of boiling the crushed cane was introduced into Sze-chuen and other parts of China from Turkestan or Central Asia. Hence, in China, sugar is called tang, the name of the dynasty being combined with the radical for food.

In Europe, cane-sugar has been largely supplemented by that manufactured from beet-root. One ton of beet-root is said to yield about 100 lbs. of ra[illegible]55 lbs. of refined sugar. The imports in[illegible]ritain were from—

	Sugar-cane—tons.	Beet-root—tons.
[illegible]	144,119	687,552
[illegible]	168,836	565,351

[illegible] there were about 1,925,000 acres [illegible]r-cane in India, and 168,700 acres [illegible]-palm, besides an area of 17,000 acres [illegible]myra and cocoanut in the Madras Presid[illegible]m which sugar is made. Of the total [illegible]r sugar-cane, the North-Western Pro[illegible]ne comprise 921,000 acres; the Panjab, [illegible]cres; Bengal, 185,000 acres; and Oudh, [illegible]cres. Next to these come the Central [illegible] with 94,000 acres, and the Bombay [illegible]y with 89,000 acres; the Madras Presid[illegible]s only 34,000 acres, and the remaining [illegible]have returned comparatively small areas. [illegible]otal area under date-palm utilized for [illegible]king, Bengal had 131,000 acres; and next [illegible]ysore, then Madras, Burma, and Bombay, [illegible]as respectively of 29,000, 4000, 3708, and [illegible]res.

[illegible] imports into and exports from India of [illegible]d sugar-candy have been as under :—

[illegible]ed into India.		Exported from India.		
Cwt.	Rs.	Year.	Cwt.	Rs.
[illegible]10,524	89,39,283	1875–76	107,288	11,04,274
[illegible]18,202	1,47,75,653	1878–79	51,043	6,96,792
[illegible]72,672	1,08,69,610	1882–83	1,207,423	67,86,420

[illegible] imports, four-fifths from Mauritius, one-[illegible] China and Straits. The great bulk into [illegible]a small part into Burma, smaller into [illegible]adras, and Sind. The exports, in the [illegible]gar, sugar-candy, molasses, jagari, gur, [illegible]hiefly to Great Britain. Large quantities [illegible]re made from the juice of the palmyra [illegible]he Jaffna Peninsula, Ceylon, chiefly in [illegible]bourhood of Point Pedro, the agent used [illegible]t fermentation being coralline, a little [illegible] is put into each chatty. The coarse [illegible]r which results from evaporation over [illegible]ired into minute olah baskets (made of [illegible]aves of the palmyra), and exported [illegible] Pondicherry, where it is refined and [illegible]d. The natives of the interior obtain a [illegible] cakes of which very much resemble the [illegible]ar of North America, from the kittul [illegible]yota urens.

SUGAR-CANDY.

[illegible]ing-t'ang, . . .	CHIN.	Shakr-kand, . . .	HIND.
[illegible]hini, ...	HIND.		

[illegible] Is made in China by crystallizing the raw sugar; [illegible]e best comes from Foh-kien, called Chin-chew, [illegible]om which province, especially through the port [illegible] Amoy, the exportation is likely to increase.

Pingfa sugar is the name given to pounded sugar-candy. Pingfa means crystal flowers, and is applied to this sort because it is the Ping-t'ang or candied sugar made fine. It was formerly carried to the United States and to India.

SUGAR-CANE.

The sugar-cane, Saccharum officinarum, *L.*, S. violaceum, *Toss.*, and S. Sinense, *Roxb.*, thrives from the equator to the 32d parallel of latitude. It is one of the largest of the grasses, from 8 to 12 feet in height, and acquiring a diameter of one to two inches; the sugar being contained in the loose cellular juicy pith with which the stalk is filled. The sugar-cane of India was introduced into Arabia, Europe, Africa, W. Indies, and Mauritius. The mention made of it in the Hebrew Scriptures down to the Christian era, is simply that of a sweet cane, or of a fine kind of honey found in an Indian reed. Nearchus, the admiral of Alexander the Great, was the first who made known the existence of the sugar-cane in the western world; and from his time it is mentioned by Theophrastus, Varro, Dioscorides, and others. Herodotus alludes to 'honey made by the hands of men.' Lucan speaks of the sweet juice expressed from reeds, which the people of India were fond of drinking, and which Pliny calls saccharine. Still later, Arrian, in his Periplus of the Red Sea, alludes to the honey from reeds called saccharí, as an article of trade between the Indian ports and the countries of the Red Sea. Sugar-cane was found in the Crusades growing in the meadows about Tripoli in Syria; and mention is made by a writer of that day of eleven camels loaded with sugar being taken by the Crusaders.

Will and Fresenius, of the Gressen laboratory, give the inorganic elements of Otaheite cane as—silica, 47·75; soluble matters, 32·35; phosphate of peroxide of iron, 4·45; phosphate of lime and magnesia, 3·95; carbonate of lime, 4·10; magnesia, 3·90; carbonaceous matters and loss, 3·50. The 32 per cent. of soluble matters consisted of potash, 10·05; sulphuric acid combined principally with potash, 8·40; chlorine in combination with soda as common salt, 4; soda, 2·65; gelatinous silica in combination with potash, 2·55; carbonic acid combined with potash and soda, 1·10; phosphoric acid combined with potash, 0·85; loss, 2·40.

There are many varieties of it, some used only as fruit, others for the manufacture of sugar, an acre of cane yielding six tons of sugar; but in the little advanced countries, in the absence of machinery and of scientific appliances, where the rough sugar press or sugar mill is used, much of the juice of the cane is left in the refuse. At places the mill is dispensed with, the cane being cut into thin slices, and the saccharine contents of its cells extracted by bringing the slices into contact with water at an elevated temperature. The water extracts only the soluble substances contained in the juice of the plant, while most of the impurities—which in the ordinary process pass into the juice, and must be subsequently removed at great expense—are left in the unbroken cells of the cane, and do not contaminate the

juice. By this process, it is said, the extraction can be carried so far that 95 per cent. of all the sugar contained in the cane is passed into the clarifier, while the best roller mills at present in use do not extract more than 75 per cent. of the sugar contained in the cane. The diffusion process thus not only improves the quality of the sugar, but produces an increased out-turn of 20 per cent.

In Oudh, three presses are in use,—the Panjabi, the Bairam, and the Tantia. In the Panjabi mill, the canes are crushed whole, and the produce is greater; it is costly, and difficult to keep in order. The Tantia mill is in common use, and consists of a mortar of hard wood, a pestle, a boom to which the cattle are yoked, and another boom connecting the cattle beam and the pestle.

Mr. Bonnefin claims to extract the whole of the saccharine matter from the cane, to prevent fermentation, to thoroughly clear the syrup of all suspended matters ready for filtration, to completely purify the juice by filtration, and to make direct from the cane only pure white, refined sugar. Mr. Bonnefin does away with the cane mill, and substitutes for it what he calls a 'pulpefactor,' which consists of a series of vertical saws, which rapidly cut the bundles of canes into slices. The cut cane falls into a disintegrator placed beneath the saw frame, and in which the cane is quickly reduced to a fine pulp. It is afterwards passed between a pair of rollers, and the whole percentage of the juice extracted. The juice is then mixed, gallon by gallon, as it is produced, with a proper proportion of lime, and passed over a continuous 'preparator,' which consists of a long and broad table having a corrugated or furrowed surface, heat being applied underneath. There are a series of pockets at intervals in the corrugations, and as the juice flows along, the impurities held in suspension are deposited by gravity, and become collected in the pockets, or catchpits, from whence they are cleared out at intervals. The juice travels backwards and forwards for a long distance through the corrugations, finally arriving at the outlet in a favourable condition, both as regards quality and temperature, for filtration. This process is effected in a filter specially devised by Mr. Bonnefin, and which consists of a series of metal rings covered with india-rubber, and placed horizontally in a press. Over each alternate ring—the internal diameter of which is 12 inches—is hung a filter-cloth made of pure unspun cotton of the finest fibre. The rings and cloths, to the required number, which varies according to the rate of filtration desired, are closely pressed and held together by screws, and the syrup is pumped into the press. It passes through the whole series of rings and cloths, the solid impurities being intercepted and retained by that portion of each filter-cloth which covers the opening in the ring, while the syrup passes by capillary attraction through the surrounding portions of the cloths, and is delivered in a perfectly clear and pure condition at the outlet. The pure juice as it leaves the filter-press is conducted either to the ordinary vacuum pan or to the more rapid and effective evaporator and concentrator designed by Mr. Bonnefin. In the evaporator the juice is rapidly deprived of such water as it may contain, while in the concentrator it is as rapidly brought into the condition of sound sugar. All these operations, from the time the cane is placed in the pulpefactor to the moment when it leaves the concentrator in the form of crystallized sugar, it is said, do not occupy more than one hour, as against some 6 to 12 hours with the ordinary process, and its attendant drawbacks.

There are many varieties of sugar-cane in India, some used only as a fruit. For instance, in the N.W. Provinces and Oudh, the thun, paunda, and kala ghanna are edible; and for making sugar are dhaunr, dikchan, matna, padara, and rakhri.

Other varieties mentioned in Benares and E. Oudh are barokha, katara, khusyar, khiwahi, munga, reora, rukra, saranti.

In the Lahore district is a purple cane, called kumad kala; a hard, thin cane, called mad lahori, another called kata, and others of which were obtained from Jala Saharunpur. In Gujranwalla are thr cane, daula, treda, and chinkha. Daul is the best, treda is yellowish, chinkha reddish and small, produces good kand

A large variety in Canton has a ba appearance, but a smaller variety is c largely for making sugar, and to be eaten in Sze-chuen, Ho-nan, Foh-kien, and Ca

Tahiti has eight varities.

Sugar-cane in W. Oudh is planted in and March, irrigated from one to three tin the rains, and the cutting begins about th of November. The cuttings used for plan be of all parts of the cane.

Ukh or Ikh generally applies only to the other names to the cane.—*Cal. Cat. Ex Mad. Ex. Jur. Rep.; Les Anglais et l'Inde Faulkner*, iii. p. 113; *Powell.*

SUGRIHITA NAMNA ARYA CRHA ASYA is a phrase of constant occurrenc Sanskrit dramas, and indicates the impo attached, not to well-sounding, but to lu propitious appellations. This superstit common amongst the ancient nations of and, according to Cicero, care was take lustration of the people, that those who c the victims, and on the formation of th that the first soldier on the muster-rol have auspicious names. M, a Native State in Gujerat, bounded
rth and east by Wao State, on the south
at State, and on the west by the Salt
r Runn. Area, 161 square miles; pop-
(1872), 10,104 persons. The territory
out A.D. 1450, granted to Pachanji, the
son of Rana Sangaji, and, like Wao, is
ed amongst a numerous independent
or brotherhood. Like their brethren of
chiefs of Suigam were noted freebooters,
he early part of the 19th century gave
istance to the Khosa in their predatory
p. Gaz.

A, a girl of a village on the banks of
jara, who gave food to Sakya as he sat
bodhi tree, where he became a Buddha.

T, an ancient Rajput principality which
r the British Government by the treaty
In 1864, full sovereignty was con-
e raja Oogur Sein, his heirs and those
of his brothers according to seniority, unless specially set aside by Government for incapacity or misconduct. The right of adoption has been conferred on the raja by sunnud. It lies between lat. 31° 13′ 45″ and 31° 35′ 25″ N., and between long. 76° 49′ and 77° 26′ E., on the north side of the Sutlej river, which separates it from the Cis-Sutlej Hill States. Area, 420 square miles; estimated population (1875), 44,180. The country of Sukeit was united to that of Mandi until about the year 1200 A.D.—*Aitcheson's Treaties, etc.* p. 375; *Imp. Gaz.*

SUKHAN. HIND. A helm. Sukhani, a helmsman, the sea cunny of British seamen.

SUKHARA, Saiva mendicants, distinguished by carrying a stick three spans long. They dress in a cap and petticoat stained with ochrey earth, smear their bodies with ashes, and wear earrings of the rudraksha seed; also over their left shoulder a narrow piece of cloth dyed with ochre, and twisted in place of the zonar. They use the word A-lakh. See Rukhara; Ukhara.

SUKHAVATI, the abode of the blessed; in Tibetan, Devachan, the happy; in Chinese, Ngyan-lo, pleasure; also Kio-lo, the greatest pleasure; also Tsing-tu, pure or glorious land. Sukhavati is described as a large lake, the surface of which is covered with lotus flowers (Padma), red and white, with perfumes of rare odour. These flowers form the couches for pious men, whose virtues were the cause of their growth while yet sojourners upon earth.

SUKHPANNI, followers of Krishna who pay great attention to personal cleanliness, and wash themselves many times in the day, using various purifying substances. They live apart from society, and have no disciples. The Sukhpanni are of both sexes, and their bodies are burned after death.—*Sherring's Hindu Tribes.*

SUKKUR, a town in Upper Sind on the right bank of the Indus, in lat. 27° 42′ N., and long. 68° 54½′ E. Its tall minarets are seen a long way off, and the banks of the river, for some distance below the town, are densely clad with date and cocoanut groves. Opposite Sukkur is the old town of Rori, built high and overhanging the stream. In the centre of the stream, nearly opposite Rori, is the ancient fortress of Bukkur. Here the river is considerably narrowed, and the stream powerful. The heat of Sukkur is intense, and its climate unhealthy.

SULAIMAN HILLS, a mountain range in Afghanistan and the Panjab, of India on the west. It south from the Allah Koh and Ghazni, and, running break, forms the system of Afghanistan and Baluchista lat. 31° 35′ 39″ to 34° 40′ 59″ 58′ 39″ to 70° 0′ 45″ E., thus Dehrajat in Bannu, Dehra Isma Ghazi Khan districts. The h Takht-i-Sulaiman, nearly ue west Khan town, has two summits, respectively and 11,070 feet above sea-level. The Kuram almost the only river of any importance, ta its rise amongst their dry summits. Length fro north to south about 350 miles. They form the watershed between the Indus and the Helmand. The axis of this chain runs close to Ghazni, which is elevated 7726 feet, and to Quetta 5540 feet. The highest part of the chain is near the Koh-i-Baba. It is called the Safed Koh, and is 14,000 feet high. Near Ghazni it is 9000 to 10,000, and near Quetta the same, the peak of Chahal-Tan being 10,500 feet. The east face dips rather steeply to the Indus, but the west declivity, much more gradual, to the table-land of Seistan. From Tank down to Sind, the most important features in the range of hills are the three Tokes. These tokes are the narrow precipitous defiles separating the outer from the inner range. In places their gorges are so confined as to resemble fissures in the rock, not more than ten yards wide, and interrupted by rocks running right athwart the defile; occasionally it widens out, and the bed thus formed is choked up with sand. These glens and ravines, almost impassable to strangers, can be easily footed by mountaineers and their horses. From these defiles, running parallel with the outer range, there are numerous

outlets opening into the plains. The base of the hills is skirted by a Mehra, or open uncultivated plain from 10 to 20 miles broad, having villages on either side; it becomes contracted towards the south, near Dehra Ghazi Khan. In this vicinity it is overgrown with brushwood, but elsewhere it is generally a naked waste; without any sign of life or vegetation. Cultivation is scattered, and depends for irrigation on tanks, and on the mountain torrents rudely trained to descend in steps and terraces.

SULEA or Sele. BENG. The Polynemus sele, a large fish of the river Ganges and Bay of Bengal. It is migratory in habit, and in the cold weather enters the Bengal rivers in great shoals. Its swimming-bladder, as isinglass, is of value as an article of commerce, and the fish is esteemed as food. It is the Kala-min, TAM., of John of Tranquebar, and abundant in the Kistna and Godavery. From 8 to 12 oz. of isinglass may be obtained from each fish. Dr. M'Clelland supposed that isinglass is also afforded by a far larger species, namely, P. tetradactylus, Telia or Teriya bhangan, identical with the maga-jellee of the Coromandel coast, and which Buchanan often saw six feet long in the Calcutta bazar, and was informed it sometimes equalled 320 lbs. avoirdupois in weight. It is seldom used by Europeans. M'Clelland says he has frequently seen them loading whole cavalcades of carts on their way to the Calcutta bazar during the cold season.—*Indian Fishes*, pp. 183, 184; *Royle on Isinglass*.

SULIMAN, a [illegible]ant of Bussora who made [illegible]ia from the Persian Gulf, of [illegible]ount, A.D. 851 (A.H. 237). He [illegible]ara was ruled by the Balabhi [illegible] tolerably coherent account [illegible]between Oman and China, [illegible]e sea of Lar (which washes [illegible]), the sea of Harkand (from [illegible]lives, and Serendip or Ceylon, [illegible]umatra); the Lankha-balus or [illegible] and the two (Andaman) islands [illegible]ndaman, and of Kalabar, a depend- [illegible]Zabaj (Java); Tayumah (Tiyoman Island), [illegible]anj (Siam), Sanf (Champa and Camboja), [illegible]d Sandar Fulat (Pulo Condore). The port in China frequented by the Arabs was Khan-fu (the port of Kinsay or Hang-cheu). He notices the abstaining from wine of the Hindus. He voyaged to India and China in the beginning of the 9th century. His principal establishment was probably at Bussora. His book is styled Salsilat-ut-Tawarikh, and it was continued by Abu Zaid-ul-Hasan of Siraf.—*Ell. Hist.* p. 7; *India in the 15th Century.*

SULIMAN, prince of Nera, is by all the historians of his nation, and also by the more accurate Christian writers, affirmed to be forefather of the Turkish emperors. Suliman was of the noblest Oguzian family among the Scythians, and head of a horde or tribe of Tartars near the Caspian Sea. By these, as well as by the neighbouring people, Suliman was proclaimed by the title of shah. Treading in the steps of the great Chengiz Khan, he came forth from his country with 50,000 followers, the flower of the Scythian youth, and overran not only the neighbouring regions, but all Azerbijan and Syria, as far as Aleppo. When the news of these conquests was brought to the Persian court, the name Turk, common to the Chengiz Kha[illegible] army.

SULIM[illegible] bearing [illegible] and long. 45[illegible] South Kurdistan. T[illegible] in general, of low statu[illegible] robust, and healthy, and o[illegible] the swarthy Arabs; or thei[illegible] the neighbourhood of Kerm[illegible] out of the direct road to S[illegible] low hills crowned with a [illegible] rising from their clayey and [illegible] On the side of one of these hills[illegible] the north-west, Strabo described [illegible] ten in number. The springs co[illegible] pits or wells, seven or eight feet in d[illegible] ten or twelve deep. The whole number [illegible] the compass of 400 or 500 yards. A [illegible] steps in each pit, cut for the purpose of [illegible] ing the fluid, which rises and falls acc[illegible] the dryness or moisture of the weath[illegible] natives lave it out.—*Porter's Tr.* ii. p. 44[illegible] *Kurdistan*, i. p. 63; *Mignan's Tr.* p. 329[illegible]

SULMA. HIND. A peculiar kind[illegible] tinsel for embroidery. Gold and silv[illegible] used in making turbands, slippers, and l[illegible]

Sulphur, from Sal, salt, and $\pi\upsilon\rho$, fire, [illegible] ployed in medicine by the Greeks, Ara[illegible] Hindus. Native or virgin sulphur unco[illegible] is either a volcanic product, or occurs i[illegible] many parts of the world; found in con[illegible] with metals, as in the ores called py[illegible] sulphurets of iron, copper, lead, merc[illegible] whence it is obtained by roasting. D[illegible] from earthen pots arranged in two rows [illegible] furnace, the sulphur fuses and sublimes, [illegible] through a lateral tube in each pot int[illegible] place on the outside of the furnace, wh[illegible] forated near the bottom, to allow t[illegible] sulphur to flow into a pail containi[illegible] where it congeals and forms rough [illegible] crude sulphur. This being re-distilled, forms refined sulphur. When fused and cast into moulds, it forms stick or roll sulphur.

The great repositories of sulphur are either beds of gypsum and the associated rocks, or the region of active or extinct volcanoes. In the valley o[illegible] Noto and Mazzaro in Sicily, at Conil near Cadi[illegible] in Spain, Bex in Switzerland, and Cracow i[illegible] Poland, it occurs in the former situation. Sicil[illegible] and the neighbouring volcanic islands, Vesuviu[illegible] and the solfatara in its vicinity, Iceland, Teneriffe, Java, Hawaii, New Zealand, Deception Island, and most active volcanic regions, afford more or less sulphur. The native sulphur of Sicily occurs i[illegible] beds along the central part of the south coast an[illegible] to some distance inland. It is found in th[illegible] United States of America, on the Potomac.

Most of the sulphur brought to Hindusta[illegible] contains a considerable portion of orpimen[illegible]

being much less pure than either that which is dug out of the solfatara near Naples, or that imported from Sicily.

Sulphur and saltpetre are found in the mountains behind Teheran; also in Kishm and in a hilly tract near Khamir, a town on the Persian continent, about 25 miles N.E. from Luft. It is met with in the district of Balkh; also, according to Morier, at Balianlia in Persia. In Baluchistan it is got from the Suni mine, on the ridges separating Saharawan from Cutch Gandava; the great mart for its sale is Bagh in Cutch Gandava; also in mountains south of Kalat, in the province of Mekran.

Sulphur, somewhat mixed with impurities, occurs in the Murree Hills, and the Sulaiman Hills near Dehra Ismail Khan, at Kalabagh. It is found extensively throughout the Salt Range.

The valley of Puga in Ladakh, from whence borax is obtained, yields also sulphur. The Puga sulphur mine is situated a short distance from the Rulangchu, a small stream which is full of hot springs, and runs into the Indus at the foot of gypsum cliff. Besides the numerous springs which are with sulphuretted hydrogen, and sulphur on the rock over which they pass, the grass and weeds by their sides, sulphur in small form occurs near the surface of the limestone at Jabba, a little above the springs, in a white porous gypsum. So occurs near Panobar, four miles from on the Indus. The crystals picked out of the rock are called Aunlisar.

Sipur it is to be met with, but of a quality inferior to that which is brought from the gulfs of Oman and Persia. It is found in small quantities at Trichinopoly, Masulipatam, Guntur, Cuddapah, and Nellore, where it is a monopoly, along with gypsum in marl and clay and is found in form of metallic sulphurets.

In the Wodiapolliam jungle, south of Wolandur-pettah in the N. Arcot district, and which extends S.W. across the Peninsula, a sulphurous earth is said to be found, covering an extent of low swampy ground, and the sulphur effloresces on the surface of the brown earth after rains, in yellow crystals. In Lower Burma it is manufactured from metallic pyrites to about four tons yearly. It is also found in the Shans at Toungthoo Einlay, to the north of Mandalay. It is found in the blue clay, and is sublimed and condensed. It is abundant in the Shan States to the N.E. of Bhamo. It is said to exist in the ravines near the petroleum wells of Yenangyoung.

The Malayan and Philippine Archipelagos, the most extensive volcanic region in the world, contain a vast supply of sulphur. From the Philippines it is exported to China. The quantity is such at the volcano of Taal, or Bombon, in the province of Botengas in Luzon, that many ships might be loaded with it.

In the volcanic district in the northern end of the island of Formosa are three solfataras. One of these is about five miles east from Tamsui, and a superior one is three or four miles to the north-east. The pits are about 1750 feet above the sea, in a rocky gorge in the mountains, and clouds of steam and sulphurous vapour issue from numerous vents in the rocks. Several hot springs and pools occur, and a miniature geyser throws intermittent jets of boiling water to a height of fifty or sixty feet. A third solfatara is near the village of Kim-pao-li, seven or eight miles N.W. of Kelung. The sulphur is obtained by a rude process of melting; when the frothy slag is skimmed off, the heavier impurities sink to the bottom of the shallow iron pan, and the liquid sulphur is ladled out into wooden buckets, which are broken up when the sulphur has become solid. Similar solfataras exist in Satsuma, in the island of Kiu-siu, in Japan. But the greatest quantity of sulphur of Japan is brought from the Satsuma province. It is dug up in a small neighbouring island, which, from the great plenty it affords of this substance, is called Iwogasema, or the sulphur island. The greater part of the sulphur which is exposed for sale in the Indian provinces is brought from Muscat, from Sumatra, or from the Banda Island called Gunong Api. The Chinese obtain their supplies from the volcanic districts of Turfan, Tangut, and Sze-chuen, and from Satsuma in Japan; formerly it was brought as tribute from Siam and Sumatra.

Sulphur springs exist in many parts of Java and Celebes, and in the Pekalongan district west of Mount Prau. At the base of a high volcanic peak in the island of Damma is another. In China, sulphur springs are met with near Chefoo, and waters containing sulphuretted hydrogen and sulphurous acid gases are not uncommon. —*Bikmore*, p. 126; *Masson's Journeys*, ii. pp. 124-149; *Mason's Tenasserim; Thomson's Tibet*, p. 168; *History of Japan*, i. p. 107; *Walton's State*, p. 37; *Mrs. Hervey's Tartary*, i. p. 163; [illegible] *Powell*; *Cat. Ex.*, [illegible] *Adams*, [illegible] 1862; *Smith's China*.

SULPHURIC ACID, Oil of Vitriol.

Maulkibrit, . . . ARAB.	Acidum sulphuricum, LAT.
Liu-hwang-yu, . . CHIN.	Arak-i-gowgird, . PERS.
Acide sulfurique, . . FR.	Gandaka rasa, . SINGH.
Schwefel-saure, . GER.	Ghendaga travagum, TAM.
Gandak-ka-tezab, . HIND.	

This acid is produced in small quantities in nature, as near volcanoes, in some acid springs, and it exists in combination in numerous sulphates, especially those of lime (gypsum) and of magnesia, found as minerals, also in the water of springs. It was known to the Arabs, Persians, and Hindus. Sulphuric acid appears, from its name, to have been originally made from the decomposition of sulphate of iron. In the present mode of making sulphuric acid, sulphurous acid from burning sulphur, nitric acid vapour, and steam, are simultaneously admitted into oblong leaden chambers, so partitioned that the vapours can only advance slowly, and thus allow the whole of the sulphuric acid to be deposited. Sulphuric, nitric, mixed nitric or aqua regia, and hydrochloric acids, are all made at Lahore, and sulphuric acid is largely made at other parts of India.—*Royle; Powell.*

SULS, an ornamental style of Arabic writing.

SULTAN. ARAB. King. The Adal Shahi dynasty of Bijapur, the Bahmani dynasty of Beder, Kutab Shahi dynasty of Hyderabad, Tipu son of Hyder Ali of Mysore, Kamran of Herat, the rulers of Johore and Palembang, all took this Arabic title. Tipu engraved it on his seal. Razzia, eldest daughter of Altamsh, whose reign lasted from A.D. 1235 to A.D. 1238, took this title under its feminine form, Sultana. Sultanat is dominion, rule. Sultan-us-Sulatin, king of kings, emperor.

SULTANIAH was built as a royal residence by Oljaitu son of Argun, the eighth of the Mongol

khans of Persia, in 1305. Long after the destruction of the city by Timur, indeed into the 17th century, the tomb of Oljaitu was still magnificent, and especially noted for its colossal gates of damasked steel. The city was reoccupied by some of the Persian kings in the 16th century, till Shah Abbas transferred the seat of government to Isfahan. The ruins were of vast extent in Chardin's time. The present dynasty of Persia has again adopted Sultaniah as a summer residence. Pope John XXII. set up an archbishopric at Sultaniah in 1318, in favour of Francis of Perugia, a Dominican, and the series of archbishops is traced down to 1425.—*Yule, Cathay* i. p. 49; *Porter's Tr.* ii. p. 471.

SULTANPUR, in a saline tract in Gurgaon and Rohtak district, Panjab, area 1565 acres. Salt is manufactured from brine in wells, evaporated by solar heat in shallow pans. This tract lies on the banks of the great Najafgarh jhil or lake, and the principal works, both as to quantity and quality of produce, are in a cluster of villages on the borders of the two districts. The number of wells 330, and the pans 3799. 50,000 tons could be turned out annually.—*Imp. Gaz.*

SULTANPUR, a British district in the Rai Bareli division of Oudh, lying between lat. 26° 39′ and 27° 58′ N., and between long. 81° 36′ and 82° 44′ E. Population, 1,000,336 persons. Among low castes, the Ahir are the most numerous, forming nearly 10 per cent. of the population, followed by the Chamar and Pasi. Gujar are more common in Sultanpur than in other districts of Oudh. Among the more skilful agricultural castes, Muraas are numerous, but Kurmi are remarkably few.—*Imp. Gaz.*

SULTAN SAKADA is a deity worshipped by the Kur. Sakal Deva, or Sakra Pen, the chain-god, is worshipped in Seone and elsewhere.

SULTAN SAKHI SARWAR, a Muhammadan noted for his liberal and charitable disposition, and great generosity of character. On his death he was exalted to the position of a saint, and during February to May a fair is held at the shrine, to which annually about 200,000 pilgrims, Sikh, Hindu, and Muhammadan, resort. It is at the mouth of the Sieree pass leading to Kandahar, and is built on the skirt of the mountain. There are about 1650 priests, who issue to poor people parwane or orders in the name of Sakhi Sarwar.

SULTAN SARWAR, a Muhammadan saint whose shrine is at Baluch, four cos from Multan. He was distinguished for piety and purity of manners, and died as a martyr with his brother, fighting against a troop of idolators, and was buried with his wife (who died of grief) and his son in the same tomb. Several miracles are related as having happened at his tomb.—*Araish-i-Mahfil.*

SULU ARCHIPELAGO is a chain of many islands which stretch from the N.E. point of Borneo to the island of Mindanao. Sulu, the chief island, is high, 35 miles long, and from 5 to 10 broad; it lies in long. 121° E., near the centre of the Archipelago. The amount of land available for agriculture is about 200,000 acres. Soil volcanic in origin, with enormous depth. This group is inhabited by a warlike race, bearing in their personal appearance a strong resemblance to the Malays. In 1775 the Sulu people attacked and drove the British from Balambangan. Sulu had, even then, long been an emporium not only of regular traders from most nations, but the head-quarters of piratical marauders, who there found a ready market for enslaved victims and heterogeneous plunder, and whose descendants, to this day, are proud of the deeds of their ancestors. Spain had a military station there in order to protect the Philippine Islands, and in 1883 assumed the sovereignty of Sula. The Muhammadan religion has made progress in Mindanao and the Sulu Islands, as has the Malay language, the usual channel through which it has at all times been propagated over the islands of the Indian Archipelago. There is a considerable trade between Sulu and Singapore in bêche-de-mer and pearl shells, and a few pearls.—*Keppel's Ind. Arch.* i. pp. 56, 57.

SUMACH. Sir A. Burnes tells of colossal idols and innumerable excavations called sumach, to be seen in all parts of the valley of Bamian for about 8 miles, and still form the residence of the greater part of the population. A detached hill in the middle of the valley is quite honeycombed by them, and is called the city of Gulgul. Ca... are in greater number on the north si... valley where the idols occur, on all sides excavations occur.

SUMACH, Shumac.

Sumak, . . .	DAN., SW.	Sommaco, .	
Smak, ...	DUT.	Sumak, . .	
Divi-divi, Libi-libi,	ENG.	Sumagre, .	

The sumach trees of Europe are t... coriaria and R. cotinus, that of India... Cæsalpinia coriaria, that of China is th... venenata. The Cæsalpinia coriaria, yielding... divi of commerce, was introduced abou... 1830 by Dr. Wallich. It is a hardy plant, ... cultivation; it requires a little care, attenti... watering during the first year, or till th... attains the height of two or three feet; it ... come into full bearing till about the thi... but in favourable localities it attains a l... 10 to 16 feet, and the produce of one f... tree is about 70 lbs. of pod, which ha... valued at £8 to £12 per ton as a tann... stance. It is a good hedge plant, and bears... Its pods were used for tanning at Hunsu... questionable if it will ever come into ... with the bark of the Cassia auricu... shrub abundant on waste ground in th... eninsula. Divi-divi at Hunsur answered ad... rably for light skins, such as sheep and goa... or fancy leathers, but for strong hides it is not ... suitable; it does not, as the tanners call it, fill the hide, and instead of pliant, thickish leather, gives a thin, hard material. Rhus cotinus, *L.*, and R. coriaria, *L.*, shrubs of South Europe and the Levant, are extensively employed in tanning light-coloured leathers, and also as an orange-coloured dye. Sumach from Sicily has been sold at 12s. to 14s. 6d. the cwt. in London.

SUMAH. SIND. A tribe of Jat, though they are generally known by the former title. Such also are the Machi and numerous other subdivisions of the Jat tribes.

SUMAICHA, one of the nyad or proselytes to Islam, from the Soda race, numerous both in the t'hul and the valley, where they have many hamlets. They resemble the Dhoti in their

habits, but many of them associate with the Sehrai. They never shave or touch the hair of their heads. They allow no animal to die of disease, but kill it when they think there are no hopes of recovery. The Sumaicha women never veil their faces.

SUMAJ-BARI. At Kulna is the Raj-bari of the raja of Bardwan, several noble buildings and lofty temples; there is also the Sumaj-bari, or the houses of sepulchre, where a bone of every deceased member of the raja's family is deposited. The raja belongs to the Kshatriya class, and observes the custom of preserving the ashes of the dead. They showed here the bone of the last raja, wrapped up in a rich cloth. It is placed on a velvet musnud with cushions, and silver salvers, tumblers, hookahs, rose-water, and attar-holders in front of the seat, just as the late raja used to sit with all the paraphernalia of state about him.—*Tr. of Hind.* i. p. 23.

SUMALI. ARAB. A people on the African coast, and found in Aden and along the west coast of Arabia. Those on the coasts are slaves [illegible] descendants, brought from the interior of [illegible] the traders. The dress of the men con[illegible] white cloth wound round their waist, one [illegible] which, after being carried across the breast, [illegible] negligently over the shoulder. In [illegible] a cloth of this kind of smaller dimen[illegible] women wear a piece of tanned hide [illegible] waist, to which is added a smaller [illegible] the same material, suspended by loops [illegible] shoulder, to conceal their breasts. The [illegible] the men is frizzled into large ringlets, [illegible] of which hang on either side of the face. [illegible] left in the middle is also frizzled and raised [illegible] same means, the whole being anointed with [illegible] quantities of mutton fat. Through the upper [illegible] they thrust a straight piece of wood, re[illegible] in form and size a skewer, which serves [illegible] double purpose of a comb, and also as an [illegible] ent for adjusting their curls.—*Wellsted's* [illegible] 370.

[illegible]NAP. The industrious, peaceful, and [illegible] people who speak the Madurese language, [illegible] dialect the Sumanap, occupy the island of [illegible] divided from Java by a strait, and form [illegible] districts the bulk of the population on the [illegible] shores of Java.

[illegible]NTU, the collector of the hymns of the [illegible] Veda, a pupil of Vyasa. Sumantu is mentioned in the Hindu Puranas as a descendant of Vasishtha. He is said to be the author of a work on civil law. His doctrines were, that there is in nature an uncreated seed, from which all beings spring.—*Ward*, iv. p. 52.

SUMATRA, a great island at the opening of the Eastern Archipelago. Nicolo de Conti, of Venice, returned from his oriental travels in 1449, and communicated to the secretary of Pope Eugenius V. a consistent account of what he had seen. After giving a description of the cinnamon and other productions of Zeilam, he says he sailed to a great island named Sumatra, called by the ancients Taprobana, where he was detained one year. His account of the pepper plant, of the durian fruit, and of the extraordinary customs of the Batech or Batta people, prove him to have been an intelligent observer. Sumatra was shortly after visited by Odoardus Barbosa, who wrote a journal of his voyage in 1516, in which he speaks of Sumatra with great precision. The productions of the island, he says, were chiefly exported to Catai or China. From Sumatra he proceeded to Banda and the Moluccas, from thence returned by Java and Malacca to the west of India, and arrived at Lisbon in 1508.

Sumatra consists of a rectilinear belt of elevation, stretching from the parallel of Penang to that of Bantam, and shutting in the Malay Peninsula and China Sea from the Indian Ocean. Its extreme length is about 925 geographical miles, and average breadth rather more than 90 miles. The gross estimate of Lieut. Melville van Carnbee is 8035 leagues = 128,560 English square geographical miles. The islands on the west coast give a further surface of 5000 miles. Its S.W. coast has a narrow tract of low land, beyond which the mountains suddenly rise.

Talang, . . .	11,820 ft.	Indrapura, estimated at . .	12,255 ft.
Singalang, . .	9,634 ,,	Luse, territory of Acheen, in 3° 40′ N., . .	11,250 ,,

Seret Merapi, .	5,860 ,,		
Pitya Keling, .	680 ,,		
Lubu Raja, . .	6,234 ,,		

The island is divided into a number of petty states, the chief of which are Acheen, Delly, Langkat, and Siak. British political relations with Acheen date as far back as 1602; the various attempts, however, which were made to establish a factory at Acheen, failed. In 1815 a revolution broke out, and the reigning sovereign, Jowhar Shah, a dissolute prince, was deposed, and Syful-Alam Shah, the son of a wealthy merchant, who was related to the royal family, was raised to the throne. After protracted negotiations, however, the ex-raja was restored, through the mediation of Sir Stamford Raffles, and a treaty was concluded with him. With Delly, Langkat, and Siak, treaties exist, but after the treaty with the Dutch, of 1824, the diplomatic connection of the British with Sumatra ceased. In Sumatra island there are at least 15 nations, and the total population has been variously estimated at from 2,500,000 to 7,000,000.

Netherland India has the following settlements on the coasts of Sumatra:—

Wild Tribes.—There are two races, at the opposite extremes of the civilisation of the island. The one is a half-wild people, the scattered remnants of the aboriginal inhabitants. In the north, they are known under the name of Orang Lubu; the Battas describe them as having inhabited Pertibi before they occupied it (Willer, Tigd. v. N. Ind. 8th y., 2d part, p. 402). They are found up the Mandan above Siak (J. Anderson, Mission to Sumatra, p. 349). In the south, they are mentioned under the name of Orang Kubu by Marsden and other writers who resided on the west coast; and we know, from information received from Malays, that they are found in the

interior on ascending most of the large rivers whose embouchures are on the east coast. Major Sturler, in his account of Palembang, gives a particular description of the Orang Kubu, who in condition and habits entirely agree with the wilder tribes of the Malay Peninsula. The same remark applies to the Orang Gunong of Banka.

The southern extremity of the mountain belt is inhabited by the Orang Abung, long a head-hunting race. These are the mountain nomades; but there are also half-wild people, some living in boats in the salt-water creeks, and others in the sago forests and low jungles of the east coast. In this lowest class of Sumatran tribes should be included those inhabiting some of the western islands, such as the Enganoans. Their physical resemblance to the Malays is everywhere remarked, and (Journ. Ind. Arch. ii. pp. 332, 517) there seems no room to doubt that they are the aborigines of the Malayan region of Sumatra, and the remnants of the stock from which the present Malays have descended. Their numbers may be provisionally assumed at 6000. The Abung and Kubu in the south appear to be about 2000.

Orang Malayu. — The Malay races are the principal inhabitants of the island. They entirely occupy the wildest and middle region of Sumatra, extending from the Rakan nearly to the Palembang on the east coast, and from Ayer Bangis to Kataun on the west coast, a length of about 275 miles, with an average breadth of about 190 miles, and a superficies of 52,250 square miles, or little short of one-half of Sumatra.

The Malay population is distributed as follows:

1. Malays of the mountain region.

a. Menangkabau.
b. Malays of the region of Sapulo Bua Bandar and Gunong Sungei Pagu.
c. The Korinchi.
d. The Rawa.

2. Malays of the hilly territories to the west of the mountain region.

a. The seaboard of Menangkabau (1700 square miles).
b. The seaboard of Sapulo Bua Bandar, having a surface of 1300 square miles.

3. The Malays of the low lands or eastern countries.

4. The Malays of the east coast of the northern region.

The *Batta* of Sumatra are not unlike the Malay and Binua of the Malay Peninsula in feature, but are a finer race of men. The Batta occupy wholly the valley of Mandeling, and have an alphabet and language of their own. The women wear the sarong only, from the waist to the knee.

The Batta language is alphabetic, and invented by themselves. It has several dialects. They believe in evil spirits and omens. They are an inland people, the Malays from Menangkabau having spread and occupied all the coasts. All the Batta beyond the territories of the Dutch are from time immemorial cannibals. On the Dutch acquiring the plain of the Mandeling valley, the Batta dwelling there were compelled to abandon their cannibalism. The writings of Marco Polo show that, so early at least as 1290, they were addicted to this. The raja of Sipirok assured the Dutch Government at Pedang that he had eaten human flesh at least forty times, and that nothing he had ever eaten was equal to it. Professor Bikmore, travelling amongst them in 1865, confirms what Sir Stamford Raffles wrote in 1820, after visiting Tapanuli Bay, viz. that for a person convicted of adultery, midnight robbery, prisoners of war, intermarrying into another tribe, and for treacherously attacking a village, house, or person, the punishment is to be cut up and eaten.

The races blend with each other at their boundaries, many districts and villages in the northern region, for instance, being peopled by Malays and Battas, Malays and Achinese, or Achinese and Battas, and most of the settlements near the coast possess in addition a very mixed population of foreigners from the rest of the Archipelago, China, India, and Arabia, while Europeans are found in small numbers in the Netherlands possessions, chiefly at Palembang, Bankaulu, and Padang, little more than two millions for the entire population. Mr. Francis estimated 4,500,000, but the following table exhibits ascertained results:—

		Area.	P... 1...
I.	Wild tribes,	...	
II.	Orang Malayu,	...	
	Mountains, viz.—		
	Menangkabau,	3,000	3...

X.	Orang Mantawei,	2,240	
XI.	Orang Niha or Nias,	1,800	2...
XII.	Orang Maruwi,	600	3,000 5

The inhabitants of Komring and of Komring Ulu have a peculiar language; their writing, in letter and sound, agrees much with that of the Battas. The menareh (dancing) and berswara (singing) also differ in Komring from what they are in the other districts. The young girls dress better, are more pleasing in their movements, and their voice is more harmonious than that of women of the country usually is in singing. Girls are able, in free, agreeable, and melodious tones, to pour forth improvised couplets and verses in honour of persons and events. In former days the concubines of the sultan were chosen from the women in Komring. The Sumatrans speak of tigers with a degree of awe, and hesitate to call them by their common name (rimau or maching), terming them respectfully satwa (the wild animals), or even nenek (ancestors), as reall...

SUMATRA.

believing them such, or by way of soothing and coaxing them.

In Sumatra and the groups of islands on its western coast, in addition to the Malay, there are at least nine other languages, five of which, the Ache or Acheen on the north-western end of this island, the Batak or Batta, the Korinchi, east of the Batak, the Rajang or Rejang, and the Lampung, are cultivated or written tongues. There are also several rude languages among the scattered tribes on the mainland. The Batak or Batta nation lie to the east of the Malays. The Lampung nation, which occupies that portion of the south-western side of Sumatra which lies opposite to Java, divided from it only by the Straits of Sunda, has its own peculiar alphabet, which consists of 19 substantive letters, with double or treble consonants, making them up to 44. It has a great deal of that angular, linear, and meagre form which characterizes the other Sumatran alphabets. The Lampung people occupy the eastern end of Java, on the Straits of Sunda, and fronting the western extremity of

the groups of islands on the western Sumatra are several unwritten tongues, which may be named that of the Pogy Islands, the language of the Nias, and that In Sumatra, beginning from the west, vidence of a native written character is e Batak, and it is singular that a nation als should possess the knowledge of There was assuredly nothing of the kind e or continental Asia until long after ceased to eat each other. The form of k letters is horizontal. The Bhima alphaerly in use amongst the Bhima people in nd of Sumbawa, east of Sumatra and Java, w given way to the alphabets of the The Acheen and Malay of Sumatra are in the Arabic character. The Rejang, at nanjong in Sumatra, are a distinct race e Malays of Menangkabau, though they to the Malay race. They have a language abet of their own.

natran scrupulously abstains from pro his own name, merely as a punctilio in It occasions him infinite embarrassen a stranger, unacquainted with their requires it of him. As soon as he rom his confusion, he solicits the interf his neighbour. He is never addressed, except in the case of a superior dictating to his dependent, in the second person, but always in the third, using his name or title instead of the pronoun, and when these are unknown, a general title of respect is substituted, and they say, for instance, 'Apa orang kaya punia suka?' 'What is his honour's pleasure?' for 'What is your or your honour's pleasure?' When criminals or ignominious persons are spoken to, use is made of the personal pronoun kau (a contraction of angkau), particularly expressive of contempt. In Sumatra there were formerly three perfectly distinct kinds of marriage,—the 'Jugur,' in which the man purchased the woman; the 'Ambel-anak,' in which the woman purchased the man; and the 'Semando,' in which they joined on terms of equality. In the Ambel-anak marriage, the father of a virgin makes choice of some young man for her husband, generally from an inferior family, which renounces all further right to or interest in him, and he is taken into the house of his father-in-law, who kills a buffalo on the occasion, and receives 20 dollars from his son's relations. After this, the buruk baik'nia (the good and bad of him) is invested in the wife's family. If he murder or rob, they pay the bangun or the fine. If he be murdered, they receive the bangun. They are liable for any debts he may contract in marriage, those prior to it remaining with his parents. He lives in the family, in a state between that of a son and a debtor. He partakes as a son of what the house affords, but has no property in himself. His rice plantation, the produce of his pepper garden, with everything that he can gain or earn, belongs to the family. He is liable to be divorced at their pleasure, and though he has children, must leave all and return naked as he came.

Sumatra is known among the eastern people by the two names of Indalas and Pulo Percha (or Pritcho). No country has been more famous in all ages for gold, and the quantity procured is considerable. There are also mines of copper, iron, and tin; sulphur is gathered in large quantities about the numerous volcanoes. Saltpetre is made from the earth, which is found impregnated with it, chiefly in extensive caves, the haunt of birds, of whose dung the soil is formed; and coal is collected.

Sumatra has about fifteen volcanoes, four of which are of considerable importance,—Dempo, 10,440 feet; Indrapura, 12,140 feet; Talang, 8480 feet; and Merahi, 9700 feet: the others are of less elevations, 6000 or 7000 feet.

Sumatra has the Galeopithecus, the Gymnura Rafflesii, Cervus rusa, Cervus hippelaphus, crocodilus biporcatus Rafflesii.

Mr. George Windsor Earl, in a pamphlet on the Physical Geography of South-Eastern Asia and Australia (1855), pointed out that the islands of Sumatra, Java, and Borneo are connected with the Asiatic continent by a shallow sea; and that a similar shallow sea connects New Guinea and all the adjacent islands with Australia, these last being all characterized by the presence of marsupial animals. Carrying out Mr. Earl's suggestion, Mr. Wallace maintains that some of the islands had long been connected with the Asiatic continent, and others equally long with that of Australia; and that a line of separation can be drawn between these; and he designates the Asiatic portion Indo-Malayan, and the Australian division Austro-Malayan. The seas between Sumatra, Java, and Borneo are so shallow that ships find anchorage in any part of it, as it rarely exceeds 40 fathoms, and the seas eastward to the Philippines and Java rarely exceed 100 fathoms. The elephant and tapir of Sumatra and Borneo, the rhinoceros of Sumatra and the allied species of Java, the wild cattle of Borneo, and the kind long supposed to be peculiar to Java, are now all known to inhabit some part or other of Southern Asia; and of the birds and insects, every family and every genus of the groups found in any of the islands occurs also on the Asiatic continent, and in a great number of cases the species are also identical. The great islands of Java, Sumatra, and Borneo even yet resemble, in their natural productions, the adjacent parts of the continent almost as much as such widely-separated districts could be expected to do, even if they formed part

of the Asiatic continent. The Philippine Islands agree in many respects with Asia and the western islands, but present some anomalies. The eastern portion, on the other hand, from Celebes and Lombok eastwards, exhibits as close a resemblance to Australia and New Guinea as the western islands do to Asia. Australia has no apes, monkeys, cats, tigers, wolves, bears, hyænas; no deer or antelopes, sheep or oxen; no elephant, horse, squirrel, or rabbit. In lieu, it has kangaroo, opossums, wombats, and the duck-billed polypus. It has no woodpeckers or pheasants; but has, in lieu, the mound-making brush turkeys, honeysuckers, cockatoos, the brush-tongued lories, which are found nowhere else in the globe; and all these peculiarities are found in the islands which form the Austro-Malayan division of the Archipelago. The islands eastward from Java and Borneo form a part of a previous Australian or Pacific continent, although some of them may never have actually been joined to it. The Aru Islands, Mysol, Waigyu, and Jobie agree with New Guinea in their species of mammalia and birds, and they are all united to New Guinea by a narrow sea. The 100-fathom line around New Guinea marks the range of the paradise birds. This separation has no relation to their geological character. The Indo-Malayan and Austro-Malayan divisions hold two distinct types of the human race, the Malay and the Papuan, who differ radically in their physical, mental, and moral characters; and, under one or other of these two forms as types, the whole of the peoples of the Eastern Archipelago and Polynesia can be classed, and the line separating these two types comes near but somewhat eastward of that part of the zoological regions. This easterly jutting of the Malay line has been caused by the maritime enterprise and higher civilisation of the Malay races, who have overrun the nearer part of the Austro-Malayan region, have supplanted the original inhabitants, and spread much of their language, their domestic inhabitants, and their customs far over the Pacific. To the Malay type and to the Papuan type respectively, all the people of the various islands can be grouped. The Asiatic races include the Malay, and all have a continental origin; while the Pacific races, including all to the east of the Malay (except, perhaps, some in the Northern Pacific), are derived not from any existing continent, but from lands that now exist or have recently existed in the Pacific Ocean.—*Bikmore; London Geog.
